1054808	2/25/2021	MN	65	F	2/14/2021	2/14/2021	Nearly continuous headache behind the eyes since the evening of vaccine shot (11 days as of current date). Sometimes dull throb, sometimes sharp pain usually on left side (same side as vaccine shot). Sensitivity to light. When pain is sharper causes indigestion and nausea. Pain goes away if I take ibuprofen, but always returns and persists overnight. I don't like taking ibuprofen or acetaminophen more than once a day or for continuous days. Acupuncture worked for a short time. Affects my ability to concentrate and work on computer or watch TV. What other natural treatment will help? How much longer will this last?
1054842	2/25/2021	DE	55	M	2/19/2021	2/22/2021	fatigue, sore joints, headache, swollen around eyes, blurred vision (2-22)
1054873	2/25/2021	FL	42	F	1/26/2021	1/27/2021	I received my second covid vaccine on 1/26. On 1/27 I had severe body aches, headache, burning dry eyes, debilitating fatigue, and could barely move my arm. I had these same symptoms on 1/28
1054541	2/25/2021	IA	84	F	2/19/2021	2/20/2021	Swelling in right eye with pocket of liquid/blood around nose and eye area

1053884	2/25/2021	NJ	37	F	1/13/2021	1/13/2021	I received my second dose of the Pfizer Covid vaccine on 01-13-2021 at 8:30am in my left upper arm. By 3pm that day, my left arm was very tender to the point I couldn't lift it up and I began having whole body chills and shivering along with extreme fatigue. I went to bed at 5:30pm that night and woke up around 11:30pm to my whole body shaking and shivering and my teeth were chattering together. My husband said I was confused at that time and kept repeating that I was freezing. I must have had 5 blankets piled on top of me to try to get me to warm up. By the next morning, I soaked through the bedsheets and had extreme fatigue (like I had a hard time keeping my eyes open) all over body aches, fever and chills. I remained this way for the next week. At the end of the 1st week I still had chills, extreme fatigue, nausea and horrible headaches and my left arm pain turned into left elbow joint pain. By the end of the 2nd week, I still had extreme fatigue, headaches and left elbow pain along with body tremors. On 1-28-2021, I went to the hospital due to having two episodes where I felt so dizzy I had to lay down on the ground until the dizzy spells subsided. I was given IV fluids and sent home with orders to rest. By the end of the 3rd week I no longer had body tremors or dizzy spells but I still had extreme fatigue needing multiple naps a day along with headaches at which time my primary doctor prescribed me Imitrex to help alleviate the headaches and I still had left elbow joint pain. I also developed bronchitis. It is now February 25, 2021 and I am still having fatigue and mild to moderate headaches along with the left elbow joint pain along with some right elbow joint pain. I have been out of work for over a month now due to my fatigue and joint pain.

1053572	2/25/2021	VT	90	F	1/28/2021	1/30/2021	<p>arrhythmias; rapid heartbeat; slight nausea; slight headache; light bothered vision for some days; mild chills; A spontaneous report was received from a retired nurse concerning herself who is 90 year old received Moderna COVID-19 vaccine and have experienced arrhythmias, rapid heartbeat, slight nausea, slight headache, some visual problems (light bothered her for some days) and mild chills. The patient has prior history of irregular heart beat . Her relevant concomitant medications were cholesterol medication, Crestor and medication for irregular heartbeat. No information on allergies. On 28-JAN-2021, prior to the onset of events, the patient received her first of two planned doses of COVID-19 vaccine intramuscularly for the prophylaxis of COVID-19 infection. On 30-JAN-2021, 2 days after her vaccination, she developed arrhythmias, rapid heartbeat, slight nausea, slight headache, some visual problems (light bothered her for some days) and mild chills. After one week she felt like no more symptoms ongoing and felt good again. She visited her physician for arrhythmias, and he said, she should keep an eye on it, but no medication yet. She is concerned about her second shot. Action taken with 2nd dose of Moderna COVID-19 vaccine was not reported. The outcome of the events, arrhythmias, rapid heartbeat, slight nausea, slight headache, visual problems and chills were resolved at the time of report.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the onset date of the events, a causal relationship cannot be excluded. However, patient's advanced age and prior history of irregular heart beat are considered risk factors for arrhythmias.</p>

1053597	2/25/2021	AL	52	F	1/13/2021	1/13/2021	Eyes have gotten worse; red streaks going up arms and splotches/ splotchy red whelps and streaks up her arm; real red spot on wrist; her arms started stinging and itching; Hand and feet were itching off; burning; This is a spontaneous report from a contactable consumer (patient). A 52-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE lot number: EL1283) intramuscular on the left arm on 13Jan2021 13:15 at a single dose for COVID-19 immunization. Medical history included acid reflux, antidepressant, normally wears contacts and puts reading glasses on over it. Family medical history of cancer. Concomitant medication included omeprazole (PROTONIX [OMEPRAZOLE]) for acid reflux and bupropion hydrochloride (WELLBUTRIN) as antidepressant. The patient went and got her first shot 2 weeks ago. She is a dental assistant. She woke up between 2am-3am on 13Jan2021 and her hands and feet were itching off. They were burning and itching and she did not have any rash. So Thursday, she had to work until 1. Her hands itched and she went home, took Benadryl and put Cortisone cream on hands and feet. She does not have a dose, lot or expiration for either. It would take 2 doses of Benadryl. They just continued to itch until Saturday and she went to a doc in the box and the doctor felt it was a reaction from the vaccine. You could not see anything except red where she scratched it. She gave her some medicine and she just went to pharmacy and the pharmacist said that is just like Benadryl. She started taking it and it immediately helped, but she only gave it to her for 5 days and when she finished, the itching started again. On 27Jan2021, her hands were itching off and she has red streaks going up arms and splotches. She does not have the name. It was like hydro something. She threw bottle away. She does not have a dose, lot or expiration. It improved and stopped when she was taking the medicine and on 26Jan2021, she had a real red spot on wrist, her hands have itched and itched. When her arms started stinging and itching, she pulled her sleeve up and it looks like streaks on her arms and elbows. She has these splotchy red whelps and streaks up her arm. She also noticed she had itching on her torso the day before. She needed to get glasses to see vaccine card. This was required before she took the vaccine, but she did feel like her

eyes are worse all of a sudden. She normally wears contacts and puts reading glasses on over it. It has only been in the last few weeks that she has noticed this. Now, her arms were starting to itch again after a dose of Benadryl. She was worried about 2nd shot. She does not want it to get worse and continue. She would like to speak with someone to find out if it would be recommended for her to get second dose or not. No ER or physician's office required: Doctor visit on 16Jan2021 and they prescribed a medication to help with itching and burning for 5 days and it worked and when she stopped taking it, it started back. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The facility where the vaccine was administered was at a Clinic for the hospital. There was no history of all previous immunization with the Pfizer vaccine considered as suspect. There were no additional vaccines administered on same date of Pfizer suspect. Outcome of the events itching and eyes have gotten worse was not recovered, events burning and pain in arm was unknown and recovering for the other events.

1053664	2/25/2021	TX	73	M	1/15/2021	1/17/2021	<p>Occlusion on right eye; Can't see out of his right eye; hemorrhage in right eye; Case reference number MOD-2021-012734 is a spontaneous case report sent by a Non-Healthcare Professional on 09-FEB-2021, which refers to a male patient who received the first dose of Moderna's COVID-19 Vaccine (mRNA-1273) and experienced occlusion of the right eye and blindness in the right eye which required hospitalization and the event of hemorrhage in the right eye. The patient's medical history included a shunt installation for hydrocephalus. The patient's medication history included amoxicillin, omeprazole, potassium citrate, sertraline hydrochloride, tamsulosin, amoxicillin trihydrate, benzydamine hydrochloride, bromhexine hydrochloride, trespium and unspecified sinus medications. On 15JAN2021, the patient received the first dose of Moderna COVID-19 (mRNA-1273) Vaccine (Lot: 041L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 17JAN2021, the patient's wife reported that the patient couldn't see out of his right eye. He went to the emergency room and his ophthalmologist reported that the patient had an occlusion on the right eye which was not a result of the vaccine. On 19JAN2021, the patient left the hospital. Later that same week, the patient visited another ophthalmologist that observed a hemorrhage on his right eye with an unknown etiology. On 04FEB2021, the patient went to the dentist where multiple infections and molars were identified. Treatment included amoxicillin 875mg for 10 days. Action taken for the events of occlusion of the right eye, blindness in the right eye and hemorrhage in the right eye associated with mRNA-1273 was not reported. The outcome of the events was unknown.; Reporter's Comments: This case concerns a 73-year-old male patient, who experienced a serious unexpected events of vascular occlusion, blindness, and eye hemorrhage, after receiving first dose of mRNA-1273 (lot # 041L20A). Very limited information regarding this event has been provided at this time. Further information has been requested.</p>

1053976	2/25/2021	IL	21	F	2/4/2021	2/4/2021	Moderna COVID-19 Vaccine EUA Approximately 3 minutes after her vaccine pt became unconscious and unresponsive for a short time. Pt was quickly awoken by RN. Pt states that she has a history of syncope following venipuncture that she forgot to disclose. Approximately 15 post episode pt stated that her vision had been restored but her hearing still felt "off". Pt was given 12 oz water, crackers and juice. Pt called roommate to pick her up to bring her home. Approximately 25 minutes later, pt reports some left arm pain but was feeling better. At 1345 pt was discharged by her own choice and left with her roommate. Pt still felt "off" but reported that this was likely just due to anxiety. Pt and roommate given instructions to go to nearest ER if symptoms returned.
1053981	2/25/2021	FL	69	F	2/22/2021	2/22/2021	Within 15-minutes of vaccination, the patient reported rash, hives, itchiness, and potential swollen lips, tongue, eyes or face. EMS monitored the patient on-site. No further details were provided from clinical site.
1053990	2/25/2021	MD	28	F	2/3/2021	2/15/2021	Ballspalsy, right side Eye and facial movement issues, it started gradually a week and a half after my dose my eye was not blinking in sync with my left eye, gradually started to go down to my face where my lips my cheek or my eyebrows were not moving when I was talking all my words were slurred and off to the side of my mouth. When smiling one side trip the far far left the other side stay still. My job had me go to a doctors up where they diagnosed me with Bell's palsy it and the doctor advised me to report this. My treatment plan is antiviral medication and steroids, Valacyclovir 1gm tid, methylprednisolone 4grams qid. I am very upset and heartbroken every time I look in the mirror I cry because I cannot recognize my face I did read online that Pfizer did have side effects of bells palsy but I never thought I would get it given my age and good medical history. I would love for someone to reach out to me I need to know what happens from here. As a result I have been off of work for a couple days.
1053993	2/25/2021	FL	62	M	2/20/2021	2/20/2021	Pt felt arm soreness 4 hours later than felt fatigued, leg heaviness, arm heaviness, and then felt faint with black spots in eyes and numbness down left extremity. Symptoms are still persisting 5 days later today 2/25/21. PT did not knowingly have COVID prior.

1055535	2/25/2021	WI	70	F	2/25/2021	2/25/2021	<p>Patient was alert and conversational throughout first COVID-19 Pfizer vaccination. During post vaccination waiting period, patient became unresponsive and exhibited convulsion like movements in her waiting chair. Pharmacist quickly evaluated patient and patient was only minimally responsive to painful stimuli only. Breathing was rapid, shallow, and irregular with an expiratory wheeze heard upon auscultation. Patient was slouched in chair but supporting self and had a strong grip with her left hand. Skin condition was warm but diaphoretic. Ambulance 911 service was called. No swelling of the throat, mouth, face, nor lips was seen. Patient continued to be non-responsive, with non-comprehensible sounds, and was not opening eyes or following commands. Due to worsening ability to breathe and wheezing on expiration, epinephrine 0.3 mg was administered intramuscularly into the left thigh at 1230 on 2/25/2021. Approximately 5 minutes after epinephrine administration, the patient's work of breathing improved, wheezing was diminished upon expiration, and respiratory rate had slowed to 16 breaths per minutes. BP was 160s/80s and HR 98 (after epinephrine administration). Patient began opening eyes spontaneously but was still not following commands. Ambulance service then arrived, report was given, and patient was transported to Hospital Emergency Department. Patient was under the care of Doctor at the emergency department and received albuterol/ipratropium nebulization, dexamethasone 10 mg IV, famotidine 20 mg IV, and magnesium sulfate 2 g IV. After the physician evaluated the patient and talked with family, the patient's family stated that the patient has a history of anxiety related reactions such as this with convulsion like activity. Doctor then determined that the patient did not have an anaphylactic/allergic reaction and instead had a anxiety related vasovagal type reaction. Doctor stated that the patient could receive the second COVID-19 vaccine dose in 3 weeks without issue. Patient then discharged from Emergency Department (unsure if AMA). Patient then presented to the pharmacy with her daughter after discharge to fill in staff on the outcome of the reaction. Patient appeared to be at baseline mentally and physically. Pharmacist contacted Emergency Department to discuss case with patient's nurse to obtain information about medications</p>

1055712	2/25/2021	HI	66	F	2/24/2021	2/25/2021	morning fatigue - bedrest, recovered by mid-afternoon neck rash, watery eyes - began a week after first shot. took loratadine this morning, now neck not itchy, eyes not watery. also had covid arm a week after first shot - went away in 3 days.
1055694	2/25/2021	AZ	47	F	1/17/2021	1/18/2021	Extreme myalgia and paresthsias, Pain 9/10. Similar presentation patient experienced with past meningitis event. Insomnia, vision changes, agitation. Prednisone is helpful in making pain bearable. Gabapentin started today. Labs pending.
1055705	2/25/2021	MI	83	F	2/19/2021	2/20/2021	Five days ago, patient received her 2nd COVID vaccination. Following that she had myalgias and some sedation/confusion. She apparently stumbled and struck her head. She did not lose consciousness. She did recover from her symptoms by the next day. She has some soreness on her scalp in the scratch but no significant hematoma. However, she then developed some swelling and redness beneath her eyes. She is here to evaluate that. She she is back to her normal self. Comments: Patient has ecchymosis in swelling beneath both eyes and the bridge of her nose. It is nontender. Scalp-minor area of tenderness in the right vertex. There is a slight abrasion on the skin. No signs of hematoma. Assessment / Plan: 1. Contusion of scalp, initial encounter Contusion right scalp-I suspect patient's lungs are delicate skin informed a small hematoma. The swelling and bruising and 5th settle down into her eye sockets. I reassured patient that this will resolve the next 1-2 weeks. I believe patient had some severe myalgias and fatigue after a COVID shot. I do not think this is a longstanding problem. Expect her to get back to her normal self. Patient did have COVID-19 approximately 3 and half months ago. I told her that people have more significant reaction to the COVID vaccine after having had the illness. At this point, I do not agree need further workup.

1055719	2/25/2021	MI	22	F	2/24/2021	2/24/2021	Onset: Started 7:30 pm, had vaccine at 4 pm. Occurrence: acute. Symptoms: Dizziness, blurry vision - both eyes, headache, muscle aches, nausea. Patient then went to the Emergency Department - presents to the ED with a chief complaint of a headache that began today. The patient had her COVID-19 vaccine today around 1600 and began experiencing multiple side effects afterward. The worst symptoms for her are the headache and body aches. Her other symptoms include dizziness, blurred vision, nausea, weakness, and muscle soreness in the left arm where the shot. Eyes: Positive for visual disturbance. Gastrointestinal: Positive for nausea. Musculoskeletal: Positive for muscle pain. Neurological: Positive for headaches, dizziness and weakness. DIAGNOSIS at time of disposition: 1. Adverse effect of vaccine, initial encounter Acute patient signs symptoms are consistent with an adverse reaction of COVID-19 vaccine. Patient is experiencing the immune response mediated by the vaccine. She is hemodynamically stable, nontoxic, afebrile, well-appearing. She is not taking any medication for symptoms. She is given oral meclizine here in the emergency department for dizziness and nausea. She is given a prescription for this to use at home in addition to Tylenol or Motrin. Patient was instructed to follow up with primary care provider for ongoing evaluation and treatment of current symptoms. Patient was instructed to return to the emergency department for new or worsening symptoms. Patient understood the results, agreed with the plan, and was discharged home in stable condition.

1055727	2/25/2021			U			I woke up at 5:45 am on February 9, 2021 with bright red, raised bumps on the back of my right shoulder extending down the back of my right upper arm. I also had a few spots on my right cheek under my eye, and on my left elbow. They were very itchy and warm to the touch. I took benadryl and it started to clear up. Around 12:00, the spots reappeared and started spreading across my right upper arm. I went to the doctor at 4:45pm on February 9th. He confirmed they appeared to be hives and recommended continuation of benadryl. Over the course of 4 days (February 9th through the 12th) the hives spread across my body (both arms, back, stomach, neck, face, both legs, left foot). They ranged in size from the size of a Q-tip end to banana size hives. They would almost completely clear up when I would take benadryl and reappear as the benadryl wore off. I woke up again on February 20th with about 20 small hives on my neck. They cleared up in about an hour without medication.
1055721	2/25/2021	PA	59	F	2/25/2021	2/25/2021	Patient started experiencing tingling in mouth area within 5 to 10 minutes of receiving vaccine. Patient is aware of beginning symptoms of anaphylaxis since she has experienced in the past. Patient also started feeling her eyes swell. Patient has an EpiPen and was unsure if she should use or wait longer. I contacted 911 to dispatch a paramedic since we would need to contact them anyway if she decides to use her epiPen. Paramedics came within 5 to 10 minutes and took her to evaluate/treat.

1055132	2/25/2021	GA	52	F	2/20/2021	2/23/2021	I have a 3 inch in diameter mass of swollen lymph nodes under my left arm (had both shots in left arm). I read online that this is a sign of my body fighting the vaccine and it is a good sign. I went to my doctor just to have it checked out and because both of my eyes look like I have pink eye. My doctor isn't sure if my eyes have anything to do with the vaccine but said probably not. She said that I needed to report my mass as it is not one of the most common side effects. I also went to the health department, where I had both shots, and had them look at the mass. They said the same thing about my body fighting the vaccine. My doctor and the health department said that while they have seen the swollen lymph nodes from the shot, they haven't seen such a large mass like mine. Both of them said I needed to report this.

1051786	2/24/2021	NJ	77	M	2/3/2021	2/7/2021	Four days after receiving the first Pfizer COVID-19 vaccination (2/7/2021) I began experiencing double vision. This double vision was intermittent, lasting for several hours at one time. This double vision persisted and worsened with double vision all day long. At the ER prior to discharge, Dr. diagnosed me with possible "Ocular myasthenia gravis" and prescribed me with Pyridostigmine Bromide. After having been 30mg of this medicine daily for 1 week, the double vision has not subsided. Starting today (2/24), I am beginning to take 60mg daily. This double vision continues today (2/24/2021) even with the newly prescribed medication
1051813	2/24/2021	FL	74	F	2/17/2021	2/18/2021	Weak, tired, cold, nausea, off balance, migraine headache, eye pain, blurry vision, foggy brain, face pain, trigeminal neuralgia, neck and face hot and red, sweating and shaking, threw up like acid, insomnia, frequent urination, diarrhea.
1051819	2/24/2021	AL	80	F	2/17/2021	2/17/2021	pt stated that the day after the covid vax she had the dry heaves and body aches and pains. The second day she shaking and jerking, couldn't hold on to anything. Her blood pressure was up and down that day. She said she felt like she was dying and then she vomiting where she bruised both elbows on the toilet bowl due to the jerking movement she was experiencing. She took a nap and woke up confused. She was hallucinating saying she felt like she went from a small box to a blue box to red box and didnt recognize her room. Her sitter said her eyes were glazed but was able to recognize her sitter at that time. Blood pressure dropped so the sitter then called EMTs where they checked her out. Vital signs were good but she declined to be transported to the hospital via ambulance. The third day she was feeling some better where she was able to eat and get a sponge bath. Fourth day she was better so was able to shower. She states she is better now with just a little soreness and redness around the injection site. Pt has contacted her PCP and spoke with the nurse about her symptoms.

1051841	2/24/2021	OH	67	M	2/12/2021	2/13/2021	Sudden onset of brief, recurring flashing lights in left eye visual field for 2 hours, then sudden onset of ring shaped floater in same left eye on the afternoon of 02/13/2021; one day after receiving first Pfizer-BioNTech vaccine at the COVID vaccine clinic on 02/12/2021. No further lightening flashes since the initial day of symptoms (02/13/2021). Floater has persisted. Seen by ophthalmologist on Monday 02/15/2021 confirming posterior vitreous detachment.
1051858	2/24/2021	IN	49	F	2/23/2021	2/24/2021	Bloody nose with nasal pressure and headache, burning and itchy eyes.
1051874	2/24/2021	OH	35	F	2/23/2021	2/24/2021	Extreme pain in left jar and behind left ear. Mild face dropping on the left side, noticeable when I smile and around my eyes.
1051934	2/24/2021	TX	40	F	2/8/2021	2/17/2021	On Wednesday, Feb 17, I experienced an earache in my left ear and an eye twitch in the left eye, which continued to Thursday, Feb 18. On Feb 18, also experienced extreme fatigue and a jabbing, throbbing pain behind my left ear that came and went all day. I also noticed when I brushed my teeth that I had a hard time swishing water in my mouth, especially on the left side. On Friday morning, I woke up and noticed my left eyelid was drooping and my smile was lopsided. As I have a history of hemiplegic migraine, I assumed I was experiencing a migraine, although this was not the usual course of these migraines, and I had not had one of these types of migraines in many years. The left side of my head, behind my ear, and wrapping from my neck to my temple continued to hurt (but not as painful as a normal migraine). Thinking I was in a chronic migraine state, I took 40 mg of Prednisone, as I have done before to 'cut through' the migraine. When the facial weakness did not resolve by the next day, I suspected this was not migraine and instead suspected Bell's Palsy and consulted my physician. Looking back in time, I also realized that I had experienced some adverse tingling/taste sensations on part of my tongue as far back as February 8, that felt similar to burning your tongue from drinking too hot liquids that I realized later could have also been part of the Bell's Palsy.

1051949	2/24/2021	OH	74	F	2/5/2021	2/5/2021	About 10 minutes after receiving the Maderna vaccine my head started hurting which I reported to the doctor on site. She talked to me and said I was ok to go. My headache pain persisted all day and into the next. For the pain I took Tylenol and Advil. The pain has not let-up since the day of my vaccination. In addition to the head pain, I started sneezing and had terrible eye irritation with burning and watering. These side effects are still persisting. The worst, however, is the severe head pain which only settles down when I sleep. I am sleeping only 3-4 hours at night now. I wake up for a bathroom break at 3-4 A M and can't go back to sleep. My head pain starts after I get up every morning about 1/2 hour to an hour. My doctor recommended taking Extra Strength Tylenol and Advil alternating them and an antihistamine. Functioning day to day and making decisions has been very difficult. But, the pain is the worst!!!

A 71-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EL9265), via an unspecified route of administration at the left arm on 27Jan2021 15:15 at a single dose for COVID-19 immunization. Vaccination was done in a Public Health Department. Medical history included hypertension (HTN), gastroesophageal reflux disease (GERD), total hysterectomy and osteoarthritis, all from an unknown date and unknown if ongoing. The patient was not pregnant. There were no known drug allergies. Concomitant medication included celecoxib (CELEBREX), omeprazole magnesium (PRILOSEC), estradiol (ESTRACE), metoprolol succinate (TOPROL XL) and ascorbic acid, betacarotene, cupric oxide, tocopheryl acetate, zinc oxide (PRESERVISION). It was reported that the patient experienced right sided neck pain which began a couple of days after vaccination on 06Feb2021 07:00. On 05Feb2021, her right eye was twitchy. On 06Feb2021, the right side of her face felt swollen. It felt like when you go to the dentist and get numbed. She tried drinking a liquid and it ran out of the right side of her mouth. She went to urgent care and they sent her to the emergency department. She had a CAT-scan, MRI and blood work done which all came back normal. Her right eye was not closing all of the way and they diagnosed her with Bell's Palsy on 07Feb2021. She was prescribed a course of prednisone and Valtrex. She has continued to have right-sided facial paralysis and her right eye will not close. She had had severe pain in her right eye and had to tape it shut to sleep and often during the day because it dries out. She was using Systaine eye drops every couple of hours and an eye gel at night. She was concerned about getting the second dose because she does not want this to get worse. There were no other vaccines in four weeks. There was no COVID prior to vaccination and was not COVID tested post vaccination. The outcome of the event was not recovered.

1050998	2/24/2021	MA	86	M	1/20/2021		<p>He can barely see/he cannot see/his vision is getting worse and worse/visions problems; This is spontaneous report from a contactable consumer who reported for her father. An 86-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 20Jan2021 (at the age of 86-year-old) as a single dose for COVID-19 immunization. Medical history included two ongoing autoimmune diseases from unspecified dates and an ongoing pacemaker from an unspecified date. Concomitant medications included ongoing blood thinners from an unspecified date. The patient experienced he can barely see/he cannot see/his vision is getting worse and worse and vision problems, both on unspecified dates. The patient's child called and stated that "my father is on blood thinner. He has two autoimmune diseases and has a pacemaker. He developed visons problems within a few days after receiving the first dose of Pfizer COVID-19. Now he cannot take care of his dog. He will not be able to take care of himself. His vision has gotten progressively worse, he can barely see. I spoke to the specialist and other doctors, but they have no information. He will be seeing the doctor in 2 weeks only. I reported the side effects online. It was hard to get medical help because not many people are informed about what might go on with the vaccine. To get him diagnosed has been difficult. They can't do an MRI on him because he has a pacemaker. He is also 2 weeks out to see a specialist. In the meantime, he cannot see. His vision is getting worse and worse. His next vaccine is coming up too." The reporter had called and spoke with the director of immunization at the health department. She had also called and talked to VAERS as well. No one could point her to any help. The reporter believed this was probably related to the autoimmune diseases. The patient had no consultation not take the vaccine. The reporter had answered some information on the website while she had been waiting. The rest of the family also had autoimmune issues, and now they were all wondering if it was safe for them to take (the vaccine). The reporter wanted to know if we could provide any recommendations and if her father could get the second dose of the COVID-19 vaccine. The clinical outcome of the event was not recovered. The lot number for the vaccine, BNT162B2,</p>

1051007	2/24/2021		79	F	2/4/2021	2/1/2021	sinus infection; cannot see out of her right eye; sick; terrible terrible splitting headache on her right temple; can't sleep; pressure behind her right eye; head is all fuzzy; mind isn't good; throat hurts; jaw hurts; little off balance; she walks she falls into things; she walks she falls into things; can't see things hardly in her right eye; pain; This is a spontaneous report from a contactable consumer (patient). A 79-year-old female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection; lot number and expiration date were not reported), via an unspecified route of administration on 04Feb2021 at single dose for Covid-19 immunization. The patient's medical history was not reported. Concomitant medication included atenolol for blood thinner. The patient previously took first dose of bnt162b2 for Covid-19 immunization and experienced no adverse event. The patient stated that she received the second dose of the vaccine on 04Feb2021 and has been sick ever since. She has a terrible terrible splitting headache on her right temple and can't sleep and was having so much pressure behind her right eye. She stated she can't even lay her head on a pillow. She stated she had no reaction to the first shot but this time her head is all fuzzy, her mind wasn't good and when she sets things down she can't remember where they are. The second shot was really giving her a fit. Her throat hurts, jaw hurts, head hurts, and feels like she is running a temperature. She is a little off balance, when she walks she falls into things because she can't see things hardly in her right eye. She stated she can't put up with the pain any longer, it is terrible behind her temple and eye. She thought it was a sinus infection but now she thinks it was from the shot. She stated she almost had a wreck today because she cannot see out of her right eye because of the shot. She hit a telephone thing and almost wrecked 3 or 4 times. She tried to get tested for Covid but she didn't have an appointment and she cannot go to work until she finds out about the virus. She was going to get tested tomorrow but was going to have to call the rescue squad because she can't drive and she was not putting her son through this if she has the virus. The patient asked if she was allergic to the second shot or if these were normal symptoms. She asked what she should do. She stated she takes Atenolol, a blood thinner, and thyroid medicine.

An 81-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EN5318), via an unspecified route of administration on 06Feb2021 15:00 at single dose at left arm for covid-19 immunisation. Medical history included wrist had arthritis (pain). There were no concomitant medications. Patient height was a little less than 5. She used to be over 5 but she shrunk. Her weight used to be at 226 lbs, it came up to 230. This year (2021) it went up because, its her, she ate too much and she did not obey the rules. Patient received Pfizer vaccine on 06Feb2021 afternoon at 300 pm in her left arm and that night developed itchiness, numbness and tingling in her fingers on the right side. Last night (07Feb2021) she unable to sleep the whole night as a result of lots of pain in her wrist and hand but especially thumb/wrist on the right side. she also reported swelling in her hand and was hardly able to bend her fingers. She tried to bend her fingers and she can but her wrist was swollen, it was less right now but she still had the pain. She applied muscle relaxant (unclear if topical) and took paracetamol (TYLENOL) and massaged her hand with warm water and then for the second time she used the muscle relaxation. She hadn't taken paracetamol yet she was waiting 4 hours but the pain was still there, it was a little bit less. Not sure if it her arthritis or side effects from vaccine but believes it was from the vaccine. Stated she used to have the same problem with her wrist arthritis (pain). Also reported that she experienced additional side

1051438	2/24/2021	OK	72	F	2/2/2021	2/2/2021	feeling weak; shaky; fever, 100.4; her eyes start feeling funny and burning when she has a fever; her eyes start feeling funny and burning when she has a fever; arm was a little sore; This is a spontaneous report from a contactable consumer (patient). This consumer reported similar event for two patients. This is the first of 2 reports. A 72-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3247), via an unspecified route of administration at the right upper arm close to the shoulder on 02Feb2021 07:30 at single dose as she doesn't want to get COVID again or give COVID to anyone else. Medical history included metabolic syndrome from 1994 and ongoing, it all started when she was 46 and it runs in her family and it was a genetic thing; ongoing diabetes mellitus, was diagnosed when she was 65, so 7 years ago; she had COVID in Nov2020 but it was just a very mild case and she just had a cough; and cardio artery problems. She takes a lot of medications and she has metabolic syndrome which includes cardio artery problems and diabetes, but she has taken all of those medications for a long time. The patient says she was calling to report a couple little concerns she has. She received her shot on Tuesday, 02Feb2021 at about 7:30 in morning and her arm started at about 2 to 3 in the afternoon and she noticed it was getting sore, but it was no big deal, she did not think anything of it, and on the second day she thought that was it and she was over it on 03Feb2021. She states her husband also mentioned that he had soreness in his arm after his vaccination. She says at three in the afternoon on 03Feb2021, she started feeling weak and shaky, but she didn't think much of that. She says this began around 3 to 4 when yesterday afternoon, 03Feb2021, she had a fever. She says she took her temperature and it was 100.4 and that all kind of was gone by the evening but when she woke up this morning, she was weak and shaky again. Today she got up and was weak and shaky and it never left, she was still weak and shaky. The patient mentions that she was diabetic so she can get weak and shaky when she needs to eat something, but she had just eaten, and she ate yesterday so she doesn't think it was caused by that. The patient says she thinks we should know that she was diabetic. She says then she could tell that she had a fever, so she took her

temperature and it was 100.4 which for her was high. She states she didn't even have a fever when she had COVID. The fever began yesterday afternoon (03Feb2021). She says her eyes start feeling funny and burning when she has a fever and they felt that way so that's why she took her temperature. This was the highest it has been in years. She says last night she took her temperature again and the fever had gone away in 30 to 40 minutes, so she thought it was over. She took her temperature again before she called this morning, 04Feb2021 and it was 99.2, which was still a little hot for her. She says for her that's a fever. She was 96 and 97 usually. The patient says she still feels like she has a little fever. She was not someone who usually has a fever and it can be just a little bit of a fever for instance like this morning when she was 99.2. Her eyes were still feeling funny and burning this morning and that was why she took her temperature this morning. The outcome of the event arm was a little sore was recovered on 03Feb2021; feeling weak and shaky was not recovered; fever and her eyes start feeling funny and burning when she has a fever was recovering.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021162089 Same reporter/drug, similar event, different patient

1051445	2/24/2021		61	F	1/28/2021	1/28/2021	chest x-ray shows numerous bilateral patchy opacities; catastrophic brain bleed; Brainstem reflexes were lost; Patient died; shortness of breath; nausea; diarrhea; worsening shortness of breath/numerous bilateral patchy opacities; immunosuppressed status; This is a spontaneous report from a contactable pharmacist and a contactable other health professional. A 61-year-old female patient (not pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9261), intramuscular at arm right on 28Jan2021 (at the age of 61 years) at single dose for COVID-19 immunization. The patient medical history included bilateral lung transplant on 23Jun2017, lymphangioleiomyomatosis, hepatocellular carcinoma, antibody mediated rejection of lung transplant , bronchiolitis obliterans syndrome, grade 0P, major depressive disorder, RLS (restless legs syndrome), chronic insomnia, long term current use of systemic steroids OSA (obstructive sleep apnea), iron deficiency anemia, bilateral sciatica, hoarseness of voice, memory change, laryngeal stridor, pure hypercholesterolemia senile nuclear cataract, bilateral myopia of both eyes, osteoporosis without current pathological fracture, alopecia, immunosuppressed status, all from an unknown date and unknown if ongoing. Concomitant medication included acyclovir (formulation: capsule, strength: 200 mg) oral at 200 mg twice daily, salbutamol (ALBUTEROL HFA) as needed (MCG/ACT inhaler take 2 puffs by inhalation every 4 hours as needed) for wheezing (shortness of breath), atorvastatin (LIPITOR, formulation: tablet) oral at 80 mg once a day, azithromycin (ZITHROMAX, formulation: tablet)oral at 250 mg (every Monday, Wednesday, Friday), bupropion hydrochloride (WELLBUTRIN XL, formulation: tablet, strength: 150 mg) oral at 150 mg once a day, calcium citrate/cholecalciferol (CALCIUM + VITAMIN D, formulation: tablet) oral at 2 dose form once a day (every morning), everolimus (ZORTRESS, formulation: tablet, strength: 1 mg) oral at 2 mg twice a day, fluticasone propionate/salmeterol xinafoate (ADVAIR, strength: 500 ug/ 20 ug) twice daily (1 puff by inhalation), gabapentin (NEURONTIN, formulation: capsule, strength:100 mg) oral at 300 mg daily (by mouth nightly), loratadine (CLARITIN, formulation: tablet, strength: 10 mg) oral at 10 mg as needed, metoprolol tartrate (LOPRESSOR,

VAERS\_ID RECVD STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

formulation: tablet, strength: 25 mg)oral at 50 mg twice daily, minoxidil (ROGAN, strength: 5%) topical apply 1 cap full every other day to affected area on scalp for alopecia, ondansetron (ZOFran, formulation: tablet, strength: 4 mg) oral at 4 mg as needed for nausea, pantoprazole sodium sesquihydrate (PROTONIX, formulation: tablet, strength: 40 mg) oral at 40 mg once a day, prednisone (DELTAONE, formulation: tablet, strength: 5 mg) oral at 5 mg daily (every morning), sertraline hydrochloride (ZOLOFT, formulation: tablet, strength: 100 mg) oral at 100 mg twice a day (every morning), sulfamethoxazole/trimethoprim (BACTRIM) 400-80 mg per tablet (1 tablet by mouth every Monday, Wednesday, Friday), tacrolimus (formulation: capsule) at 3 mg daily (2 mg every morning and 1 mg at night), salbutamol sulfate (PROVENTIL HFA) as needed for wheezing (shortness of breath), salbutamol sulfate (VENTOLIN HFA) as needed for wheezing (shortness of breath) , salbutamol sulfate (PROAIR HFA) as needed for wheezing (shortness of breath), ascorbic acid/ferrous fumarate/folic acid/ retinol (PRENATAL, formulation: tablet) oral daily. The patient previously took NSAIDs and voriconazole and experienced drug allergies. It was reported that the patient presented to emergency department (ED) on 04Feb2021 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine. Full viral panel including COVID-19 was not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 08Feb2021 and then VV ECMO cannulation on 13Feb2021. Acute pupil exam changes in the early am hours of 15Feb2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. The events were all serious. The patient outcome of the events was fatal. The patient died on 15Feb2021. It was not reported if an autopsy was performed.; Sender's Comments: Based on available

							information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. However, the reported event may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Chest x-ray shows numerous bilateral patchy opacities; Catastrophic brain bleed; Brainstem reflexes were lost; shortness of breath; nausea; Diarrhea; Worsening shortness of breath/numerous bilateral patchy opacities
1051515	2/24/2021	TX	50	F	2/2/2021	2/12/2021	10 days post 2nd Covid-19 Vaccine administration I had an anaphylactic response of unknown origin. Extremely itchy eyes, palms of hands, soles of feet, progressed to shortness of breath, Bradycardic, oxygen saturation in 80s even after administration of IM epinephrin, hypotensive, swollen face, neck and tongue, severe vomiting. EMS transported me to hospital mentioned above. IV started in ambulance where IV epinephrin, IV fluids, IV Benadryl, IV solumedrol were all given prior to arrival at the ER. ER then administered more steroids and anti nausea meds and sent me home after observation and stabilization with prescription for epi pen and prednisone.
1051544	2/24/2021	CA	73	F	1/23/2021	2/2/2021	Bell's palsy. Watery left eye, facial paralysis on left side of face. Numbness Treatment - one week of steroids and antivirals. Eye cream

1051348	2/24/2021	IL	35	F	12/20/2020	12/21/2020	maybe a little low iron but not too remarkable; swelling in middle finger of right hand/puffiness in all of fingers and toes and around eyes; puffiness in all of fingers and toes and around eyes; she was not feeling great; fatigue; headache; soreness in her arm at the injection site; This is a spontaneous report from a contactable consumer. A 35-year-old female patient received her first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EJ1685) on her right arm, via an unspecified route of administration on 20Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient reported that on 23Dec2020, she was not feeling great, had fatigue and headache. On 25Dec2020, she had swelling in her right middle finger, states that has now progressed to swelling in all her fingers, toes and around her eyes. Also reported that on 21Dec2020, she had soreness in her arm at the injection site that went away the same day. The patient also mentioned that she tested negative for Covid. The patient is also a little low iron but not too remarkable. The outcome of the event vaccination site pain was recovered in 21Dec2020, not recovered for peripheral swelling and puffy eyes while unknown for the other events. Information on Lot/Batch has been requested.

1052839	2/24/2021	MO	31	F	2/19/2021	2/22/2021	Mon 2/22 had a few spots throughout my body at different times in the day starting in the morning, looked like mosquito bites, by evening, it had shown up on my legs, arms, back, stomach, my ears were hot and itchy, took 1 Benadryl 10:00 PM, went to bed Tue 2/23 6:30 AM widespread rash on both arms and both legs and isolated spots on my trunk, large areas raised red bumpy splotchy 9:40 AM sick visit appointment to see NP at my primary care office, prescribed zyrtec 10 mg in the morning, pepcid 20 mg at lunch, benadryl at night Took pepcid with lunch 3:00 PM put on a lot of lotion over my entire body, hives less pronounced, not as raised, still itchy but not as much Evening some small spots on face near hairline, took 1 benadryl Wed 2/24 morning upon waking hives not as severe, but still present and itchy, eyes slightly puffy, palms itchy but can't see any hives, overall better than the previous 2 days Took zyrtec with breakfast, pepcid with lunch (now it is currently 4 PM haven't taken benadryl yet for the evening)
1052917	2/24/2021	KS	36	F	2/3/2021	2/23/2021	Ocular Migraine- vision became blurry like looking through a heat wave for 2 hours. The vision disturbance stopped for 30 minutes, and then an intense headache set in for 7 hours. Took tylenol with caffeine, heatpack on neck, icepack on head and it helped alleviate the headache.
1052929	2/24/2021	UT	83	F	2/18/2021	2/21/2021	Sever swollen hives on face, head, neck, and torso. Itching. Went to ER, they gave a injection of dose of Pepsid and told her to take claritin and pepcid daily. Said it should clear up. She has been doing that now her eyes are itching and body again, plus has a sever sore throat now.
1053000	2/24/2021	WI	55	F	2/20/2021	2/21/2021	Initially only normal symptoms for 36 hours of fever, body aches, chills, shivers. Once those cleared, vision became blurry. Thought I was tired so went to bed. Woke up the next morning (Monday) to severe dizziness, nausea, vomiting, blurred vision. Went to ER and was diagnosed with Benign Paroxysmal Positional Vertigo. Was given Zofran and prescription strength Meclizine and sent home. Spent two days sleeping it off. Better on second day but still slightly dizzy. Much better on third day. I had never had Vertigo prior to this.

1053029	2/24/2021	NJ	70	F	2/16/2021	2/16/2021	I felt the injection fluid go into my arm with pain and a few hours later my arm pain was so severe I could not even move my arm without excruciating pain. I could not sleep or lay down. I had to pack my upper arm with ice for 72 hours. I have had flu shots before and never had a painful reaction that brought tears to my eyes for 72 hours. I don't know what size the needle was used on me, but it almost felt like it hit the bone. I am a thin person. It probably did not hit the bone, but it felt like the fluid was forced into the muscle. My husband did not have this same reaction, so I don't know if it was the person who gave the shot, or wrong needle size or what made my arm hurt like it was hit with a hammer. I now have slight itching at the shot site and there is a bump the size of a mosquito bite.

1053072	2/24/2021	TN	33	F	2/24/2021	2/24/2021	At about 1458 patient received first dose of Moderna COVID-19 vaccine Lot number 031L20A expire 07/22/2021 in Left Deltoid by RN at vaccine site. Pt was instructed to wait 15 minutes in personal vehicle in designated parking area for monitoring. At 1508 patient whom was sitting the passenger seat of personal vehicle c/o SOB, and chest tightness to LPN who was monitoring the parking lot. Nursing Supervisor was dispatched over to the patients vehicle. On assessment patient stated she had a "loss of senses, SOB, chest tightness and cold chills". Pt confirmed she has no allergies and never had any reactions to medications or vaccinations. When asked pt to elaborate on s/s pt explained tunnel vision and sweating and "throat itchiness". Pt was breathing slightly labored 12 respirations a minute pulse rapid and bounding pt pale and diaphoretic and cool to touch. 1510 called made to 911. 1510 bp 60/30 Diphenhydramine and Epinephrine drew up into syringe for precaution. While RN rechecked bp to confirm. Recheck was confirmed 60/30. At 1513 pt states "I think I am feeling better, my senses are starting to come back and breathing feels better" Pt reports she passed out once giving blood. EMS arrived at 1515. At 1515 recheck b/p was 80/40. It was determined that pt did not require Diphenhydramine and Epinephrine due to pt quickly feeling better and s/s improving pt was determined to have a vasovagal response. At 1520 b/p 106/62 normal respirations at 14 a minute. EMS left at 1522 gave pt a cold paper cloth and water to drink. Dr. was called at 1525 where he was made known of the situation. His instructions where to advise pt to get second dose of Moderna in a hospital setting for close monitoring and advise that pt do not drive home. Pt made aware of instructions from MD. Pt was not driving. At 1552 patient feeling better and requests to leave. Pt reported she has no feeling of SOB or tightness. Pt not as pale as she was at begging of the event.

1053344	2/24/2021	MI	65	F	2/16/2021	2/23/2021	?Covid-19 Vaccine EAU? The day and evening after getting 1st vaccination I felt fine but slept all day. Could not keep my eyes open. All has been fine until Tuesday, Feb 23, in the afternoon, my arm where the injection site is started itching. I had a faint rash circle around injection site. Hard and a bit swollen. On Wednesday, February 24 all seemed better until evening around 8pm then started itching again and have a large red circle rash around injection site. I looked it up on line and sounds like I have what's called ?Covid arm?. My 88 yr old Mom received her first Moderna vaccine a week before me and she had same symptoms as I'm describing now. Given that it sounds like I have ?Covid arm? I'm not too concerned but thought I should report it. It says it should go away within a week ? Thank you.

1053080	2/24/2021	OR	52	F	2/23/2021	2/24/2021	This is for the EAU for the Moderna vaccine. Due to recent injury to my left side, including an old Rotator Cuff injury on the left, I opted for my right arm. As with the first dose, the actual injection was nearly painless. The first dose resulted in localized pain to upper left arm for a day or two. Second dose was significantly different. I have a headache that is nearly the worst in my life (and I've recently cracked or traumatized my skull on 1/5/2021). If I laugh, cry, raise my voice, the pain increases to "worst ever" but only stays there for a few moments. The pain is around the base of my head and facial bones, particularly strong behind the eyes. In addition to this monumental headache, I have the same fleshy soreness to the arm as occurred last time. Except this is extremely more painful. Extending my arm forward feels very painful for the entire joint. Even flexing my muscles in that arm leads me to a severe pain in the entire arm that is most intense in the joint. My fever --- With acetaminophen --- is about 102*. I am having chills, exhaustion, wheezing. I feel like the worst hangover of my life (I've only ever had one, this dwarfs it). I understand that "If it hurts, that means it works." so probably these are minor symptoms that will pass, but I had no idea how difficult it would be!
1052404	2/24/2021	CA	61	M	2/10/2021	2/15/2021	approx 5 days after vaccination, pt states he developed itching and swelling around left ear, that then spread left side of arm over the last few days. Lesions were without vesicles or drainage, primarily raised red lesions related to hives. He visited dermatologist who rx'ed antihistamines, benadryl and OTC hydrocortisone. Denies anaphylactic reaction with no SOB, respiratory distress, swelling of tongue, mouth, eyes or lips. As of now, he is no longer itchy but with rash still present. He will have f/u on 3/8 with dermatologist for final opinion about whether he can receive his next vaccine as scheduled on 3/11/21.

1052500	2/24/2021	CA	68	F	2/20/2021	2/20/2021	Swelling in throat, tongue, face and then eyes. fast heart rate. rash on face and dizziness and weakness Give prednisone and benydril in IV and took 1 50mg prednisone at home. Weakness for 3 days and swelling has gone down
1052690	2/24/2021	VA	20	F	1/3/2021	1/9/2021	My entire face was covered with hives. Within 2 hours of the vaccine I developed hives to the bilateral aspect of my face, forehead, cheeks and eyelids. My hives were itchy and red and I have never experienced this before. I did not consume any new food or use any new products. I took Benadryl for the itchiness. I had a telemedicine visit and I also had a Covid-19 test which was negative. I called health and also reported this adverse reaction. Moreover, I had no reaction to my second dose which was on 01-28-2021.
1052751	2/24/2021	IL	43	F	1/12/2021	1/12/2021	For first shot, it was hot right away = I could feel it go down my arm as hot, like fire. As soon as I stood up my scrubs were wet with sweat. They said that I was getting red and flushed. All within a minute. They said my eyelids were starting to swell - upper and lower eye. They had me leave with an ambulance to go to ER. In the ambulance, they started an IV and they gave me Benadryl through IV and they took my blood pressure - it was elevated. I started feeling better. I could breathe. It took 10 minutes to get hospital. The swelling in my face went down. At ER I felt fine. I asked the paramedics ambulance to drive me home but they said that I would just discharged after we arrived. They gave me Pepsid and something else - antihistamine at ER. I had gotten off medication for the immunologist visit which was already scheduled prior to vaccine - but after the vaccine she just got me on higher doses of the medications. February 11th, second dose of vaccine was taken.
1052698	2/24/2021	CA	29	F	2/16/2021	2/16/2021	Bilateral eye twitching until 2/22/2021
1052395	2/24/2021	MI	61	F	12/28/2020	12/28/2020	Received first COVID vaccination at 3:50pm and 5-10 minutes later began to experience pain and throbbing in jaw and lower molars. pain began moving forward. tongue began to tingle and mouth went numb. Glands were swollen and pain was experienced in both ears, under both eyes and cheek bones. Also experienced pain in the top and back of head.

1048948	2/23/2021	UT	82	F	2/14/2021	2/21/2021	On Sunday the 2/21/2021, about 3PM I noticed that the area where I received the vaccination was red, swollen, itching, and sore. I googled search and found it was a rare but real reaction vaccine, called COVID ARM. According to the information I read it occurs between 7-9 days after vaccination. Mine occurred exactly 7 days later. I have been putting Hydrocortisone cream with Aloe in it and on it. Today it is more sore then itching and still red. The Hydrocortisone with Aloe seemed to help. I have also noticed my eyes have been watering a lot more since receiving the vaccine.

1048679	2/23/2021	MN	78	F	1/29/2021	2/2/2021	Double vision; the way she talked she kind of had slurred speech; mouth was dry; she had Bell's Palsy/ Droop in her lip/mouth; her eye was still watering; puffiness around her eye; This is a spontaneous report from a contactable consumer (patient). A 78-year-old female patient received first dose of bnt162b2 (manufacture unknown, Lot Number: 9264), intramuscularly in left arm on 29Jan2021 14:55 at 0.3 ml, single for COVID-19 immunization. Medical history included non-hodgkin's lymphoma from Jul2019 and ongoing (The first time she was diagnosed was Jul2019. She then went into remission and then got the cancer back, she doesn't know when. She knows they started treating it as the cancer had returned in Aug 2020), watering eyes from an unknown date and unknown if ongoing (Her eye was watering before the injection. She knows her eye was watering before she received the vaccine), chemotherapy from an unknown date and unknown if ongoing (she is a cancer patient on chemotherapy), fever blister from an unknown date and unknown if ongoing. There were no concomitant medications. The patient experienced she had bell's palsy and she does not know if she got this from the covid shot or not but she still has the droopy lip which apparently that can last a while. on 02Feb2021, droop in her lip/mouth on 02Feb2021, her eye was still watering on 02Feb2021, there was a little puffing around the eye/ puffiness around her eye on 02Feb2021, double vision on an unspecified date, the way she talked she kind of had slurred speech on an unspecified date. Caller was calling about the Pfizer COVID 19 vaccine. She said on Friday 29Jan2021 she had the first shot at about 12:30. Her eye started watering in the morning Thursday the day before and she maybe assumed she was getting a cold in her eye but it was really runny and she got the shot. She was a cancer patient on chemo and she went to the doctor because she was supposed to get her chemo. That Tuesday morning she had a droopy lip on the right side and her eye was still watering, there was a little puffing around the eye and the way she talked she kind of had slurred speech so she thought stroke but she was going to get her chemo in an hour or 2 so she when they checked her she told them what happened, she was seeing the PA that day so she left and came back 10 minutes later and said she had talked to the doctor, they were not going to give chemo today and told her she had

---

Bell's Palsy and she does not know if she got this from the COVID shot or not but she still has the droopy lip which apparently that can last a while. This was her first shot so as a cancer patient on chemo should be getting the second shot 21Feb. She was concerned about taking that when she already has Bell's Palsy now, what else would it cause and then if she does not get it would she be 50 % protected. The doctor seemed to say she thought it was from the vaccine, but caller does not know because the eye watering began the day or 2 prior to getting the vaccine. Product details: She does not have the vaccine card right with her and she was using a walker to get up and down and so she was not able to provide NDC lot expiration right now. It would be available if needed at a later time. Indication: doctor said she should have it because she has no immune system. They don't know what to do they are just following what they told her and they were scared to death. The caller states she was a cancer patient on chemotherapy. She received her first Pfizer COVID-19 injection on Friday, 29Jan2021. Prior to the vaccine, her eye had been watering Thursday or Friday morning before she had shot, it was just her right eye. On Tuesday, 02Feb2021, she developed a droop in her mouth and puffiness around her eye and so forth. Caller clarified it was just on the right side and with her right eye. She also has double vision in her right eye. She got up in the morning on 02Feb2021, and her husband was in the other room and told her that she sounded funny. She explained to her husband her mouth was dry and she was kind of slurring her speech. Her husband came into the room she was in and said, "huh, your lip was drooping". Since it was in the morning and she had no other symptoms besides the talking funny and the puffiness around her eye, she didn't take it as a stroke. She figured she would just until she went to her chemotherapy appointment she had the same day, 02Feb2021. She went into her appointment and showed the person and gave her information on what happened. The person wanted an MRI of the brain to make sure she didn't have cancer there or cancer anywhere else up in that area and also that she didn't have a stroke. She confirms the MRI was fine, both were negative for any signs of this. She was told she developed bell's palsy. She has a drooping lip. The caller was concerned about her second shot. She wants to

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							<p>know should she getting the second vaccine, because the person at the (institution name) office (where she receives her chemotherapy) believes the bell's palsy came from the COVID-19 vaccine. She was supposed to have chemotherapy that day (02Feb2021), but they wouldn't give it to her then, but she did have it done yesterday. Caller explains she has no NDC, Lot number or expiration date for the chemotherapy she receives. She isn't given any stuff with any numbers and she gets numerous medications. Patient's Medical History (including any illness at time of vaccination): Her eye was watering before the injection. She knows her eye was watering before she received the vaccine because as she was sitting waiting to receive her injection, she remembers wiping her eye and thinking to herself, "I wish this eye would quit watering". Caller states she had a fever blister, but she was not quite sure about when this appeared. She doesn't know if she had developed the fever blister before or the next day after receiving the vaccine, she was not quite sure. The any events were not required a visit to Emergency Room. She went to the Oncology Office for her chemotherapy appointment. No Prior Vaccinations (within 4 weeks). Caller had the MRI (magnetic resonance imaging) on 02Feb2021 showed she didn't have a stroke and no cancer of the brain. The patient underwent lab tests and procedures which included magnetic resonance imaging: negative on 02Feb2021 Negative for stroke and/or cancer. The outcome of events was unknown. No follow-up attempts are possible. No further information is expected.</p>

----------	-------	-------	---------	-----	----------	------------	--------------

He said he called his urologist, and his urologist saw him on 27Jan2021. He said his urologist took a urine sample, and his urine sample was clear and negative for nitrites. He clarified his urologist did a digital prostate exam, and his prostate was fine. He said his urologist wanted him to make an appointment for a cystoscopy, and a CAT scan of his abdomen and pelvis. He said after he got home from the urologist, he went to the bathroom, and again had blood and blood clots in his urine. He went to emergency room. While he was in the Emergency Room, he was set-up on CBI (Continuous Bladder Irrigation). He said the urologist did not seem concerned about the amount of blood in his urine. He clarified he was admitted to the hospital, and had in place for approximately 16 hours. Next day (28Jan2021) he was diagnosed with a gram negative urinary tract infection. He said he was given a daily dose of IV Ceftriaxone 1gram on 29Jan2021 and 30Jan2021. He said he was also given a daily dose on 29Jan2021 and 30Jan2021 of IV Ferlecit 125mg because his iron level was low at 21. He said a normal iron level for a male is 35. On 31Jan2021 he had injection site pain in his left arm, he said the COVID-19 Vaccine injection site was red and puffy. He said the COVID-19 Vaccine injection site pain, redness, and puffiness resolved on the same day, 31Jan2021. He said his second COVID-19 Vaccine dose was given in the same arm (left) on 06 Feb2021. He stated he asked that the second COVID-19 Vaccine dose be given in the same arm (left) because his left arm is his non-dominant arm. He was discharged from the hospital on 30Jan2021, and was given a prescription to take 1 Levaquin 250mg orally for 3 days starting on 31Jan2021. He said the Levaquin 250mg was dispensed in a pharmacy bottle, and did not have the NDC, Lot, and Expiration Date. He said he was also prescribed oral Feosol 325mg, twice a day, starting on 31Jan2021. He provided the Feosol 325mg, NDC Number: 12451-10-17 (unsure if he provided the correct NDC), Lot Number: 201167, and Expiration Date: Jul2022. At around 2:30-3:00PM on 31Jan2021, he developed a rash on his hip and back, saying the hip and back rash were along the same pathway. He said he spoke to a PA (physician assistant) about his rash. He said on 31Jan2021 he had taken 1 oral dose of the Levaquin 250mg. He said the PA discontinued the oral Levaquin 250mg, and changed his

prescription to Macrobid 100mg, twice a day, for 5 days. He said he started the Macrobid 100mg, twice a day, on Monday, 01Feb2021. He said he completed the Macrobid 100mg prescription on Sunday, 07Feb2021, and did not have the Macrobid 100mg NDC, Lot and Expiration Date. He clarified his rash was raised, oozy, and looked weird, like a pimple that came to head. He said he spoke to his dermatologist on a video call Sunday, 31Jan2021. He said his dermatologist told him he had shingles and prescribed Valtrex 1gram, three times a day, for 7-10 days. He stated the Valtrex 1gram was dispensed in a pharmacy bottle. He said he took his first Valtrex 1gram dose on Sunday evening, 31Jan2021, and was still taking the Valtrex 1gram as of today (08Feb2021). He had an appointment to see his dermatologist in person on Wednesday, 03Feb2021, but woke up with a wicked headache that morning, so he took paracetamol and went back to sleep. He said when he woke, he still had headache, and his left eye was totally blurry. He said back in Nov2020 he had fallen at work and landed on his left side, hitting his head and left knee. He said his fall left him with a knot on the left side of his head, and he had bleeding from above his left eyebrow, and had a left black eye. He said he also had a subarachnoid hemorrhage. He said he had a CT scan of his head that showed the subarachnoid hemorrhage was contained, so the doctors wanted to just monitor him. He said he was on Effient at the time and the doctors changed him to Plavix. He said he also was taking Aspirin 81mg. He said he was taken off of Plavix on 27Jan2021 when he was admitted to the hospital for having blood and blood clots in his urine. He said he continues to take the Aspirin 81mg daily. He clarified he has been on compensation since his fall in Nov2020. He said he also had cataract surgery 2 years ago. He said he immediately called his eye doctor, and then went to the hospital Emergency Room because he thought he had a stroke. He said the Emergency room did a CAT scan and CTA of his head, which were both normal. He said a neurologist saw him in the Emergency Room, and said since it was a headache with one eye blurriness, he should see his eye doctor. He said the neurologist told him if he had a headache and both eyes were blurry, it would more likely have been a stroke. He stated when he was discharged from the Emergency Room on

03Feb2020, he went directly to his eye doctor. He said his eye doctor did several tests: field of vision, a sonogram, pictures of his left eye, and a dilation of his eyes. He said he had an eye test where he looked at a half circle and clicked a counter when he saw dots, and another eye test where he stared at something that looked like a hot air balloon, while the eye doctor took measurements. He said the eye doctor also measured his eye pressure, which was normal. He said he was at his eye doctor's office for a good couple of hours. He said his eye doctor told him that he has little white dots on the background area of his eyes that indicates he has severe eye dryness. He said his left eye is much worse than right eye. He said his eye doctor asked him if he took Crack, or Cocaine, or any kind of opioids in the last few weeks. He said he told his doctor he took 1 dose of an opioid on 31Jan2021 because of the shingles pain. He clarified he had a Percocet prescription leftover from his hospitalization in Nov2020. He said he took another dose of the Percocet the week before 31Jan2021 for pain in his knee from the fall he had in Nov2020. He said his eye doctor told him his dry eyes could be caused by the Percocet. He said his eye doctor prescribed lubricating eye drops (Refresh Optive Mega 3, UPC Number: 0023577330, Lot Number: T095, and Expiration Date: Aug2022), that he is to use in both eyes every hour, and an eye ointment in his left eye only at bedtime. He had been using crutches when he walks because of the problem with his right knee since he fell in Nov2020. He said on 06Feb2021, he took a shower, and when he went to get out of the shower, his right leg gave out. He said he didn't fall, but he couldn't walk afterwards. He said he went to the Emergency Room on 06Feb2021, and an x-ray and sonogram were done of his right knee. He said he was told he had another soft tissue injury like he had when he fell back in Nov2020. He said he was given a leg immobilizer to use. He said when he first fell in Nov2020, he originally fell on his left knee. He said he has had PT since being discharged from the hospital on 17Nov2020. He said he also had a pacemaker implanted while he was in the hospital in Nov2020. He said after his discharge from the hospital on 17Nov2020, he went to take shower at home on 18Nov2020 and his left knee gave out. He said he was able to lower himself to the floor in the shower stall, but he couldn't get out of the

VAERS\_ID RECVD STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

shower stall. He said he was left sitting on his left leg and he couldn't use his right leg. He said he finally got himself to bed, and iced his right knee because he sat on it for over an hour. He said the next day (19Nov2020), he couldn't walk and had to have an ambulance take him to Emergency Room. He said he hasn't had PT since 27Jan2021, and needs clearance from his doctor before he can restart PT. He said he has been without PT for 2 weeks now. He said on 06Feb2021 he was unable to get a MRI on his knee because he had too much swelling that would have made the MRI imaging cloudy. On 06Feb2021 he was due for his second COVID-19 Vaccine, so before he was discharged from the Emergency Room he was given his second COVID-19 Vaccine dose. He was using the Refresh Optive Mega 3 eye drops constantly now. He said he had no fever, but is more tired than in the past. He said the last couple of days he can sleep for hours, and wake up and feel like he can go right back to sleep. He said he and his cardiologist are concerned because since 27Jan2021, he has only been on Aspirin 81mg. He said he has 3 cardiac stents since Oct2020, and should be on dual therapy. He said he had a CT of his abdomen and pelvis while he was in the hospital. He said he has been off of Plavix since 27Jan2021, and can restart the Plavix until he has a cystoscopy. He wants to know if UTIs in men are common after getting the COVID-19 Vaccine, so he can decide if he should cancel the cystoscopy and restart his Plavix. The second COVID-19 Vaccine Lot number as EL9261 or EI9261. He stated the vaccine lot number was handwritten on his COVID-19 Vaccine immunization card and was difficult to read the handwritten vaccine lot number. The patient underwent lab tests and procedures which included bacterial sepsis: gram negative urinary tract infection on 28Jan2021. Clarified he had no pain, burning, or urgency with the UTI. He said he was told by the hospital he had gram negative rods in his urine, when he was started on the IV Ceftriaxone on 29Jan2021. He stated he has never had a UTI before. Clarified his body temperature is rarely 98.6 degrees, and is normally 98.2 degrees and he had never had shingles before. He said he had chicken pox as a young adult, and he only had 1 spot of chicken pox. He had never had dry eyes before. Reporter seriousness for fever, UTI, injection site pain, injection site redness, injection site puffiness, rash,

shingles were medically significant. For other events were unspecified. The outcome of event injection site pain, injection site redness, injection site puffiness was recovered on 31Jan2021, dry eye, tiredness was not recovered, while the outcomes of other events were unknown.; Sender's Comments: Based on the temporal association and the known possible local reaction, a possible contributory role of BNT162B2 to the development of injection site pain, redness, and puffiness cannot be excluded. The other events are considered as due to underlying or intercurrent conditions and unrelated to the use of BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021134924 same reporter/drug, different patient, similar event

1048215	2/23/2021	CA	44	F	1/5/2021	1/5/2021	Dizziness; stoke like symptoms; lost taste; Lost smell; lost hearing; weakness; right eye droopy; This is a spontaneous report from a contactable other hcp (patient). A 44-year-old female patient receive first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EL0142), at same age, via an unspecified route of administration in left arm on 05Jan2021 10:00 at single dose for covid-19 immunisation. Medical history included high blood pressure. Concomitant medication included metoprolol. The patient previously took ampicillin and experienced drug allergy. The patient experienced dizziness, stoke like symptoms, she lost taste, smell, hearing, lost station on my whole right side. Right side weakness. Only one eye blinks right eye droopy, all on 05Jan2021 10:00. Events resulted in emergency room visit. The patient was hospitalized for 1 days for all events. It was unknown whether treatment was received for all events. Patient is not pregnant at the time of vaccination. Facility where the most recent COVID-19 vaccine was administered was hospital. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient underwent lab tests and procedures which included nasal swab/ covid test: negative on 08Feb2021. The outcomes of events were not recovered.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported dizziness, stoke like symptoms, she lost taste, smell, hearing, lost station on my whole right side, right side weakness, only one eye blinks right eye droopy, and the administration of the COVID 19 vaccine, BNT162B2, administration, based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

1048659	2/23/2021	IL		F	2/3/2021	2/3/2021	<p>Tired; Received another dose of the Moderna COVID-19 vaccine the next day; Sore arm; A spontaneous report was received from a consumer, concerning herself, a 76-year-old female patient, who accidentally received first dose of Moderna's COVID-19 vaccine and experienced sore arm, received another dose of the Moderna COVID-19 vaccine the next day and was tired. The patient's medical history included sleep deprivation, short term memory loss, hyperparathyroidism, plaque in the artery, heart burn, ocular hypertension, irregular heartbeat, osteopenia, hypertension, cardiac arrhythmia, mitral valve prolapsed, aortic valve prolapsed, DVT, diverticulosis, IBS, rosacea, dry eye, osteoarthritis. Products known to have been used by the patient, within two weeks prior to the event, included Amlodipine, red yeast rice, ezetimibe, latanoprost, propranolol, Irbesartan, Flonase, N-Acetyl-L-Cysteine (NAC), heartburn essential and several supplements. The patient received their first of two planned doses of mRNA-1273 (Lot number:007M20A) intramuscularly in the left arm on 03 Feb 2021. On 04 Feb 2021 approximately 1 day prior to the onset of the events, patient received their second of two planned doses of mRNA-1273 (Lot number: 007M20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. The patient received first dose of mRNA-1273 vaccine on 03 Feb 2021 and was accidentally administered second dose of mRNA-1273 vaccine on 04 Feb 2021 from the same facility. Patient called poison center and was told the side effects may be intensified other than that patient should be fine. Patient stated of reading all the side effects and only thing she had was sore arm. Patient was tired because she only got 4.5 hours sleep on 04 Feb 2021 night. She was scared by the event. No treatment information was provided. Consent to follow up was given by her. Action taken with mRNA-1273 in response to the event sore arm was no change. Action taken with mRNA-1273 in response to the events received another dose of the Moderna COVID-19 vaccine the next day and tired were not applicable. The event received another dose of the Moderna COVID-19 vaccine the next day was considered resolved on 04-Feb-2021. The outcome of events, sore arm and tired were considered unknown at the time of this report.; Reporter's Comments: This case concerns a 76-year-old female patient who received their first and</p>

The patient's medical history was not provided. Concomitant medication history was not provided. The patient received their first of two planned doses of mRNA-1273 (batch number: unknown) on 24 DEC 2020. On 21 JAN 2021, the patient received their second of two planned doses of mRNA-1273 (batch number: 028L20A) intramuscularly for prophylaxis of COVID-19 infection. The patient developed injection site pain and diarrhea after the second dose. She continued to have the headache from the first dose that was administered. On 03 FEB 2021, the patient experienced double vision and dizziness while driving to work. The patient passed out at work and was admitted to the hospital. A CT of the brain showed no acute findings and her CT angiography was normal. The patient was discharged in less than 24 hours with the diagnosis of static vision, hypothyroid and status post syncopal episode. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the event passed out/status post syncopal episode and static vision/double vision were resolved. The outcome of the events hypothyroidism, diarrhea, injection site pain, and headache were unknown.; Reporter's Comments: Very limited information regarding this events has been provided at this time. 1048677	2/23/2021	MI	58	F	1/19/2021	2/1/2021	shingles; Bump on nose; It is painful; broke out in rash/rash under right eye; pretty sick; This is a spontaneous report from a contactable nurse (the patient). A 58-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), intramuscular in the left upper arm on 19Jan2021 at 11:15 to 11:30 (at the age of 58-years-old) as a single dose for Covid-19 immunization. Medical history included COVID-19 in Mar2020 and was reported as recovering (ongoing). The patient's concomitant medications were reported and none. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 02Feb2021, the patient experienced a bump on her nose and later got a rash under the right eye and broke out in a rash; on 08Feb2021, the patient was diagnosed with shingles; on an unknown date in Feb2021 she experienced she was pretty sick now; not feeling well and it was painful. The patient went to the emergency room about 3:40am on 08Feb2021. The events were considered serious per disabling since she was not able to return to work until blisters were crusted over. Has missed a couple days of work. Her only concern was that it was not in her eye and she was good. Treatment was given for the shingles which included Acyclovir. The clinical outcome of the events herpes zoster, rash, illness, skin disorder and pain was not recovered. The reporter stated she was supposed to get her second dose but cannot now. The reported considered the events herpes zoster, rash, illness, skin disorder and pain related to BNT162B2. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics

1048683	2/23/2021	VA	82	M	1/25/2021	2/2/2021	<p>passed out; light headed; This is a spontaneous report from a contactable consumer (patient's daughter). An 82-year-old male patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EK4176), via an unspecified route of administration on 25Jan2021 09:50 at single dose for covid-19 immunization. Medical history included visual problem. The patient's concomitant medications were not reported. The patient experienced passed out on 02Feb2021 and light headed in 2021. Clinical course: Consumer was calling regarding her dad who got the Pfizer COVID-19 vaccine. She said her dad had an event and she took him to his cardiologist who checked him out and suggest they call about it. She said that her dad passed out a week and a day after getting the vaccine and had been light headed. She said she was concerned that the second dose of the vaccine was supposed to be worse for effects, and she knew he was supposed to get it, but she wasn't sure that he should. She said her dad would say to call his daughter, because he had a visual problem, which he had since before the first dose of the COVID-19 vaccine. Caller said that NDC/EXP were not provided on the handwritten card. She said it said he got his first dose 25Jan2021. She said that the report she filed online asked what time he got the vaccine dose, and she put 09:45AM since it would not let her put 09:50AM, it was really at 09:50AM. Outcome of events were unknown.</p>

1048708	2/23/2021	FL		F	1/15/2021	1/18/2021	Brain hemorrhage; Allergic reaction; Face, eyes, ears, lips and hands were swollen; Face, eyes, ears, lips and hands were swollen; Face, eyes, ears, lips and hands were swollen; Face, eyes, ears, lips and hands were swollen; Face, eyes, ears, lips and hands were swollen; Hands were itching; A spontaneous report (United States) was received from a consumer a 74-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced brain hemorrhage, allergic reaction, face, eyes, ears, lips and hands were swollen, and hands were itching. The patient's medical history, as provided by the reporter included allergy to gadavist and tromethamine. The concomitant medications reported included diltiazem, atorvastatin calcium, ezetimibe and hydrochlorothiazide for unspecified indications. On 15 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 011LZ0A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 18 Jan 2021, the patient experienced brain hemorrhage, allergic reaction, face, eyes, ears, lips and hands were swollen, lips looked as an overdose of botox and hands were itching. The patient was taken to the emergency room (ER) and treated with intravenous diphenhydramine and steroids. It was stated that the swelling lasted 36 hours and the patient was prescribed prednisone to treat symptoms after leaving ER. Action taken with mRNA-1273 in response to the events was not provided. However, the healthcare professional recommended patient to cease with the vaccination series due to probability of the patient being allergic to tromethamine. The events, allergic reaction, face, eyes, ears, lips and hands were swollen, and hands were itching, were considered resolved on 20 Jan 2021. The outcome for the event, brain hemorrhage, was unknown.; Reporter's Comments: This case concerns a 74 year old, female patient, with a medical history of allergy to gadavist and tromethamine, who experienced a serious unexpected event of Cerebral hemorrhage, hypersensitivity after receiving first dose of mRNA-1273. Very limited information regarding this event has been provided at this time. Further information has been requested.

1050140	2/23/2021	WA	41	F	2/20/2021	2/20/2021	<p>Pfizer shot #1: She received the 1st COVID vaccine Pfizer on January 24th at 7:00 p.m.. The following day she noted a low-grade fever. On January 26 she noted edema of her eyes and lips associated with facial redness and itching that she treated with Benadryl intermittently for the past 2.5 weeks. She was seen in follow-up by her dermatologist who suspected an inflammatory reaction and prescribed anti-itch facial cream. She was also seen by her primary care who suspected angioedema and prescribed her an EpiPen which she has not needed to use. Pfizer shot #2: 2nd shot delayed due to snow. Above sx resolved before shot #2. She had her 2nd COVID injection February 20 at 3:50 p.m. About 1.5-2 hours later she noted onset of itching to her eyes and nipples along with itching of the skin in the locations of her usual eczema. She noted that her lips and eyes were a little puffy but less severe swelling to the eyes and lips than the 1st injection. She took 2 Benadryl shortly after onset of these symptoms. This seemed to lessen symptoms about 50%. Later she noticed that her voice sounded raspy and hoarse and she had a sensation of swelling to her tongue and throat but she was able to swallow. Her throat felt scratchy. She denies having lightheadedness, urticaria or GI symptoms. She went to the ED and was treated with benadryl, solumedrol and pepcid, monitored for a few hours and then discharged on 60 mg prednisone X 3 days and advised to continue benadryl 50 mg Q6h. She takes zyrtec 10 mg BID for seasonal/perennial allergies. Allergy history: She has a history of both idiopathic urticaria in early childhood and idiopathic angioedema in her early 20's. States she had extensive testing but the cause was never exposed. Took high dose prednisone for 4-5 months, angioedema resolved spontaneously and then flared again a few months later. Finally resolved with n additional 3 months of prednisone. She has both seasonal (feb-may) and perennial allergies to cat and dust, asthma and allergy to ampicillin--rash in childhood, and humira--fevers.</p>

1050152	2/23/2021	WA	66	F	2/20/2021	2/20/2021	She received her 2nd shot on 2/20/2021. Within minutes she noticed that she could not see, due to localized swelling around her eyes. She began to feel itchy and her tongue felt swollen. She was taken to ED and was given Benadryl and Solu-Medrol, her symptoms continued and she was administered epinephrine about an hour later which immediately cleared up her symptoms. She has some residual generalized itching and has been taking Benadryl 50 mg every 6 hours until 9:00 p.m. yesterday. She also takes Zyrtec 10 mg daily starting yesterday. She denies having any dizziness or lightheadedness, hives urticaria, nasal congestion, weepy eyes, diarrhea or abdominal cramping. She does endorse nausea and was administered Phenergan in the emergency department. She also endorses that her eyes felt itchy. She also endorses that she was able to swallow. Takes celebrex but paused this prior to the vaccine to prevent possible anti-inflammatory interrupting vaccine efficacy. Her ED record is available for review. Exam findings endorse she is tolerating secretions, speaking in full sentences and her tongue was not enlarge. No labs were drawn during her visit. She denies historical reactions to vaccines. She does get itching with some medications. Historical angioedema/urticaria post pistachio and bran muffin were singular events and have not recurred. She had a normal tryptase in 2014
1050274	2/23/2021	CA	30	F	2/5/2021	2/5/2021	Immediate experience of hot flushes and chills with severe nausea. Chest felt tight, upper stomach in extreme discomfort, Hard to see, lights hurting eyes, seeing spots in the air. Sound became amplified and began to experience a migraine. "People talking low to me felt like they were screaming into my ear drums." Extreme fatigue so could barely keep eyes open. Standing was difficult; moved to wheelchair. Most symptoms lasted 2 to 3 days. Fever of 102 on first day only. Fatigue for one week. Right upper arm, not at the injection site, had a "hive" about the size of a nickel that has not gone away (as of 2/23/21). New migraines with light sensitivity that affect ability to work also have not gone away (as of 2/23/21).

1050309	2/23/2021	CA	64	F	1/15/2021	1/16/2021	I had my 2nd dose of covid vaccine on 1/15, around 5 pm. Next day when I got up about 7:20 I felt dizzy nausea and wanted to vomit. Then I passed out, I fell down and hit my face on the floor. My family called 911 paramedica. They ,measured d my blood pressure and it was too low. The area around my right eyebrow was swollen and my neck hurt as precaution I went to the hospital. I suspect the incident and its symptom are side effects of the vaccine given the timing. Later on I had headache off and on and brain fog.
1050313	2/23/2021	CA	70	F	2/11/2021	2/21/2021	First odd thing was 8 hours post injection- allergic reaction with seemingly no provocation- sneezing, coughing, eyes watering- terrible tickle in my throat. took a Zyrtec and some vitamin C and it went away completely in 20 minutes. mild headache continued for a couple days. Second reaction is a red mark- slightly warm at injection site- no fever or pain Called my MD and he recommended reporting here.
1050101	2/23/2021	CO	28	M	2/20/2021	2/20/2021	Pt states he was initially feeling fine s/p receiving his COVID vaccine. After 5-6 minutes he notes a syncopal episode that he describes as feeling like he randomly fell asleep. When this occurred, he fell back in his chair and hit his head. He notes blurry vision after this occurred but felt like he was slowly improving. While he was being brought to the ED in a wheelchair he began experiencing blurry vision again and his face became very pale. He was given some apple juice and reports that after 5-10 minutes he felt back to normal. While his vitals were being taken, his HR and BP were very low and he experienced another episode. Pt does not have a hx of passing out 2/2 needles and notes that he gets a flu shot every year and is totally fine. He does note that he became queasy when he tried to give blood in the past but that this does not normally happen. Of note, pt denies any leg swelling prior to these episodes. Pt endorses a low baseline HR in the 50s per his Fitbit but otherwise denies any known heart problems. He notes a fhx of heart problems and states that his dad had heart bypass surgery a couple years ago. Pt denies any daily medications other than vitamin gummies. Denies DVT risk factors or prior history of DVT.

1050376	2/23/2021	FL	83	M	2/9/2021	2/9/2021	Approx 10 hrs after shot began to see black circle with football shape inside of circle. Entire thing kept moving away and then coming closer. Could not see during this event. Tried closing eyes but was still there when I opened them. Fell asleep approximately 20 minutes later and eyes were fine in morning. Note that I did have eye surgery about 6 years ago and had surgical lens implants.
1050387	2/23/2021	KY	45	U	2/17/2021	2/23/2021	45-year-old female presents the emergency room for evaluation of headache, chest discomfort, nausea, hot flash sensation while at work today. States she felt well yesterday. Has not measured a temperature. Has not had any recent Covid testing or no known ill exposures but does work in as a medical assistant in a medical office. Headache is dull in nature frontal, gradual and not of sudden onset. No associated vision/speech change, neck pain or stiffness, focal extremity numbness or weakness. Chest is discomfort with some shortness of breath and congestion but no productive cough or purulent phlegm. No associated palpitations or lightheadedness and no history of heart disease, DVT/PE. Did have nausea but no abdominal pain and did not vomit. No unusual recent foods. Normal bowel movements without constipation, diarrhea, melena. Normal urination. No new leg pain or swelling. Symptoms mostly improved at this time but still has some head discomfort.
1050417	2/23/2021	HI	36	M	2/18/2021	2/18/2021	Adverse events: cramping at injection site (deltoid), cramping in injection arm, general body cramping, muscle spasms, numbness, body temperature dropping, high fever (101F), chills, severe headache, excessive sweating, severe earache, lethargy, loss of appetite, loss of balance, dizziness, vertigo, joint pain (knees), altered sense of smell (acidic smoke), altered sense of taste (metallic), altered color vision (tinted yellow), altered mouthfeel (plastic film feeling), gum sensitivity, blotchy rashes (legs), tightness in chest, difficulty breathing. All occurred within first 48 hours following injection and began to subside without intervention prior to 72 hours following injection.

1050464	2/23/2021		23	F	2/23/2021	2/23/2021	10 minutes post vaccination during observation, patient fainted and did not rouse immediately. I administered ammonia inhalant was used within 1-2 minutes of her LOC, and patient gained consciousness but was diaphoretic and pale. Within 2 minutes of the ammonia inhalant, she began convulsing (full body convulsions, eyes rolled) For 30-45 seconds. She had continued LOC for 1-2 minutes, 15L O2 mask was administered, and patient slowly came in and out of consciousness for the next 5-10 minutes, bradycardic 35-45 bpm, BP 72/50, HR irregular, RR 16 BS clear. At the time of observed convulsions, 911 was called and arrived within 10-12 minutes. When EMS arrived, she remained pale but with some improved pallor, HR 45 bpm, and more alert. Transported by EMS to hospital for eval.
1050465	2/23/2021	PA	66	F	2/11/2021	2/17/2021	I get migraines and I get continuous treatment for migraine headaches, so I don't know if I would have as many if I had not received the vaccine. The first reaction was a sore arm at the injection site. The second continues to be a rash at the injection site, which started 6 days after the injection and has not subsided. It changes in visual characteristic but itches fairly consistently. I have taken acetaminophen for the discomfort, and some migraine specific medication (rizatriptan) for the headaches.
1050482	2/23/2021	AZ	46	F	2/21/2021	2/21/2021	Heaviness in chest. Swelling on face , eyes and lips
1049487	2/23/2021	PA	62	F	2/8/2021	2/8/2021	Red face, swollen lips, itchy watery eyes, red rash over body
1049316	2/23/2021	KY	20	M	2/21/2021	2/21/2021	Started with a fever that slowly worsened to a high temperature. This resulted in chills, aches, pains, fatigue. nausea, congestion, sore throat, headaches, and weakness. There was also swelling at the injection site and swelling of my eyelids.

1050316	2/23/2021	CA	23	F	2/19/2021	2/19/2021	From patient note: 2/19/21 Day of Vaccination - Morning of the vaccination had burning in arm at and around the injection site with severe soreness of arm developing over the day. After 5 hours faintness, sore neck/shoulders, trembling hands, "super shaky", also headache with stabbing pain in head and neck which continued for several days. Tight chest developing within 3 hours gradually turning into extreme difficulty breathing by 9pm. Around 9pm both arms from shoulders to fingertips went numb and tingly "like nerves were TV static". Throughout night drank about 1 bottle of water per hour, each time getting up and taking a few steps vision would start blacking out, would feel clammy, and would barely make it back to bed before fainting. Extreme muscle and joint pain made walking difficult for 3 days.. Fever of 99-101 for 3 days. Day 2 - extreme back pain accompanied by heartburn On 2/22/21 reports doing better but continuing to have soreness, night sweats, chills
1049548	2/23/2021	MO	37	F	2/22/2021	2/22/2021	About 10 min after patient received 2nd dose, swelling on face and eyes. patient described difficulty breathing/something in throat. administered 1 dose of epipen. within 1 minute reaction was getting better, patient was back to normal in 5-10 min. facility called ambulance, patient was taken to hospital for futher evaluation.

1049639	2/23/2021	NM	40	F	1/26/2021	2/5/2021	swelling on the left side of my face; Bell's palsy/ left side can not function properly. I have little eye, mouth and forehead movement; This is a spontaneous report from a contactable consumer (patient). A 40-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EL8982), via an unspecified route of administration (at the age of 40-years-old) on 26Jan2021 10:15 at a single dose in Left arm for COVID-19 immunization. Medical history was not applicable (N/A). The patient was not Pregnant at the time of vaccination. The patient's concomitant medications were not reported. The patient experienced swelling on the left side of my face and Bell's palsy/ left side can not function properly. I have little eye, mouth and forehead movement on 05Feb2021 10:30. The patient reported, "I have swelling on the left side of my face as well as Bell's palsy. My left side cannot function properly. I have little eye, mouth and forehead movement." The events resulted in Doctor or other healthcare professional office/clinic visit, Disability or permanent damage. The outcome of the events was not recovered. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No other medications received within 2 weeks of vaccination. Therapeutic measures were taken as a result of the events which included anti-viral medication and a steroid. The events were assessed as serious (Seriousness criteria-Disabling/Incapacitating). Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19.
1049744	2/23/2021	PA	60	M	2/12/2021	2/19/2021	One week after 2nd vaccine, Friday 2/19, woke up with my right eyelid red, swollen, itchy, discharge. Saw eye doctor, OD., whom I work for. She diagnosed "Swollen sub-mandibular & pre-auricular lymphatic nodes." I am being treated with: 1) Erythromycin Ophth Oint 3.5GM 2) Prednisolone AC 1% Ophth Susp 5ML 3) Pataday Doctor believes that my viral infection might be a result of the Covid 19 vaccine, and gives assurance that her treatment will resolve issues. She is unsure whether, or not, I am considered contagious during this time? Inquiries at the college were unfruitful. I hope my reporting this is not a violation in any way. Many thanks.

1049860	2/23/2021	TX	60	F	2/5/2021	2/5/2021	<p>I received my second Moderna vaccine on 2/05/2021. Within 10 minutes of receiving the vaccine I got a real bad headache, was very dizzy and felt very hot all inside my body. I reported it to the nurse and she told me it was a normal reaction to the vaccine and to wait a little longer than the 15 minutes to see if it would go away. She gave me water and I did feel better and we left medical center. At around 5:30 pm that same day I started to get cold chills and body aches especially on my right side. my lower back and my right hip were hurting a lot and I was having trouble walking. at around 8:00 pm my husband notice my right foot was very swollen and I notice by breast, my arm and hand, my underarm and leg were extremely swollen and painful. I did take a Tylenol because that is what they told me to take. I was freezing cold by the time I went to bed during the night I was sweating a lot. As of that day my symptoms were: Swelling on my right side Body aches, Headaches Fever Difficulty breathing/Shortness of Breath Rapid heart rate ranging from 100-125 w/o doing anything My neck and throat were very swollen around my thyroid area Blurring vision Chills and hot flashes Fatigue/Malaise Big round red welt around my injection site about 4 inches wide and hot to the touch I finally called medical center on 2/18/21 because I still had right leg, hip pain and swelling. I had a tele-med appointment with one of their doctors and she told me I had to first get a Covid-19 test to see if I didn't have Covid. Which the test did come out negative. She also told me that maybe the vaccine triggered something in my body that was causing all the swelling. I do have an appointment for chest, hip spine x-ray and lab work for 3/22/21. I still have the hip pain but not as bad. The person who gave me my Covid test results said I should report my symptoms.</p>

1046052	2/22/2021	MO	50	F	2/14/2021	2/14/2021	02/14/2021 at 1130 am-I received my 2nd Dose of Covid Vaccine (Moderna) at work. Stayed at work for monitoring. I start getting dizzy and nauseated at 1330 and have told the provider about it. He questioned me if I had eaten anything, which I have not. So, I head home ate and took a nap. ? At 1000pm that night- I started having chills with Fever of 100 degrees, body aches. I took Tylenol 650mg 2 tabs and try to sleep. My fever broke at about midnight and was sweaty, groan and moan all night, ?coz of pain. ? 02/15/2021 at 0430am ? Started chilling again, with Fever of 101, severe body aches and joint pains, severe headaches. Took Tylenol 650mg 2 tabs around 5am. ? At 1100 am-Shivering, Fever 102 degrees, exploding headaches, joint pains, muscle pains, body aches, neck pain, diarrhea x 2, dizziness, nausea, extreme weakness, and little fingers are bending forward and painful. My headache was unbearable, I felt like my brain is going to explode. Tylenol 650mg 2 tabs taken. Ice compress to forehead and back of neck applied. Called Dr office which I was told to be in the clinic office at 1330 and I will be consulting with Dr instead. ? At the Clinic- I was told that I was having bad reactions from the Covid Vaccine and my symptoms will be treated as if I have ?Covid?. My Blood pressure was 150/100 as I am extremely in pain. He gave me a Toradol shot 1st thing and let me rest for about an hour with lights off. By then, my pain were tolerable including my headache. He gave me Medrol Dose (steroid) shot and Rocephin shot then. I was instructed to come back in the Clinic for f/u the next day. He wants to monitor me closely as he has seen uneventful cases of this that leads to death. He sent me a dose of Toradol for pain to be given between about 11pm if needed for pain. ? At 11pm -Started having chills again with fever of 100 degrees. My body aches/joint pain started to intensify and my head starting to ache. Took Tylenol 650mg 2 tabs for fever. My Sister who?s a Nurse gave me the IM shot of Toradol dose prescribed by the doctor. I was able to sleep all night without interruptions, but woke up with clothing wet because of too much sweats. ? 02/16/2021 at 0830-My body aches/HA are under control, but still extremely weak. As I was getting ready for 1000 am Doctor?s follow up. I started getting short of breath with simple activities such as dressing and walking. By the time I got to the office I am very

1045960	2/22/2021	TX	28	M	2/4/2021	2/4/2021	<p>much short of breath, but my oxygen Saturations has been staying up above 90?s. He gave me an inhaler to ease my breathing. Prescribed me Dexamethasone and Azithromycin, Symbicort. He?s not releasing me to work until he sees me in a week, schedule for 02/22/2021. ? At 11pm that night- started to have mild chest pain lasted about 30 minutes. I took Ibuprofen 600mg and force myself to sleep. I roughly sleep that night. ? 02/17/2021 at 0930-Start having increased Short of breathe with talking, walking, dressing (simple activities). My lungs felt bruise and painful, but I have no cough nor phlegm. My headaches are back with intensity of 9/10. I felt very exhausted as I gotten up at 0500 and felt like I have not slept and unable to rest/calm my mind. Started having chest pain again on and off. I took all the prescribed medications and inhalers. My BP 149/98, Pulse 108, R 22, T 98 Spo2- 96%. Started having chest pain again on and off. My short of breath has ease a little at rest and after inhalers usage. ? 3:00pm-Gotten up to check Vital signs BP- 138/82, P-100, R 20, T 97.8, Spo2-95%. Lungs still painful, breathing?s better, headaches still there annoying but tolerable. Then I started seeing floater?s in my eyes. Checked Blood sugar-131. 02/18/2021- I feel like 60% better with breathing. However, I?m very weak and easily fatigue. Needs intermittent rest every 2-3 hours. My voice seems to be fading, can only speak in soft volume voice as if not enough strength with my vocal voice. 02/19/2021- Called Dr office for update of my condition and was told to come to Clinic at 5pm. EKG was done in clinic , spirometer. Due to new onset of chest pain and EKG result. Doc suggested direct admission for more lab works, cardiac work out and CXR. I was direct admitted at Hospital at 6:30pm at Cardiac/Telemetry unit. 02/20/2021 ?See data?s/documentations from hospital. I was discharged at 8:30pm to home. To f/u with Dr on Monday the 22nd. As I arrived home, I ate a little then vomited a lot. 02/21/2021- I have massive abdominal cramps with diarrhea. Very dizzy and very weak still, but no more short of breath at this time. My voice seems to be coming back to normal volume.</p> <p>Face and eye swelled up. Also got very red. Next day low grade fever and extremely tired.</p>

1045636	2/22/2021	MS	33	M	2/1/2021	2/1/2021	<p>diagnosed with vertigo; Allergic reaction which elevated patient's spinal cord pressure and brain stem swelling; Allergic reaction which elevated patient's spinal cord pressure and brain stem swelling; Allergic reaction which elevated patient's spinal cord pressure and brain stem swelling; Very hard time focusing my eyes; Extreme burning and tingling sensation over his entire body; Extreme burning and tingling sensation over his entire body; extremely dizzy; confused; nauseous; uncontrollably shaking; Headache; This is a spontaneous report from a contactable consumer reporting for himself. A 33-year-old male patient received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), via an unspecified route of administration, on 01Feb2021 at 11:00 AM, at single dose, for COVID-19 immunisation. Medical history and concomitant medications were none. Patient had no known allergies and did not receive other vaccine in four weeks. Patient did not have COVID-19 prior to vaccination. On 01Feb2021 at 12:00 PM the patient developed a headache. Over the next few hours the headache moved to the back of his neck and base of his skull. On 03Feb2021 the patient experienced very hard time focusing his eyes and extreme burning and tingling sensation over his entire body, he was extremely dizzy, confused, nauseous and uncontrollably shaking. Patient went to his family doctor and was diagnosed with vertigo on 05Feb2021. Patient took meclizine with no relief. On 10Feb2021 the patient was visited by another doctor and went under two days of testing including acoustic stimulation tests, balance test, visual acuity tests, CT scan and MRI all with unknown result. The doctor said the vaccine shot caused an allergic reaction which elevated patient's spinal cord pressure and brain stem swelling. Therapeutic measures were taken as a result of spinal cord pressure and included treatment with Diamox. Outcome of the events was not resolved. The events were considered serious as life-threatening and as per disability. Patient was not tested positive for COVID-19 after vaccination. The information on the lot/batch number has been requested.</p>

1047316	2/22/2021	MA	65	F	2/18/2021	2/19/2021	fever with delirium including visual hallucinosis - unclear duration approximately 6 hours - unable to confirm detail was back to usual state of health following day when she awoke
1045149	2/22/2021	TX	67	F	2/19/2021	2/19/2021	I received the 2nd Covid injection. I went to the 15-minute waiting area. The waiting area was full, so my husband and I were standing. I stand and work every day, so this was not difficult. I texted my daughter, who is a hospital employee, and told her that we had a super experience with no wait and had already received our 2nd dose. However, 5 to 7 minutes after the injection, I SUDDENLY felt dizzy and weak and had to sit down. Within a minute or so, I could not stand or open my eyes. The weakness made it difficult to breath or talk. My husband had to lift me up into a wheelchair. I was taken to the ER. For the longest time, I could not even open my eyes or talk above a whisper. After 4 hours, I was able to get my eyes open and talk better. I, gradually, was able to move my hands and feet. Last of all, I could move my hips and walk. It was as if my body had been put to sleep. I could feel everything but my body wouldn't move. As it wore off, my face and limbs felt slightly tingly. I was, basically, fine after 5 hours other than being tired from the experience. The doctors had no explanation for what happened and said it must be an emotional response to getting the shot. They wrote that I was not exerting enough effort to move my body. One said that I was hyperventilating when I pulled my mask up to breathe after he told me to hold my leg in the air. Though I tried, I was too weak to hold my leg up and it fell to the bed. The doctor told me that I should not tell anyone about what had happened or people would not come to get the Covid vaccination. He obviously knew that SOMETHING had happened that I couldn't control but he didn't put that in his report!

A 65-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE lot number: L9261) via an unspecified route of administration on the left arm on 27Jan2021 14:30 at a single dose for COVID-19 immunization. Medical history included ongoing Sjogren's syndrome from 2015 (sees her Rheumatologist/ do blood work once a year to make sure her inflammation levels are okay), ongoing rosacea; dry eye syndrome (related to Sjogren's syndrome); spasming, burning and twitching (last 2 medications she was on in November and January she had similar type reactions in her muscles); arthritis flareup from Oct2019 (in her left leg, she saw her neurologist who did tests and they came back normal) and sinus infection in 2020. Ongoing concomitant medication included ciclosporin (RESTASIS) for Sjogren's syndrome, ergocalciferol (VITAMIN D [ERGOCALCIFEROL]) for blood test: deficient and ascorbic acid, betacarotene, cupric oxide, tocopheryl acetate, zinc oxide (PRESERVISION) for dry eye syndrome related to Sjogren's syndrome. The patient previously took prednisone from Nov2020 and experienced weirdness in her legs got strong enough to keep her up at night and bad flare up for her leg symptoms; metronidazole for flare up or Rosacea (0.75% as needed, which she has used daily for last few weeks), meloxicam in Nov2020 and pantoprazole in Jan2021 and had bad flare up for her leg symptoms (symptoms subsided as soon as she stopped taking the medication after about 5 days); ibuprofen, acetaminophen and pepcid for her stomach. She had the vaccine, her first

---

dose, on 27Jan2021, about a week ago. The first two days she didn't notice anything and then she had weird sensations in her legs on 28Jan2021. The second night she had a weird sensation in her legs which was similar to what she had experienced with the two medications she took in November and January. On 30Jan2021 the sensations spread through her body, she describes these sensations as twitching, burning, cramping, and tingling. She clarifies the sensations moved to her arms which did not happen with the other medications that she tried in November and January. Monday night, 01Feb2021, she was up all night and couldn't sleep and says she called the family doctor yesterday and he called in a prescription for Gabapentin 100 mg. She said she took the medication last night and she did sleep last night, but she was unsure if it was from exhaustion from the last few nights from not sleeping or the medicine, but she did sleep better and her symptoms were a lot less last night. Patient said she wanted to report this and that her concern is with the second dose; will she have a worse reaction, is there anything she can do or take and should she be concerned about it. She said the events gradually increased, they started mildly and then became significant. She felt the sensations a little bit in the day time but they start big time in the night when laying down. These sensations experienced in her legs started the second night, 28Jan2021, and then spread to her arms in the last couple of days which had not happened with her other incidences (with the medications mentioned above back in November and January). Clarified that the sensations spread to her arms on 29Jan2021, but the worst nights were 31Jan2021 and 01Feb2021. She said they were bad nights. She said in regard to her sleeping, starting on 29Jan2021, she was restless, she had trouble getting sleep and trouble getting in a comfortable position. She woke up frequently. Saturday the sleeping was a little worse, but she did sleep. She said on Sunday, 31Jan2021, and Monday, 01Feb2021, she hardly got any sleep. The sensations spread to her arms and it probably started a little on Saturday night, but Sunday and Monday it was very noticeable. She started Gabapentin; it was one a day before bed. The leg symptoms were still there last night. The sensations in her arms were not much at all. She did get up once with the leg cramp and was feeling tightness in her left leg but

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>

it never went into a cramp. The cramp was in her right leg, which was unusual because it was usually in her left leg. She stated she was unsure if her symptoms were starting to subside or if the Gabapentin had an immediate effect. The events did not require a visit to physician or ER. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Outcome of the events was unknown.

A 75-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot Number: EZ5138), via an unspecified route of administration in the left arm on 29Jan2021 12:01 (age at time of vaccination: 75 years) at first single dose for COVID-19 immunization; Vaccination Facility: community clinic. Medical history included bone marrow donor from an unknown date and unknown if ongoing (about 20 years ago). There were no concomitant medications. The patient experienced the following events and outcomes: the caller stated a few days ago he had an intense dizziness after he got the first dose of the vaccine. on 01Feb2021 at 11:30 with outcome of recovering, it just about wiped out cognitive function on an unspecified date with outcome of unknown, slight headache on 29Jan2021 with outcome of unknown, little anxiety on 01Feb2021 with outcome of recovered on 02Feb2021, shallow breathing on an unspecified date with outcome of unknown, change in heart rhythm/change in his pulse rate/his normal is usually 60 but in this case it was 56 to 60 on 01Feb2021 with outcome of recovered on 02Feb2021, exhausted on 02Feb2021 with outcome of recovering, panting on an unspecified date with outcome of unknown, hungover feeling/he felt like in his eye sockets and in his neck and everywhere that there was something in him, some unfamiliar sensation on 02Feb2021 with outcome of recovering, not being able to get around on an unspecified date with outcome of unknown, he shrunk from 6 foot getting older on an unspecified date with outcome of unknown; all of which were medically significant. The events did not require a visit to a physician office or emergency room (ER). The patient did not receive any prior vaccinations within four weeks

VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

of the bnt162b2; and there were no additional vaccines administered on the same date of the Pfizer Suspect. The patient underwent lab tests and procedures which included blood pressure: good on an unspecified date, height: shrunk from 6 foot getting older on an unspecified date, heart rate: good on an unspecified date, pulse rate: 56 to 60 on an unspecified date. The caller stated a few days ago he had an intense dizziness after he got the first dose of the vaccine. This was 72 hours after the shot. He had the shot around 12:01 last Friday (29Jan2021). Monday (01Feb2021), about the same time, he had a very very intense dizziness that came on suddenly (came on in about 30 seconds) and it was full blown and it lasted for pretty much 24 hours. It slightly lessened after 20 hours but it was a day before he could stand up. It was not gradual, he knew right then he was in trouble, he couldn't sit up or roll over. He stated he was in great health but if he was taking medication or had a heart condition he doesn't think he would be available for this conversation. It stressed him out and he didn't know he could go that far and come back. He stated it was comparable to cardiac arrest and was a life threatening experience. If other people may have this reaction (if intoxicated or on drugs) they may not survive it. It was very very severe and scary. He stated his reaction seems extreme to everybody he knows. It just about wiped out cognitive function. He stated around here it doesn't seem that people are having severe reactions. He knows a couple people getting the shot, one who drinks, one who had diabetes and he let them know about this. Additional Context: The patient stated he wanted to report his experience and ask a question. The patient stated he received the first dose of the Pfizer COVID 19 vaccine on 29Jan2021 at 12:01 in the left arm. The patient did not use drugs or alcohol and did not have any medication and had good health. The patient's heart rate and blood pressure were good. The patient had a slight headache. Then 72 hours later on Monday at about 11:30 he started to get dizzy, suddenly, and it was very intense. The patient took about 12 steps and recognized it and got to the bed. By the time he got there he knew he was in trouble, he had little anxiety and noticed a change in heart rhythm. The dizziness was very intense and intensified when he went to bed and continued. Tuesday morning it lightened a bit and then around 11:30 on

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

Tuesday it withdrew; exactly 72 hours from the vaccination. The patient felt okay now, except he was kind of exhausted and had a hungover feeling, not totally clear but he was walking around. The patient felt if a person had been intoxicated or on medication or had a heart condition, he did not think they would survive this. The patient was physically challenged to get through it with shallow breathing, really panting, and not being able to get around. The patient had to focus on his breathing, panting to get through it. It was serious for him. Initially he noticed the change in his pulse rate and kept checking his pulse. His normal is usually 60 but in this case, it was 56 to 60. The anxiety was mild, he was concentrating to keep calm. The patient stated: "This is a world crisis, a year old and it is not ideal conditions but this might be a critical issue in terms of the negative effects being more severe than anticipated for certain groups of people and he wanted to discuss this concern with someone at Pfizer." The patient added he wanted to make sure that Pfizer knew that the intensity of the experience was a 100, it was very extreme. The patient added he felt like in his eye sockets and in his neck and everywhere that there was something in him, some unfamiliar sensation that has now gone away. When he bent over yesterday, he was mindful that that the dizziness had gone away. The patient added he still felt tired. The patient mentioned he did not eat for a while with that dizziness. The patient was scheduled for the next dose on 19Feb2021 but was a little unsure about getting it. Follow-up (05Feb2021): New information reported from a contactable consumer includes: suspect vaccine (lot number; anatomical location, vaccination facility, Time), concomitant medications, reaction data (added events: Headache, Anxiety, Shallow breathing, Pulse abnormal, Exhaustion, Abnormal breathing, Feeling abnormal, Activities of daily living impaired, Body height decreased), outcomes updated and clinical course.

1045871	2/22/2021	MA	42	F	2/5/2021	2/5/2021	<p>Patient reports that she received dose one of the Pfizer COVID-19 mRNA vaccine last Friday, February 5, 2021 at 2:03 PM. She received this here at facility campus vaccine clinic. She felt a strange tingling sensation immediately upon receiving the injection that extended from the injection site across her upper back but otherwise tolerated the injection well. Because of her history of food allergy she was advised to remain at the vaccination clinic for 30 minutes. During that 30-minute wait period she felt generally well however began to develop pruritus at her back in the legs. She did not mention this to the staff at the vaccine clinic and did not look at her skin. The pruritus was not too bothersome and she left the vaccine area after 30 minutes and walked down to our clinic to return to work. Her pruritus intensified very quickly upon returning to her desk and within a few minutes of after her return she went into the bathroom to look at her back and had patches of red, raised, urticarial lesions across her back. She began to feel itchy all over her body. She remained at work and did not take any medication or seek any medical help. She did not look at her legs. The pruritus intensified and when she looked at her skin of her legs approximately 1 or 2 hours later she had developed urticaria essentially head to toe. She had large confluent patches of urticaria at bilateral thighs, urticaria at her face, trunk, arms, legs. At this point she felt otherwise well. She went home and took 10 mg of Claritin and applied a topical Benadryl cream to her skin. This was not helpful. She had severe pruritus of her eyes and eyelids. She took 50 mg of oral Benadryl which also was not particularly helpful. Sometime in the middle of the night that night she developed chills, felt feverish, and developed intense muscle and joint aches. She took an unknown dose of ibuprofen with minimal improvement in muscle and joint pain. She did have improvement in fever. Following day was Saturday, she spent the whole day in bed in extreme pain. She describes the pain at her wrists as feeling as though "somebody was breaking my bones" with any movement of her wrists. She had pain even laying flat in her bed and had severe pain at all of her joints with movement. She tried taking a flexeril with no improvement. She recalls a T-max of 102 sometime on Saturday or Sunday. At that time she had been taking ibuprofen around-the-clock. She also took 10 mg of</p>

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

Claritin approximately every 4 hours. Each night she also took 50 mg of Benadryl. She continued to experience urticarial skin rash and intense pruritus of the skin. The urticaria waxed and waned during this time. She also developed a fever blister at her lower lip. She spent most of Sunday in bed also. She was feeling a bit better by Monday however still had intense pruritus. Skin rash was much improved at most of her body however she still had mild urticaria at her face. She did not have a fever on Monday but was continuing to take ibuprofen around-the-clock. She discontinued ibuprofen yesterday and has not had fevers or chills since Sunday. At this point her urticaria has essentially resolved. She continues taking claritin 10mg BID to 3 times a day and also 50mg bendaryl at bedtime. She did not experience any bruising related to this rash however did have excoriation from scratching particularly at her face. Throughout the course of these days she did not have any episodes of angioedema of the lips, tongue. She denies difficulty breathing, cough, wheezing, shortness of breath, throat tightening, nausea, vomiting, diarrhea, dizziness, lightheadedness, syncope. She has a history of oral allergy syndrome with peanut. Promethazine has caused diplopia, weakness. Simvastatin caused muscle weakness. She has never had any issues with vaccines. She has been getting a flu shot yearly with no difficulty. Her most recent vaccine was October 8, 2020, quadrivalent influenza vaccine. No known history of allergy to polyethylene glycol. No history of chronic urticaria. She takes NSAIDs frequently without any difficulty. She has not taken any NSAIDs prior to receiving this injection or developing this urticaria. She had however taken 10 mg of Claritin prior to receiving this injection. She has no history of anaphylaxis. She has undergone surgery under general anesthesia on more than one occasion without issue. No history of reaction to stinging insect venom. She receives immunotherapy for inhaled environmental allergens here in our office and has done well with this. She denies any recent medication changes or new over-the-counter medications. She has not previously been diagnosed with COVID-19.

1045735	2/22/2021	MA	29	F	2/20/2021	2/20/2021	Around 5:30 PM I began experiencing normal symptoms like headache and muscle ache. At 8:15 PM I began to feel light headed, nauseous, and short of breath. Around 8:20 I needed to lay on the floor to prevent myself from fainting. My eyes were rolling back because I was borderline unconscious. I felt like I had no control of my body and had to go to the bathroom. For around 15 minutes I was on the floor convulsing, shaking as if I had chills and my muscles were involuntarily tensing. My pulse was extremely low. After the convulsions stopped I remained on the floor an additional 15 minutes. Around 8:45 PM I was able to return into my bed with assistance. My nauseous remained and I began experiencing chills. I slept on an off the entire night. At about 1 AM what I suspect was a fever began to break and I was extremely sweaty. For the following day I experienced exhaustion and muscle soreness. I am still experiencing exhaustion. I recognize a bulk of my symptoms were normal but the convulsions, losing consciousness, and inability to control my body seemed worth reporting.
1045763	2/22/2021	FL	49	F	1/15/2021	1/15/2021	Patient felt light headed. Denies SOPB, chest pain, palpitations, V/V, or visual changes.
1046560	2/22/2021	WA	54	F	2/18/2021	2/18/2021	Almost immediately got a very bad headache and nausea. About 30 minutes later I got foggy in the head. Within an hour, I felt exhausted. I went to sleep until about 7pm and when I woke up I felt really nauseous and still very tired. I had a little broth and went back to sleep. on 02/19/2021 at 1am I woke up feeling really hot and had horrible body aches. Even my joints hurt. I took my temperature and it was only 99.2 but my temperature usually runs 97.4 or 97.6. I woke up on 02/20/2021 and my left eye was crusted over just like the first vaccine. My body aches and nausea lasted until 02/20/2021. In the evening of 02/20/2021 I noticed about 10 little red bumps in various places on my body. (2 on left arm, one on back neck in hairline, two on upper back, one on chest, two on left leg, one on lower back and one on left buttock. Today is 02/22/2021 and I am still feeling fatigued. It's not as bad as it was over the weekend but I am still tired. My arm was much sorer with this injection.

1045844	2/22/2021	NY	65	F	2/4/2021	2/10/2021	Soreness, mild swelling and redness at injection site followed 5-7 days later, by mottling in the skin of both extremities, clavicle area and back of neck with prominence of veins in feet and upper extremities with temperature changes. This was accompanied by a prickling sensations. I got a sore inside my right nostril and a cold sore on right upper lip. The mottling and vein prominence continue intermittently still. Improving but not resolved entirely. Along with this, my eyes became intermittently itchy as if I had an allergic irritation. This has also completely resolved. I spoke with a relative who is a physician and he felt that I may have had a hypersensitivity cutaneous vasculitis reaction.
1045140	2/22/2021	OR	53	F	2/2/2021	2/3/2021	About a day after the 1st vaccine, I got a rash on my face that felt like sandpaper. My face was became more swollen after four days and finally started decreasing in swelling after the 5th day. My eyelids were the most noticeable.

1045611	2/22/2021	FL	35	F	2/5/2021	2/1/2021	<p>large quarter sized hives all over; This is a spontaneous report from a contactable nurse (patient). A 35-year-old female patient (pregnant: No) received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), via unspecified route of administration on left arm on 05Feb2021 at 08:30 AM at single dose for COVID-19 immunization. The relevant medical history included known allergies: lyrica, possibly cilantro, pollens; insulin resistance; vitamin D def (Vitamin D deficiency); GERD (Gastrooesophageal reflux disease). Concomitant medications included metformin, famotidine (PEPCID), clarithromycin (CLARTIN), topirmate, diphenhydramine hydrochloride (BENEDRYL). The patient previously received first dose of BNT162B2 (lot number: EH9899) at the age of 35 years old, via unspecified route of administration on left arm on 11Jan2021 at 03:30 PM for COVID-19 immunization (first vaccine administered and was fine then had hives and swollen eye on the day the second was to be administered. Delayed shot- received solumedrol shot and prednisone oral with benedryl/pepcid/atarax). The patient took second shot 1 week later on Friday with prednisone on board - woke up on Sunday AM with large quarter sized hives all over. The event resulted in emergency room/department or urgent care. The event was reported serious due to hospitalization. Treatment received included urgent care- Solumedrol shot- RXs. No other vaccine in four weeks. The outcome of the event was recovering.; Sender's Comments: Based on available information and plausible temporal association, a possible contributory role of the subject drug BNT162B2 cannot be excluded for the reported event large quarter sized hives all over. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

1047176	2/22/2021	LA	83	M	1/27/2021	2/19/2021	On Friday morning, February 19 around 9 am, patient felt like he was biting his lip but didn't say/do anything about it. He got up and got dressed, went about his day. Around 12:30 his nephew saw him and commented that his left eye was puffy and red, his face was swollen and drooped and he looked like he was having an allergic reaction of some kind. At that time, his speech became slurred. They got a neighbor, who is a nurse, to come over. She recommended medical attention. They went to an urgent care center and were immediately sent to the hospital... Left side of his face was drooping and his speech was slurred. There were no cognitive issues. Arrived at hospital around 1:30. He was assessed immediately for a stroke and it was determined that he had not had a stroke. Bell's Palsy was diagnosed. He was given a steroid injection at the hospital and given a Medrol dosepak to begin on Saturday, Feb. 20 and sent home. As of today, Monday, February 22, his symptoms are improving.
1047513	2/22/2021	MO	36	M	2/13/2021	2/13/2021	EXPERIENCED NUMBING AT THE BASE OF THE TONGUE THE EVENING OF 2/13/21. EXPERIENCED TINGLING AT THE NAPE OF THE HEAD 2/14/21. PT WAS NOT ABLE TO CLOSE LEFT EYE COMPLETELY THE MORNING OF 2/15/21.
1047528	2/22/2021	MN	42	F	2/13/2021	2/20/2021	One week to the day of receiving my first dose of the Moderna COVID-19 vaccine, the injection site began to itch and a hard ?knot? developed. I thought the ?knot? was in my muscle, but maybe not. Upon visual inspection, a red area developed around the injection site, about the size of a 50-cent coin. The red area was slightly painful when touched. Now, 2 days later, the red area is still visible and the area still itches, but much reduced in intensity.
1047611	2/22/2021	KS	30	F	2/16/2021	2/17/2021	The adverse events: weak legs, malaise, eyes spinning, general weakness, given Benadryl, steroids, Pepcid, she recovered in a couple of days.

1047489	2/22/2021	TX	91	F	2/4/2021	2/6/2021	She had the vaccine on Thursday and no visible side effects. On Saturday she was very weak and had to be lowered to the ground. She was drooling and staring vacantly and was not responding to questions. This lasted for a bit. I called the ambulance which took her to the hospital. They hydrated her and sent her home with no idea what caused it. The next day she was sitting on the toilet and passed out with her eyes closed. She started drooling. I again called the EMTs and they came. She had come to and they said she fainted and it was probably because she was having a bowel movement. This has not happened before or since these two episodes. I do not know if she should get the next shot.
1046701	2/22/2021	CA	34	F	2/19/2021	2/19/2021	itchy eye watering eye all around eyes were watering and itchy they are swollen and puffy
1047589	2/22/2021	NE	66	F	1/26/2021	1/26/2021	When I first got the vaccine I was fine but as the day went on I felt soreness in my left arm with some stiffness in my neck. Later on in the afternoon, I started getting a headache, neck was getting stiffer and my back started to hurt. When I got home around 5 I fixed some dinner, within 30 minutes or less it felt like my stomach exploded, I was throwing up continuously, it was so intense, I tried sips of water to throwing it up as well. I could feel my esophagus burning up to my throat, and starting to feel like it was closing up. All during this time my eyes hurting and light really bothered me. I was to afraid to lay down, I got myself to calm down, and doing deep breathing. That seemed to help me. I was scared. I stayed home through the night and woke up the next day feeling better. I still have headaches to this day.

1047161	2/22/2021	AS	68	F	1/20/2021	1/30/2021	Started getting some burning around the left eye & nose. Same area I had shingles 10 years ago. By Monday left eye swollen shut. Saw opthmologist prescribed Acyclovir. Over a couple days swelling dissapeared and burning, itching subsided. The thing is, I had my second COVID dose on 02/10/2021, 10:00AM Pitzer Lot #9581. On 02/18/2021 late evening, started to feel burning in left eye nose area again, next morning eye swollen shut. Saw Dr, said I was having an allergic reaction and put me on prednesone and Amoxicylin. No reduction of swelling and burning, blisters were forming. Went to Urgent Care on 2/20/2021 and was prescribed Acyclovir again. Swelling now gone and itching burning diminished.
1046618	2/22/2021	TX	87	F	1/16/2021	1/18/2021	About 2 days after receiving the vaccine, she bitter taste in her mouth. She still has it as of today. It is kind of metallic taste. She also has blurry vision and swelling in her eyes. It felt like she had discomfort behind her eyes. It was causing difficultly reading. This lasted about 2 weeks. It is not as blurry but her vision is not what it is was prior to receiving the vaccine. She went to Eye Center, they told her they didn't know what it was from. They gave her some eye drops and gave her antibiotic/steroid cream. She has a follow up appointment 2/26/2021.
1046637	2/22/2021	OH	68	M	2/16/2021	2/16/2021	Felt dizzy, blurry vision, passed out, pale. Short of breath and vomited. RPh gave epinephrine which worked right away. Squad came and took to ED where he was observed for 4 hours. They did a chest xray, troponin, EKG, Lab work. Everything normal. Name of physician or treating hospital: ED- MD. Pharmacist advised not to get the 2nd dose. ED MD advised to get a 2nd dose. His MD told him to get the 2nd dose in a medical setting where he can be monitored.

1046983	2/22/2021	AR	51	F	2/12/2021	2/14/2021	Enlarged lymph nodes on left and right side of armpits and both breasts. The left side enlargement was very visible to the naked eye and looked to be as large as a tennis ball. Both breasts where swollen and tender/sore. Right side enlargement of armpit as not as large (maybe the size of a golf ball).
1046944	2/22/2021	NH	73	F	2/19/2021	2/19/2021	Vaccine at 945 am Friday Calves of both legs cramped rock hard at 10 pm Friday and remained so for 18 hours. Had to use heating pad and massage to help feet relax from en pointe position so I could walk to the bathroom. Legs were sore after 18 hours but not cramped . Also massive headache made my eyes light sensitive all day Saturday and Sunday until about 9PM. Extreme exhaustion. Recovering today, Monday. Still tired an s slight residual headache at times but not bad enough for painkiller.

1046854	2/22/2021	MA	60	M	12/18/2020	1/6/2021	1/6 18 days after the vaccination I woke up with floaters in my right eye. Much more developed throughout the day. The next day Thursday I had a visual deficit in my eye along with the floaters. By Friday evening I went up to see the eye doctor while at work and was advised I had 5 tears to the retina of my right eye and was advised it needs to be repaired immediately. On 1/9 I had a vitrectomy and the tears in the retina were repaired as well. I was advised the surgery had an 85% success rate but advised I will develop a cataract in the eye within 6 months but within 6 weeks it developed. 2/22 I had the cataract removed and a lense replaced in my right eye.
1046940	2/22/2021	CA	52	F	1/29/2021	1/29/2021	Within 15 minutes of receiving the vaccine, the patient described feeling prickly sensation and pruritus around mouth and labial region. She also noted within 20 minutes of receiving the vaccine that her tongue felt larger than normal. 50 mg Diphenhydramine (BENADRYL) was administered within 5 minutes of symptom report, patient noted she was feeling less, itchy, her tongue still felt larger than normal. Patient was able to swallow the two caplets without any difficulty and a visual exam of her mouth, tongue and pharynx at time of symptom report and before leaving the clinic was normal with no enlargement noticed. ER precautions reviewed and the patient was encouraged to call clinic immediately for any concerns, worsening or non-improvement. Patient was advised to take Diphenhydramine (BENADRYL) 50 mg in about 5-6 hours. The patient was called at home around 8 PM, she still felt some residual symptoms and agreed to take Diphenhydramine 50 mg (second dose). She is also advised to take Allegra (Fexofenadine) 180 mg daily for 14 days. Patient referred to an allergist for advice on whether or not to receive Moderna #2 due four weeks following initial dose.

1047076	2/22/2021	UT	67	F	2/20/2021	2/22/2021	Blurred vision, benign vertigo, immediately after vaccine given. Corrected itself over the next hour. But at 4:30 am 2/22/2021 I was awakened by intense itching on my left arm and hand. Over the next 2 hours the itching increased in intensity and progressed to my right arm and hand, over my upper back and shoulders, and along the back of my thighs and buttocks. I took 2 Benadryl allergy tablets (25mg) and used Benadryl GEL extra strength on the affected areas. This resulted in my sleepiness for the remainder of the day. Contacted my physicians office for an appointment to resolve the issue.

1045098	2/21/2021	VA	23	F	2/20/2021	2/20/2021	29 minutes after being given the vaccine my tongue started itching and swelled up a bit, my mouth felt dry, my face became a bit reddened, puffy, and itchy, my throat began to swell a bit and my chest felt tight, giving me some discomfort when it came to breathing. I let the nurses who were keeping an eye on those waiting for 15/30 minutes know that I was having a reaction. I waited 1 more minute, and when my throat felt tighter and I had a bit more difficulty breathing, I took 1 Benadryl tablet, and waited 2 minutes, and when the symptoms were still worsening slowly, I took a second Benadryl tablet and after a few minutes my symptoms started to go away. I waited another 10 minutes and then went home when it seemed that my symptoms were going away. At 6:45pm on 2/21/2021 my throat and chest started feeling tight again and gave me mild breathing discomfort, so I took another Benadryl tablet, a few minutes later my face began to itchy and my mouth felt dry and my tongue felt a bit swollen, whereupon I took a second Benadryl tablet at 6:56pm, and then felt a wave of nausea. At 6:59pm, the feeling of tightness had not abated, but also hadn't worsened noticeably, and the itching feeling began to spread from my face to my ears and down my neck. At 7:04pm the tightness of my throat and chest began to increase some, and I started to feel some anxiety. At 7:11pm I inhaled two puffs from an albuterol inhaler used for treating asthma as my throat and chest were continuing to slowly get tighter. At 7:26pm I still felt itchy and my throat and chest still felt tight, but it wasn't noticeably worse. At 7:35pm, my throat began to feel tight enough to give me noticeable discomfort while breathing and for me to make a slight wheezing sound while breathing, and my tongue felt like it swelled a bit more, and my mouth still felt dry. At 7:51pm the Benadryl made me feel sleepy, but had no effect on my itchy skin or tightness of throat or chest. 8:00pm, my throat and chest felt tighter and I started having some difficulty swallowing and I felt very warm. 8:05pm, I had a lot of difficulty swallowing and had trouble breathing, so I went to the Emergency Room and was given an Epinephrine shot and sent home after an hour of observation.

1044752	2/21/2021	NJ	52	F	2/12/2021	2/20/2021	On 8th day after vaccine on Saturday 2/20, I started to experience "covid vaccine arm" - a very large (2 inches by 3 inches) red patch on my left arm below the injection site. The rash was hot, hard and very itchy. It was slightly itchy the days leading up to Saturday. I also experienced minor muscle aches that came and went. I iced my arm and applied hydrocortisone cream and later Benadryl cream. In the later evening, around midnight, my face also broke out in a red and hot rash. It did not itch. My eyes felt a bit tight. The rash was mostly on my cheeks. I applied some Benadryl cream to my face as well. I also took 25 mg of Benadryl. The symptom eased within an hour. When I woke on, the rash on my face was hardly visible. The rash on my arm is still visible, but is no longer itchy, hot or hard. I have not had to take additional Benadryl. I plan to call my doctor and allergist on Monday.
1044738	2/21/2021	VT	78	M	2/16/2021	2/18/2021	Moderna Covid-19 Vaccine EUA given February 16, 2021 followed two days later with left eye irritation that has persisted until now (February 21, 2021)
1044720	2/21/2021	ID	64	F	2/18/2021	2/18/2021	2/18/21 time around 9pm, sore arm along with red rash, still remains today but better. Had this reaction 1st vaccine 1/18/21 Moderna Lot #011620A. 2/19/21 body soreness, hands hurt, general not feeling well. 2/20/21 Awake at 2:00 am fever, dizziness, unable to walk straight and passed out. Slight temp w/tingling and numbness in both arms from mid shoulder to fingertips. Vision blurred and wavy. Rested all day. Today, 2/21/21 felt better at 8:00, vision better and tingling & numbness gone in arms. Foggy head, unable to focus on numbers. Resting but having to do chores for work week tomorrow. Vision still not 100%.

1044691	2/21/2021	MI	64	F	2/16/2021	2/17/2021	When trying to drive to work the next day, I experienced extreme light sensitivity. While I am light-sensitive in the morning when the sun is low on the horizon, especially when there is snow on the ground, as was the case that morning, this was far more extreme than usual. I was wearing a very good pair of sunglasses I bought at an eye-doctor's office that protected from both the front and the sides. Still, I felt as though I had a strobe light flashing directly into my eyes. I was driving through town, in very familiar area, I realized when I got out of town into less familiar area, it would be unsafe to drive. I went back home and called work and told them I was not well enough to go to work that day. I later called the nurse who gave the vaccine and explained the situation to her. I received no treatment. I had my eyes examined the next morning and was told to use eye-drops four times daily for at least two months.

1044434	2/21/2021	AZ	76	F	1/23/2021	1/25/2021	Syncope 18 hours post injection, Feb 13 left eye irritation with tearing, Feb 14 mild case of Bell's Palsy right side of face, along with headache, herpes on left corner of mouth, fatigue and ?Epstein-Barr. I was exposed to the virus by my hairdresser on 2-11-21 and she developed symptoms and tested positive 4 days later
1044648	2/21/2021	NM	49	F	2/21/2021	2/21/2021	left facial tingling, left sided headache, no vision changes, denies CP, denies SOB
1044433	2/21/2021	NC	73	M	1/28/2021	2/7/2021	Immediate sore shot site, 10 days later mild fatigue, joint soreness, dizziness affecting balance, achy eyes ,trouble focusing when reading.
1044444	2/21/2021	TX	44	M	2/2/2021	2/12/2021	The night of the injection, I woke up with a 10/10 headache, tinnitus, and shortness of breath. I thought nothing of the shortness of breath as I am asthmatic. The next couple of days I felt completely drained, fatigued. Ten days later I have partial facial paralysis. I saw the emergency physician at the hospital who prescribed prednisone, acyclovir, over the counter eye drops, and an eye patch to wear at night.
1044449	2/21/2021	MA	54	F	2/20/2021	2/20/2021	Within minutes felt hot, profuse sweating, increased heart rate and BP, nausea and dizziness, blurred vision, then diarrhea followed by chills and shaking. Stayed at clinic for an our hydrated and waited for dizziness to pass. Drove home with severe chills. 2hrs post vaccination elevated temp 102, continued to experience chills sore joints and moderate nausea. By evening site of injection and right arm pain. Sx improved after taking Tylenol. Day 2 moderate joint pain and nausea low grade fever 101- controlled by Tylenol.
1044473	2/21/2021	AZ	71	F	2/1/2021	2/20/2021	Lethargic, dizziness, nauseous, matted eyes
1044495	2/21/2021	SC	72	F	1/23/2021	1/27/2021	Looked and felt like bug bites, turned red with liquid inside, itchy. After 2 weeks working with Terminix it was suggested that I had an allergic reaction to something. Took Benadryl Allergy Diphenhydramine HCl 25 mg. and it stopped. Right eye dialated and left one did not for several hours. Washed eye out and took one drop of Naphcon A eye drops. Situation corrected itself within 1/2 hour and never returned. This occurred on 2/10/21

1044527	2/21/2021	OR	54	M	2/16/2021	2/16/2021	I had pain in arm from injection immediately, after injection, which was much different than first dose. But not unexpected. But the adverse symptoms started about 5 hours in or so, i developed a cough, and dyspnea, it was tight in my chest, hard to breathe. the cough was/is (it remains), sometimes hard and raspy, i was a bit wheezy, and I had air hunger, like i could not breathe or get air. if i exhale too strongly i cough, if i talk too much i cough, if i sing i cough, if i inhale too deeply i cough. I also have been very dizzy since the shot and vertigo. I am still coughing and it is 5 days post shot. I started developing headache and severe body pain, pain in my spine, low back and joints. which is expected, but i also had scalp pain and it hurt to be even touched the slightest bit on my scalp and everywhere on my body. I had very stiff neck and eye socket pain as well. I also feel "funny" in my head. Like dizzy, and vertigo, but also like it is wrapped in a heavy towel and my eyes feel heavy and like i can't see well. my vision is as if it has diminished. 5 hours after shot cough started, and the dyspnea, i started feeling chills and deep squeezing ache in my arm at jab site, and soon had fever of 100.6, over night it went to 100.8 and i felt terrible, headache, body ache, restless. but next day fever was 102. it remained all day, i had zero energy slept the whole day. no appetite, did not eat anything except a scramble egg which made me nauseous. fever remained all day at 101.8. over night. next day temp was 99.8 (my normal is 97.6) and it was 99.8 all day. Cough was persistent and really bad with the dyspnea this whole time and i still have cough 5 days out, just giving a timeline here. by friday, my temp was 98 but i felt extremely fatigued. I went and got a covid test which was negative. i saw the chiropractor and they helped my back and headache a little bit. went home and rested. cough has lingered, dizzy lingers, chest tight and sob lingers. fatigue lingers. Cough and dyspnea are NOT signs, the sheet i got for V-safe says right on it these are NOT expected.

1043771	2/20/2021	NC	78	F	2/8/2021	2/8/2021	Update .January 11 - February 2021 1- January 11,2021- Received first Covid-19 shot. Injection was easy, never felt it go in and no evidence on arm of a shot being given. I was symptom free for the entire two weeks. 2.- Feb.8,2021- Received my second Maderna shot. When given it was like I had been punched. The one that inserted it was very rough and heavy handed. I went to wait my time after receiving the shot. It was only 10 minutes and I knew I was going to crash. I had time to leave my chair, quickly told my husband, signaled a worker to come to me asked for a wheelchair so I wouldn't fall and told the next gal what was happening and that I would not be able to talk, open my eyes or respond, but I would be aware of everything. And so I responded exactly as before. The nurses and workers tried everything they had been trained to do. Smile they said, lift your arm, open your eyes. They were trying to figure out if I was having a stroke, a TIA, a heart attack. One gal noticed my arthritic hands and suggested I was having an arthritic attach. They asked me if they should get an ambulance. Of course they got nothing from me. Finally they asked my husband if this was normal which he affirmed it was. They asked my permission to call an ambulance. When hearing nothing, they asked my husband. Of course he said yes but told them I would come out of this. By the time the ambulance walked into the room my episode had basically passed.. It was probably nearly an hour that had passed. I could stand and greet them. Naturally they took all of my vitals which showed everything normal. I said I was happy to go home and that I could walk to the car but asked for them to walk with me for safety. I got home and immediately went to bed and slept until mid morning the next day when a Paramedic came to check on me. 3. The shot was given at 6:00 pm. It was now about 10:00 the next morning and I had a low fever. During the next two weeks I am not aware of my temperature getting higher. For the next 3 days I basically slept and had very little appetite. I developed a rash on my left arm injection sight and on and around my upper torso. It lasted 3 solid days. I did not care for it in any way but tried to keep clothing away and make sure all was clean. Next my mouth became ulcerated. My throat was swollen, the roof of my mouth was ulcerated and uncomfortable. My tongue was heavily coated and felt swollen. I rinsed my

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							mouth throughout the day to help it heal. Then my normal dizziness after eating increased and was continuous for many days. Next was a silent migraine on my left side for two days. I did not feel comfortable to walk my normal 2 1/2 miles each day. I had diarrhea for one day. About Thursday of the second week I felt like things were coming back to normal. 8. 4. Feb. 19th I went to Clinic. They found there were crystals in the left ear and gave me a treatment. I am scheduled for two more appointments next week.
1043196	2/20/2021	WI	73	M	2/5/2021	2/16/2021	Lethargy. Multiple unformed stools. Eyes feel ?heavy.? Mental foggiest. Decreased appetite. Decreased motivation - hard to get going. Feeling cold but no fever.
1043099	2/20/2021	GA	46	F	2/13/2021	2/16/2021	24-48 hours after receiving dose, had low grade fever, headache, and malaise. On Tuesday morning (3 days after vaccine), woke up with vertigo, visual changes, severe nausea, diagnosed with cerebrovascular accident
1043108	2/20/2021	CA	65	F	2/19/2021	2/19/2021	Reported feeling dizzy, a dry throat and blurred vision. Alert and oriented x4, speaks in complete clear sentences. Denies SOB and pain. BP 182/90, P 89, O2 97%, R 19. No facial droop noted. No hearing deficit. Swallowing without difficulty. Lungs clear, heart sounds WNL. Second set VS: BP 185/100, P 84, O2 96%, R 17. 15 minutes later patient reports symptoms improving. Recommended evaluation by physician. Patient refused EMS and plans to go to urgent care. Informed urgent care is not appropriate level of care and educated. Patient reports no symptoms upon discharge from clinic.
1043125	2/20/2021	GA	66	F	1/12/2021	1/19/2021	One week after the shot, the area where I got the shot got red and swelled up a bit. Was itching. An area below the shot also got red and itchy. This lasted a couple of days and then went away. I also noticed on and off my face getting flushed under my eyes and across the bridge of my nose which has lasted on and off during the whole month before the second shot.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1043147	2/20/2021	GA	66	F	2/9/2021	2/16/2021	Exactly one week after the second shot, on 2/16/2021, I started getting very itchy on my wrists and noticed little bumps. Then my ankles became itchy and the same little bumps occurred. They continue to itch and I have gotten other areas that are becoming itchy and little bumps are appearing. I awake at night feeling itchy. My scalp is also itching. I am on day four of itching as I write this. The bumps remain. I also get occasional flushing on my face under my eyes and across the bridge of my nose. I have been taking lots of allergy meds as I have a fear it could cause breathing issues if I don?t. It has helped a bit but does not last as long as I would like so I?m taking more pills than I prefer!
1043175	2/20/2021	CA	76	F	2/15/2021	2/16/2021	The area around my eyes turned red and puffed up for at least 48 hours. I have never had Botox or any other injections around my eyes. This happened after the first dose, also.
1043187	2/20/2021	OR	43	F	1/31/2021	2/10/2021	Started with hives on my left hand, then hives on my right hand. Put some cortisone cream. Over 4-5 days the hives got increasingly worse and spread to my ears, nose, cheeks, eyebrows, face and neck. Monday 2/15/2021 it was beyond uncomfortable and it felt like a pea sized lump was in my throat causing me to worry my breathing might be affected. Went to the ER/Urgent care. I was given a shot of solumedrol, and a predisone pack and given an ointment for the rashes, Triamcinolone. I saw my PCP the following day as it was a scheduled appointment but wanted to see her to update her on this event. I then developed allergies to the ointment worsening the rash. She advised on 2/19/2021 I stop taking the predisone pack and gave me 7 days of 20 mg predisone instead and prescribed a different ointment that is not due to arrive until Monday 2/22/2021. As of today 2/20/2021 the rash is still growing up my arm over my elbow and now I have some hives on my legs and back.

scalp, on chest, on cheeks. Wed. I call the health department and my doctor. Pink ring around 2nd injection site Stinging welts on left arm forming a band almost all the way around arm on Wed. include first injection site. Pale band below, a transition zone, hurts a lot more than the warm pink welts. Stinging welts below injection site create bands of bright pink that stings like ant stings, hot to warm temp. Pale band below and patches sting like bees, much more painful. pain like hornet sting where they overlap as band wrapped around arm. Pink stinking at back and left side of neck .Ears itching and ringing. Some stinging in areas of hand, left fingers, space between thumb and index finger. Feels like Cold cream stinging on face, left cheek large patch under left eye, smaller patches around left side of eye and three small patches on left eyelid. Began turning pink a few hours later. Mouth started itching. Pale patch the size of my hand on my left shoulder and chest aches and stings, is tender. Feels like it is going to become a big welt like the pink one below the injection site. Stinging pricks of pain very occasional on left thigh, left side of back and even on right shoulder blade, left side of neck I brush my hair instead of scratching at my scalp. scabs on left shoulder and chest from stratching. Prolonged fever of 100 after most flu symptoms resolved, into Friday, Thursday my dr sent me to ER. Pale transition zone that hurt the most, below and in fold of elbow is darker, creases because there is more swelling. patch is expanding. Called ER for wait time. Went to Patient First Urgent Care. EKG normal limits. Started Methylprednisolone Pack, 6 day stepped down dosage. Told to use cortisone cream without getting in or near eye, not on lid. Told to take Benadryl. Tylenol. Friday the band on left arm signif diminished, welts forming on face are gone. Some areas still sting and itch, even without looking red. Mouth does not itch. some itches and sharp stings. Still some stinging in left eye and left eye lid. Sat. morning my temperature is below normal even for me. 96.7 Still some stings and itches. Pink ring around injection site fading. Heart rate normal. Still some chest discomfort occasionally.

1042757	2/20/2021	IL	59	F	1/13/2021	1/16/2021	On January 16th I started feeling very dizzy in my eyes got blurry very dry mouth and palpitations, and I almost passed out at home, my husband had to take me to Er. They wanted to keep me in the hospital but I told him I will follow up with my doctor on Monday, I did not want to stay on the floor with covid patients the test that they had ordered at the hospital were normal they did not order a CMP they only did a basic metabolic panel and that was normal, so I followed up with my doctor on Monday which was January 18th, and she ordered CMP and all the labs, when they threw my blood my liver enzymes were very elevated over the thousands LT ASG and the and others, then the doctor ordered a second set of blood works of CMP just to make sure it wasn't a fluke, they were even more elevated they were over 1,400.
1043275	2/20/2021	OH	73	F	2/17/2021	2/17/2021	Immediately after vaccination patient felt experienced stomach upset, then tingling around the mouth. No respiratory issues, but had facial flushing nd mild redness and swelling around the eyes with some itching. Benedryl capsule PO given and responded with in 15 minutes. Driven home by husband and advised to seek ER RX if needed. Advised not to seek 2nd does of vaccine.

1043033	2/20/2021	TN	26	F	1/26/2021	1/26/2021	Moderna vaccine 041L20A (I think) Given 1/26/2021 Adverse Events started 1/26/2021 ?? Symptoms at the time of the shot Tuesday January 26th: burning at site for twenty minutes, warmth shooting down my arm, up my neck, and across half my face, headache, vision disturbances. ?? Night one: sore arm, joint pain, headache, nausea, fatigue unfixed by rest, slept all night, chills, and intermittent fever. ?? Wednesday: sore arm, joint pain, headache, nausea and vomiting, fatigue unfixed by rest, slept all day, chills, and intermittent fever. Ate two bites of banana and sipped Ginger Ale and Gatorade. ?? Night two: sore arm, joint pain, nausea, fatigue unfixed by rest, slept all night, chills, and intermittent fever. The friend checked on me thought I died because I (a very light sleeper) didn't wake up at first. ?? Thursday: sore arm, joint pain, nausea, fatigue unfixed by rest, slept all day, chills, and intermittent fever. Couldn't stand for more than five minutes without rest. Ate two bites of toast and one cup of honey chamomile tea. ?? Night three: sore arm, intermittent joint pain (feet especially), last fever at 4pm, fatigue unfixed by rest, slept all night, chills. ?? Friday: achy all over, nauseous, brain fog, fatigue unfixed by rest, heart palpitations. I went to work, stimmed most of the day plus erratic emotions and behavior. Ate two bites of cereal, one burrito (over the course of three hours), and drank two cups of water. Blood Pressure 116/76 (6 more than normal of each) pulse 93 (33 bpm more than normal). I woke at 30% capacity. ?? Night four: brain fog, heart palpitations, achy, nauseous, exhausted. After work, I got home at 1% capacity and collapsed in bed, unable to do anything else. ?? Saturday: achy, heart palpitations, vision disturbances, brain fog, tinnitus, intermittent chills (maybe fever? Too tired to check), debilitating fatigue unfixed by rest. Not actively nauseous, but allowed to eat ONLY what my body craved (anything else would have been thrown up) a doughnut, French fries, two cups of tea. Woke at 5% capacity. Fed myself and pets, slept. I did not clean, brush hair, or anything else. ?? Night five: achy, heart palpitations, brain fog, headache, tinnitus, fatigue unfixed by rest. ?? Sunday: achy, heart palpitations, tinnitus, intermittent chills (maybe fever? Too tired to check), debilitating fatigue unfixed by rest. Woke at 10% capacity - fed myself and pets, cleaned dishes and litter box, brushed hair, and slept for the rest

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

of the day. Ate 1/2 cup cereal, one kiwi, meatloaf, drank lemonade. ?? Night six: achy, heart palpitations, fatigue unfixed by rest. ?? Monday: achy, debilitating fatigue unfixed by rest. Woke at 15% capacity - ate, cleaned dishes, brushed hair, fed cat and cleaned litter box, did laundry, took out trash - slept for the rest of the day. Ate baked potato, meatloaf, kiwi, drank lemonade. ?? Night seven: achy, heart palpitations, fatigue unfixed by rest. ?? Tuesday: debilitating fatigue unfixed by rest. Went to a clinic and Tested Negative for Covid with a rapid test, Negative for antibodies. ?? Night eight: fatigue. I went non-verbal for a few hours. ?? Wednesday: heart palpitations, headache, intermittent chills (maybe fever? Too tired to check), debilitating fatigue unfixed by rest. ?? Night nine: fatigue, heart palpitations. ?? Thursday: debilitating fatigue unfixed by rest, nausea, headache. ?? Night ten: fatigue. ?? Friday: fatigue. Got checked at a clinic - normal labs, FNP thinks it is some kind of autoimmune response (due to my family history) and said it usually goes away in about a month. ?? Night eleven: Fatigue. ?? Saturday: chills (maybe fever?), headache, debilitating fatigue unfixed by rest. ?? Night twelve: Fatigue, heart palpitations. ?? Sunday: chills, headache, debilitating fatigue unfixed by rest. ?? Night thirteen: Fatigue. ?? Monday: went to work at 25% capacity. Left at noon. Sharp headache, nausea, heart palpitations, shaky, falling asleep at desk, sharp intestinal pain, stabs of chest pain, nausea, uncontrollable fidgeting, fatigue unfixed by rest. Work hour one: equilibrium. Completely out of touch with my body - immune to cold (I'm always cold) and everything else. Work hour two: moderate physical discomfort and mental strain. Work hour three: severe physical discomfort and mental exhaustion. Work hour four: felt like I was losing my mind, intense physical pain (NOT anxiety - I know what anxiety feels like - this was my body shutting me down by whatever means worked) ?? Night fourteen: heart palpitations, sharp chest pain, sharp intestinal pain, felt like I was going insane, headache, chills (no fever), fatigue. ?? Tuesday: 5% capacity. Nonfunctional. Heart palpitations, headache, aches all over, chills, debilitating fatigue unfixed by rest. Ate and slept. ?? Night fifteen: headache, body aches, chills (no fever), fatigue. Slept with a heating pad. First emotional meltdown. ?? Wednesday: 10% capacity. Headache, body aches,

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							debilitating fatigue unfixed by rest. I had a two minute burst of energy, then off like a light switch, and slept for hours. ?? Night sixteen: chills, body aches, fatigue. ?? Thursday: Body aches, debilitating fatigue unfixed by rest. ?? Friday day seventeen - present 2/19/2021 with no end in sight. Debilitating fatigue unfixed by rest. I can?t read, can?t watch movies most of the time, get tired making myself food even when I sit in a chair in the kitchen, only drive if I absolutely have to, sleep 20ish hours a day, regular headaches (I almost never got headaches before), symptoms severely worsen with minimal or no activity, only resting in a quiet dark room helps. I am debilitated. I can?t work. I can?t grocery shop. I can?t cook without sitting down. If I take out the trash, I have to sleep the rest of the day. I have brain fog and can?t read. I can?t function.
1042899	2/20/2021	OK	66	M	1/13/2021	1/15/2021	12/21/2020 I had my first Pfizer COVID-19 vaccine and the second on 1/13/2021. Two days after my second vaccine on 1/15/2021 at 8:50 PM I had a scintillating scotoma in my right visual field in both eyes consisting of a bright flash of light in the center of my visual field that cleared but then it expanded into a C-shaped series of zig-zag lines that slowly expanded into the periphery of both right visual fields. It ended at 9:20 PM. I had no headaches afterward. While I have had migraines when I was younger, I haven?t had one in several decades and I never had an aura before it. I went to the ED where I was evaluated for a possible TIA and then admitted into Hospital. While there my platelet count was 400% of what it usually was. Other than the platelet count and anemia (I donated 2 unit of packed red blood cells on 12/17/2020) the rest of my blood work was unrevealing. The scintillating scotoma only lasted 30 minutes but the elevated platelets (although slowly coming down) continues to this day.
1043783	2/20/2021	AZ	39	F	1/19/2021	1/19/2021	Facial numbness/paralysis started 10 minutes after injection. Paralysis of tongue and jaw muscles followed an hour later. Paralysis of eyelids followed. Medical staff on-site were not informed on how to proceed and recommend to take a benadryl and sleep it off. Muscle function returned 12 hours later.

1042998	2/20/2021	CA	70	F	1/22/2021	1/29/2021	Damage to cranial nerve 6, left eye, resulting in double vision. On the MRI there was no sign of any bleed or other problem to explain the double vision. My shot was just 5 days before, leading the doctors to conclude the vaccination was the likely cause. At the same time, from the MRI they determined that a pituitary adenoma they had been following for 5 years had enlarged and needed to be removed so I had surgery for that right away. But they were confident that the tumor was not the cause of the double vision.
1043299	2/20/2021	TX	69	F	2/3/2021	2/3/2021	Developed severe photosensitivity to sunlight with visual disturbances of acuity. Lasted 24 hours and seemed to resolve ( but could be because there was an absence of sun light) UNTIL 2/19/21 and then was unable to go outside because of the sunlight could not keep eyes open or leave house. Mild problem with computer/iphone but No problem with LED, home lighting or TV light
1285000	2/20/2021	MO	86	M	2/9/2021	2/19/2021	DATE: 02/20/21 12:00AM - AWOKE WITH SEVERE ITCHING ON WRIST OF BOTH ARMS 12:00 - 12:45AM - STAYED AWAKE WHILE IN BED ITCHING BOTH ARMS 12:45AM - WENT TO BATHROOM TO A VISUAL VIEW OF ITCHING ARM. BOTH ARMS, WRIST TO ELBOWL, WERE EXTREMELY RED "RED" DOTS OVER WHOLE BODY FROM THE THROAT DOWN; NO SPOTS OR REDNESS ON THE HEAD OR FACE. SLIGHT PRESSURE ON CHEST. APPLIED CERAVE LOTION ON MULTIPLE AREAS OF THE BODY, WHICH PROVIDED INSTANT RELIEF. DRANK A CUP OF BIGELOW MATCHA GREEN TEA WITH TURMERIC. WEN TO BED AT 02:00AM UNTIL 07:30AM. ALL PROMBLES ABOVE WERE GONE. SKIN LOOKED THE SAME AS LAST EVENING AT BEDTIME 10:30PM.

1043888	2/20/2021	NY	45	F	2/19/2021	2/19/2021	While sitting in the waiting area I began to feel itchy. it was around 7:50am. I quickly took 2 chewable (12.5mg each) benadryl tablets. after about 5 min. i felt stable enough to leave. on the way home I started to feel the itching intensify and I felt very warm. I had welts forming and hives appeared all over. As I pulled into my driveway( 7 min drive from vaccination site) I felt my lips and eyelids swell, and my throat felt tingly. I took another 2 chewable benadryls. (12.5mg each). I immediately called my Doctor and explained what was going on. I also started to wheeze. I used my inhaler. He told me to use my epipen. Which I already had prepared since I knew this was anaphylaxis. I started to feel stable enough to go inside. I called my husband to come downstairs to be with me. I still wasn't feeling well and the tightness and wheezing persisted. At around 8:40, My dr. told me to use the 2nd Epipen and use my nebulaizer. If I wasn't better in 10 minutes he would call an ambulance. Thank GD the itching and hives subsided and the wheezing and tightness diminished by around 8:50am. My dr. continued to monitor me and check up on me. By 3pm I was back to myself.
1043857	2/20/2021	MD	34	F	2/14/2021	2/15/2021	Menstrual/uterine cramps that I would describe as fairly intense. I don't usually get cramps associated with menstruation, and I was not menstruating at the time, nor did I begin to, I just experienced the cramps over the course of 48 hours beginning the day after the first dose. The cramping was certainly not incapacitating but was for sure the most intense I've ever felt. Went away about 72 hours after receiving the shot. Also: very sensitive skin. The skin around my eyes tingling and then got red and puffy and itchy after applying a vitamin c serum I've used regularly for six months with no issues. Got worse over the course of a week and then resolved.
1043797	2/20/2021	CA	59	F	2/14/2021	2/14/2021	At 30 minutes after vaccination, chest tightness, eye and lip swelling, hoarse voice. Albuterol inhaler relieved chest tightness. Other symptoms lasted a couple of hours.
1043733	2/20/2021	AZ	46	F	2/15/2021	2/18/2021	Eyes blurry, left eye only, red eyes, strained

1043541	2/20/2021	AZ	36	F	2/19/2021	2/20/2021	About 12 hours after receiving the shot, I woke up in the night feeling unusual. I went to the bathroom, where I felt pressure in my head, increased ringing in my ears, and increased loss of vision. A few moments later when I realized this was an emergency, I could no longer see or walk. I crawled blindly through the home feeling for the walls and familiar facets calling out for help. My family woke up and called emergency. By then, I was nearly gone/unconscious. I was laid down on cold tile until the paramedics arrived. Heart, blood sugar, and blood pressure were all tested. Considering I'm a completely healthy individual, they attributed it to the vaccine.
1285002	2/20/2021	NJ	55	M	2/20/2021	2/21/2021	Right eye swelling without drainage or change in vision. Ice pack placed and swelling decreased
1043426	2/20/2021		68	F	1/17/2021	1/28/2021	Bell's palsy. Earache began several days prior to diagnosis. On 1/28, woke up with a drooped left eye (couldn't close it fully), followed that day by loss of taste and sensitivity to noise. The next morning (1/29), experienced drooling. That afternoon, I went to the ER at NY, and was diagnosed with Bell's palsy. Treatment was prednisone (50mg) and valacyclovir (1g) for seven days. Symptoms were halted by the meds and now, three weeks later, have nearly disappeared.
1043380	2/20/2021	RI	87	F	2/18/2021	2/18/2021	10-15 minutes after vaccination patient complained of dizziness, blurred vision, and shortness of breath. Patient states she felt slightly short of breath walking into the clinic prior to vaccination but did not mention symptoms to staff. Patient was evaluated by clinic medical director and EMS staff. No objective signs of local or systemic reaction, only patient's subjective statements. Patient was transported to Hospital for further evaluation.
1043802	2/20/2021	MO	74	M	2/12/2021	2/13/2021	Pt says Saturday morning right eye started watering in the morning and numbness on the right side progressed as the day went on. Sunday he called the insurance nurse and she told him to go to urgent care. Urgent care told him to go to ER. ER ruled out a stroke and diagnosed him with Bells Palsey. He alerted his primary care physician.

1043530	2/20/2021	GA	30	F	2/18/2021	2/19/2021	Individual received vaccine 2/18/21. Woke up morning of 2/19/21 with pain to right eye. Redness and drainage noted to eye on morning of 2/20/21.
1043402	2/20/2021	OR	35	F	2/19/2021	2/19/2021	Pt was given her first Pfizer vaccine at 10:31 am on 2/19/21. Patient reported feeling nauseous and dizziness one minute after receiving the vaccine. Pt had no history of heart disease, no previous reactions to other vaccines. Patient did have history of panic disorder. At 11:10 patient reported that symptoms had neither improved or gotten worse. At 11:20 patient opted to return home with her sisters who would keep an eye on her. Pt would follow up with her PCP if symptoms worsened.
1043302	2/20/2021	TX	73	M	2/5/2021	2/6/2021	My dad received the Pfizer vaccination on 2/5/21. He was admitted into the hospital the next day for C-Diff bacterial infection. He had been on dialysis treatments for kidney failure treatment since 2017 and had recently been diagnosed with stage 3 colon cancer in June 2020. He had completed his final treatment of chemotherapy on 2/4/21 and several weeks prior had been determined cancer free. On Tuesday 2/9/21 he was released from the hospital and went home. Early Thursday morning 2/11/21 @ approximately 1:30 am CST his eyes rolled back in head and he stopped breathing and was non responsive. My mother called 911 and attempted CPR. Paramedics arrived and were able to successfully get a pulse then transferred him to the hospital. He was put on a ventilator @ the hospital and then transferred to a different hospital a few hours later. He lost pulse/heartbeat several times @ the 2nd hospital he was transferred to. We were not allowed to travel with him or see him b/c of all of the COVID restrictions. We were communicating with the ICU doctor by phone who ultimately communicated to us that there was nothing further that could be done to save his life. He subsequently passed away @ approximately 8:55 am CST on 2/11/21.

1043427	2/20/2021		62	F	2/20/2021	2/20/2021	Pt assessed after receiving COVID-19 vaccination drive thru site. She reported onset of mild lightheadedness and a non-specific "funny feeling" in her head. No vertigo or presyncope. No other new neurologic changes such as vision changes or extremity weakness. No chest pain, palpitations, dyspnea. No other signs of allergic/anaphylaxis (ie rash, throat swelling, GI side-effects). She reports hx of high blood pressure and is on one BP medication but cannot recall the name. States she took it today. Reports eating breakfast this morning. Exam notable for BP 140/85, HR 60. Pt well-appearing, no acute distress, no obvious CNS or peripheral deficits. RRR, normal s1/s2, no m/r/g. Lungs CTAB. No obvious rash or facial swelling. During course of evaluation pt reported symptoms improved but did not quite resolve. Advised pt to continue monitoring at vaccination site for additional 15 minutes. Offered juice, crackers, fluids which she declined though did drink some of her own water. Upon reassessment pt reported continued improvement though symptoms had not completely resolved. Offered to have EMS come assess pt though she declined. Warning signs/symptoms discussed with pt for when to seek out care at ED. She is in agreement.
1043433	2/20/2021		27	M	1/26/2021	1/26/2021	Dose 1 on 26Jan2021: Sore left arm at injection site; persisted for approx. 40 hours. Slight brain fog - difficulty completing basic mental math (addition/subtraction with values less than 50); persisted for approx. 12 hours. Dose 2 on 16Feb2021: Sore left arm at injection site; persisted for approx. 30 hours. Low-level headache focused behind my eyes; effectively treated twice with Tylenol and later with Ibuprofen; onset within 1.5 hours of injection; persisted for approx. 12 hours.
1043454	2/20/2021	WI	26	F	12/26/2020	12/31/2020	Dizziness described as a swaying sensation. Swollen eyelid. Dizziness/sway has not gone away. Also off balanced and visual axis is now tilted.
1043500	2/20/2021	OH	29	F	1/8/2021	1/11/2021	When I got up Monday morning, I noticed I had a enlarge lymph node, in the same arm where the vaccine was given. It was the size of a tennis ball. I went to the Doctor, she did a chest xray and blood work to rule out lymphoma. That came back negative and I have had some shortness of breath. This hasn't went away, has got smaller but still there, My PCP is keeping an eye on it.

1041172	2/19/2021		63	F	1/29/2021	1/29/2021	Within 1.5 hours of vaccine #1: Eye pain (both), itching without visible rash (left buttock only), thumb pain, brief leg "heaviness" (both) and fatigue, brief RLQ pain, increased tinnitus. The next evening: low back and neck (bone?) pain while attempting to sleep, out of character to usual back pain. By day 3 post injection, left nose tingling similar to onset of cold sore, which included left side of mouth the next day. By 7 days post injection, entire mouth area felt tingly similar to Novocaine wearing off. This lasted 3 days. Now improved. (took B-12 p.o.) Other brief episodes of chest discomfort, gum irritation, and anxiety. Vaccine #2 scheduled for 2/19/2021
1041481	2/19/2021	SD	22	M	2/19/2021	2/19/2021	Patient got lightheaded and clammy. Eyes rolled to back of head about 3 minutes after injection. MT assessed pulse, slow but steady. RE got BP cuff and took BP. 1st BP reading was 146/96 with pulse of 59. Sat O2 was 100% Staff went to get patient water per patient request. Resident claims he 'lost hearing' for a small time period. BP reading at 1147 was 148/91. SS, CNP, was summoned to vaccination area to assess patient. Spoke with patient / family. He has had similar reaction before after knee surgery. Patient feeling better. CNP requests continued observation until DBP is below 80. BP reading at 1153 is 135/79. Patient released from observation and left vaccination clinic.
1041283	2/19/2021	VA	24	F	2/17/2021	2/18/2021	Excruciating left side of face/head pain. In jaw, neck, face, above and around eye. Extreme sensitivity to light and sound. Began around 19:00. Tried OTC Motrin and Tylenol with no relief. Tried Orajel since the pain felt similar to maybe a toothache but have had no teeth issues. No relief from anything. Pain was 9/10. Around 5am pain completely went away. No more issues since then.
1041291	2/19/2021	NY	40	F	2/4/2021	2/4/2021	Within a couple minutes I began having tingling of my chin that worked up to my forehead. My throat felt like I had a lump in it. I felt off like I may pass out. My vision seemed a little blurry. This lasted about an hour. I felt itchy all over my body. This lasted for several hours.

intact. Conjunctiva/sclera: Conjunctivae normal.  
 Neck: Trachea: Trachea and phonation normal.  
 Cardiovascular: Rate and Rhythm: Regular rhythm.  
 Tachycardia present. Pulses: Normal pulses. Heart  
 sounds: Normal heart sounds. Comments: Slightly  
 tachycardia (103) Pulmonary: Effort: Pulmonary effort  
 is normal. Breath sounds: Normal breath sounds and  
 air entry. No stridor, decreased air movement or  
 transmitted upper airway sounds. No decreased breath  
 sounds, wheezing, rhonchi or rales. Comments:  
 Speaking full sentences. Musculoskeletal: Cervical  
 back: Full passive range of motion without pain. Skin:  
 General: Skin is warm. Findings: No rash.  
 Comments: Injection site w/o erythema or swelling. No  
 adhesive reactions Neurological: General: No focal  
 deficit present. Mental Status: She is alert.  
 Psychiatric: Mood and Affect: Mood is anxious (slightly).  
 Thought Content: Thought content normal. Judgment: Judgment normal. Re-  
 evaluation of lung sounds and throat was done  
 periodically about every 5-10 minutes. No acute findings  
 seen/heard. Assessment/Plan Treatment included:  
 albuterol, antihistamines, water and solu-medrol IM and  
 pepcid, albuterol (pt used her own). Follow up response  
 to treatment: excellent. Scale of 0-10 based on  
 symptoms of tightness was 7 at first. Upon discharge was  
 3-4/10. Patient discharge: Stable to go home and follow  
 up with PCP and her allergist. Differential Diagnosis:  
 Anaphylaxis/anxiety (dyspnea, stridor, drooling, tongue  
 swelling) We discussed close monitoring at home and  
 when/if she were to take her epi-pen and call 911 if  
 symptoms were to worsen. She's to let her allergist know  
 about her visit today. She may need to have other  
 medications taken prior to her #2 dose of Pfizer  
 according to her allergist recommendations. Pt  
 appreciative and is ready to go home. Pt wheeled out to  
 front door by security. Accompanied by husband.

1041183	2/19/2021	ME	68	F	2/12/2021	2/14/2021	I did experience some headache and lethargy on Sat. so laid low. I did go for a walk about 3:30 walking up hill at times as is usual. I did have an appetite and prepared dinner. I did not go to work (child play therapist). Sunday I felt more myself and did notice the soreness in my arm was surely not as bothersome as with the first shot. Had a very active day, no walk but yoga class. Prepared a nice dinner for VD and settled in to view television later in the evening. Strangely, the memory of the exact nature of how this started eludes me, but I do recall experiencing discomfort in the very upper extremities of my chest. Sharing this with my husband he wondered if it may have had something to do with sleeping on my right side cramping the rib area due to not sleeping on my left side because of the shot. I also pondered if it might be related to my gym workout on Thursday ? I recall feeling tired and headed to bed. I recall awakening to use the bathroom and feeling a slight brief bout of dizziness. When I did awaken the next morning the chest discomfort was still present to I called the Health Center and was advised to go to the ER. The EKG was fine. The troponin level was elevated to 0.19 so I was told I had suffered a mild myocardial infarction and I was going to the ICU.

1041393	2/19/2021	CA	70	M	2/18/2021	2/18/2021	Patient received Moderna Covid vaccine to left arm at approximately 11:55AM. Afterwards, patient sat in the observation area, accompanied by female companion, presumably his wife. As soon as patient sat down, medical assistant witnessed the patient shake, lose color and roll his eyes back. Medical assistant called out to observation nurses for assistance. Nurses approached the patient immediately. Patient went limp and was assisted to floor. Wife was questioned about patient's history, which she reported were cardiac related; CABG. Patient was lethargic but oriented x4. Manual pulse taken revealed a weak pulse of 60. O2 Sats on room air showed 90% on pulse oximeter. Patient was clammy and pale. When questioned about his current symptoms, patient responded that he felt "heartburn" and tingling to this left arm. An AED was placed on patient's chest and 911 was called. No shock was delivered. Patient remained conscious but lethargic and nauseous. Paramedics arrived at approximately 12:00noon and patient was taken to nearest hospital. No additional information regarding patient's condition is known at this time.

1040686	2/19/2021	WI	52	F	2/17/2021	2/17/2021	At 9:30 that evening I started throwing up, terrible chills I couldn't get warm even under my electric blanket and featherbed, my muscles were spasming, my joints hurt like never before with stabbing pains, the headache was worse than the worst migraine I ever had, it hurts to open my eyelids even in the dark , I literally thought I was dying from the 2nd shot.
1041517	2/19/2021	WI	64	F	2/17/2021	2/17/2021	12 hours after receiving vaccine I woke up from a deep sleep because my tongue felt thick and too big for my mouth. I am a RN so I assessed myself. No tingling. No numbness. No difficulty breathing. I could swallow my saliva. Fell back asleep. Soon after I woke up again and thought wow my tongue is huge and it is occupying my entire mouth. I looked in the mirror and my tongue was huge. Swollen and the knobs on the back of my tongue were huge too. No other symptoms. I grabbed my cell phone and was able to fall back asleep. In the AM my tongue felt better and only the sides felt funny. Visually, my tongue had decreased and I could again see the grooves and marks in my tongue which were gone when it was swollen. On AM of 2/19 it appeared to resolve completely.
1041419	2/19/2021	FL	83	F	2/3/2021	2/4/2021	Adverse events experienced and are they still occurring now: -double vision (MRI done last week and everything seemed normal) What happened as a result of the adverse event? went to her pcp and did various check ups and everything was normal, doctor still recommended her to get her vision done also went to the eye doctor and they told her she doesn't have anything abnormal
1040827	2/19/2021	MN	40	F	2/10/2021	2/18/2021	After shot, just felt like someone took a bat to my arm. However, yesterday I noticed a slight itching and bump on left arm by injection site when I was teaching. This morning I woke up and noticed it is red, itchy, little swollen and the arm is sore. I have also had a headache the past 2 days and slight dizziness/unfocused visual effects this morning.

1040533	2/19/2021	CA	72	M	1/24/2021	1/25/2021	<p> Syncope; Diarrhea; Low pressure; Flu-like symptoms; A regulatory report was received from a consumer concerning a 72-years-old, male patient who received Moderna's COVID-19 Vaccine, and who experienced flu-like symptoms, head went back, eyes went white, jaw move left to right, made a last breath, thought he died, diarrhea and low pressure. The patient's medical history included high blood pressure. Products known to have been used by the patient, within two weeks prior to the event, included Metoprolol succinate. On 24 Jan 2021, approximately one day prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (042L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. On 25 Jan 2021, the patient reported flu-like symptoms. Treatment information was not provided. On 26 Jan 2021, the patient reported head went back, eyes went white, jaw move left to right, made a last breath, thought he died, diarrhea and low pressure. Treatment information was not provided. Action taken with mRNA-1273 in response to the events was unknown. The event, flu-like symptoms was considered recovered/resolved on 25 Jan 2021. The events, head went back, eyes went white, jaw move left to right, made a last breath, thought he died, and diarrhea was considered recovered/resolved on 26 Jan 2021. The outcome of the event low pressure was unknown.; Reporter's Comments: This case concerns a 72 year old male with medical history of hypertension on metoprolol, who experienced a serious unexpected event of syncope and non-serious unexpected events of flu-like symptoms, diarrhea, and low blood pressure. Event onset was 1 day after first dose of mRNA-1273. Flu-like symptoms resolved. Based on the current available information and temporal association between the use of mRNA-1273 and the start date of the events, a causal relationship cannot be excluded. </p>

1040542	2/19/2021	IL		M	12/24/2020		<p>Psychosis; Pain in the back of eyes; Weakness; Chills; Muscle pains/ Myalgia; A spontaneous report was received from a consumer concerning a male patient of an unknown age who received Moderna's COVID-19 Vaccine (mRNA-1273) and developed psychosis, pain in the back of his eyes, chills, myalgia, and weakness. The patient's medical history included schizoaffective bipolar disorder. Products known to have been used by the patient, within two weeks prior to the event, included paliperidone. The patient received their first of two planned doses of mRNA-1273 (batch number not provided) on 24 Dec 2020. On 21 Jan 2021, an unknown amount of time prior to the onset of the events, the patient received their second of two planned doses of mRNA-1273 (batch number not provided) intramuscularly for prophylaxis of COVID-19 infection. On 27 Jan 2021, the patient received paliperidone. On an undisclosed date, the patient experienced pain in the back of his eyes, felt a chill, muscle pains, and weakness. The patient had been diagnosed with schizoaffective bipolar disorder and was missing at the time of the report. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not applicable because the patient had received both doses. The outcome of the events psychosis, pain in the back of his eyes, chills, myalgia, and weakness, was not reported.; Reporter's Comments: This case concerns a male patient of an unknown age who experienced a medically important event of psychosis, and in addition non-serious events of pain in the back of his eyes, chills, myalgia, and weakness. Based on the current information and temporal association between the use of the product and the start date of these events, a causal relationship cannot be excluded, however the patient's history of schizoaffective bipolar disorder is a strong confounder for the event of psychosis. The case is lost to follow-up as Consumer did not give consent to follow-up.</p>

1040638	2/19/2021	CA	50	F	1/23/2021	1/31/2021	On Sunday, Jan 31, 2021 I woke up around noon after working a graveyard shift and wasn't feeling right. There was a pressure in my head, along with sinus and ear pain and a fuzzy feeling in my face. By Monday, Feb, 1, 2021, the pain was worse now with a fatigued feeling after sleeping 20 of the last 24 hours. I went to my Dr on 2/1/2021 and recognized a slide on the left side of my face. From my forehead not wrinkling up the same as right side, left eye wasn't closing as tight and the left cheek and side of mouth were sliding. He said it was Bells Palsy. He prescribed 10 days of prednisone and an antivirus medicine to be taken 3 times a day. That week I slept a lot and wasn't able to sit up much due to the head pain and the lightening bolt feeling in my face. By the 2nd week I was able to sit up more, but still very tired/fatigued. I was off work for 2 weeks, returning to work on 2/14/2021. There is still a slight slide on the left side in the eye and cheek.
1040685	2/19/2021	VA	65	M	1/29/2021	1/29/2021	One hour after the vaccine I experienced loss of sensation of my left cheek from under my eye to my mouth. My wife noted loss of muscle tone of my cheek and inability to smile on the left side. Symptoms started about one hour after the injection and resolved after three hours.

1041110	2/19/2021	ME	52	F	2/18/2021	2/18/2021	Around 10 minutes after vaccination patient alerted pharmacy staff members at the clinic that she had a "weird taste in her mouth like she has when she has seizures". Employees of her congregate-care facility came over and told pharmacy staff that she does not have true seizures, but rather "pseudo-seizures" as part of her mental health condition. The pharmacy staff has the patient immediately sit back down. She appeared to have lost consciousness one time. Staff reported her eyes seemed glazed over. The patient denied any feeling of throat closing or tingly of lips or tongue. The pharmacy staff was able to obtain a carotid pulse but due to obesity was unable to take a blood pressure even with a large cuff. At that point pharmacy staff called 911 to get patient further evaluation. EMS evaluated the patient and declined transport and instead returned her to her apartment. Congregate-care staff reported that patient has a history of this type of reaction when being around groups of people.
1040864	2/19/2021	NC	61	M	1/20/2021	1/21/2021	Received at approximately 2:30pm. At just after midnight following vaccine, woke up and had what appeared to be Vertigo/dizziness. This has not completely gone away since onset on 1/21/2021. I began having "floaters" in my vision beginning about 8am following vaccine. This has not gone away. I did have a bout of vertigo in January 2020, that had not reoccurred since that time. I have not had "floaters" prior to the 2nd dose of the vaccine.
1040872	2/19/2021	CA	69	F	2/13/2021	2/15/2021	I woke up with distorted vision, possibly an ocular migraine. Went to loss of peripheral vision in my left eye and was left with a headache for the next 24 hours.
1040893	2/19/2021	MO	56	F	2/17/2021	2/17/2021	Arm pain but it was tolerable, but extreme joint pain, as well as extreme muscle pain, fatigue, and eye pain. Tinnitus and dizziness. Also had chills. Remained pretty consistent for a day and half.

1042409	2/19/2021	AL	66	F	2/19/2021	2/19/2021	Her injection was at about 10:55 am. About 15 minutes after the injection, patient claimed that she is dizzy, heart is racing. We get her seated. She wanted some water and we gave it to her. Advised her to take her mask off if she wanted. Then she she claimed that her eyes are sensitive to light and her throat is scratchy. We offered her lay down in our immunization room. At 11:45 am, she was laying flat on her back in our immunization room with both legs elevated on chair. She asked to have the light turn off. We have one of our staff to check on her every several minutes. She claimed that her feet were cold. Her husband came in the room with her and gave her his jacket to put on her feet. We offered to check her blood pressure and call EMS for her but she was not interested. At 12:04, she stated that the room is spinning. At 12:30, she was comfortable to get up assisted by one of our staff and leave. We checked on her at 5:25 pm. Per spouse, she is doing better but sleeping at the moment.
1042456	2/19/2021	CT	45	F	1/4/2021	1/6/2021	Eye soreness/pain. Halos around light. Light sensitivity. Headache. Nausea. Dx: Iritis both eyes. Dx on Friday January 8, 2021. Steroid eye drops prescribed. Infection and steroid drops are ongoing as it has not resolved yet. Needed to stay home from work due to headache/nausea. Headache and nausea is on the Covid symptom list and the hospital I work at would not allow me to work until I'd had a negative Covid test.
1042465	2/19/2021	IL	34	F	1/27/2021	1/31/2021	I received dose 1 of the Covid 19 vaccine on 1/27/21. On Sunday 1/31/21 I noticed my left eye was itchy, red, and felt like something was stuck inside. A visit to my eye doctor revealed that I had developed a corneal ulcer in my left eye. I am not an eyeglass or contact wearer. I have never had issues with dry eyes. I was put on a regimen of steroids and antibiotic eye drops. Update: Today 2/19 is 1 day post dose 2 of covid19 vaccine. I made a return trip to the eye dr and my right eye is now inflamed and my left eye corneal ulcer is still unhealed despite steroid medication.

1042526	2/19/2021	CA	68	F	2/15/2021	2/15/2021	<p>Moderna COVID-19 Vaccine EUA. Monday, 2-15-21. 11:45 am. ? Received first dose of Moderna Covid-19 vaccine. 12:30 pm. ? Headache developed. 8:00 pm. ? Watching TV noted irregular heartbeat, and a minute later, increase in respiration rate. That lasted 20 minutes at the most, and then went away. Went to bed at 10 pm and slept well. Tuesday, 2-16-21. 7:00 am. ? In kitchen. Lightheaded, increased respiration, feeling like I'm going to pass out, so I quickly sit down. Two minutes later feel fine. Went about making breakfast. This happened two more times. Realizing this might be a reaction to the vaccination, went to urgent care. Doctor listened to my heart, ordered EKG and result showed that I was in atrial fibrillation (A-Fib). NO previous cardiac issues, no high blood pressure, no diabetes, never a smoker, not obese. Ambulance was called to take me to Hospital. Another EKG confirmed still in A-Fib. Blood drawn. Hooked me up to a wireless/remote heart monitor. Still in A-Fib, elevated heart rate, higher than normal blood pressure. Kept overnight in hospital awaiting more test results, continuous monitoring, and with ECG ordered for Wednesday morning and then consultation with cardiologist. Wednesday, 2-17-21. 11:45 am., ECG done. Still in A-Fib. ECG shows no signs of blood pooling or clotting. Cardiologist proposed courses of action, starting with what makes sense based on current conditions: A cardioversion. Having done thousands (his words) and given my great state of health otherwise, and very low risk for complications, a cardioversion is agreed to. That would happen immediately after first doing a Tee (transesophageal echocardiography) to look at the back of my heart. Then if all looks clear, no clotting, proceed with the cardioversion procedure. 3:00 pm., anesthesiologist asks if I have any further questions. I didn't. He sedates me. At 3:17 pm. I open my eyes, see the cardiologist standing at the foot of the gurney giving me thumbs up. I returned the thumbs up and said to him, ?good job.? Heartbeat successfully restored to normal rhythm by the cardioversion procedure. 6:00 pm. (approximately) - Discharged from hospital with prescription for Eliquis and Lopressor, and instructions for follow up appointments with primary care physician, and with cardiologist.</p>

1042606	2/19/2021	MO	72	F	2/5/2021	2/13/2021	First symptom began on 2/14/2021 with severe nerve pain in my right jaw bone. On 2/16/2021 I had a burning, painful red rash on the right side of my face side, redness, swelling, pain to the touch, Redness and pain first diagnosed by NP - Urgent Care 2/16/2021 as Shingles - prescribed prednizone and Valtrex. By 2/18/2021 redness, pain and swelling had progressed to the right eye as well and continued to have all aforementioned symptoms. I was seen by an ophthalmologist on 2/18/2021. He said it was not typical of Shingles and had no idea what it was told me to see my primary. I saw my primary that afternoon. He agreed that it was not shingles but also had no idea what was causing it. While in his office, my hands turned bright red and painful and within 30 that resolved. Prescribed a higher dose of Prednizone, Keflex and Valtrex. Symptoms are still unresolved. No fever involved.
1042644	2/19/2021	AZ	35	F	2/12/2021	2/14/2021	At 50 hours post-vaccine, nausea began; vomited at 52 hours; weakness and nausea remained for an additional 2 hours following vomiting; then for the next 6 hours, experienced chills and coldness in extremities to the point of pain; vomited again at 70 hours post-vaccine, leading to the onset of a severe, excruciating migraine; migraine lasted for 45 hours, accompanied by 14 hours of tears continuously leaking from eyes & nasal congestion; by the end of 5 days post-vaccine, all symptoms had subsided. No treatments were administered outside of ibuprofen (which seemed to have no effect) and a heating pad.

1042698	2/19/2021	CT	31	F	2/3/2021	2/13/2021	<p>-Initially I had moderate side effects to my 2nd shot, shortness of breath/increase of asthma symptoms, severe joint pain, flu-like symptoms (slight fever, chills, loss of appetite, inability to sleep) lasting for a total of 4 days. I have anaphylaxis to Walnuts (2x needed epipen and hospitalization) and asthma, many seasonal allergies, and am highly biologically sensitive (have broken out in hives several times), -8 days later I traveled to a high altitude location (Aspen, CO), and had 4 glasses of wine over a 8 hour period. For the next two days I skied for 5 hours, going up to 12,500 ft in altitude. On the first morning after arrival I started feeling badly, with symptoms including dizziness, asthma symptoms (unusual for me as it is only exercise-induced), a headache in the front of my head, and a slight redness in my left eye. As the days increase my symptoms increased to the point of inability to leave the house. After 3 days I received an IV, oxygen, that did not help. On day 4 I went to the hospital after a virtual appointment with a clinician and had chest xrays taken as Hospital (never received the results) and was put on Diamox 250MG 2x/day, this helped slightly. Day 6 I left and traveled back to CT at low altitude, my symptoms did not improve immediately and got worse (eyes became significantly more red by this point), asthma and dizziness increased). Two days after arriving home I went to two doctors who misdiagnosed me with a sinus infection, water in my middle left ear and left lung, and conjunctivitis. I was given antibiotic eyedrops that had no improvement for 36 hours. Upon receiving a 1mg cortisone shot these symptoms improved, I was also given 500MG of a Z-pack type antibiotic 1x day/4 days. I went to my PCP, doctor who was able to accurately diagnose my symptoms as an immune response to being unable to acclimatize due to my moderate immune response to the 2nd shot. My body went through significant inflammation. He treated me with Prednisone and continued my antibiotic.</p>

1261993	2/19/2021	MI	68	M	2/4/2021	2/10/2021	Ocular Issue--had vision change at 9:30am on 2/10/21, could not focus on his computer screen, esp right eye, central focus and had a right eye stabbing pain, patient has had 3 day migraines years ago with vomiting etc. On the day of hospital admission, 2-11-21 after a walk in the bright snow, then sex and a nap, patient was disoriented for 15 minutes, then it mostly resolved. But his memory was a bit off for the next 6 hours. It took him 3 tries to get his wife's name correct. Briefly he didn't know where he was and did not recognize his cat. So he went to the ER.
1261996	2/19/2021		64	F	2/12/2021	2/12/2021	Narrative: HPI: Patient is a 63 who presents for evaluation of itching eyes, feelin of nasal swelling immediately after receiving COVID-19 vaccination. Patient reports approximately 15 minutes after receiving vaccination, she started feeling as if her nostrils were swelling, her eyes were itching and her tongue "started to feel funny." Patient reports prior history of anaphylactic reactions to multiple allergens. She was given diphenhydramine 25mg IM once and transported to ER. At ER she was given diphenhydramine 50mg oral, famotidine 40mg oral, and acetaminophen 925mg oral. At ER patient reported 20 minutes after COVID vaccine her lips and tongue began to feel tingly and larger inside her mouth. She reported she has had reactions before to some immunotherapy drugs some years ago. She denied any symptoms of difficulty swallowing, wheezing, difficulty breathing, chest tightness, abdominal pain, nausea, vomiting, diarrhea, sweating, runny nose, eye itching, or any other symptoms at this time. Physical exam was unremarkable, no obvious swelling noted, no rash or hives noted, no secondary signs of allergic reaction, vitals remained stable, no hypotension or tachycardia. She was discharged home with instructions to continue taking diphenhydramine every 8 hours for 24 hours and to follow-up with primary care in 1-2 days.

1041629	2/19/2021	IL	65	F	2/16/2021	2/16/2021	1 PM I received the vaccine and withing 5 minutes had a slight pain on the left side of my head which then continued to a pain in my neck. also left side, then back pain, then slightly short of breath. I remained in the waiting area for over a half hour and felt no worse, but did report it to the young woman at the exit who said that was odd and seemed the kind of response with the second dose. I presumed it might be due to my already having antibodies. As I continued my day those symptoms quickly dispersed and I felt fine, albeit with a light soreness at the site on my left arm. At approximately 6pm I felt very fatigued and rested until 10pm, when I began to have chills, a headache and nausea. My left arm was also so sore I could not lay comfortably. I took Tylenol and aspirin both at 11:30 pm and attempted to sleep, which was fitful and disturbing. I had strange neurological events, such as odd visions in my half sleep and bizarre semi dreams but could not waken. At 4:00 AM I finally was able to pull out of this state and the last thing in my mind was a conversation with someone trying to explain what was happening to me, in my mind not vocal, that was in Italian. That is my second language. All day I had unwanted words, ideas etc. floating about in my brain. I could no longer sleep and was very weak, had terrible head and body aches and my legs also ached terribly. I was also slightly nauseous. These were all symptoms, minus the disturbing neurological one, that I had with Covid. I was too weak to leave the bed until much later in the day. I am still having effects but much less and I am at the 72 hour mark. I remained at rest all day and ran a low fever, then again a fever
1042640	2/19/2021	NV	29	F	2/18/2021	2/19/2021	Patient received vaccine 2/18/21 about 6:30pm. Patient called pharmacy at 4pm on 2/19/21 to report minor left eye swelling. Patient stated it was not itchy or sore, just noticeably swollen.

1042109	2/19/2021	OR	40	F	2/18/2021	2/19/2021	I had Hyaluronic Acid filler put in my upper cheeks in mid-November 2020. I received my 2nd dose of Moderna COVID vaccine at 11 am on 2/18. 24 hours later, I started experiencing pain in areas where filler was injected. Went to sleep and woke up 3 hours later at 2 pm on 2/19 (27 hours after 2nd vaccine received), and immediately noticed swelling in upper cheeks under eyes and firm swollen nodules where the filler had originally been placed. NOTE: This did not occur when I received my first Moderna COVID vaccine on January 21st Called injector, and was advised to take Benadryl and Allegra, and to come in for a base line blood pressure reading in case additional medications were needed.
1042176	2/19/2021	UT	49	F	2/9/2021	2/9/2021	approximately 5 minutes after the injection my upper lip went numb along with my left side of my face, primarily my upper cheek below my eye. Then it slowly moved to the top of my head and the top of my left hand. My heart was racing a bit, but that could be due to me being nervous about my face going numb. An attendant stayed with me until it started to subside, approximately 15 minutes later. Other side effects were mild the following day. A bit of a headache, fatigue and chills. Fatigue lasted a couple days but all minor.
1041711	2/19/2021	UT	43	M	2/6/2021	2/16/2021	Began to have pain around ear and behind right eye. Headaches moved to upper back of head. Felt weird on right eye. headache got worse, took ibuprofen. Next morning right side of face couldn't move or blink, then entire right side of face unable to move. Diagnosed at Urgent Care with Bell's Palsy. Started on prednisone and gabapentin. Following day, seen in the ER, had normal MRI. Started on antiviral acyclovir. Pain was still intense, given Norco. 12 days since vaccine.

1042200	2/19/2021	WA	45	F	1/8/2021	1/9/2021	Severe arm pain in the middle of the night - woke me up (the arm pain lasted at least a week); Saturday morning-nausea and headache and I took Motrin. As the day progressed, 4-6pm fever started - went to 102.8 and Motrin lowered to about 101. Very fatigued, body aches, nauseated and headache got worse. I didn't want to keep my eyes open. Fever lasted until Monday and I felt very unwell. I called Clinic Monday morning - Advice nurse - and she suggested I get a COVID test. I felt so miserable - I laid in bed for whole week. It took all my energy to get to the bathroom. I went to work on that Wednesday to deliver my rounds of meds and went back home to bed. Friday, Jan 22nd - Doctor - redness wrapped all around my arm (from the inch down from shoulder and two inches above elbow) and it was warm to the touch (it wasn't painful at that point) but it itched like mad and he ordered an anti-nausea medication for me. Arm recovered before second dose. Nausea lasted to the second dose. I was anti-nausea medication - Andanzitron - 8 mg tablets (Clinic) - to get through my days. Nausea has gotten a little better but still have to take medication from time to time. Second dose received 5th of February.

1042329	2/19/2021	FL		F		1/22/2021	<p>still her sore throat was going bad, didn't get better/sore throat had been going on for two weeks; her headaches were the same/She had a headache that didn't go away; her eyes sight, her vision sometimes was not clear/Her vision had also been affected. Sometimes she cannot see clearly; her lips looked like when had a high fever, which she hadn't and it's blue, the skin was going off/Her lips looked like she had a fever. Her lips were blue. Her lips were losing skin; her lips looked like when had a high fever, which she hadn't and it's blue, the skin was going off/Her lips looked like she had a fever. Her lips were blue. Her lips were losing skin; This is a spontaneous report from a contactable consumer (patient). A 68-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via unspecified route of administration on 22Jan2021 at single dose for COVID-19 immunization. The relevant medical history and concomitant medications were not reported. The patient stated that still her sore throat was going bad, didn't get better and her headaches were the same, her eyes sight, her vision sometimes was not clear and her lips looked like when had a high fever, which she hadn't and it's blue, the skin was going off and she didn't know. Her biggest concern was her headache and her sore throat. She called her Doctor and he said there was nothing that he can do to call for advice. She had been taking every 4 hours Tylenol and taking antiseptic for her sore throat which had helped her in numb that site and help her for like 1 hour-1 hour and a half but then it came back. She had side effects that were still active. The worst side effect was a sore throat. Her sore throat had been going on for two weeks at the time of the report. Sometimes it seemed like it was going to get better, and then it came back. Her vision had also been affected. Sometimes she cannot see clearly. She had a headache that didn't go away. Her lips looked like she had a fever. Her lips were blue. Her lips were losing skin. She had taken her temperature, and she didn't have a fever. The outcome of the events was not recovered. Information about lot/batch number has been requested.</p>

1037275	2/18/2021	IL	62	F	2/10/2021	2/10/2021	Within 1 hour of receiving 2nd vaccine, I started to get pain behind my right eye. That night, the pain turned into shooting pains on right side of head, every 3 to 45 seconds at worse. Head pain continued to Daturday, the 13th, when it stared migrating to right ear (same stabbing-type pain). By Tuesday the 16th, if further migrated to glands below my right jaw line ( same stabbing-type pain). Over last 48 hrs I have also developed scaly patches on right half of scalp. Tonight I started developing scaly rash on top of right side of face. As of now, stabbing pains continue in right side of head, right ear, and right side of throat. On Friday the 12th I also had swelling and tenderness under left arm. This has dissipated.

1039951	2/18/2021	NJ	66	F	2/11/2021	2/12/2021	Severe Headache; eye pain; earache on side of shot; itching both arms; severe jaw pain; severe chest pain; body ache; high fever; fatigue; profuse sweating; belabored breathing; hot; butterfly rash of face; This is a spontaneous report from a contactable physician (patient). A 66-year-old female (Not pregnant) patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration at right arm on 11Feb2021 14:30 at single dose for covid-19 immunization. Medical history included hypothyroidism, hypertension, hypercholesterolemia, breast cancer, osteoporosis, ligamentous RA, degenerative joint disease (DJD). The patient had known allergies to cilantro, cephalosporins, all morphine and morphine derivatives, Herceptin, astralogous mushrooms, gadolinium dye, fentanyl. The patient's concomitant medications reported as other medications in two weeks was yes. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced severe headache, eye pain, earache on side of shot, itching both arms, severe jaw pain, severe chest pain, body ache and high fever & fatigue - profuse sweating, belabored breathing hot butterfly rash of face on 12Feb2021 at time of 06:00 AM. AEs resulted in Doctor or other healthcare professional office/clinic visit, Life threatening illness (immediate risk of death from the event). The patient received Prednisone 80 mg and Benadryl 50 mg as treatment. Prior to vaccination, the patient was diagnosed with COVID-19. Covid was tested post vaccination. The patient underwent lab tests and procedures which included Nasal Swab and PCR test: negative on 09Feb2021. The outcome of events was recovering. Information on Lot/Batch has been requested.; Sender's Comments: Based on the compatible temporal association, there was a reasonable possibility that the vaccination with BNT162B2 played a contributory role in triggering the onset of the reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and

1037726	2/18/2021	WI		F	12/1/2020	12/1/2020	nerve or neurological symptoms have all occurred on the left side of my body; headache; pain over my left eye; some sensation change in my left cheek; chills; muscle aches; fatigue; mild fever; hot flashes; nausea; throwing up; trembling uncontrollably; had muscle spasm in my left leg and eye periodically; had muscle spasm in my left leg and eye periodically; nerve pain; This is a spontaneous report from a contactable other hcp, the patient. This 44-year-old female patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine) (Lot number: EK5730), first dose, intramuscularly in the left arm on an unspecified date in Dec2020 at 08:45 (at the age of 44-years-old) as a single dose for COVID-19 vaccination. Medical history included peripheral neuropathy (genetic and progressive) from an unknown date and unknown if ongoing, Charcot-Marie-Tooth disease from an unknown date and unknown if ongoing and amoxicillin allergy from an unknown date and unknown if ongoing. Concomitant medication included minerals nos, quercetin, thioctic acid, vitamins nos (EMERGEN-C) and sambucus nigra extract (SAMBUCOL). The patient previously received the flu shot via an unspecified route of administration on an unspecified date in Oct2020 as a single dose for immunization and experienced headache/ pain over left eye and some sensation change in her left cheek. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient was not pregnant at the time of vaccination. On an unspecified date in Dec2020 at 08:45, the patient experienced new nerve or neurological symptoms have all occurred on the left side of her body, which is the side she got her injection. Hours after the vaccine, she experienced a headache/ pain over her left eye and some sensation change in her left cheek. This also occurred after her Flu shot in October as well, but for the first time (has gotten Flu shot before without this response). The patient expected a headache and arm tenderness as she had been informed ahead of time. She felt functional though the rest of the day, with some chills in the evening. Day 2 was the most challenging day, with all the symptoms (mostly expected)-headache, muscle aches, fatigue, mild fever, chills, but also hot flashes, nausea, to the point of throwing up (after a long nap). The vomiting only occurred twice, and nausea

1037781	2/18/2021	MN	47	F	1/23/2021	1/23/2021	My lymph node in my neck swelled to the point it stuck out like a robin egg; sores in mouth (roof, gums, and inside lips); sores in nostril; sores on nose and lips; sores on nose and lips; Face swelled significantly on my left side; pink eye; severe headache; sinus pain; jaw main and numbness in my molars; severe shooting nerve pain in my front teeth; This is a spontaneous report from a contactable consumer (patient). A 47-year-old non-pregnant female patient received her first dose of bnt162b2 (BNT162B2 reported as PFIZER COVID-19 VACCINE; lot number: EL9262; expiration date: unknown), via an unspecified route of administration right arm on 23Jan2021 18:45 at a single dose for covid-19 immunization. Medical history included breast cancer survivor as of 11Sep2019. The patient was not diagnosed with COVID-19 prior to vaccination. Concomitant medication included venlafaxine hydrochloride (EFFEXOR), clonazepam, anastrozole (ARIMIDEX), vitamin D3, calcium, vitamins NOS (MULTIVITAMIN), "It Works" and "Fat Fighter". The patient previously took fentanyl but had allergies. The patient did not receive other vaccines within 4 weeks prior to the COVID vaccine. The patient reported that her lymph node in her neck swelled to the point it stuck out like a robin egg. It was mentioned that it was more swelled there as well and super sensitive to touch. These reactions occurred only on left side of her face, sores in mouth (roof, gums, and inside lips) and sores in nostril. She had sores on nose and lips. The patient mentioned that her face swelled significantly on her left side. She had pink eye, severe headache, sinus pain, jaw main and numbness in her molars, severe shooting nerve pain in her front teeth. The events were considered as non-serious and adverse events resulted in doctor or other healthcare professional office/clinic visit. The patient has not been tested for COVID-19 since vaccination. The events required treatment for the adverse events that included Keflex, Bactroban, prednisone, Valtrex, and lidocaine viscous-aluminum &magnesium hydrAM. The outcome of the events was recovering.

Emergency Room/ Urgent Care Visit. Prior to vaccination the patient was not diagnosed with COVID-19. The patient has not received any other vaccines within 4 weeks prior to the COVID vaccine. On 20Jan2021, the patient had Nasal Swab, PCR, covid test result was negative. The events were assessed as non-serious by the reporter, did not result in death, not life threatening, did not cause/prolonged hospitalization, not disabling/incapacitating, did not cause congenital anomaly/birth defect. The outcome of the events was not recovered.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

1037842	2/18/2021	FL	79	F	1/22/2021	1/27/2021	may have had a mini stroke; Bell's Palsy/developed facial drooping/her eye was drooping; fell; This is a spontaneous report from a contactable consumer (patient). A 79-years-old female patient received bnt162b2 (BNT162B2, Pfizer COVID-19 Vaccine; Batch/lot number: EL9262), via an unspecified route of administration injection to right upper arm on 22Jan2021 14:00 at SINGLE DOSE for covid-19 immunisation. Medical history included ongoing she was a fainter (She was a fainter, she just faints so she has a hard time getting shots. Pfizer COVID-19 Vaccine administered to her by nurse while she was in her car seat. She just asked the nurse to let her lay down in the car seat when injection was administered so that if she fainted she would not fall far; she was still getting the wash cloth on her head preparing when the Nurse had already finished administering the injection.); ongoing depressed sometimes (she was depressed sometimes, was stressed. She was the primary caregiver for her 96 year old mother. She had seen something about stress and COVID and shots and everything); ongoing Very tired (She was almost 80 years old so she was very tired often. She was the primary caregiver for her 96 year old mother. By the time she comes home at night around 21:30 she was just wiped.); Obesity (She was really overweight but she did not like the term obesity.); thyroid disorder; hypertension; Cataract and glaucoma in left eye; family history of ongoing facial paralysis (Dad had Bell's palsy that might have been 30 years ago. He died at age 87 years.); diagnosed allergies, compromised immune status, respiratory illness, genetic / chromosomal abnormalities, endocrine abnormalities (including diabetes). Concomitant medication included Levothyroxine at 100mcg taken once daily in the morning early before she eats with Start date unknown, but at least 10-15 years ago for Thyroid. Enalapril at 10mg taken once daily (Caller initially reported product name as Vasotec, but clarified it is not Vasotec, it is drop for eye cataract and glaucoma) for High blood pressure. Brimonidine with Strength unknown, 1 drop in both eyes twice daily, started maybe 1 year ago. Specified cataract and glaucoma in left eye; but drop was administered to both eyes; and left eye was eye affected by Bell's palsy for Cataract and glaucoma in left eye. The patient previously took codeine and experienced allergy with

----------	-------	-------	---------	-----	----------	------------	--------------

onset maybe about 50 years ago, she was not sure; occurred during dental procedure; had bad headaches but no lasting effects so they assumed allergy to codeine; she did not know if still has allergy but says she does if asked. The patient experienced bell's palsy/developed facial drooping/her eye was drooping on 29Jan2021 with outcome of recovering, may have had a mini stroke on an unspecified date with outcome of unknown , fell on 27Jan2021 with outcome of unknown (reported date of end of reaction was 27Jan2021), she could not blink that eye on 29Jan2021 with outcome of not recovered. Five days later she fell and developed facial drooping. HCP suggested she may have had a mini stroke causing facial drooping and the fall. She went to the ER on 29Jan2021 and the ER believed it was Bell's Palsy. She was still experiencing facial symptoms but they are improving. This consumer was administered her first dose of Pfizer COVID-19 Vaccine 22Jan2021. She reported having fell 27Jan2021. She was diagnosed with Bell's palsy in 29Jan2021 after having been seen in the emergency room. She is supposed to have the second dose/booster of Pfizer COVID-19 Vaccine on 12Feb2021. She called to ask if she should or should not still get the second dose as scheduled; and if Bell's palsy could be a reaction to the Pfizer COVID-19 Vaccine. The emergency room staff did not know how she got Bell's palsy, but knew she had the Pfizer COVID-19 Vaccine and were kind of assuming the Bell's palsy was a reaction to the vaccine. She does not have Bell's palsy bad. The emergency room staff thought at first she had a stroke before diagnosing her with Bell's palsy. On Wednesday, 27Jan2021 she had a friend named (Name withheld) who came over for tea. Patient has an oriental rug, and around 15:00 patient fell face first on oriental rug. She was just fine after the fall initially. She wonders if her having fell has anything to do with the Bell's palsy. She thinks it was the night of 27Jan2021 or 28Jan2021 when she asked her son if her face looked funny, did she look ok, because her face felt a little funny. She was looking in the mirror and her smile was looking crooked, and her eye looked like it was drooping. When she got up Friday, 29Jan2021 she could see her eye was drooping, and she could not blink that eye. She called her Ophthalmologist who saw her the afternoon of 29Jan2021 around 13:30-13:55. The Ophthalmologist said yeah something is going on with

---

that eye. Her friend called his friend who is a Pediatric Neurologist that advised her to go to the emergency room. She was seen in the emergency room of (Hospital name withheld) around 17:00 on 29Jan2021. She was not admitted to the hospital at that time; but was evaluated and treated. She Bell's palsy outcome: she is doing so much better. She still has a hard time blinking her left eye, she still cannot blink her bad eye: left eye, without also closing her good eye: right eye. She is not drooling, she can drink without drooling. Her smile is still just a little crooked. She was given 2 prescriptions in the emergency room which were Prednisone and Valtrex. On 29Jan2021 in the emergency room they did tests including testing her heart with EKG; X-ray of her heart or lungs or something; took blood tests; and continuously took her blood pressure. There were no notable or abnormal results of any of those tests. They wanted her to go see her doctor last week but she did not have a chance to do so. She has an appointment with her primary doctor on Monday coming up. She has not yet seen her primary doctor about this. History of all previous immunization with the Pfizer vaccine considered as suspect (or patient age at first and subsequent immunizations if dates of birth or immunizations are not available) was None. The event Bell's palsy require a visit to Emergency Room, no to Physician Office. The patient was not hospitalized. No Prior Vaccinations within four weeks prior to the first administration date of the suspect vaccine. The patient underwent lab tests which included her heart with EKG; X-ray of her heart or lungs or something; took blood tests; and continuously took her blood pressure, all with no notable or abnormal results of any of those tests on 29Jan2021.

1038003	2/18/2021	FL	69	F	1/28/2021	1/31/2021	redness; lumps on her head; swelling of the face/swelling on the side of her face; swelling of her eye; swelling of the back; rash/rash all over the body; itching; This is a spontaneous report from a contactable Physician. A 70-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) at the age of 69 years via unspecified route of administration in the right arm on 28Jan2021 13:00 (lot number EL6982 and expiry date unknown) at single dose for Covid-19 immunization in a facility. Medical history included drug allergic to penicillin, liver problems 17 or 18 years ago and has fully recovered from the liver problems. The patient was admitted to the hospital because her liver enzymes were high; ongoing high blood pressure, ongoing cholesterol (blood cholesterol abnormal), ongoing blood pressure (blood pressure abnormal). Concomitant medication included ongoing atenolol for blood pressure, ongoing lovastatin for cholesterol, ongoing losartan for high blood pressure, ongoing vitamin c [ascorbic acid] (VITAMIN C [ASCORBIC ACID]) for unspecified indication, aminobenzoic acid, biotin, choline bitartrate, folic acid, inositol, nicotinamide, pantothenic acid, pyridoxine hydrochloride, riboflavin, thiamine hydrochloride, vitamin b12 nos (B COMPLEX [AMINO BENZOIC ACID;BIOTIN;CHOLINE BITARTRATE;FOLIC ACID;INOSITOL;NICOTINAMIDE;PANTOTHENIC ACID;PYRIDOXINE HYDROCHLORIDE;RIBOFLAVIN;THIAMINE HYDROCHLORIDE;VITAMIN B12 NOS]) from unspecified date for unspecified indication. The patient received first dose of BNT162B2 at the age of 69 years on 07Jan2021 13:00 (lot number EL3246) in the right arm for Covid-19 immunization and had no side effects. The patient has no prior vaccinations within 4 weeks. On 31Jan2021, the patient experienced swelling of the face, swelling of her eye, swelling of the back, rash and itching. The reporter (a retired physician/husband) was calling regarding his wife who received the second dose on 28Jan2021 and on Sunday 31Jan2021 she got swelling of the face and eyes and went to the ER for 5 or 6 hours. The patient received cortisone and Benadryl and she was some improved. Today (unspecified date) she was still getting more swelling of the face and redness. The reporter clarified that the patient received the second

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

dose on 28Jan2021 at 13:00 in the right arm. The patient noticed 31Jan2021 in the evening swelling of her face, swelling on the side of her face, swelling of the eyes and swelling on her back, also some lumps on her head. The patient was a little improved at the ER, but today there was more rash all over the body and itching and it was getting worse. The reporter added that the rash appears on one side and then disappears and went to another part of the body. The patient underwent lab tests and procedures which included lab tests: normal on unspecified date, neck x-ray: showed no significant, it was normal except for degeneration of C5-C6 on unspecified date. The patient received treatment with the events swelling of the face/swelling on the side of her face, swelling of her eye, swelling of the back, rash/rash all over the body, itching, lumps on her head. The outcome of the events was not recovered. The events swelling of the face/swelling on the side of her face, swelling of her eye, swelling of the back, rash/rash all over the body, itching was reported medically significant.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of all reported events cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1038181	2/18/2021	MD	72	F	2/14/2021	2/14/2021	Vaccinated at public Health clinic " drive through" .Within the 1st 5 minutes of getting the dose she noticed her face became very red she said almost beet red although she says she did not feel flushed, nauseous or hot but she saw the red in the mirror. She really felt perfectly fine she had no tachycardia, anxiety, nausea, itching, tingling of the mouth throat or tongue. In fact because she was asymptomatic except for the visual appearance she chose to not call over the attendants to check on her. After the 15 minutes she just drove home and by the time she got home her face was normal she has had no other symptoms since.
1038209	2/18/2021	CT	70	M	2/16/2021	2/16/2021	when i first got the shot i could feel a difference in my body immediately. i started hurt on my left side of my throat, then started getting puffy face and eyes. was given some Benadryl pulse 45 blood pressure 90/54 and did an EKG , then medic didn't like what he was seeing and called 911 . Medic gave him an epi pen because his throat started swelling. Went to the hospital where he was there for 5 hrs.
1038219	2/18/2021	NY	85	M	2/12/2021	2/12/2021	ound patient in sitting position in elevator s/p 2nd dose of vaccine. Patient awake, opening eyes, mumbling, incoherent speech, noted to be pale. As per patient's wife, "He felt dizzy and used walker to assist himself into a sitting position on elevator floor. He did not hit his head, I do not think he lost consciousness. He waited in the waiting room for more than 15 minutes and drank 2 cups of juice before we left." No obvious injuries noted. Palpated weak, thready pulse. Patient tachypneic w/ shallow respirations. Called for assistance. Vital signs: B/P 98/34, HR 121, RR 23, unappreciated O2 sat. Fingers cool to touch. FS = 139. Attempted to re-orient patient, given small sip of apple juice. 911 activated. Patient transported to ER with wife. Noted patient to be more alert, responsive with clearer speech upon arrival to ER. After monitored in the ER, the patient was cleared for discharge.
1038283	2/18/2021	NJ	71	M	2/16/2021	2/16/2021	Lost consciousness. Fell to the floor. Was disoriented and not aware of time or place. He cut his forehead over his right eye. Brought to ER. They performed ct scan, EKG and blood work. All came back normal. Received 20 stitches to forehead.

1040201	2/18/2021	ID	48	F	1/5/2021	1/6/2021	By 8 am, I recognized I realized I felt different - headache and foggy and tired. By 12 pm my headache became really severe - even when walking or chewing. My face was really hurting me; very tender by left eye. I felt so tired. I had to go home from work at 2:30. Felt very cold and I put on really warm clothes and got under three 3 blankets and I slept for three hours. I felt better by that evening, I slept normally that night. Face was very swollen under my eyes - two days after vaccine. (I have filler under my eyes - it's been a year since I had that put in.) Benadryl every six hours. It took 12 hours for pain to go away and for it to decrease. But it did help. Everything resolved.
1040206	2/18/2021	CA	37	F	1/6/2021	1/6/2021	About 5-10 min later I started getting tingling sensation on my lips and tongue. After 15, my lips got numb, along with my jaw. The numbness was only on my left side and went from my jaw to my eye. I also had a headache as well. I also felt like something was stuck in my throat, but not like I couldn't get air. Those symptoms lasted about 2-3 hours. When I got home, about an hour after I got the vaccine, I ended up breaking out on torso. I took Benadryl and went to sleep. The next morning, I was itchy and breaking out in hives in torso area. I took Benadryl again and the numbness and itchiness improved, but I had a headache for like 8 days. On the 6th day, I had really bad body aches and my headache was extreme. Per on call allergist, I wasn't allowed to get 2nd dose based on CDC guidelines.

1040344	2/18/2021	MI	42	M	2/3/2021	2/4/2021	I received my first Covid-19 Moderna injection and felt slightly groggy and tired as the day progressed. Just before bed I noticed my arm was quite sore and I still felt tired and slightly light headed. The next day (Feb 4) I had a very sore left arm at the injection site but felt good otherwise. I came home from work and took one 200mg Ibuprofen as my arm was still quite sore. The following day (Feb 5) my arm pain subsided but I still felt light headed during the evening. I am writing this on Feb. 18th and each day I have bouts of being light headed and have difficulty concentrating. There is no real pattern to what time of day I get the symptoms. I do not have the classic headache but definitely feel pressure in my head and behind my eyes. I also find that I wake up after a full nights sleep and feel not well rested. I spoke with my doctor last week and he suggested I give it until this week to see where things are at. I plan on contacting him soon to schedule an appointment to discuss my symptoms more. Before getting the vaccine I did not have any of these symptoms as I describe.

1039063	2/18/2021	CA	57	F	1/17/2021	1/18/2021	At 3:00 AM on 1/18/21 she was awoken from sleep with shoulder pain, hip girdle pain, long bones of the thighs, could not raise arms above head, neuropathy of the palms, pain in wrist, tingling, numbness, stiffness of wrists, stiff fingers, hurt to bend fingers with pulsing capillaries. Started more centrally then extended down to extremities, did have some pain in ankles, neuropathy to the feet. Much worsening of the mucosal dryness of her eyes, mouth, lips, throat to the point that she was hoarse, and also her vaginal mucosa started to dry up as well. She took Acetaminophen, etc. She then was given some narcotics, which did not help the pain symptoms either. Her doctor had no answers, and did not prescribe her anything. Her eyes and throat dryness has waned somewhat. She is still having pain in her shoulder girdle. Does have the neuropathy pain, still hard to bend fingers. She had a very severe reaction this past weekend where she could not eat from Saturday to Wednesday due to nausea. She did get an order for Zofran on Monday, 2/15/21. She is still taking the Acetaminophen and Naprosyn, not taking the Norco due to constipation. Started taking her Synthroid again, but low dose. She is an RN and not able to work due to this condition. She also become leukopenic, her WBC's were lower than normal at 2.9, and her neutrophils dropped to a suboptimal level as well. She is now immunocompromised, and another reason for her not going to work as she works in an overflow unit for COVID patient's.
1040257	2/18/2021	IL	28	M	2/18/2021	2/18/2021	About one minute after the vaccine was given, he got pale, diaphoretic, blurred vision, difficulty speaking for about one minute. Ice pack applied to his neck. He stated that he felt a bit shaky and sweaty for another 5 minutes, at which point he started feeling "normal". We watched him for another 30 min, with no further symptoms.
1039383	2/18/2021	MO	49	U	1/27/2021	1/29/2021	Blurry/decreased right eye vision. Admitted for steroid infusion in Hospital from 2/12/21 - 2/13/21 then dismissed to home

1039099	2/18/2021	IL	72	F	2/8/2021	2/16/2021	Starting 2/16/20 eye lids upper and lower began to swell, with redness and itching. Swelling continued to increase to the point of going for a doctor visit on 2/18. Diagnosis a possible reaction to vaccine. Prescribed: Antibiotic oral, eye ointment, and medrol dose pack ordered.
1040261	2/18/2021	AZ	66	F	2/11/2021	2/16/2021	Broke out in severe rash on 5th day after vaccination. Swollen lips, ears, upper eye lids, under both arms, under breasts and upper thighs. Terribly itchy. Rash was raised like welts. Got worse the next day and included scalp, neck, hands, forearms and knees. Called my family medicine doc and he called in a script for MethylPredisone. Took the first 3 pills after lunch as recommended by pharmacist. Slept through the night and noticed the rash was not as angry looking. I have continued on my second day doses. Have noticed the itch coming back starting around 4:15 pm today. Have 3 more doses to take today.
1040037	2/18/2021	MN	66	F	1/28/2021	1/28/2021	I started experiencing spasms in the right side of my face. I had a weird feeling in my veins that went up and down my arms and by Saturday it was up in my head. this lasted for 4 hours. I had a bright white light in my right eye that was like a burst of light every time I blink. I went to the eye doctor on 2/5 and they gave me an eye dilation drop and he said that when the lining of the eyeball pulls away from the eyeball it catches the light coming into the eye and reflects down into the eye very bright. I started swelling and had a red rash on my neck, back of my neck, jaw, arms and kegs and belly. it started itching and had raised dots. about 12 dots on each limb/surface. I took Claritin and Famotidine. I woke up with more itching and a cold wave over my body. I took more Claritin and famotidine. My arms, legs, belly, and back started itching again. I had chills. The skin on my arm was hard in spots. I took half a Benadryl on Monday the 8th at 5 am. at 8am I was still itching. it died down but then flared up again and I took Zyrtec at 8pm. Tuesday the 9th I woke at 5am with more itching. I ate food and had more itching. Wednesday I had pain in my jam and my tmj flared up and I had pain in my molar but the Dentist said there was nothing wrong with my tooth. On 2/9 I had a blood draw and everything was normal. the only thing not normal was the carbon dioxide in my system. On 2/16 I was still feeling weird.

1039145	2/18/2021	CT	68	F	2/13/2021	2/17/2021	4 days after I was walking into my office and I got very dizzy, room was spinning, then my vision blurred. The whole event lasted a few minutes. I went to the ER they ran a bunch of tests and couldn't find a reason for the event. Not sure if it was the vaccination or something else.
1039173	2/18/2021		77	F	1/28/2021	2/2/2021	Red, bull's eye rash that grew over time, swollen and lumpy arm, hot and itchy. Lasted about 10 days.
1039178	2/18/2021	MI	78	F	2/11/2021	2/11/2021	My Mom had an allergic reaction four hours after receiving her first dose of the Pfizer Covid 19 vaccine. Her face swelled up and became red....worse on the right side than the left...her eyes were swollen as well. It lasted this way for four days....it is a little better now, but her face is still a little swollen (seven days after shot). She had a headache on and off and felt tired (which we understand is not an allergic reaction, but rather an immune response). Her family physician suggested taking antihistamines before her second shot. Needless to say, we are apprehensive about what the outcome from the second shot will be like for her.
1039137	2/18/2021	OH	70	F	2/4/2021	2/4/2021	About 2 hours after Covid vaccine injection in left arm I felt a twitching on Left side of my face which travelled to my Left eyebrow. About one day later the twitching involved the left eyebrow and left side of eye. After two weeks (today February 18, 2021) twitching is now on left eyelid.. No other symptoms.
1039312	2/18/2021		57	F	2/18/2021	2/18/2021	Lips puffy, puffy above eye and puffy at throat
1039388	2/18/2021	NY	88	F	2/8/2021	2/9/2021	She said that it looks like she is looking through water. She has a retinal bleed. She is going tomorrow 2/19/21 for a shot in the eye to stop the bleeding. The outcome is pending.

1039499	2/18/2021	IL	76	F	2/15/2021	2/16/2021	The first night after the vaccine had a headache and woke up with pain near her mouth. The 2nd night, Tuesday, 2/16/21 it got bad, woke up around the same time early morning, had pain on the right quadrant of her upper body, from her ear, eye, throat and down to right under her throat. When she swallows the pain is very severe with difficulty swallowing and that pain radiates to the upper part of her chest. Then on the third night, last night, all the same pain but the headache had disappeared. Today, 2/18/21 she is still having the same symptoms. The hardest thing to deal with is the ear pain in the right ear, and the pain under her right throat area. She has taken one Benadryl at 8:00 AM, and will take another at 8:00 PM. The Benadryl triggers her tinnitus so is limited with that. Her daughter is trying to find OTC medicine for the ear. She has not called her doctor as they are trying to treat it with OTC medicines. For additional information call her daughter: who takes care of all her medical information.
1039538	2/18/2021	WA	66	F	2/6/2021	2/6/2021	per patient report: "103.5 fever with heart rate of 100-120s. Farmer's Lung activated with profound coughing. O2 sats went transiently low to 85 but mostly 91-92%. Became very unsteady on feet, requiring support of walls, furnishings and counters. Horrible chiari headache with bad nausea Neuropathy in BLE flared, legs were buzzing and I was getting intense spasms of bilateral feet and ankles that made it hard to use them. Visual decline Passed out twice cold in the bathroom [found myself in bathroom, when "I came to"] In bed for 3 days except to use the restroom and make tea. Could not attend to any other ADLs. Injection site red from shoulder to elbow, swollen and itchy with axillary lymph swelling". Symptoms

1039950	2/18/2021	MI	59	F	1/11/2021	1/28/2021	<p>Bell's Palsy; Occipital Neuralgia; Stroke; Fever 101 degree; Myalgia; Headache/severe cephalgia; Blurred vision; dizziness; neuropathic pain; This is a spontaneous report from a contactable Physician (patient). A 59-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Lot number ER9831, Intramuscular in left arm on 11Jan2021 08:20 at single dose for COVID prevention. Medical history included Asthma Moderate persistent on 20Jun2020. Concomitant medication was not reported. The patient previously received first dose of BNT162B2 on 23Dec2020 and experienced Aches, Fever 102 degree, myalgia, and headache. The patient experienced 101 degree, myalgia, Headache after the second dose of BNT162B2. The patient experienced Bell's palsy and occipital neuralgia on 28Jan2021 10:00 which resulted in stroke woke up and will lead to time off work and further imaging of cervical spine and possible nerve blocks. She had blurred vision and dizziness in addition to severe cephalgia and neuropathic pain. Treated with Aleve, steroids, Acyclovir + neurontin. Duration unknown as still with symptoms. The events Bell's palsy and occipital neuralgia resulted in Emergency room visit. Lab data included CT head with illegible Head Contrast, CT Angiogram head and MRI Head on 27Jan2021 with Result: NI. The outcome of Bell's palsy was Resolved with Sequel. The outcome of the event Stroke was unknown. The outcome of Fever 101 degree, Myalgia was resolved. The outcome of other events was not resolved.; Sender's Comments: The causal relationship between BNT162B2 and the reported events cannot be completely excluded based on temporal association. The information currently available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. 1039942	2/18/2021	VA	36	F	1/15/2021	1/21/2021	Fainting like episodes; Blurred vision; Severe vertigo; Chest pain; Fatigue; This is a spontaneous report from a contactable other health professional reported for herself. A 36-year-old female patient received first dose BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE) Lot # EL8982, via an unspecified route of administration in right arm on 15Jan2021 12:00 at single dose for covid-19 immunisation. There were no relevant medical history or concomitant medications. The patient was not pregnant at the time of vaccination.The patient had no allergies to medications, food, or other products.The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine.On 21Jan2021, exactly "4 1/2 days" after vaccine the patient experienced fainting like episodes, blurred vision, severe vertigo, chest pain, fatigue. The patient has been out of work since the 20th and she still had blurred vision. The adverse event resulted in Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. No treatment was received. The patient was not recovered from the events. She has been to the ER, cardiologist for an echography, ultrasonography of thyroids, Magnetic resonance imaging (MRI) of her head, went to ENT dr and neurologist in 2021. All blood work in 2021 came back normal as well. The reporter considered the event as non-serious. The patient was not diagnosed with COVID-19 prior to vaccination. She had negative Nasal Swab Covid test post vaccination on 22Jan2021.; Sender's Comments: Considering the temporal association, a causal association between administration of BNT162B2 and the onset of fainting like episodes cannot be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1039902	2/18/2021			F			feeling flushed and faint; her blood pressure went up as well as her heart rate; her blood pressure went up as well as her heart rate; brain fog; slurring her words; lethargy/lethargic for 2-3 hours; hands were so cold it was like they were stuck in a snow bank and wasn't able to get them warm; feeling flushed and faint; This is a spontaneous report from a contactable consumer. A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on unspecified date as a SINGLE DOSE for COVID-19 vaccination. The patient's medical history and concomitant medications were not reported. The consumer reported her daughter had a bad reaction and is concerned about getting the second dose since it is said people could have more severe reactions. The patient's heart rate was up, blood pressure was up, feeling flushed and faint. Since her daughter works at the hospital and was next to the emergency room they kept an eye on her and everything. When she was okay to go back to her department she had brain fog, lethargy/lethargic for 2-3 hours, and slurring of her words and that lasted 2-3 more hours. A few days later her hands were so cold it was like they were stuck in a snow bank and she wasn't able to get them warm. Not sure if that was a late reaction since it has never happened before. The patient underwent lab tests and procedures which included blood pressure: blood pressure was up on unknown date, heart rate: heart rate was up on unknown date. Outcome of the feeling flushed and faint, her blood pressure went up as well as her heart rate, brain fog, slurring her words, lethargy/lethargic for 2-3 hours were unknown. Information on the lot/batch number has been requested.

1039896	2/18/2021	MI	29	F	12/30/2020	1/7/2021	<p>hemifacial spasms on the right side of face; weird sound in the ear; pulsating in the neck; This is a spontaneous report from a contactable other healthcare professional reported for herself. A 29-year-old female non-pregnant patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) intramuscular at the left arm on 30Dec2020 10:00 (lot number and expiry date unknown) at single dose for Covid-19 immunization in a workplace clinic. Medical history included hidradenitis suppurativa. The patient was not diagnosed with COVID-19 prior to vaccination. Concomitant medication included unspecified other medication. The patient received first dose of hepatitis vaccine in the left arm on 15Dec2020 (29 years old) for immunization which was within 4 weeks prior to the COVID vaccine. On 07Jan2021 07:15, the patient experienced hemifacial spasms on the right side of face. The right side of face tightens to the point her eye closes, mouth pulls up and cheeks pulls up as well along with a weird sound in the ear and pulsating in the neck. The events resulted in doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care. The patient underwent lab tests and procedures which included CT scan: unknown results in Jan2021. The patient has not been tested for COVID-19 since the vaccination. The patient received treatment of muscle relaxer, medrol dose pack. The outcome of the events was not recovered. The reporter considered the events serious as disabling/incapacitating but did not results in death, not life threatening, did not cause/prolong hospitalization, no congenital anomaly/birth defect. Follow-up activities are possible, information on the batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the hemifacial spasms and other reported events due to temporal relationship. Additional information is needed to better assess the case, including complete medical history, diagnostics including results of Head CT scan, EMG and chemistry panel, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures</p>

1035814	2/17/2021	AR	49	F	1/6/2021	1/7/2021	About 3am the next morning I woke up to a loud ringing in both my ear. When I sat up I was very very dizzy. I got up and showered and my feet swelled very bad. I did not feel well but I went to work but the feelings never got better. So on 1/10 Sunday I went to the medical center because I jjust didnt not feel well. The swelling in the lower legs was still there so I was prescribed 20 mg of presnisone for 5 days. The sound changed during the time of the antibiotics but after I stopped taking the prednisone the ringing sound came back, my left foot is still numb and my eyes are constantly red and burning even after putting drops in my eyes, I still suffer from headaches and if I turn my head too far left or right I get dizzy still to date. On 1/14 I was given a 60 mg dose of tapered predinosone for 2 week to help elevate the symptoms but it did not work. On 2/12 I saw an ENT specialist who performed a hearing test which did produce minor hearing loss and was diagnosed with having Tinnitus.

1035955	2/17/2021	CA	56	F	2/5/2021	2/6/2021	~~I am reporting a reaction to my second Moderna vaccine given on 02/05/2021 around 10 AM . Initial headache/nausea/tiredness started on 02/06/2021 and lasted for 3 days. Missed work on 02/08/2021 due to nausea/HA /tiredness. Slight Headache alone for another 4 days- through 02/12/2021. On Saturday (02/13/2021) I started feeling a bit ?off?. I was having trouble remembering things and just in general feeling slow and not right. My husband was concerned, and I was frustrated. He was checking me for TIA symptoms. Sunday I had a mild HA ( 3-4 pain scale) but it did not bother me too much. Monday 02/15/2021 I would not have been able to work if I was scheduled- nausea/HA (level 8) with visual migraine aura. I had to go to bed. I slept for 5 hours. Again today 02/16/2021. I am leaving work early because I have nausea/HA (level 8) with pressure and having trouble focusing. Feels a lot like the migraines I had 20 plus years ago. Please let me know if you have any additional questions.~~

1036091	2/17/2021	CA	61	M	2/15/2021	2/15/2021	Fever, chills, & dizziness. Blurry vision, aches/pains and shortness of breath.
1036092	2/17/2021	AZ	54	M	1/30/2021	2/1/2021	I started feeling sinus pressure behind my eyes. a few days later I started experiencing vision loss in my left eye. Ophthalmologist diagnosed me with optic neuritis. auto immune disease which causes pain and vision loss in the eye. it is inflammation of the optic nerve.
1036116	2/17/2021	IN	62	M	2/11/2021	2/14/2021	He received the vaccine on Thursday. The left nostril started running, then his eye started getting vision issues on Saturday. He went to sleep and thought it would be better. On Sunday morning he could not stand the sunlight at all, and pain on top of the eye. He went to the ER and they called the eye doctor in. He didn't know what was going on, had blood work done. He told him to FU with his doctor. Gave him eye drops, Ibuprofen and eye cream to go into the eye. He is feeling better today, but when the light hits it a certain way the pain is bad, but it clears. In the morning he has to get used to the sunlight. His eye is red. He is to FU with his PCP.

1036192	2/17/2021	CA	58	F	1/14/2021	1/14/2021	That evening a mild tremor began in my left calf. It progresses to my entire left leg, left hand. My left hand began to curl up, the tremor continued to increase. Although I have full ROM in the hands at rest the fingers are curled and my index finger points outward. The worsening occurred each day. I had electric type pain in the left foot. The previous double vision worsened in the left side. The symptoms then spread to the right side. My balance worsened. I had an MRI of the brain and neck, contrast and non-contrast approximately a week after symptoms began. I went to the ER as the symptoms worsened. My left leg was dragging, I had trouble walking. IV toradol decreased symptoms. I was given Motrin at home with no result, then another anti-inflammatory, then a steroid, all with no results. I had several blood panels. After a month of symptoms we did another brain MRI and full spine MRI's all negative. We did extensive blood work for autoimmune, inflammatory and eight or so other items such as Lyme, Syphilis, arsenic and I'm not sure what else. The neuro exam showed normal reflexes and strength. He did some nerve conduction tests. The right calf was normal. He couldn't assess the left because of the tremor. I feel my legs will 'give out' and feel weak when performing activities and was told it's from the tremor. I have cramps and spasms in the left foot and lateral calf. My balance is much worse, I fell over today while walking. These are all symptoms that are similar to the brain tumor in that it mostly affected the left side, but they are much, much worse. The deficits I had from the tumor in 2008 have been completely stable. A year or so after the surgery stress could increase the double vision or balance but not since 2009.
1036266	2/17/2021	MN	72	F	2/12/2021	2/13/2021	I can not walk a straight line. My balance is off. Body movement is OK, But I can not turn my head or move my eyes fast without going off balance. It feels like I am on a ship in a storm and need to hold on to the side.

1035747	2/17/2021	SC	27	F	2/15/2021	2/15/2021	9 hours after, experienced extreme headache, pressure on my eyes 12 hours later, extreme chills and body aches, headache 24 hours later chills, aches, and headache 48 hours later, swollen several lymph nodes in left neck
1036269	2/17/2021	OH	74	F	2/5/2021	2/5/2021	5-10 minutes after I received the vaccine I had a headache. At first it wasn't bad, however, that afternoon it worsened and did not improve with Tylenol or Advil. The next day was worse than the first because the headache became very bad and I was unable to do anything besides rest on the sofa. The following day I felt somewhat better but the headache persisted along with eye irritation, burning, and pain. That continued for 2 more days. My headache worsened on Tuesday, February 16. I awoke with a pounding headache in the back of my head. It caused me to become nauseous for several hours which improved by the afternoon. I've never had a migraine but think that's what this was. I rested the entire day. Today, Wednesday, February 17, I awoke with a mild headache which worsened during the day. Along with this my eyes ached and I noticed reading words and numbers was difficult because they were blurry. I decided to hold off on taking any pain medication to see whether or not the headache would calm down and it hasn't; it tends to move around my head during the day. Hopefully, the Tylenol will help today.
1035538	2/17/2021	GA	64	F	1/28/2021		the reaction is inflammation to her retina; dose given 11Jan2021, and second dose LOT: EK9231 for dose given on 28Jan; This is a spontaneous report from a contactable consumer. A 64-years-old female patient received 2nd dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot: EK9231), via an unspecified route of administration on 28Jan2021 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. Historical vaccine included 1st dose of BNT162B2 (lot: EH9899) received on 11Jan2021 for COVID-19 immunisation. Patient went to her ophthalmologist and they examined her eye. The ophthalmologist said that the reaction was inflammation to her retina. Outcome of the event was unknown.

1035559	2/17/2021	NC	81	M	1/18/2021	1/19/2021	Stroke; like he had a film over his eye, it was cloudy, like a cloudy day; This is a spontaneous report from a contactable consumer (patient). A 81-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number: EL1283 and expiry date: 30Apr2021) solution for injection, intramuscular in left arm on 18Jan2021 13:10 at a single dose for Covid-19 immunization. Medical history included chicken pox, measles, and mumps (had chicken pox vaccine, measles, and mumps when he was younger, and he got the flu shot for flu). The patient's concomitant medications were not reported. The next day (19Jan2021) after receiving the injection, patient reported it was like he had a film over his eye, it was cloudy, like a cloudy day. This went on for a couple of days before it improved. There was still a little bit in his left eye, but he can read and it has improved. He can see now and his eyes were improving. He found out that he had a stroke on 28Jan2021. He did not go to the hospital. He does not think the stroke affected anything else. He was supposed to have an MRI sometime this week. He went to the eye doctor and the eye doctor was the one that discovered the stroke and his eye doctor sent the report over to his primary office. He had a vision field test which was how the stroke was diagnosed. He was taking a baby aspirin and he will be put on a blood thinner called Plavix. He has not started Plavix yet, he has to go pick it up. Outcome of the event stroke was unknown while the other events was recovering. No follow-up activities are needed. No further information is expected.
1034599	2/17/2021	HI	60	F	1/18/2021	1/19/2021	Extreme fatigue, nausea, chills, headache, dizziness 18-20 hours after receiving the 2nd vaccine for about 10-12 hours, then lessening to feeling tired, bouts of vertigo and occasional headache. Five days later on 1/25 I experienced blurry vision, nausea, confusion, dizziness, and impaired speech (to a co-worker). This lasted about an hour.

1036362	2/17/2021	NC	68	F	1/21/2021	1/1/2021	Rash on the injection arm; Retinal bleeding present in the left eye; A spontaneous report was received from a consumer, concerning herself, a 68 years-old female patient, who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced retinal bleeding present in the left eye and rash on the injection arm. The patient's medical history was not provided. Concomitant medications reported included simvastatin. On 21 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (lot # 032L20A), intramuscularly for prophylaxis of COVID-19 infection. On 21 Jan 2021, following the vaccination, the patient experienced a rash on the injection arm that had lasted for about a week. Additionally, the patient went for a routine eye exam on an unknown date in Jan 2021 and it was determined that there was retinal bleeding present in the left eye. The rash had subsided at the time of the report, but the retinal bleeding remained the same. Action taken with mRNA-1273 was unknown. The event rash on the injection arm was considered resolved on an unspecified date in Jan 2021. The event retinal bleeding present in the left eye was considered not resolved at the time of this report.; Reporter's Comments: Very limited information regarding these events of unlisted serious event of retinal hemorrhage and non-serious listed event of injection site rash has been provided at this time. No further information is expected.

1034980	2/17/2021			M			Hallucinations; A spontaneous report was received from a consumer concerning 72-year-old male. The patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced hallucinations, seeing ghost. The patient's medical history was not provided. Concomitant product use was not provided. Prior to the onset of symptoms, on an known date, the patient received the first of two planned doses of mRNA-1273 (Batch number not provided), for prophylaxis of Covid-19 infection. On 01 Feb 2021 the patient left a voicemail message to Safety stating that he began having, "what I guess you would call hallucinations" after receiving his first dose of Covid -19 vaccination. He further stated, " I've seen ghosts". "I've never seen ghosts in my life before". The patient then went on to ponder whether the event was vaccine related or possibly related to the fact that he experienced a problem in his eye some years ago that caused him to "see weird things". No treatment or other relevant information was provided. Action taken with mRNA-1273 in response to the event was not provided. The outcome of the event hallucinations was unknown at the time of the report.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Further information has been requested.

1034988	2/17/2021	LA	76	F	1/29/2021	1/29/2021	<p>she hasn't been eating like she should; lost eye sight for 5 minutes, everything was grey; could hear her niece, but that her niece sounded far away; very nauseated/wanted to throw up but couldn't; This is a spontaneous report from a contactable consumer, reporting for herself. A 76-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EL9265), via an unspecified route of administration at the left arm on 29Jan2021 14:00 at a single dose to prevent getting COVID-19. Medical history included cholesterol, high blood pressure, arthritis, medications for her heart, and medication for her stomach. Concomitant medication included amlodipine for high blood pressure and atorvastatin for cholesterol. The patient has been on amlodipine in a good while, 7-8 years and atorvastatin for 5 years. The patient had the COVID shot on Friday, 29Jan2021 at 14:00, and about 4 hours afterward, she had a bad experience. She became very nauseated and lost her sight for 5 minutes. Everything was grey. She was wondering if there is anything she can take afterward. She was scheduled for her next one on 19Feb2021. She was wondering if she will experience the same thing. She has lost about 11 pounds because she has been on a diet. She gave up sugar. After getting the vaccine, she was on her way back. She began to feel very nauseated in the car. Then, all the sudden she wanted to throw up, but couldn't. She couldn't hear her niece or say anything to her. She clarified she could hear her niece, but that her niece sounded far away. She couldn't respond. She rolled the window down to get air in her face. She hadn't eaten. In about 25-30 minutes got better. Since then, she hasn't been eating like she should, so she was still a little nauseated. It has improved though. She got the vaccine in her left arm. Her right arm is mostly metal. She decided to get it because she is over 70 and wanted to prevent getting COVID-19. It was also reported that she was also on an arthritis medication, medications for her heart and a medication for her stomach. She has had no problems with those medications though. The patient underwent lab tests and procedures which included weight: lost on an unspecified date. She has lost about 11 pounds because she has been on a diet. She gave up sugar. The outcome of the events "lost eye sight for 5 minutes, everything was grey", "could hear her niece, but</p>

1035001	2/17/2021	MI	40	F	2/1/2021	2/1/2021	<p>mild case of Bell's Palsy.; skin of the patient's jaw and chin started to feel numb/numbness of her cheeks, eyebrows, and ears; headache; This is a spontaneous report from a contactable consumer (patient). This 40-year-old female patient received the 2nd dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3248, expiration date: Apr2021) via intramuscular in the upper left arm on 01Feb2021 at 04:30 PM at single dose for COVID-19 immunization. Medical history included asthma (exercise induced) and menstruating. Concomitant medications included Ibuprofen because she was menstruating. No other vaccine in four weeks. The patient previously received the 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3248, expiration date: Apr2021) via intramuscular in the upper right arm on 11Jan2021 at 04:30 PM at single dose for COVID-19 immunization. The patient was not pregnant. The skin of the patient's jaw and chin started to feel numb about 20 minutes after receiving the vaccine, headache came and went rapidly on 01Feb2021 17: 00. The sensation progressed rapidly to include numbness of her cheeks, eyebrows, and ears. The symptoms appeared rapidly after leaving the clinic as the patient was driving away on her from work. Both sides of her face were impacted equally. She went to an urgent care facility to be evaluated. An Urgent Care Physician's Assistant evaluated the patient. They looked inside her throat to see if it was closing up (it wasn't). They used a swab to test her sensory ability on her face by pressing with either the fuzzy-side or the blunt (wooden) side. When the patient asked the PA how she did, she indicated that she failed the test. They gave her Benadryl. At home, the patient went to bed, woke up normally, and did a "frown test" in front of the mirror. Her left side of face wasn't working the same way as the right side. She may have a mild case of Bell's Palsy in the morning of 02Feb2021. The patient had no covid prior vaccination, no covid tested post vaccination. Benadryl was received as treatment for the events. Outcome of the event "skin of the patient's jaw and chin started to feel numb/numbness of her cheeks, eyebrows, and ears" and "mild case of Bell's Palsy" was recovering, of the event "headache" was recovered.</p>

soft, nondistended, nontender to palpation, no rebound tenderness, no guarding or rigidity. GU: deferred. Musculoskeletal; no deformity. Neuro: alert, moves all extremities, follows commands. Skin: warm, dry, bilateral arms are normal in appearance, no hives, No rash. Patient has several scattered Hives on her back. Lab Results: No results found for this or any previous visit (from the past 24 hour(s)). Nurse ordered the above labs and reviewed the results. Radiology: No Radiology Exams Resulted Within Past 24 Hours. Nurse ordered the above noted radiological studies. Nurse reviewed the images and results. Nurse agree with the radiologist interpretation. Procedures: Medications - No data to display. PROGRESS DATA. A complete history and physical exam have been performed. All available laboratory and imaging results have been reviewed by nurseself prior to disposition. After the initial H&P, Nurse discussed pertinent information from history and physical exam with patient/family. Discussed differential diagnosis. Discussed plan for ED evaluation/work up treatment. All questions answered. Patient/family is agreeable with plan. ED Course: Patient complaining of allergic reaction, hives seems to be resolving, no symptoms consistent with anaphylaxis. Symptoms seem to be improving after oral Benadryl, no further medication at this time, will monitor closely. Patient reassessed, reports rash has resolved, itchiness has resolved. Patient continues to deny any swelling of lips tongue or throat, no difficulty breathing, no nausea or vomiting. Discussed at length with the patient that Nurse do not advise her to get the second dose of the vaccination as it can cause repeat allergic reaction, possibly worse allergic reaction. Discussed possibility of obtaining the mother no vaccine once it becomes available. Patient understands. Discussed need for close follow- up with primary care physician, Extensive discussion return precautions. Discharging. The patient was reexamined. They have had symptomatic improvement during their ED stay. nurse discussed today's findings with the patient, explaining the pertinent positives and negatives from today's visit, and the plan of used plan for discharge as there is care. No emergent indication for admission. Discussed limitation of the ED work-up and that this is to rule out life-threatening emergencies but that they could require further testing as determined by their primary

care and or any referred specialist patient is agreeable and understands need for follow-up and repeat exam/testing. Patient is aware that discharge does not mean there is nothing wrong. Indicates no emergency is present, and that they must continue their care with their primary care physician and/or any referred specialist. They were given appropriate follow-up with their primary care physician and/or specialist. nurse had an extensive discussion on the expected clinical course and return precautions. Patient understands to return to the emergency department for continuation, worsening, or new symptoms. Nurse answered any of the patient's questions. Patient was discharged home in a stable condition. As of 14:11 EST Vitals: BP - 144/86, HR -79, Temp - 97.6 OF (36.4 Tympanic) O2 SATS - 96%. DISPOSITION: DISCHARGE: Patient discharged in stable condition. Reviewed implications of results, diagnosis, meds, responsibility to follow up, warning signs and symptoms of possible worsening, potential complications and reasons to return to ER. Patient/Family voiced understanding of above instructions. Discussed plan for discharge, as there is no emergent indication for admission. Patient referred to primary care provider for BP management due to today' BP. Pt/family is agreeable and understands need for follow up and repeat testing. Pt is aware that discharge does not mean that nothing is wrong but it indicates no emergency is present that requires admission and they must continue care with follow-up as given below or physician of their choice. 1035741	2/17/2021	VI	78	F	2/10/2021	2/10/2021	Patient reports being in her usual state of good health when she presented for COVID19 Vaccination. She reports onset of diplopia without other symptom approximately 45 minutes after vaccination. Later that night she notes onset of full L eye ptosis which resulted in resolution of the diplopia. She was evaluated by ophthalmology the next day, 2/11, and was referred to the ER where she had a brain CT with no acute changes and unremarkable labs. Treatment with Plavix 75mg was initiated. She was evaluated in my office on 2/16 for persistent ptosis of her L eye and her exam is consistent with isolated third nerve palsy. Diabetes and lipid levels are at target.

1035599	2/17/2021	WI	62	F	12/19/2020	12/22/2020	Woke up one morning w/pain/ache in left lower jaw/back teeth, especially w/opening my mouth. Chewing on back molars hurt. As time went on pain worsened and radiated into my cheek, left eye and left ear. ~ One week later, I saw a dentist; he couldn't say whether it was TMJ or tooth problem, so sent me home w/quick splint to separate my top & bottom teeth at night and some exercises. These didn't help, so ~ a week after that, he gave me antibiotic. No improvement in symptoms until ~ a week after that. I saw pcp, as it felt like something was crawling inside my left ear. Ears were fine; she agreed w/inconclusive answer of dentist - at this point, there was some improvement in my symptoms. She suggested prescription-strength Naproxen for 10 days, which I did. the pain/ache has been mostly gone since completing the Naproxen. For last few weeks, I've been back to normal - no ache/pain/strange sensations in ear at all.
1035607	2/17/2021	IN	40	F	2/9/2021	2/11/2021	Extremely fatigue, nausea, headache, right eye blood shot, right side jaw pain, swelling right side face , right side ear pain
1035674	2/17/2021	FL	66	F	2/11/2021	2/11/2021	Within 15-minutes, the patient reported a "pulsating sharp pain" behind their right eye. EMS evaluated the patient on-site and they were found to be hypertensive (173/88). The patient proceeded to a emergency department. In the ED, the patient remained hypertensive with a mild generalized headache. They reported that their eye pain is constant but comes in waves of higher intensity. Differential diagnosis was possible stroke due to right-sided hemianopsia and right-sided ptosis. Patient was admitted and evaluated. Aspirin was administered and blood pressure was monitored prior to discharge.
1035682	2/17/2021	NJ	73	F	1/27/2021	2/2/2021	Around the 2nd or 3rd of February I started seeing double vision. I went to the eye doctor about a week or ago. The Dr. said it was muscle pulling of my eyes. Tomorrow I have cataract surgery. One March 4th I have a follow up to discuss the double vision. If I cover one eye then I can see fine, but when I look with both eyes I am still seeing double vision.

1035683	2/17/2021	MI	48	F	1/23/2021	1/26/2021	Developed terrible neck pain, headache, nausea, fever, chills, chest pain, difficulty breathing and by Wednesday, 1/27/21, had a rash with welts all over my body; I also had eye puffiness to the point that my vision was impaired
1035690	2/17/2021	KY	37	M	1/22/2021	2/10/2021	Patient here today with left sided jaw pain starting 2 days ago. He has subsequently had worsening paralysis of the left side of his face. He is not able to fully elevate his left eyebrow, close his left eye, or smile with the left side of his face. He had a COVID 19 vaccine 1 moth ago and was scheduled for his second one today. No word finding difficulty or headache. Diagnosed with Bell's Palsy; treated with prednisone and Valtrex. Instructed to go to ED for loss of vision or evolving symptoms. Wait on second COVID vaccine until prednisone is finished.
1035711	2/17/2021	VA	64	F	2/12/2021	2/13/2021	Sat, Feb. 13, 2nd day after shot: during the afternoon arthritis pain intensified and Tylenol Extra Strength for Arthritis did not alleviate it, which it always has in the past. Later sometime in the middle of the night, I wasn't able to fall asleep as if I'd had a stimulant, and had intense arm pain where shot given, some nausea, some intestinal discomfort, intense pain at temples and behind eyes, overall "crappy" feeling. Sun., Feb 14, 3rd day after shot: Pains/symptoms same as above with the addition of a low grade fever (99.9), chills, fatigue, no appetite. Tylenol didn't help. Was able to drift in and out of light sleep. Later in the day, fever and majority of symptoms suddenly "left", gradually decreasing until I felt fine again by Sunday evening. No issues Monday, Feb. 15.

1035724	2/17/2021	MI	68	F	2/11/2021	2/12/2021	woke up the night of my vaccine with pain in my left eye and significant itching and tearing. The pain went away in a couple of hours but the itching continued for 3 days. It woke me up from sleep 3 nights in a row. I took Zetidol eyedrops and Allegra with very little improvement. I get similar eye symptoms with seasonal allergies but this was the worse I have ever experienced and was not accompanied by runny nose, sneezing or coughing which I usually get with seasonal allergies and this is not a typical season for my allergies this may be just a coincidence but since I have read that Covid 19 can give similar ocular symptoms I am concerned about my second dose. I got a COvid test 2 days ago (no other symptoms) and do not yet have the results
1035532	2/17/2021	FL	67	F	1/7/2021	1/1/2021	Sty on my right eye; This is a spontaneous report from a contactable consumer. A 67-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) first dose, lot number: EL3246, via an unspecified route of administration on 07Jan2021 11:00 at a single dose for COVID-19 immunization. Medical history included multiple sclerosis (MS) and environmental allergies. Concomitant medication included ascorbic acid (VIT C), colecalciferol (VIT D3), zinc, acetylcysteine (NAC) and montelukast. In Jan2021, after 1 dose the patient formed a sty on her right eye, and it was still there three weeks later. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior vaccination the patient was not diagnosed with COVID-19 and has not been tested for COVID-19. The outcome of the event was unknown. The event was assessed as serious-medically significant.

1036923	2/17/2021	MA	56	F	1/2/2021	1/2/2021	Evening my arm started hurting (injection site arm). Next day, dull pain in my back and arm still hurt. Monday (day 3) the pain moved to my chest - a dull pain. Day 6 I noticed that my throat was tight at end of the day. It didn't hurt; just tight. Friday morning, I woke up feeling chilled. I called Employee Health. They had me tested. I had a low grade fever for a couple of days. I took Motrin. As the week progressed, I had a little cough but bad enough to treat I had a little bit of sinus. I had two days of sinus headache - took Motrin. I had a day (maybe Wednesday) that I got a blister on my eyelid. It irritated my eye. It subsided about two days after. The end of the week, I lost my sense of smell. It took a couple of weeks before that came back.
1036943	2/17/2021	IL	66	F	2/15/2021	2/17/2021	Day of vaccine symptoms previously recorded cleared up next day. Today, 48 hours after vaccine I now have cold symptoms. Watery eyes/nose and spitting up phlegm.
1036950	2/17/2021	PA	55	F	2/11/2021	2/12/2021	About 20 hours after injection, in addition to sore arm, my brain felt foggy. I work on the computer could not remember what to do next as I searched for needed files. At the end of the day, I signed off my computer but needed to think about how to turn off the monitor. The next day was better, but by the 3rd day out I became very sensitive to sound. On the 4th morning the brain fog got much worse, my head hurt and I felt like I was moving through life in slow motion. This continued for two whole days and I could not sleep at night due to the intensity of my headache. All of this could have been a migraine which I had in the past, but never to this extent. Past migraines were visual in nature and only lasted about an hour. By the 5th day, I started to feel normal, with the occasional headache or wave of nausea.

1037036	2/17/2021	IN	67	F	2/4/2021	2/10/2021	On February 10, 2021 I awakened with an irritated left eye that was "glued" shut. My eyelid was also droopy and the eye appeared to be more closed than usual. My left pupil was also larger than that of my right eye. My vision was blurrier than normal in that eye also. In the past I have had herpes simplex episodes with this eye and believed that my eye was "acting up" again, although I had not had these exact type of symptoms before. I had hoped that the eye issue would resolve within a few days as I was already on maintenance drugs as mentioned previously. However, the symptoms did not improve. On February 16, 2021 I determined that I should consult my ophthalmologist. Upon examination, he saw a new dendrite had formed over the center of my eye; my eye pressure was elevated and the herpes virus once again resurfaced. Dr. asked if I had had a flu shot or been ill, as that can cause the herpes virus to re-establish. At that time I informed him that I had received my first Moderna Covid vaccine on 2/4/2021 and it was his belief that this shot caused my herpetic eye virus to re-erupt. I had filled out a previous VAERS report (temporary E-Report #297262) because I had developed "covid rash" on my left arm at the vaccine injection site. I completed that form on 2/11/2021, as the rash appeared on 2/10/2021. Apparently, the herpes/eye infection was another adverse reaction to the first Moderna vaccine, but at the time I did not "connect the dots"; my ophthalmologist did so for me at my 2/16/2021 visit.
1036963	2/17/2021	HI	34	M	2/16/2021	2/16/2021	C/O dizziness. Medical reserve corps volunteer took vital signs @12:53 BP 120/80, pulse 68, RR 16, breath sounds clear. Reported history of discomfort after shots. Bottled water given. Client reported feeling better, cognitively intact. Answered questions appropriately, made good eye contact. Released from post-vaccination monitoring area.

1037056	2/17/2021	PA	21	F	1/9/2021	1/10/2021	January 10, 2021 around 1:00 AM i woke up from a sound sleep with 10/10 midsternal chest pains. I was seen in the emergency room for the chest pains. The emergency provider ruled out the chest pains as NOT being cardiac or Gastrointestinal related after doing countless blood tests and other various tests. I then followed up with my PCP and they said to keep an eye on it to see if it got any worse and to seek medical attention if the chest pains did get worse. After 4 days the pain went away.
1037131	2/17/2021	NY	40	F	2/11/2021	2/12/2021	That night, 2/11, left arm, neck and head became so sore it woke me up in the middle of the night about 3am on 2/12. The next day, 2/12, full body aches and muscle/joint pains and headache. It felt like all my previous injuries in life came back to haunt me. As the day went on, my head got hot and my feet freezing. Then the fever and chills/sweats began. Fever reached 100.6 degrees. The soreness radiated out from my left arm until my hands and head hurt. Eventually, my teeth/gums, eyes and scalp were hurting. I took both ibuprofen and Aleve but neither helped much. The morning of 2/13, I couldn't wake up in the morning. I woke up from one vivid bad dream into another into another. Finally was able to wake up. Fever was gone, soreness decreased over the course of the day. But my chest, back and ribs hurt like they had when I was sick with COVID. I developed a runny nose and raspy voice and shortness of breath. Used my inhaler and felt better. Now fully recovered.
1037150	2/17/2021	WA	48	M	2/10/2021	2/12/2021	Two days after the injection on Wednesday, red spots began to appear on the neck from Friday. From the evening it began to spread to the chest and legs. Saturday got worse, so itching in my neck and chest. The eyes were swollen and the double eyelid disappeared. On Sunday, my eyes were swollen and pus started to form from the red spots. On Monday, I couldn't go to work because my eyes were so swollen, and my skin became dry and itchy.

1035543	2/17/2021	FL	68	F	1/29/2021	1/1/2021	<p>out like a 'light' and this stuff knock her out; whole entire face her head, down her back her neck was numb/Numbness in leg/jaws are numb; I'm feeling my teeth are still and my jaws are numb; felt very odd sensation as she was swallowing; was closing up but much wasn't closing up/it was not full open; swelling on her throat; Muscle pain in my left arm where they gave me injection and it hurts my neck area across my back down my arms specially my left side; it hurts my neck area across my back; it hurts my neck area across my back; Stumbling; face was swollen; eyes looks like little switch; thirsty; felt very sluggish; nose started to running; This is a spontaneous report from a contactable consumer (patient). A 68-year-old female patient received first single dose BNT162B2 (Solution for injection, batch/lot number and exp date not reported), via an unspecified route of administration (anatomical location: arm left) on 29Jan2021 15:00 for COVID-19 immunization. Medical history included insomnia and asthma. The patient's concomitant medications were not reported. Patient stated, "I got the vaccine yesterday about 3 pm and I came home and I had dinner and sat down to watch TV at 9 O' clock, I turn the program on and I was out like a 'light' and this stuff knock me out (onset date: 29Jan2021). My dog has to wake me up licking my face at 3:15 this morning. I normally don't sleep long 4 hours and that's it. I'm 68 years old and I have insomnia (History) but when I woke up I was stumbling around, still have to sleep (onset date Jan2021), I took the dog out to walk and came back and saw myself in mirror, my face was swollen and my eyes looks like little switch. I noticed, I was thirsty and I went to get and drank, some coke because I felt very sluggish and I drank some coke and when I was swallowing the coke I felt very odd sensation as I was swallowing, I noticed that after swallowing. I have asthma (History) to begin with so I'm anticipated on having some of the symptoms it start showing up a bit, my nose started to running and I noticed that my whole entire face my head, down my back my neck was numb along with swelling on my throat, I felt okay but I felt it wasn't being, it was closing up but much wasn't closing up you know what I mean it was not full open. I also had muscle pain in my left arm where they gave me injection and it hurts my neck area across my back down my arms specially my</p>

left side. I also noticed I went to a lovely person and when I went to bathroom I pull my pants down I felt numbness on my legs. So, my whole body was kind of having that not tingling sensation but numb and when I ran my fingers across my leg you know how you feel numbness when you run your fingers across a part of your body when it's numb that's exactly how I felt and that was about 3:30 this morning that happened I woke up by but I also want to ask question because I got to go back to my second shot. I'm wondering if I go back to my second dose am I going to have even more intense reaction to the stuff that I get this time." Patient further added "I was still trying to eat something but I'm feeling my teeth are still and my jaws are numb and this I got since yesterday (29Jan2021)." The outcome of events was unknown. Information on the lot/batch number has been requested.

69 yo female reports AE after receipt of Covid vaccine #1 (EN 5318 13 FEB 21) via drive thru event. She reports within minutes she felt unwell but had difficulty being more specific. She states she felt a warmth in her chest which traveled to her stomach. A few minutes later she felt SOB, and could not catch her breath. She states her respiratory rate increased. She talked to staff and was told if got worse to honk horn or use flashers. She did not request additional assessment. She waited her required 15 minutes and drove home another 20-25 minutes. She states she noted her face swelling. She thinks she may have had some throat swelling, but then wasn't sure. She developed some nausea, but no emesis which continued for 2-3 days. She denied watery or red eyes, runny nose, pruritis, rash, palpitations, heart racing, chest pain, cough wheezing. She states the breathing symptoms resolved in a few hours. She was unsure of the facial swelling resolution time frame. She developed a headache and felt malaise for 2-3 days, then symptoms resolved. She never took any medications other than her prescriptions. She did not seek care during symptom time frame.

1036412	2/17/2021	NY	72	F	2/8/2021	2/16/2021	I do not know if this was an adverse event to the vaccine or not. It was not like an allergy reaction which I really don?t get. Felt more llike a mild flu. I have read that some people had delayed effect. It started out as a eyestrain type headache last night that got worse then I felt somewhat queasy like I had to throw up which I did three times. Then I had Somewhat loose stool. It could have been another ailment but I don?t know. I was feeling fine until this happened. I had a sore arm after the injection at injection site for maybe three or four days but it was gone by time this happened. I did not have a fever that I know of but I did have periods of becoming chilled or hot. I do not feel like I drink anything including water. I did not have any rash, but I did have a bruise that showed up the day before and right lower arm above my right wrist. But who knows I might have bumped my arm I or not I just don?t know. Today I feel a little better. Able to eat Jell-O. Headache almost gone.

1036843	2/17/2021	CA	58	F	12/23/2020	1/13/2021	On 1/13/21 my 2nd injection I was fine the next day I felt fine but in the afternoon around 2:30 I noticed my left side of my neck was swollen so I had asked 2 of the M.D.'s and a N.P. to check it and they felt 2 lumps along with the swelling and asked me to keep a eye on it, After a few days the swelling in my neck was gone but the lumps were still there so they asked me to contact my PCP which I did and a few days later she ordered a ultra sound which I had done on 2/4/21 and the results showed there were 3 lumps. I was asked by my PCP to wait 2-3weeks to see if they subside and if not she will order a new ultra sound(which I am waiting to hear back from her)

1036510	2/17/2021	CA	65	F	2/9/2021	2/11/2021	On February 11, 2 days after my vaccination, I woke up with pain and swelling under my left eye. Over the next 2 days, the left side of my face under the eye experienced redness and swelling then subsided and localized into a large styel on the lower left eyelid. Now, a week later, the styel is still red and pus filled but has improved and is slowly resolving. I would not normally think that this affliction had anything to do with getting a vaccine but it does seem strange that something like this could occur in someone who is very healthy and and does not experience any side effects from vaccines. The last time I had a styel was in my 20's and it wasn't nearly as bad as the one I am now experiencing. Since the Covid vaccine is so new and however unrelated this coincidental affliction seems, I thought I should report it regardless.
1036767	2/17/2021	CA	79	F	1/28/2021	1/28/2021	4 seizure type episodes (including shaking, eyes rolling back for about 15-30 seconds long) after being moved out of bed - lasted 4 days Fever up to 102.5 - lasted 5 days Could not stand - 8 days Body aches - 8 days Could not walk - 9 days Weakness - on going since vaccine Shaking - on going since vaccine
1036723	2/17/2021	OR	31	M	2/17/2021	2/17/2021	The patient began experiencing symptoms 30 mins. after the vaccination was given. He reported sudden sense of nausea, tunnel vision, headache and light sensitivity. He returned to the clinic shortly after leaving due to his condition. We had him rest in one of the outpatient rooms while monitoring his vitals, was also given an instant ice pack for his head. The pt. was prescribed Banophen (anti-histamine), Ondansetron for nausea and Ibuprofen 800mg for pain relief. He was given 6 TAB of both the Ondansetron and Ibuprofen but took 1 tablet of each of the 3 medications after coming into the exam room. Our patient relaxed in the room and was closely monitored for 45mins.-1hr. following coming back. Pt. began feeling better about 30mins. into his stay where he waited another 20-30mins. to ensure symptoms resided and he felt better. He was free to leave once better. Instructions were to contact our clinic or return if the headache or nausea returned or if his symptoms worsened.

1033473	2/16/2021	CO	79	F	1/21/2021	1/21/2021	<p>Blackened out; fell down the stairs; concussion; damaged or severed 6th cranial nerve to right eye; brain bleed; split lip; A spontaneous report was received from a consumer concerning a 79-years-old, female patient who received Moderna's COVID-19 Vaccine, and who blacked out, fell down the stairs, brain bleed, concussion, damaged or severed 6th cranial nerve to right eye and split lip. The patient's medical history included diabetes, two unspecified high blood pressure medications and naproxen sodium. Products known to have been used by the patient, within two weeks prior to the event, included Sitagliptin and blood pressure medication. On 21 Jan 2021, approximately one and half hours prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Lot number 027L20A) intramuscularly for prophylaxis of COVID-19 infection. On 21 Jan 2021, the patient "blacked out" while walking downstairs after one in and half hours of receiving vaccination. Patient was hospitalized from 21 Jan 2021 until 22 Jan 2021. Patient has a brain bleed and a concussion, damaged 6th cranial nerve to right eye, and split her lip which need stitches. Treatment for the event included Tylenol as needed. Action taken with mRNA-1273 in response to the events was withdrawn. The events blacked out and fell down the stairs was resolved on 21 Jan 2021. The outcome of the events brain bleed, concussion, damaged or severed 6th cranial nerve to right eye and split lip was unknown.; Reporter's Comments: This case concerns a 79 year old female patient with medical history of diabetes, two unspecified high blood pressure medications and naproxen sodium, who experienced serious unexpected events of fall, cerebral hemorrhage, loss of consciousness, concussion, damaged or severed 6th cranial nerve to right eye and split lip. The event occurred approximately one and half hours after first dose of the study medication administration. Treatment included Tylenol as needed. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Noting the subject's underlying medical condition could remain a confounder.</p>

1033513	2/16/2021	VI	68	F	2/14/2021	2/15/2021	Was fine on Sunday, while at work on Monday, starting to feel a little dizzy, her eyes became blurry. By the time that she looked in her rear view mirror her face was swelling up. Her face started to burn, fast heart beat, and dizziness. Her neck started to burn as well. She looked at the side effects. She called her doctor and took 2 Benadryl as she recommended, and took a nap. Her doctor told her to continue taking the Benadryl and to call us to report the reaction. She still has the swelling and the burning sensation in her face, and is still getting a little dizzy but it comes and goes. The fast heartbeat comes and goes as well.
1033523	2/16/2021	CA	66	M	2/6/2021	2/16/2021	Upon leaving morning shower, visually and physically experienced red spots/rash on shoulders and upper chest and arms.

1033517	2/16/2021	CA	52	M	1/19/2021	1/19/2021	Patient is allergic to cats, had tightness in chest, unable to breathe. Took a benadryl- it went away, eyelids was swollen. Sx did improve- eyelids are still swollen. Received #2 COVID 1/19/21 at 8am. Had a dental appt that afternoon for extraction, given Lidocaine w/out Epi, took Ibuprofen after visit. Reports acute onset chest tightness, SOB, audible wheezing at 5pm (approx 9 hrs post vaccine), then felt anxious. Took Benadryl 25mg and started feeling better in 20 min with resolution of wheezing and chest tightness after 1 hour. Also reports left eye swelling the same evening that has gradually decreased, now only mild with itching. Had similar eye swelling, however bilateral, after first vaccine dose. No SOB or wheezing noted since eve of 1/19/21. Denies hx asthma. NKDA. Allergic to cats. Denies swelling of lips, tongue, throat or rash. Reports feeling well today. Denies Covid-like sxs.
1032985	2/16/2021	FL	67	F	2/14/2021	2/14/2021	Injection was extremely painful. about 3-4 minutes after injection got very dizzy and flushed. Red face and pressure behind eyes. Heart rate jumped to 150 and stayed above 125 for several minutes. I could barely walk back to vaccination area where pharmacist waited with epipen. I was given water and after a few minutes HR went below 100. I stayed another 30 minutes and left however I did still feel a bit dizzy. At about 8 hours post injection got chills and fever of 101.5 and HR remained high (above 102) for at least 6 hours after onset of fever. Resting HR usually 59 and still remains above 90 at 48 hours.

1032687	2/16/2021	CA	68	F	2/13/2021	2/13/2021	About 10:00 pm on Saturday evening of noon injection, injection site was painful--at the same time got intensive, but very brief headache, very dry eyes and, within minutes, (no idea if it's related) I noticed weird sensation in my nether regions, which felt like my underwear was knotted and pressing on it. Went to check and found big kind of oblong lump (abscess) on outer labia extending to inside thigh--quite painful. It came out of nowhere--hadn't noticed it at all before that moment. Goggled it and thought it was probably Bartholin's Abscess and treated it as such. (Later realized it couldn't be because it wasn't inner, but outer labia.) Took sitz bath, and continued taking sitz baths next day and applying heat. Abscess extremely painful, fever 100.3--quite high for me., rash on chest and abdomen. It started draining while sleeping Sunday night and continued draining slowly on Monday with fever down to 99 and now down to 98.1. Rash has disappeared. Arm no longer sore. Abscess still painful but less so
1033524	2/16/2021	AL	49	F	2/4/2021	2/13/2021	Eight days after having the shot, my left arm developed a bull's eye type rash and was hot to touch. Furthermore, the site is itchy and I have taken Benadryl to calm the effects of the itching.

1032811	2/16/2021	IL	41	M	2/11/2021	2/12/2021	Symptoms began just after midnight the following day of shot. Between midnight and 2 am I suffered from severe chills and sweating. When I woke up at 5 Am I suffered from severe headache. Remainder of the day I had extreme digestive issues that continued over the next several days. At the conclusion of the second day I developed a fever of 101. Pinpointed severe pain developed at the base of my neck between my shoulder blades. That pain remained for approximately 24 to 48 hours that lead to extreme pain and stiff neck on my right side. Chills and periodic fever developed for two days past shot. By day three I had extreme right side neck pain that continued down into my right shoulder blade. By day four and five I suffered from extreme neck pain and severe headache that was focused from my right eye through my head down the right side of my neck to my right shoulder blade. By day 4 this continued with dizziness and blurred vision. I had inability to eat and strong feelings to vomit but only didn't because I hadn't consumed any food that day. I continued to suffer from extreme headaches and complete physical exhaustion with inability to stay away. In addition, I continued to have periodic chills but with no fever. As I submit this in day 5 I still suffer from lack of energy and the stiff neck remains down through my right shoulder blade.
1032824	2/16/2021	IL	88	F	2/12/2021	2/12/2021	All symptom occurred on the right side. Same side where the vaccine was given. Mouth drooping, eye tearing and won't close, paralyses of the right side of the face in general
1032828	2/16/2021	KY	62	F	1/8/2021	1/8/2021	Developed typical flu symptoms but developed severe incapacitating migraine/nausea/photophobia/vertigo. Felt feverish but no temp. Severity so bad almost went to ER. Took Imitrex x2 with chest tightness occurring after 2nd dose. Lasted x3 days then pressure on right side of head eye for a month. Elected not to do 2nd shot due to above s/s.

1032849	2/16/2021	TN	35	M	1/22/2021	1/26/2021	Swelling of the R eyelid started 5 days post-vaccine. Initially thought to be a Sty. First tried conventional warm compress multiple times a day. That did not help. Started to use Raw Honey and Hot Black Tea bags on eye, that brought the swelling to a head (pimple), and started to drain at week 2. Then the docs prescribed erythromycin opthamolgc ointment and I had an adverse reaction to that which increased the swelling again. Now going on the 4th week, the swelling is still present and not showing any improvement. Is it possible it's related to the vaccine??
1032865	2/16/2021	GA	70	F	1/28/2021	1/29/2021	4am (1/29/2021) extreme sweating to the point of soaking the hair on head; extreme dizziness with vertigo and inability to stand up or walk straight leading to nausea and vomiting 11am( out of bed) needed assistance to chair bc of vertigo and vision impairment; spent most of day seated; cont to require assistance with any walking 9pm to bed 8am(1/30/2021) Wake up and all symptoms worse. Unable to walk without assistance and had a severe body lean to left. Husband called doc and they suggested calling 911 to get to ER ASAP 1130 Arrived at hospital ER and was subsequently diagnosed and admitted with a cerebellar stroke

1032966	2/16/2021	OH	49	F	2/9/2021	2/9/2021	Pt was being observed for 15 minutes after covid vaccine administration. Pt was noticed to be "sleepy" and RN SB went to talk to pt who appeared to be lightheaded. I went and got the available emergency kit for RN SB to check pt's pulse ox. Pt's SaO2 was 99% and Pulse was 89. Pt reports that she had a recent heart cath and high blood pressure. Pt reports not taking her blood pressure medication prior to coming. 5-10 minutes after covid vaccine pt was more alert and stated she was feeling better but had vision changes. Pt's blood pressure was checked and it was 160/110 which was taken manually, pulse ox 98% and pulse was 87. Pt denies difficulty breathing or shortness of breath. Pt able to speak in full sentence. Pt was told that we would like her to stay for further evaluation. Pt was able to ambulate without difficulty to another place in the auditorium for further observation. 30 minutes post covid vaccination pt was alert and respirations were even/unlabored. BP 130/110 on both arms manually, pulse 67 and SpO2 99%. Pt still complaining of blurred vision/double vision. Pt was talking to husband on phone without difficulty and asking him to move to garage area to pick her up. Pt was told to follow up with her cardiologist and PCP. 45 minutes after vaccine admin pt asked if I could help her call her cardiologist office. I told her yes. I called Doctor's office and was transferred to the nurse line. The nurse told me that she was not Doctor's nurse but she would send him a note and recommends pt go the emergency department for vision changes. Pt was told the recommendation and called husband to tell him to meet her at ED while we were waiting for a wheel chair to transport pt. Pt works in nutrition and there was a supervisor or manager that knew her and said that he would let them know what was going on. She was supposed to work at 1330 today. Pt walked to wheelchair without difficulty and pt was transported to ED. Pt's husband was at the ED waiting when we got there. ED triage nurse was updated that pt had received 2nd dose of covid vaccine, had a recent heart Cath and was told by cardiologist office to go to ED for vision changes.

1034054	2/16/2021	KY	33	F	1/6/2021	1/7/2021	24 hrs after the vaccine I was about to have lunch and started feeling dizzy, couldnt hear the people in the room and began to fall as I was advised and someone in the room caught me. I was laid down and administered water until I felt better. I went back to my worksite while having to use the hand rails because my vision was blurred and I finally made it to my desk. I was then transported to the ER and my BS was taken which was 85. I was given IV fluids, a chest xray was performed, a UA and pregnancy test was done, EKG and a CBC done which all was negative and normal. From my knees down felt shaky the remainder of the week. I had a visit with my PCP the following week on Tuesday and had a sugar test done which was also normal and by the end of that week all symptoms had resided
1034057	2/16/2021	CA	59	F	1/19/2021	1/19/2021	Left eye twitching
1034071	2/16/2021	MN	72	F	2/16/2021	2/16/2021	About 5 minutes after receiving the vaccine, described seeing a dog in the corner of the room - a hallucination. She then said she was feeling overall unwell. Over the subsequent 30 minutes, she described a severe headache, nausea, itching, and had trouble answering basic questions. Paramedics were called, who conducted an evaluation, which noted dizziness, vision trouble and uneven arm weakness. Paramedics determined she needed further evaluation at a hospital, and was taken to Hospital.
1034083	2/16/2021	AZ	77	M	2/12/2021	2/12/2021	I'm a 77 year old Male, I take no Meds. I do have Peripheral Neuropathy, I'm not a Diabetic. About 20-25 minutes after my shot on driving home my left leg started to go numb, time I got home both were feeling the same numbness. [takes about 15 minutes to get home] Here it is 4 days later still have the numbness, but not as bad. Then on 2/13 Saturday evening I was watching TV, my eyes I started to see colors floating around in them. About 20-25 minutes later it was gone. The biggest thing with my feet and is it OK to go with the second shot?

<i>VAERS_ID</i>	<i>RECVDATE</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1034093	2/16/2021	CO	55	F	2/14/2021	2/14/2021	After receiving the second COVID Moderna vaccine, Patient reports that she is dizzy and her tongue feels thick. She is having trouble coming up with words, having difficulty focusing eyes, and feels like she is in a brain fog. She denies any issues with first vaccine. She consents to Benadryl administration. She would like to stay here to be monitored rather than call an ambulance at this time. She has no facial droop, no weakness or unequal grips. After about 10-15 minutes, she reports her dizziness and thick tongue feeling is improving. After another 5 minutes, symptoms have not fully resolved. She still feels like her mentation is abnormal, and her tongue is still feeling "sticky." After another 5 minutes, patient continues to be mildly dizzy, and still reports difficulty finding words, difficulty thinking, and persistent visual disturbance. I discussed with patient that she needs to be seen in the ER. She declines an ambulance, states she would like her husband to drive her. Patient left.
1034094	2/16/2021	CA	70	F	2/13/2021	2/14/2021	First thing in the morning could only stand for a few seconds without feeling I was going to faint. Symptom lasted for about 4 hours. At 1:00 p.m. took temp which was 102. Approximately 5 minutes later I had a seizure. My partner who witnessed the event stated I laid back on our sofa, my head turned and my eyes rolled to the right and I was shaking. I was unresponsive. It lasted about 15 to 20 seconds. Immediately after coming out of it I lost my bowels.

1033536	2/16/2021	NY	47	F	1/26/2021	2/15/2021	With the first dose I felt sick for 1 day. I called out. The morning after receiving the 2nd dose I had severe fatigue, joint pain, my wrist and my armpit was budging, I noticed swelling my clavicle on my left side, chills, and dizzy. I had to miss work for 2 days. I had to lay bed in for 2 days. By 3rd it was much improved but I still feel weak. About 4 days after receiving the vaccine I was back to feeling my self. On 2/14-15/2021, my face was itching, I scratched it, and there is a small abrasion. My face started to swell, around 2AM this morning I had to go to the ER because my eyes were getting small, the swelling was getting worse. I also had bumps that looked like hives on my face, there was some fluid coming out of my face. I went to early this morning, The ER doctor said she thinks it is not infected she thinks it is inflamed. I did not mention that I had recently received the COVID vaccine and did not realize that it may be linked to the vaccine until later in the day. She prescribed Hydrocortisone 0.5 % cream and Mupirocin 2% cream. Since I have been home the ER the swelling has worsened. My face is painful, it feels like an orange peel when you touch.
1034014	2/16/2021	AL	70	M	1/28/2021	2/4/2021	central retinal vein occlusion involving the right eye
1033774	2/16/2021	MI	83	M	2/11/2021	2/12/2021	Day 1 after receiving vaccine he started to notice redness on face and fatigue. Day 2 woke up face was swollen and eyes almost swollen shut and hot, started taking benadryl and sleep most of the days. Denies SOB. Day 3 continue benadryl, zyrtec and pepcid. Day 4 came to PCP as it's gotten worst. Swelling of bilateral ears, face, and forehead.
1034096	2/16/2021	CA	71	F	2/12/2021	2/13/2021	I have a condition known as Spinal Stenosis. Diagnosed 3years ago. It creates alternating pain in neck, shoulders and upper arms, mostly on my right side. I had the shot in my left arm. The next morning at 10:00 AM, I started having spasms in my upper right arm that continued for 6 hours. I have never had anything like this happen before. It was completely debilitating. I sat for hours with heating pad on neck and arm. It was so painful I had tears in my eyes for most of the day. I slept on and off while heat treating it. Then after about 6 hours it stopped. The next day the muscles in that area were sore.

1034317	2/16/2021	VA	23	F	2/11/2021	2/12/2021	Friday morning I woke up extremely fatigued. I saw stars in my vision and I had to lay in bed all day. I didn't have energy to even eat. Saturday evening or Sunday morning I noticed red splotches along my torso. Sunday they began to itch and I still have them along my neck, back, upper and lower torso, and a few on my legs. I haven't changed any environmental factors (no new lotions, creams, hair products, diet, or perfumes). Today I used Benadryl cream, but in the past I've been putting my regular, non-scented Aveno lotion and coconut oil.
1034325	2/16/2021	FL	66	F	2/12/2021	2/15/2021	left eye was swollen, crusty, and painful
1034335	2/16/2021	IN	45	F	2/4/2021	2/14/2021	Left sided facial numbness/drooping began morning of 2/14/21. and left side arm and leg weakness was noticed later in the day . at 6pm I went to ER and received MRI and labwork. Ruled out Stroke or Brain mass or issues. was diagnosed with Bells palsy given order for prednisone which I started on 2/15/21 and made appointment with Neurology for March 3rd. Plan to make PCP appointment when the office opens. The facial numbness and drooping continue with expected complications. Teary eye, dry eye, pain in jaw and ear and headaches. Difficulty eating drinking with numbness.

1034107	2/16/2021	OH	41	M	1/29/2021	2/5/2021	1/29/21 0700 received vaccine 2100 started not feeling well fever of 99 1/30/21 0300 fever was between 102 and 103.5 1000 fever stayed around 101 to 102 1/31/21 1000 fever was down to 99 and disappeared around 1500 2/4/21 I started having a sore throat and some mild ear pain. 2/5/21 ear pain was getting worse. 2/6/21 ear pain was very bad 2/7/21 went to the clinic they gave me amoxicillin for and ear infection 2/10/21 ear pain was still the same and things were not getting any better. I called my doctor and he switched me to amoxicillin-clav. I was not able to pick it up until 1/11/21. 1/11/21 my left eye started bothering me and if felt like pink eye. 2/12/21 I started getting a metal taste in my mouth and it started feeling numb. I called my doctor back around 1300 and he told me to switch back to the regular amoxicillin. By 1640 my vision in my left eye started to get blurry and my entire left side of my face was numb and paralyzed =. My doctor told me to go to the ER. Being the stubborn person I am I didn't go right away. 2/13/21 I went to the hospital. I was diagnosed with Bell's Palsy. The doctor did not seem to think I had an ear infection. My entire left side of my face is paralyzed. I still have pain behind my right ear and around the ear canal. My vision in my left eye is terrible. My speech is getting slurry. 2/16/21 I followed up with my primary doctor. He is hoping with the treatment I'm on this will go away in 1 to 2 weeks. He encouraged me to fill this adverse reaction form out. I have a follow on 2/17/21 with and ophthalmologist for my blurred vision.

1030426	2/15/2021	WV	76	F	1/28/2021	1/29/2021	Hemorrhage on right eye; A spontaneous report was received from a consumer concerning a 76-year-old, female patient who received Moderna's COVID-19 vaccine and experienced hemorrhage on the right eye. The patient's medical history was not provided. No relevant concomitant medications were reported. On 28 Jan 2021 prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 007M20A) intramuscularly for prophylaxis of COVID-19 infection. On 29 Jan 2021, the day following her injection, the patient experienced a right eye hemorrhage. The patient also informed that she had a substance of unknown origin injected into her eye, when she visited the eye doctor. No treatment information was provided. Action taken with the second dose of mRNA-1273 in response to the event was not reported. The second dose is scheduled for 24 Feb 2021. The outcome for the event hemorrhage on the right eye was not reported.; Reporter's Comments: This case concerns a 76-year-old, female, who experienced serious events of Eye haemorrhage after receiving first dose of mRNA-1273. Noting her recent visit (unknown date) to an eye doctor involved an injection into her eye may remain as confounder. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Follow-up information is expected.
1030443	2/15/2021	FL	66	F	2/12/2021	2/12/2021	A few hours after receiving the shot I was experiencing lightening bolts in my right eye, then it felt like bugs were flying in the right eye, now there are two black floaters that look like spiders and my eye feels tired. I've used tear drops, and will contact my ophthalmologist for an appointment. After a while it gives me a headache. The shot was given on my left arm, but the eye issues are just on the right side, the right eye.

1030773	2/15/2021	WA	55	F	1/16/2021	1/23/2021	A week after my first injection, my left arm at the injection site swelled up, was hot, red and super itchy. This lasted about 4 days. At three weeks after the injection under my eyes swelled up, was red and super itchy. It felt like a chemical burn. I used no new products.
1030791	2/15/2021	CO	61	F	1/27/2021	1/29/2021	Two nights after had extreme vision change like blacking out (lasted 30 seconds). Did not black out but have been lightheaded (slightly dizzy) since then. It comes in waves. I feel like it could be caused by inner ear and not sure the vaccine has anything to do with it. Visited my doctor on 2/11/21 and she assessed dizziness. Put me on steroid inhaler, nasal washes, antihistamine.
1030525	2/15/2021	GA	61	F	2/2/2021	2/2/2021	Severe migraine headache with pain behind eyes with uncontrolled tearing, ringing in head, pain and pressure lasting about 12 hours. No treatment. Dull headache with numb forehead lasting several days. Took Advil for 3 days Wheezing and shortness of breath lasting 6 hours and the same symptoms the following day lasting about 6 hours. No treatment Did call the doctor with my reaction and concerns for second dose recommendation.
1030084	2/15/2021	IL	33	F	1/28/2021	1/28/2021	tingling on the left side of her face below her eye and lower half of her face/facial tingling on the left side of her face; This is a spontaneous report from a contactable Consumer (patient) A 33-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 28Jan2021 at single dose in her left arm for COVID-19 immunization. The patient medical history and concomitant medications were not reported. On 28Jan2021 patient noticed facial tingling on the left side of her face below her eye and lower half of her face. The final outcome of the event was unknown.Patient would like to know if her symptoms were normal and would like to know what she should do about her symptoms. She wanted to know if she should be worried about that and if it was a known side effect. information on the batch number has been requested

1032025	2/15/2021	MO	72	F	2/15/2021	2/15/2021	As I was administering the vaccine, the patient stated: "I feel" and then fainted on me. Her husband and I kept trying to get her to talk to us, she was squeezing my hand as we talked, I ran an alcohol pad under her nose. We got her to open her eyes a few times and decided to call 911. She was breathing and I could feel her pulse. 911 had us lay her on the floor where she started to come to and mentioned how bad her vertigo was before I gave the shot. She also said her blood pressure was really low this morning and didn't want us to call the news as she didn't want to be on the news
1029833	2/15/2021	AZ	65	F	2/11/2021	2/11/2021	Injection site soreness; headache (front of forehead across top of head all the way back to ears); sinus ache under eyes; muscle ache across shoulders; hint of nausea; early morning awoke to profuse sweating; tired.
1029844	2/15/2021	CA	56	F	2/12/2021	2/12/2021	I was very sick with all the regular symptoms for 2 days; headache, all over pain, nausea, fatigue, extremely cold feet, chills. In addition to symptoms above, I also loss part of my vision. I couldn't read because I couldn't see the entire print. I did not go to hospital or call doctor. I went to bed because I felt so bad. The next morning my vision was back to normal.
1029994	2/15/2021	AL	33	F	2/1/2021	2/1/2021	Won't let me type everything. Long story short. Face tingled for a few days after shot, forehead skin got tight and dry, now I've lost vision in my right eye! Today is exactly 2 weeks after 1st vaccine and sight in my right eye is worse and painful

1030020	2/15/2021		73	F	1/1/2021	2/1/2021	sixth nerve palsy of the right eye; A spontaneous report was received from a healthcare professional concerning a 73-year-old female patient, who received Moderna's COVID-19 Vaccine (mRNA-1273) and developed sixth nerve palsy of the right eye. The patient's medical history was not provided. Concomitant product use was not provided. On an unknown date, approximately two weeks prior to the onset of the event, the patient received their first of two planned doses of mRNA-1273 for prophylaxis of COVID-19 infection. On 01 FEB 2021, she was seen at an ophthalmologist office and diagnosed with sixth nerve palsy of the right eye. An MRI was performed on an unknown date for the patient's condition which revealed there was mild generalized cerebral atrophy, prominent enlargement of the lateral and 3rd ventricles out of proportion to degree of cerebral atrophy. 4th ventricle is non dilated. There is patchy bilateral cerebral white matter flares. Hyperintensity is noted likely representing findings of chronic microvascular ischemic change. No obstructive lesion identified. No contiguous band of flare/T2 hyperintensity along the surface of the ventricles to suggest the presence of transependymal CSF flow. Impression was that in the setting of potential 6th nerve palsy, this constellation of findings may potentially represent underlying increased intracranial pressure. Normal pressure hydrocephalus was an alternative consideration in the appropriate clinical context. No treatment information was provided. Action taken with second dose of mRNA-1273 in response to the event was not reported. The outcome of the event, developed sixth nerve palsy of the right eye, was not reported.; Reporter's Comments: This case concerns a 73 year old, female patient who experienced a serious event of Ophthalmoplegia after receiving second dose of mRNA-1273 (Lot# unknown). Very limited information regarding this event has been provided at this time. Further information has been requested.

1030026	2/15/2021			M			Hallucinations/ Have seen ghosts; A spontaneous report was received from a consumer who is a male patient, who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced hallucinations and seeing ghosts. The patient's medical history, as reported, included problem in eye that caused patient to see weird things some years ago. Concomitant medications were not reported. On an unspecified date, the patient received their first two planned doses of mRNA-1273 (Batch number: unknown) for the prophylaxis of COVID-19 infection. On an unspecified date, the patient experienced hallucinations and seeing ghosts. No treatment information was provided. Action taken with mRNA-1273 in response to the event was not reported. The outcome of event, hallucinations and seeing ghosts, was unknown.; Reporter's Comments: This case concerns a 72-year-old male patient who received their first of two planned doses of mRNA-1273 (Lot unknown), and who experienced the serious unlisted event of hallucinations. Based on the current available information and temporal association between the use of the product and the onset of the event after vaccination, a causal relationship cannot be excluded.

1030060	2/15/2021	AL	28	F	1/21/2021	1/21/2021	Arm was tingling; heavy; Became dizzy; Felt very weird; Broke out in rash on neck and face; Went pale; Couldn't open my eyes; Slurred speech; I couldn't breath; couldn't speak; couldn't swallow; My throat had closed up; I am still very sick and unable to work; This is a spontaneous report from a contactable other healthcare professional (patient). A 28-year-old female patient received first dose of bnt162b2 (Pfizer-BioNTech COVID-19 mRNA vaccine), via an unspecified route of administration in the left leg on 21Jan2021 14:30 at a single dose for covid-19 immunization. The patient has no medical history. The patient had not had covid prior to vaccination. patient is not pregnant. Concomitant medication included isotretinoin (ACUTANE). On 21Jan2021 14:30, immediately after administering vaccine the patient reported arm was tingling, heavy, patient became dizzy, felt very weird, broke out in rash on neck and face, went pale, couldn't open her eyes, slurred speech, then patient couldn't breath, couldn't speak and couldn't swallow. The patient added that her throat had closed up. The patient was administered with Epi pen. The patient reported that she was still very sick and unable to work. The patient underwent a covid test post vaccination via nasal swab on 25Jan2021 and 26Jan2021 with negative result. The outcome of the events was not recovered. Information about lot/batch number has been requested.; Sender's Comments: Based on the time association and product's safety profile, the reported serious events are possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.
1030542	2/15/2021	VA	53	F	2/9/2021	2/9/2021	Initially, soreness around injection site. Backaches. Then the next few days, I realized, I was having a flare up of sjogrens. Dry mouth and dry eyes were worse. Dry cough, chest discomfort was the most difficult to deal with and GERD issues got worse

1030107	2/15/2021	CA	19	F	1/27/2021	1/27/2021	<p>Bell's Palsy; low grade fever; body aches; chills; This is a spontaneous report received from a contactable healthcare professional (patient) communicated to a Pfizer colleague. A 19-year-old female patient received second dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, formulation: solution for injection, Batch/lot number: EL9261 and expiry date: 31May2021) via an unspecified route of administration to Left Deltoid on 27Jan2021 09:30 at single dose for COVID-19 immunization in workplace clinic. Patient medical history included factor V Leiden mutation (Blood Clotting disorder), common migraines, pelvic pain diagnosed 5 years ago, on 05Nov2020 hip surgery on the right side, foot surgery on 21Jan2021 with local anesthesia and nerve block in the left foot. Patient family history included mother has same Factor V Leiden mutation and father has iodine and shellfish allergy. Concomitant medications included cetirizine hydrochloride (ALERGET), gabapentin, prazosin and colecalciferol (VITAMIN D), all from an unknown date and ongoing. The patient had not received other vaccinations within 4 weeks. Patient past drugs included chlorhexidine which she experienced allergy: super itchy skin burning and lidocaine injection for local anesthesia. Patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL1284) in the right deltoid on 06Jan2021 at 09:35 Am for COVID-19 immunization. Second dose on Wednesday on left side and she stated that she had mild side effects low grade fever, body aches and chills on 27Jan2021 evening. No treatment was given for low grade fever, body aches and chills. She reported that she began to feel left sided swelling, tingling, and drooping of her face on the evening of 29Jan2021. She further described that on Friday (29Jan2021) evening her face was super weak, 1st manifestations were the eye and the left side of her face droopy and neck pain. She took 2 BENADRYL at 8:00 pm and went to sleep. At 08:00 AM next morning she took TYLENOL as her jaw and neck were hurting. She mentioned that while driving to work it got aggravated. She called advice line and she was instructed to go to emergency room. She went to emergency room and was diagnosed with Bell's Palsy on 30Jan2021 via physical exam. She has been prescribed steroids and antiviral for now (30Jan2021). Started Saturday (30Jan2021) on 20</p>

1030137	2/15/2021	PA	56	M	1/26/2021	1/26/2021	had to close my eyes due to the faint feeling; palpitation; Fatigue; chills in the back of the head; Arm soreness; felt a mild palpitation but not as strong as the strong one I experienced after the first injection/Arm soreness was much less than after the first dose/Fatigue was comparable; This is a spontaneous report from a contactable consumer (patient). A 56-years-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EL3246), via an unspecified route of administration in right arm on 26Jan2021 12:30 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. Historical Vaccine included received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EL0140), via an unspecified route of administration in right arm on 05Jan2021 at single dose for COVID-19 immunization and experienced palpitation, Arm soreness and Fatigue. 30 min after injection, the patient felt a mild palpitation-stronger than any previous mild ones but not as strong as the strong one he experienced after the first injection, and he had to close his eyes due to the faint feeling. This was followed by a mild one 3 min later. In the next few days he had several additional mild to weak palpitations. The strong one that he experienced 12-14 hours after receiving the first dose did not show. Arm soreness was much less than after the first dose. Fatigue was comparable, and in third day still had to take a nap immediately after the breakfast. Additional nap was taken during the day-needed more but did not have time. The patient felt some chills in the back of the head some days but did not get "sick" at all. All events occurred on 26Jan2021 13:00. No treatment received for the events. The patient did not receive any other vaccines in four weeks. The patient had no COVID prior vaccination. Since the vaccination, the patient had not been tested for COVID-19. The outcome of the events was resolved in Jan2021.

1031731	2/15/2021	PR	99	M	2/12/2021	2/12/2021	Patient is a 99-year-old man with prostate cancer and sprouting eyes. No signs of dementia; awake, alert, and oriented by 3 (person, place, time). The patient needs a walker and a person assisting so he can move. He visited the pharmacy and came with two family members. After I evaluated the patient, I administered the vaccine. Just after the administration of his first dose of the Covid-19 Vaccine he felt very dizzy and with severe headaches after standing up. Family members told me the patient occasionally suffers from dizziness when he changes from the sitting position to the standing position. I sat him again and he keep telling everyone he did not felt fine. He was semi unconscious; his eyes were almost wide shut and his family members besides me told me he felt cold and never had dizziness like this. Just after that, I asked him if he could breathe, and he nodded yes with his head. I was ready for applying CPR or oxygen depending on the scenario. But I was very worried for him because of his age and decided to call the ambulance. The paramedics came in half an hour, but he started to feel better after a while. The paramedics got his blood pressure and was low and his glucose levels were high. They recommended the patient to go to the hospital, but he refused. He talked with his family members and instead decided to go home.
1031763	2/15/2021	AL	52	F	2/15/2021	2/15/2021	1 hour post injection, patient returned to the vaccine clinic c/o burning and tingling (L) side of face near cheek bone & eye. While talking, she developed a "cold sensation, like when you get IV fluids" on her left side.

Started supplemental oxygen via NC, 2L, then 3L. Sats went up to 93% for a while, Sprvsr called. Unable to auscultate Left lung sounds. Called to update Res daughter. Called to page NP, writer went back to assess Res and O2 sats were 88%, turned O2 to 4LPM, called 911 for transport to Hospital ED. Left around 1030. NP called back afterwards, was updated. Family updated that Res was sent to Hospital ED. Note Text: Received phone call from daughter as well as information from hospital. Resident has pneumonia with septic shock. She is on abx and had thoracentesis performed for large pleural effusion. [linked]
1031790	2/15/2021	WI	94	F	2/6/2021	2/7/2021	Received influenza vaccine 1/29 at PCP clinic. Received Moderna vaccine on 2/6 by pharmacist at her place of residence. She was taken to the ER on 2/9, unresponsive. Staff reported she wasn't acting normally since 2/7. During her hospital course (2/9-2/13) she was only able to open her eyes. Unable to follow any commands. MRI showed large right MCA stroke. She was discharged from the hospital on hospice.
1031795	2/15/2021	CA	66	M	2/15/2021	2/15/2021	Immediately after pt received vaccine he told his wife (driver) that he was feeling dizzy. Wife then stopped vehicle in Lane #6 halfway down to observation and called for help from observation staff. Upon arrival of observation staff pt was found to be unresponsive but still had a pulse and was breathing on his own. Pt was in the passenger set. Observation staff alerted onsite medical professionals and MD and the crash cart was brought to the car. Vitals were taken. Within a minute pt became responsive and opened his eyes and began to communicate with healthcare staff. O2 sat was noted to be low so O2 was applied at 6L/min via facemask. Onsite Battalion Chief stated he had already called EMS and they were en route. MD remained at the vehicle with pt and continued to monitor until EMS arrived and assumed care. EMS did an EKG and pt found to have sinus brady, with a pulse in the 50's. EMS decided to transport pt to hospital for further evaluation. Pt transported to ambulance via stretcher in stable condition, alert.

1030890	2/15/2021	MO	31	F	2/12/2021	2/12/2021	About two hours after receiving the vaccination, I had severe dull pain in my entire left arm which received the vaccination. About 7 hours after the vaccination, I had extreme fatigue and slept for about 2 hours. I then got up to go to my neighbor's house (please note, it was about 4 degrees, -6 wind chill, outside at the time). When I got to the house, I stayed outside and smoked a cigarette for about 5 minutes. Upon going inside, I got extremely light headed, fatigued, my hearing went to "white noise" and a high pitched ringing, and my vision got blurry. I then left the house with assistance to head back home. While outside, despite the intense cold, I was dripping sweat in a matter of seconds. I continued sweating and experiencing effects akin to what is felt prior to passing out, for about 7-10 minutes. I then laid down and went to sleep. Third day, still some soreness in the arm, but only at the injection site. No more adverse experiences since.

							took Tylenol before vaccine administration Follow up response to treatment: excellent. Patient discharge: Stable to go home and follow up with PCP. Differential Diagnosis: Vaccine-Related Anxiety (include misc mental health) and Local reaction (arm pain, bleeding/bruising, mechanical irritation, localized rash) Patient feeling back to normal. BP 152/76 at 1203. All symptoms have resolved. Left deltoid without swelling, redness, rash. Patient ambulating without difficulty. She is cleared to drive home. If she should have symptoms return or worsen, she is to call PCP or go to ER.
1030523	2/15/2021	OH	93	M	2/13/2021	2/13/2021	Patient received his second dose of the Pfizer vaccine. He was accompanied by his daughter. Per daughter prior to receiving his vaccine he was his "normal" self. He was sitting in a chair next to the vaccinator. He did walk in with a walker and minimal assistance from his daughter. He did have a gait belt on around his waist. When I came to patient he was looking straight ahead with his left eye open - right eye s/p surgery to his right eye per daughter. He did not respond to questions asked. His daughter stated mentally he is normally intact. His pulse was faint but palpable. His color was pale with slight dusky skin to hands. 911 was called. Undetectable blood pressure initially with his faint pulse. Initially his heart rate was 105. He was shallow breathing. BP was undetectable sitting - with oxygenation low 80's on room air. He was lifted to a bed/cart with legs elevated. He was given supplemental oxygen. After laying down with legs up he started to look around. He was able to tell me his name and respond to questions. His blood pressure was 117/68 with heart rate 55 and oxygenation on 6L nasal cannula 87-88%. Patient's daughter stated that patient was recently at hospital with low blood pressure and questionable seizure activity. No obvious seizure activity noted today. Paramedics - updated with patient history and events. Blood sugar checked at 183. Patient neurologically improved with ability to state name, his daughters name and his age. No injury noted. Dr phoned and updated on patient condition and events. Patient transported without injury on oxygen. Two daughters with patient to emergency room. Pt being evaluated by cardio on admission for syncope/possible seizure. Still admitted

Moderna COVID-19 vaccine #1 in series administered. 1318- pt. reported blurred vision to RN. Pt immediately assessed, during assessment pt. temporarily lost consciousness. Vitals- O2 sat-96%, HR-55, B/P-55/27, resp-16; 1320-DOD called, recommendation was to send to the ER via 911; 1324- Paramedics arrived and assessed pts. blood sugar (167), vitals O2 sat-98%, HR-71, resp 16, BP-91/40. Paramedics stated transfer to hospital was not necessary, but offered, Pt. declined ambulance transfer to ER. 1330- Continued to monitor pt. while giving oral fluids. Pt. reports she has fully regained consciousness, and blurry vision has resolved. Vitals, BP-102/42, HR-73, O2sat-96%, resp-16; 1335- Vitals, BP-110/50, HR-82, O2sat-96%, resp-16; 1400- Vitals, BP-121/45, HR-66, O2sat-97%, resp-18; 1420- Vitals, BP-125/31, HR-66, O2sat-96%, resp-16, DOD advised pt. should be assessed by MD. Pt. continues to refuse transfer via ambulance, no family members present. 1440- Pt discharged. o Action(s) taken: Recommended transfer to higher level of care, risk and benefits explained to patient, patient declined ride from ambulance to ER and was discharged. o Patient advised to discuss second dose considerations with a clinician
1031930	2/15/2021	CA	47	M	2/12/2021	2/12/2021	Shortly after the shot I began to feel itchiness in my right eye through out the day. The next day 2/13/21 I woke up with blood in my right eye. I did not have any itchiness, pain, or teary eye. On 2/14/21 the blood now was in 75% of my right eye. Today on 2/15/21 I went to urgent care to have it checked out and they told me I had a ruptured blood vessel. My entire eye is now covered in blood. I had not experienced any vomiting or had any cough of any type, or hit my eye anywhere for this to happen.

1031942	2/15/2021	PA	91	F	2/3/2021	2/6/2021	Significant loss of vision R eye-awoke on Feb 6 and noted splotches in vision of R eye. Workup suggests compromised blood flow to that eye
1031986	2/15/2021	NC	30	F	1/5/2021	1/6/2021	Starting January 6th started having itching on my upper L eyelid. The itching/pain progressed despite warm compresses multiple times a day. The morning of January 8th had swelling and redness in upper eyelid which then lead to some extremely mild ptosis and inability to fully open eyelid. I got concerned at work on the 8th because of the pain due to the swelling of the eyelid. I was able to be seen by my eye doctor the afternoon the 8th . He prescribed me topical steroid (Desonide). Personally I felt like it felt different than a stye. He reported he didn't feel any bleb or any raised lesion that he felt was suspicious for a stye. I hadn't used any new products/soaps or makeup on that one eyelid. Of note, I did fine for the second vaccine.
1032017	2/15/2021	IL	28	F	2/12/2021	2/12/2021	After receipt of her 2nd dose of the Moderna vaccine, the patient complained of her eyes feeling swollen. She also had hives her back. She was provided an icepack in the monitoring area for her eyes and was observed. She denied itching or throat tightness. Due to increasing hives and additional eye edema, she was taken to the ED. At the ED, she was examined and no hives were found upon examination, only a small area of redness on her chest. Patient was administered one dose of 50mg Benadryl in the ED. She was discharged and counseled to return for worsening signs/ symptoms which were described to patient. The patient indicated understanding and was advised to take Benadryl for symptom relief and follow up with her doctor within 1-2 days for worsening or continued problems. The patient discharged to her home.

1031847	2/15/2021	WA	43	M	2/9/2021	2/10/2021	Baseball sized diameter swelling around injection site, red (like a rash) in color, itchy, painful to touch and warm to touch. Rash looked yellow to black and blue around the edges as it progressed down the arm. Over the course of 5 days spread from injection site, around the elbow and into the forearm. Hip, knee, foot, shoulder and elbow pain on left side only, Body aches, nausea, visual impairment and loss of balance. Difficulty concentrating and relative "brain fog". Severe drowsiness in the sense of falling asleep while talking to someone and then no memory of it. Chest pressure and constant feeling of being out of breath. Cannot catch breath walking across the house from one room to the next. Severity of symptoms subsided within 24 hours, but some linger up to the time of this report. They are shortness of breath, rash with warmth and pain, lack of concentration and brain fog. Elbow still tender to touch.
1030936	2/15/2021	WI	74	F	2/10/2021	2/11/2021	light headed, foggy mind, unable to walk, lift hands and arms, did not know where i was. husband put me in high back chair, gurgling in throat or sinuses, eyes closed, could not understand him. temp just before 103. such shallow breathing he thought i might have died,. finally after prodding he saw i was breathing again. He kept putting cold rags on my head and the temp came down to 99. . kind of alert. ate a little. napped for 3 hrs, ate a little, slept 3 more hours and then slept all night. Next day was alright to drive and do about regular lifel. I have the medrna rash on my left arm. getting lighter. got up to 8 inches wide. still not 100% but can function, just need naps.

1031704	2/15/2021	GA	60	F	2/8/2021	2/9/2021	About 30 hours after vaccine I had bumps on my shoulder blade on left side where I received the vaccine - a rash that itched. It lasted about 4 or 5 hours - I put Calamine lotion on it and that soothed it. I also experienced a little itching of eyes and a slight itching in mouth. About 9:30 pm I had a rapid heartbeat for about 30 or 40 minutes. The itching sensation continued off and on the next day but bumps weren't visible any longer. The itchy eyes continued off and on for the next day as well.
1030904	2/15/2021		45	F	1/31/2021	2/9/2021	On the evening of the 9th day after receiving my first dose of the Covid19 vaccine, the injection site was painful and felt bruised and made it hard to sleep on that side of my body. By the morning of the 10th day, my upper left arm, site of the injection was very red, itchy and hot to the touch. It wasn't painful, just irritated and concerning. We marked around the red part to keep an eye on it and make sure it wasn't spreading. It continued to be red and warm to the touch for three more days. The redness did spread slightly downward to the base of my bicep area. All of the redness was finally gone by day 15 after receiving the vaccine.

1030912	2/15/2021	WA	50	F	1/21/2021	1/21/2021	She received her 1st vaccine without any adverse or side effects. Within 30 seconds of her 2nd vaccine she became flushed, within minutes she developed hives starting on her hands and then becoming more generalized, as well as itchy palms. She also was hypertensive. The COVID vaccine clinic administered epinephrine and transfer her to the emergency department where she was given prednisone, Benadryl, and famotidine. ED notes do indicate she had some mild expiratory wheezing but on further discussion with her today this is a consistent finding after being diagnosed with asthma last year (more on this below). She was monitored for over 3 hours and discharged home. Her itching resolved in the ED, hives resolved about 3 hours after discharge and other symptoms resolved around 24 hours post vaccine. She did have labs drawn in the ED: troponin and C4 WNL. CBC showed leukocytosis with lymphocytosis and eosinophilia. No personal history of seasonal, perennial, food, or bee sting allergies; asthma history as below. She did have an episode of bilateral eye swelling in December that was evaluated by her PCP; she was treated with benadryl & prednisone and this took 3 days to resolve. She has no other history of anaphylaxis, hives or angioedema. She was able to show me pictures of this today.
1030935	2/15/2021	GA	68	F	2/12/2021	2/13/2021	Started with general malaise, slight chills and some body aches. After 3 or 4 hours a headache began; it involved pressure and pain around eye sockets, pain over forehead. It began on pain scale as a "3" or "4" and over the next couple of hours became a "9" or "10". I have a past history of migraines and it was worse than any headache I have experienced. I took 1 Tylenol Arthritis and it took the pain to a "7" or "8", but only for a couple of hours, then it was back with a vengeance and nausea began. By around 8:00 in the evening of the 13th, the pain started to diminish and the next morning I had a dull ache in my head which has since resolved.
1030987	2/15/2021	NJ	68	F	2/9/2021	2/12/2021	Infection, inside lower eyelid, left eye. Treated with Ciprofloxacin 0.3% eye drops.

1031459	2/15/2021			F	12/30/2020	12/30/2020	Vision not clear; Pounding of chest; throat felt contracted; A report was received from a healthcare professional concerning a female patient who was participating in the mRNA-1273 Emergency Use Program and experienced vision not clear, pounding of chest, and throat felt contracted. The patient's medical history, as provided by the reporter, included asthma and hypoglycemia. No relevant concomitant medications were reported. On 30 Dec 2020, approximately 15 minutes prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 30 Dec 2020, 15 minutes following vaccine administration, the subject's vision became unclear, and she described everything seeming hazy and smoky. Her throat then began to feel contracted and her chest was pounding. The patient was transported to the emergency room (ER) via an ambulance. Her electrocardiogram (EKG) result was normal, while blood pressure and blood sugar results were increased. She remained in the ER overnight but was not admitted. Her vision returned to normal 5 pm the same day. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not reported. The event, vision not clear, was considered resolved on 30 Dec 2020. The outcome of the events, pounding of chest, and throat felt contracted were unknown. The reporter did not provide an assessment for the events, vision not clear, pounding of chest, and throat felt contracted.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. The Patient's medical history of asthma and hypoglycemia remains as confounders.
1031610	2/15/2021	SC	71	M	2/11/2021	2/12/2021	Went over artery on right side of face between eye and ear. 1031491	2/15/2021	CA		F	1/25/2021	1/25/2021	experienced bleeding from her eyes and red blood circles around her eyes; bleeding internally; head breaking out in lumps and pustules and itching; head breaking out in lumps and pustules and itching; head breaking out in lumps and pustules and itching; she experienced a strange headache in the frontal area; she almost vomited; noticed a strong taste of chemicals; This is a spontaneous report from a contactable consumer (patient). A female patient of unknown age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 25Jan2021 at single dose for COVID-19 immunization. Medical history included poisoned with chemicals, sensitive to chemicals, thoracic aortic aneurysm and was taking the blood thinner for that reason. Concomitant medications included 14 prescription drugs including a blood thinner. The patient received the first dose of the Pfizer-Biontech Covid-19 vaccine on Thursday, 25Jan2021. About 20 minutes after the injection, she experienced a strange headache in the frontal area. While walking out of the clinic, she almost vomited and noticed a strong taste of chemicals. On Friday night, 26Jan2021, she experienced her head breaking out in lumps and pustules and itching. On Friday and Saturday, she experienced bleeding from her eyes and red blood circles around her eyes. The consumer thought she was bleeding internally. The outcome of all events was unknown. Information on Lot/batch number has been requested.

1032059	2/15/2021		50	M	2/12/2021	2/14/2021	Unable to feel heart beating in chest, even after heavy exertion. Same thing happened after first dose, but only lasted 3 weeks. I'm able to visualize my heart rate through an application on my Watch, but do not physically feel tasked, when performing exercises that push my heart rate of over 140 bpm.
1032246	2/15/2021	CA	69	M	2/13/2021	2/14/2021	Fine for 24 hours after. At almost exactly 24 hours after vaccine, had an EXTREME reaction that lasted about 45 minutes. Extreme dizziness (actually causing me to fall even when walking a few feet), extreme nausea (I think probably caused by the extreme dizziness), weakness, profound diaphoresis. I was sick like I have never been in my life, thought I might die, and when I was the most symptomatic actually wanted to die, I was so sick. Anyway, came on over about a 10 minute period gradually, and then was absolutely profoundly ill for about 45 minutes. After about 1/2 hour or so was able to negotiate the 25 feet or so to my den couch, closed my eyes and lied down, with gradual relief coming and severe illness totally gone in about 1-1/2 to 2 hours. No return of any similar episode since. 24 hours later, still a little lethargic and mildly "achey" with some weakness, but not so bad and kind of what I was expecting.

1029034	2/14/2021	WA	62	M	2/13/2021	2/13/2021	<p>a 62 y/o M who presents with concerns for an allergic reaction to the second dose of the Covid vaccine. According to him he got the vaccine around 8:45 AM. He has a history of anaphylactic type reactions with a swelling and urticaria in the past but has not had any symptoms in the last 5 years. He felt sudden onset pit in his stomach, tingling and warm sensations over his face and some chest tightness. He denies all the symptoms currently. He did get medications prior to arrival but states his symptoms were already getting better before he been given anything. He was given epinephrine as well as Benadryl beforehand. He denies any symptoms currently. Denies headache, change in vision, difficulty swallowing, lightheadedness or vertigo, chest pain, sore throat, wheezing, cough, nausea or vomiting, rash, falls or injuries. Denies any recent foreign travel or sick contacts. He did work a full shift yesterday and was coming off a 24-hour shift prior to getting his vaccination. He denies any significant reactions to the first vaccine.</p> <p>Medical Decision Making On initial presentation is an overall well-appearing 62-year-old male who has normal vital signs without fever or tachycardia. He is presenting with concern for allergic reaction of the field to a recent vaccination. The vaccine was given roughly 1 hour prior to arrival. He was given epinephrine intramuscularly as well as IV Benadryl. He states he is currently feeling mildly tired from the Benadryl. He denies any other recurrent symptomatology and feels better. Examination is not concerning for anaphylaxis at this time, no evidence of airway involvement or multisystem involvement. No evidence of local allergic reaction. Low clinical concern for occult infection, metabolic abnormality, ACS or arrhythmia for a cause of his symptoms. He is overall very well-appearing. Labs have been obtained as part of screening for reactions to the vaccination per CDC recommendations including a tryptase and C4 complement. They were drawn over an hour after the vaccine was administered. ECG was within normal limits. After observation patient remained asymptomatic. Did offer steroids, however he wanted to hold off on them as he just got his vaccination which seems appropriate at this time. He was sent home with a new EpiPen. We also gave him follow-up in the allergy clinic. He has any worsening symptoms we do recommend he use the EpiPen as well as call 911. He is</p>

							understanding. At this point he stable for outpatient management. I did tell him he should expect to feel aches and potentially have inflammatory response to the vaccine, he is understanding of this. Pt was discharged home/self-care. Pt provided strict return precautions, including but not limited to, any worsening symptoms or any new concerning symptoms. Otherwise, Pt instructed to see PCP on an as needed basis.
1029282	2/14/2021	MI	52	F	2/11/2021	2/12/2021	2:15 am woke up with chills (as expected) followed by a raging headache. By 4:00 am I had severe vertigo where it was difficult to keep my eyes open because the room was spinning horizontally at a rapid rate, not long after I began vomiting. I attempted to take 800 mg of Extra Strength Tylenol. I called my doctor at 8:30 am and was told that the effects are common but if headache got worse I should go in. I was told to take 1000 mg of Motrin which was an issue because I was vomiting. My husband placed ice packs on my head. The vomited stopped at 2:00 pm on 2/12/2021. I took 800 mg of Motrin at that time. The headache at this point was more like a severe sinus headache and that remained with little relief until 3:30 am on 2/13/2021. I will not do a 3rd booster if it is recommended with variants. I just felt it was necessary that you knew about this reaction/side effect. This was so much more than a headache or dizziness.
1028737	2/14/2021	CA	83	F	2/12/2021	2/12/2021	Injection instantly felt hot. Within 5 minutes patient was flushed and not feeling well to the point she had to drink water and ingest candy. I offered her to lay on the ground but she just had to silence herself from the commotion in the pharmacy closed her eyes and slowly inhaled and exhaled to calm her thoughts and reaction to the vaccine. Offered her to call 911 but she declined. Her daughter was with her and waited in the vaccine room for about thirty minutes.
1029338	2/14/2021	GA	44	M	1/28/2021	2/4/2021	Blurry and cloudy vision in left eye, cant see correctly

1029275	2/14/2021	MA	51	F	2/11/2021	2/12/2021	Woke with visual distortions, elevated mood, whole body increased nerve sensations, impulsive thinking (symptoms akin to tripping on LSD). Symptoms had started in sleep state and invaded dream space and woke with them still active. Lasted about 4 hours after waking. Then fatigue and headache with no further of the symptoms that were awoken with.
1029237	2/14/2021	CA	47	F	2/12/2021	2/13/2021	Fever, Nausea, headache, body aches, facial and lymphatic swelling, swelling heat and rash at injection site, blurred vision, and fatigue. Seems like every time I woke up from a nap, I would feel a little better. Kept Tylenol on board and that helped with fever. This morning, 2/14, I am feeling much better, just have the rash and light headache.
1029177	2/14/2021	NY	37	F	2/10/2021	2/11/2021	I am due September 12, 2021. At the time of the first dose, I was five weeks and three days pregnant. I had no noticeable side effect other than a sore arm which went away within 24 hours. At the time of the second dose, I was nine weeks and three days pregnant. I went to bed early that night (7:30 pm) but attributed it to pregnancy. I awoke at 3:00 am on 2/11/2021 with a headache, fever, nausea and pain and swelling at the injection site. My temperature was 100.4. I ate some crackers and went back to bed until 6:00 am. At 6:00 am, I still had a slight fever (100.4) and the nausea was still there. I had some toast. At 7:20, I vomited. I went back to bed around 9:00 am and slept until noon. When I awoke at noon, my fever had broken (99.6) but I had an intense headache centering around my left eye and upper neck/base of my head on the left side. This headache has been continuous up to the time of writing this (4 days post second dose 2/14/2021). Additionally, I have had an increase in nausea and vomiting. On Friday, 2/12, nausea was constant throughout the day, and I vomited 7 times (5 of them happening in the morning between 5:00 am - 10:30 am). On Saturday 2/13, the nausea subsided slightly and I vomited only twice. Now, Sunday, 2/14, there is still nausea (vomiting once) and the headache. My injection site is no longer swollen, but is still slightly red and has some bruising.

1029012	2/14/2021	IL	39	F	2/9/2021	2/10/2021	Awful body aches, fever, headache, eye pain, dizziness, feeling like a truck hit me. Started about 8 hours after the vaccine, continuing up until today 2/14/21
1029006	2/14/2021	NY	59	F	2/11/2021	2/11/2021	Approximately 30-40 minutes after receiving vaccine at 3 PM , I noticed numbness on the right side of my face, starting with my lips and cheeks, which slowly spread to the rest of that side of my face. No other symptoms besides extremely sore arm that ran the length of my right arm, from fingertips to shoulder. Called the VAERS hotline, who recommended calling my MD or going to ER. Called my MD, who assessed my symptoms via phone call, and found nothing to indicate allergic reaction. Suggested it could be beginning of possible Bell's Palsy. I was told to monitor the numbness, which felt like I had a mild injection of novocaine, for half an hour and if it did not diminish, I was to go to urgent care. It seemed a tiny bit less severe in that time, so I decided to monitor at home. By 11 PM that night, the numbness was gone around my lips and cheek, but remained around my eye socket and upper cheekbone nearest my hairline. My 8:00 AM the next day, the numbness had dissipated.
1029003	2/14/2021	FL	82	F	1/7/2021	1/10/2021	I video chatted with her Thursday after receiving the vaccine. My mom was in poor health but she was talking in complete sentences and responded appropriately. She was upright in bed and made eye contact. She smiled and denied pain. By Sunday, she was extremely weak and unable to sip water with a straw. Her health had changed dramatically and rapidly. She moaned in pain and was very fatigued. Her condition continued to deteriorate over the week and she stopped talking and was constantly sleeping. They started antibiotics for the oozing cancer lesion and then morphine for pain and end of life care. She passed away on January 22nd which was 15 days post vaccination.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1028963	2/14/2021	PA	42	F	2/8/2021	2/12/2021	Adverse event: I had anaphylaxis on 2/12/21 that required transport via ambulance to the nearest emergency room for life saving treatment. Background information. I took a 7 day course of celebrex (200mg orally once daily) on 1/25/21, prescribed by my primary physician for a flare up of low back pain. A 14 day course was prescribed; I stopped taking it after 7 days because my stomach was getting upset and I didn't want to take it close to my 2nd covid moderna booster. I got my 2nd moderna covid vaccine booster on 2/8/21. For 1-2 days, my left arm (injection site) was sore and I was mildly fatigued. I took over the counter advil (200mg twice daily) and tylenol (500mg twice daily); the day I took advil, I was sneezing and developed signs of allergic rhinitis (congestion/runny eyes and nose). I did not have any other immediate adverse reaction and by Thursday, 2/11, the arm soreness and fatigue resolved. My low back pain began to bother me again, so I took a 200mg oral dose of celebrex at 7:30a on 2/12/21. I went to work (I am a veterinary neurologist. While at work, at 9:30a on 2/12/21, I had a severe anaphylactic reaction and had to be taken via ambulance to Medical Center. I developed hives/welts/burning/itching all over my body, within 5 minutes my throat closed up, I couldn't breathe, I became hypotensive/collapsed; in the ambulance, I was given IM epinephrine; then at the ER, I was given IV steroids (solumedrol), benedryl, famotidine, zofran (due to abdominal pain/nausea) and IV fluids. This stabilized my signs within 1 hour and I improved and was going to be discharged at 2pm. However, the hives returned at that time, so I was given additional IV benedryl, famotidine, fluids and oral prednisone and kept in the hospital overnight for monitoring; I was discharged to go home on 2/13/21 on a 4 day course of oral famotidine, benedryl and prednisone; I remained itchy and continued sneezing at home on 2/13/21. Today, 2/14/21, all signs of this reaction have resolved. The ER doctors and myself believe the 2nd moderna covid booster on 2/8/21 stimulated my innate immune system, leading to this anaphylactic reaction to celebrex (a medication I had taken 2 weeks prior with no problem). The doctors feel the celebrex is what set off the anaphylactic shock, but that my immune system was primed to do so after the vaccine. In hindsight, I realized that I was having allergic rhinitis symptoms after taking oral advil on 2/9 the day

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							after my booster (which has never happened to me before either). I am a person with no pre-existing allergies of any kind. There was nothing different at all in my routine including food or potential environmental exposures) on 2/12, the day of my anaphylactic reaction, other than my taking a 200mg dose of oral celebrex. I am not allowed to take NSAIDs until I see an allergist for testing now. I am reporting this adverse event as I believe the moderna booster caused an anaphylaxis to the celebrex medication.
1028852	2/14/2021	IL	32	F	2/12/2021	2/13/2021	Right after: discomfort in elbow, eye sensitivity Next day: sore arm, fever (101.5), body aches, severe chills. Third day: sore arm, inflamed lymphnode in left side armpit.
1028814	2/14/2021	PA	86	F	2/8/2021	2/9/2021	Less than 24 hours after receiving 2nd dose of vaccine, resident developed symptoms of fever (101.7F), body aches, peri-orbital fluid in right eye, right eyelid ptosis with mild facial droop, tongue deviates to the right.
1028778	2/14/2021	CA	46	M	1/7/2021	1/10/2021	On December 17, 2020, my husband, received his first BioNTech BNT162b2 COVID-19 vaccination. On Thursday January 7, 2021, he received this second COVID-19 vaccination. The following three days after his second vaccination, he felt fine. The fourth day, on Sunday January 10, my husband felt extremely fatigued. On Monday the 11th and Tuesday the 12th, he worked a full shift but complained of extreme fatigue and extreme chills to the point that his teeth were chattering while on the phone with me. He decided to work through it. When he got home on Monday night, he started vomiting. On Wednesday January 13, he woke up and had swollen eyes. Once again, he felt extremely fatigued, even after a full nights rest. He had the day off but had an early meeting. After his meeting, he was still tired so he went back to sleep. I left to get lunch, and drop off our kids, and upon my return, I found him on the walk in closet floor, face up, having passed away. He felt as cold as ice. The rapid test done after they called the paramedics resulted in a negative COVID-19 test for him.

1028859	2/14/2021	FL	76	F	2/11/2021	2/11/2021	extreme Chills followed by being very Hot and then chills again , headache , teeth hurt , eyes sensitive to light and eye balls aching and still are ,temperature 3rd day morning 100.2 never checked on 2nd day. Shot in the arm hurt 1 st day where a 1st doze shot did not hurt till next day, nausea, weakness all over and joints hurt. I took 1/2 of 2 percocets 1half every 3 hours for 12 hours and that helped with headache and teeth..tylenol did not help headache and I never have headaches. I thought I was dying. I spoke to friends who have had 2nd dose and most experienced some but not all and many nothing after 2nd dose.
1029343	2/14/2021	CA	35	F	12/21/2020	12/21/2020	Patient received the Pfizer-BioNTech COVID-19 Vaccine EUA at 1931. Then started experiencing lip tingling at 1942. Benadryl 50mg given at 1944, tingling resolved at 1950. Reports dry eyes but otherwise ok at 1956 and left the vaccine clinic.
1028783	2/14/2021	KY	24	F	2/5/2021	2/9/2021	Shingles outbreak on my face and in my eye. Flu like symptoms for 2 days after 2nd shot and then tingling/itching on my face day 3. Day 4 small bumps. Day 5 painful rash and swollen face. Day 6 and currently painful rash all over face, eye is swollen shut and shingles are now appearing on back and one blister on stomach. Everything is on the right side.
1029688	2/14/2021	NV	26	F	2/12/2021	2/12/2021	2-3 hours after injection, sore and stiff arm. Another 2 hours and I began to feel extremely fatigued in the muscles, like they weren't attached to my bones. Very difficult to move. Felt extremely tired and weak. This continued for 15 hours. 6 hours after injection and I also began feeling very cold. Fever at 101.6 F. These chills lasted approximately 6 hours. 8 hours after injection I began experiencing extreme lower back pain. This was nearly unbearable. It hurt close to the spine and radiated laterally. Heat seemed to help slightly. The pain made it impossible to sleep. This lasted approximately 12 hours, at which time I took a Tylenol and the pain subsided slightly. 17 hours after injection I experienced a headache behind my eyebrows that moved from side to side for 2 hours until I took a Tylenol. A lesser version of the headache and chills returned 48 hours after injection and lasted for 3 hours at time of this report.

1029704	2/14/2021	CA	67	F	2/12/2021	2/12/2021	Moderna COVID-19 Vaccine EUA - I received my second dose IM in my left arm at 9:16 a.m. on Friday, February 12, 2021. Within a couple of hours, I experienced soreness at the vaccination site (as I was expecting based on information provided by Department of Health and Human Services). By about 7:00 p.m. I began experiencing some of the expected side-effects (achy shoulder, arm, neck, ribs, and eyeballs). I took an Aleve (NSAID) for the pain at about 9:00 p.m. I felt a little better in the morning on Saturday, February 13, 2021. I took my second (and last) Aleve at about 7:00 a.m. that same morning and then slept for a few hours longer. By the afternoon on Saturday, February 13, 2021 most of the previously described symptoms had subsided. When I woke up at around 3:00 a.m. on Sunday, February 14, 2021 I woke up with a painful (pain level 7/10) sore throat (mostly on the R side of my throat ), noticed that I had a small blister on the left side of my lower lip, and had what looks like oral thrush or ?COVID-19 tongue?, (bumpy white patches on the tongue). I slept poorly until about 3:00 p.m. and was still experiencing these 3 oral syptoms at 5:30 p.m. on Sunday, February 14, 2021 (about 56 hours after receiving Moderna dose #2).
1029801	2/14/2021	CA	34	M	1/30/2021	1/31/2021	01/31/21 approx 12 hours after receiving the second dose of Moderna vaccine I experienced blurred vision to right eye. Upon further eval I confirmed 30% loss of vision to right eye. No other symptoms noted. To date no change in symptoms. Since onset of symptoms I have been evaluated by various providers. 02/03 MD, 02/04 MD, 02/04 emergency room intake with blood work and MRI at hospital, 02/12 MD.
1029677	2/14/2021	MO	74	M	2/12/2021	2/13/2021	Bell's Palsey with first symptoms of tearing eye beginning next day after shot. Progressed to numbness and drooping on one side of face by the next day. Went to urgent care and was immediately directed to the ER

1029660	2/14/2021	CO	71	M	2/11/2021	5/11/2021	Absolute ZERO side effects from first dose, not even a sore spot on injection location. Migraine intensity headaches started 4 hours after injection of the second dose and lasted for approx. 40 hours. Went to sleep at 10:30 PM the night of the second dose and woke up in a startled state every half hour until I got out of bed at 5:30 AM. From 5:30 AM until approx. 10 PM the day after my second dose I experienced seizure-like symptoms where I would seem to fall asleep while in a sitting position and awake just a minute(s) later in a confused state of mind. This would happen frequently and stopped its frequency slowly and stopped entirely late that same night. I experienced eye pain to the point I had to apply ice bags to my face the entire day after the second dose. Body pain was so sever I cannot compare it to any other flu-like symptoms I've ever had. Totally recovered after 48 hours.
1029656	2/14/2021	CA	26	M	2/12/2021	2/13/2021	Bell's Palsy (left sided facial droop, difficulty closing left eye lid). Outpatient treatment with oral corticosteroids, valacyclovir and topical Lacrilube (eye lubricant) prescribed by ED physician and referral to primary care for follow up.
1029536	2/14/2021	CA	35	M	1/30/2021	2/2/2021	I noticed I was itchy and had hives/swelling near my right eye, right shoulder, and right thigh.
1029638	2/14/2021	TX	49	F	1/7/2021	1/10/2021	Moderna COVID-19 Vaccine EUA. I slept for 36 hours. Upon awakening I was unable to walk on my own due to dizziness and disorientation and this caused me to throw up a lot. The migraines increased in frequency and pain. The vaccine greatly aggravated my Meniere's, Tourette's, visual dependency syndrome, vestibular migraines, and sensory integration disorder. I have had to move in to the smallest room in the house. I sleep on the same bed that I sit on all day. When I am having bad days I have to be put in a wheelchair to be taken to the bathroom that is 5 feet away. I was not doing well before the vaccine but this is vastly worse. I have injured my shoulder and have an appointment with an orthopedist because I have fallen or have tried to keep myself from falling so many times.
1029587	2/14/2021	CA	25	F	2/13/2021	2/13/2021	Besides the regular symptoms that others have reposted (fever,chills,pain, and nausea) I also had notable inflammation of the right eyelid.

1027975	2/13/2021	OH	68	F	2/12/2021	2/13/2021	I was fine when I went to bed on the 12th, at 00:30 on the 13th Feb, 2021 I woke up and felt like I needed to vomit. I made my way to the bathroom where I no longer felt nauseous, but began to feel very unwell and needed to get back to bed to lay down. I was sweating quite profusely and just wanted to close my eyes and lay there. My husband took my temp. 95.5F which restored to 97.7 after I stopped sweating. My blood pressure was normal 119/78 with a HB of 54 bpm. At this time I began to experience intense waves of pain and cramps in my lower bowel region. This continued for around an hour, after which time I returned to the bathroom to empty my bowels - although this was not diarrhea. I settled back to sleep with no more cramping and at 05.30 am I awoke with the feeling that I needed to empty my bowels again, this time it was like the end of a colonoscopy preparation., with little more fecal matter to come. I got up at 06.30 am and although I felt washed out, did not have any further issues.
1028000	2/13/2021	NC	67	F	2/4/2021	2/11/2021	One week after receiving vaccine, I had a MRI with gadolinium containing contrast used. I have had this contrast at least 3 or 4 times in the past 6 years with no problems. (last time was August 2020). This time, I had allergic reaction minutes after receiving contrast. Teeth and nose tingled, eyes itched. After MRI was done, nurse observed red flushed face, so put me in room for observation. Over next hour, arms and hands got red and itchy, and got hives in several places. Part of legs also reacted same. They finally gave me 25 mg. shot of benadryl, which helped all areas except one. That evening I still had a itchy rash about the size of a tennis ball on the upper right arm, which is where I had the COVID

Went to Urgent Care on 2/13/21 and received diagnosis of Bells Palsy. Prescribed Prednisone 60mg daily x 7 days. Will start today - 2/13/21
1028039	2/13/2021		58	F	2/11/2021	2/12/2021	Sore arm, headaches, body aches, chills, fever, acidity, burning of eyes
1027882	2/13/2021	FL	73	F	1/7/2021	1/26/2021	First dose of vaccine 1/7. Had acupuncture on 1/26. That evening began having migraine. three days later and still having severe headache felt bumps on scalp. three more days later still had headache and bumps in several places. Forehead (hairline), eye brow, eyelid. Went to emergency room in FL. The Dr. gave med a cocktail to get rid of headache and also diagnosed me with Shingles. I don't know if this was the result of 1st dose vaccine or may have been triggered by the acupuncture. I have not had Shingles before.
1027493	2/13/2021	OH	63	F	2/12/2021	2/12/2021	Started with itchy eyes (15-20 minutes afterwards), felt swelling in nose and then within approximately 30 minutes of injection tongue felt strange and started swelling like it was getting too big for my mouth. Increased BP. Given injection of Benadryl at 4pm. and squad was called for transport to ER. Had tachachardia in ambulance BP still high. Had BP cuff on, oximeter and leads on chest. Hospital monitored me. At six was given liquid Benadryl and Pepcid as felt like symptoms getting worse. Swollen nose and roof of moth felt swollen. At one point in time male nurse said my face was red. Not sure how long that persisted. Also, sounded funny when I talked when symptoms had returned. Like I had a clothes pin on my nose and sinus clogged. After 4 hours was sent home with instructions to take Pepcid once a day for 14 days and to take Benadryl every 8 hours. About 1am I was still awake. Felt like my heart did a flUp flop for lack of better words. Few minutes later felt fluttering. 2am I?m taking Benadryl and going to sleep.

1027645	2/13/2021	MD	31	F	2/11/2021	2/11/2021	I had a mild reaction of rash after my first vaccine 1/14/21 but it went away after taking 25mgs of Benadryl. The second shot I was instructed to pre medicate with Benadryl before hand. After my second shot 2/11/21, within about 5-10 minutes I started with a red hot spot on my left ear, and a rash at injection site. Then it spread down my arm and to my chest. I took another 25 mgs of Benadryl and was given Pepcid as well. My chest started getting a tightness feeling in it and then I was instructed to go to the Emergency Room. I was given solu-medrol in IV and it seemed to help. The next morning 2/12/21 I took 25 mgs of Benadryl prophylactically. At 1142, I started feeling like the rash was coming back. It started under my chin and spread all over my face to my neck and chest and to my arms. My chest started feeling tight again. My blood pressure was 154/94, pulse 108. I got in touch with the nurse who was with me the night before with my first reaction and she instructed me to go to the ER again. There they gave me another round of solu-medrol IV. And sent me home with steroids to take. Today, 2/13/21 I woke up and my face still is rashy and hot to the touch, my eyes are puffy and tongue is more swollen than usual and my chest still feels tight. I have taken the steroid dose for this morning and Benadryl 25mgs.
1027613	2/13/2021	MN	87	F	1/12/2021	1/13/2021	Mom fell the next day 1/13 and was brought to hospital emergency then released about half day later (broke her eye glasses in the fall), she had second vaccine on 2/9/21 and fell the next day 2/10 and was brought to hospital and has fractured rib and possibly two more fractured ribs. Is this a huge coincidence or did she have really bad reactions to the covid vaccines? Should she have been observed for 24 hours afterwards by the assisted living facility, had a family caretaker watch her for 24 hours, Pharmacy should have observed for 24 hours?

No complaint of difficulty breathing, heart rate or dizziness. Pharmacist in the clinic gave the patient diphenhydramine 25mg and patient was observed for additional 15 minutes. Irritation resolved and patient had no complaint at end of observation period. Discharged to home.
1027495	2/13/2021	WA	28	F	1/30/2021	1/30/2021	With 15 minutes of first dose patient experienced dizziness, blurred vision, face swelling and extreme fatigue. These symptoms subsided and the patient slept. The following day patient woke up with a 8 pain scale neck pain, stiffness and some head pain in the back of the skull, and arm soreness. Patient focused on hydration and rest. Today (02/12/2021) neck pain and stiffness has persisted, with slight headache on the back of the head. Reduced to a 4 pain scale. Overtime patient has also consistently experienced low-appetite, and fatigue. Patient is looking to understand why these symptoms have persisted, and how it can be resolved.
1027835	2/13/2021	NH	71	F	2/1/2021	2/7/2021	on 2/7 intense full body itching and hives, 2/9 both eyes more than bloodshot (looked full of frank blood) after taking 1 dose of prednisone, 2/9 woke to face and eyes badly swollen As of 2/13 itch is diminishing but still acute
1027476	2/13/2021	WA	66	F	2/9/2021	2/10/2021	18 hours after 2nd dose, severe cramping, diarrhea, sweating. Passed out while on toilet. Came to with nose bleeding from both nostrils, goose egg on forehead. Husband helped me back on commode, more diarrhea, then threw up 3 times. After 15 minutes, helped back to bed, chills, shakes, fatigue. May have broken/cracked nose and slight concussion - was slightly confused for 24 hours, headaches, unable to wear eyeglasses due to swelling and bruising on nose. Ice pack on nose 4x day for 15 minutes. Tylenol and Ibuprofen for pain. At 60 hours (after injection) welt is fading and not hot, beginning to feel better, although still fatigued, and headaches continue. This description was sent to my doctor.

1028120	2/13/2021	NC	28	F	2/11/2021	2/11/2021	Called to see patient ~10 min after prime dose of Moderna COVID-19 vaccination. Patient reported acute onset of left eye swelling sensation and throat tightening. Was able to talk without difficulty. Normal salivation. Moved immediately from observation area to treatment room. Reaffirmed that symptoms persisted and that time she also reported chest tightness. Vitals were normal and pulse oximetry = 99%. Exam conducted while vitals being measured. No wheeze or stridor. No rash. No obvious oral lesions or swelling. Eye lids not swollen. Epi IM given at once (within 1-2 min of arrival at the treatment room). Symptoms resolved over the next 10 mins. Vitals were monitored frequently. Heart rate was increased before and just after Epi then dropped to ~70 b/m. Other vitals also remained normal and she was comfortable. EMS was called and she was transported to ED for continued observation. Husband accompanied her. She was seen in ED and observed for 4 hours. Benadryl, Pepcid and Prednisone taper prescribed. She was released from ED.
1028508	2/13/2021	NJ	72	M	2/5/2021	2/6/2021	moderately high fever, headache for two days, then three days later (Tuesday morning) Signs of TIA - slurred speech, central vision blurry, word recall difficulty

1028383	2/13/2021	NY	45	F	1/28/2021	2/2/2021	I received the Covid vaccine on 1/28/21- and had been completely healthy. But 5 days later on 2/2/2021- the LEFT side of my face was no longer moving the same as the right side of my face. I went to the mirror and noticed that I couldn't smile, couldn't raise my eyebrows , couldn't close my eyes shut... and realized that i was experiencing a BELLS PALSY. I called the doctor and got a prescription for Prednisone and Valacyclovir. that same day. The next day 2/3/21.. I got in to see the neurologist who confirmed the diagnosis and asked that I get an MRI of the brain and start physical therapy on my face due to facial memory loss-- which I did the next day 2/4/2021. The hardest part of this facial paralysis has been my eye- which continuously runs and burns- so much so that the neurologist sent me to a cornea specialist- whom I saw the next day on 2/5/21. I was instructed to tape the eye down to prevent severe dry eye and allow eye to rest. I have been going to PT now twice a week since then, taping my left eye and completing massage exercises at home as i was told.
1028382	2/13/2021	CT	52	F	1/27/2021	2/4/2021	On 2/4 it began with severe pain from behind my left ear radiantly upward to the top of my head.I have numbness on the left side of my face with mouth distortion (only opens to right side)My left eye does not blink or close.I tape it close nightly per MD.

1028381	2/13/2021	MA	34	M	1/25/2021	1/31/2021	Delayed reaction to the vaccine that began 6 days after first dose and persisted for approximately 3 days. I first became itchy on my abdomen and arms, I then developed flat oval hives and my eyes and upper lip began swelling. My throat did not swell. I took 2 Benadryl that evening that helped the itch and caused the facial swelling to subside somewhat. I slept thru the night and when the Benadryl wore off in the morning, the same symptoms returned. I took 1 Benadryl which again calmed the symptoms. The same symptoms returned in the evening and I went to an Urgent Care. I was prescribed Prednisone and more Benadryl. These medicines helped to calm the symptoms even more, but the itchiness and hives did come and go thru the next day. On day 3 I took Zyrtec in addition to my last dose of Prednisone and the itchiness subsided completely. I took one more dose of Zyrtec the next day and the symptoms have not returned. I followed up with my PCM who tested for a Hazelnut allergy as I had eaten them that first night. She also referred me to an Allergist. I saw the Allergist who said in their opinion my immune system was having a reaction to the first dose of the COVID-19 vaccine and classified me as "medium risk" for the second dose. He recommended that I still get the second dose and to premeditate with Zyrtec the night before, day of and for 7 days following.
1028219	2/13/2021	NY	71	M	2/9/2021	2/10/2021	On the afternoon following second dose of the Pfizer Covid vaccine, I began to experience worsening of myasthenia symptoms, principally diplopia and difficulty with swallowing. Symptoms persisted the following day and on third day following I experienced very severe fatigue in combination with diplopia, ptosis of both eyelids, right side weakness and trouble swallowing. Called doctor, who increased prednisone and today symptoms have almost entirely abated.

1026019	2/12/2021	TX	39	F	1/26/2021	1/1/2021	I got a strange vision/hallucination; rapid and hard heartbeat; shortness of breath; nausea; headache; had nightmares all night; stiff, sore arm; stiff, sore arm; my arm has a bumpy, red mild rash at and around injection site; my arm has a bumpy, red mild rash at and around injection site; This is a spontaneous report from a contactable consumer, the patient. A 39-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EN5318), via an unspecified route of administration on 26Jan2021 at 14:45 (at the age of 39 years) as a single dose in the right arm for COVID-19 vaccination. Medical history included fatty liver. The patient had no known allergies. Prior to the vaccination, the patient was diagnosed with COVID-19 on an unspecified date. Concomitant medications were not reported. The patient reported that on 27Jan2021 at 12:30 AM, approximately ten hours after the vaccine, the patient experienced a rapid and hard heartbeat, shortness of breath, nausea and headache. These lasted for one and one half hours. As she lay down falling asleep she got a strange vision/hallucination (this had never happened to her before) of her eyes turning lightning blue and her body rising up in the bed. She stated that she does not take medications or drugs and does not have a history of mental illness. She could not shake the vision. She fell asleep and had nightmares all night and nightmares are rare for her. One day two she woke up fine just a stiff, sore arm. On day three her arm has a bumpy, red mild rash at and around injection site. The patient did not receive any treatment for the events. Lab data included a COVID SARS CoV-2 positive test on an unspecified date. The clinical outcomes of hallucination, heart rate increased, shortness of breath, nausea, headache, nightmares, pain in arm, limb stiffness and vaccination site rash were reported as recovering. It was also reported that since the vaccination, the patient had not been tested for COVID-19.

1025665	2/12/2021	GA	68	F	2/11/2021	2/11/2021	~~My eyes feel strange" Calm and cooperative. 12:25pm. Lungs clear, symptoms absent. Patients reported eye strain has improved. Raspy voice that patient attributes to as Asthma symptoms. Pt. declined EMS services and was observed for 50 minutes prior to departure. Oral Diphenhydramine 1 ml. PO, 12.5mg/5ml given at 12:25pm. Disposition: Patient status stable, declined need for EMS, also no immediate need observed. Observed for 45min.
1025633	2/12/2021	NY	48	F	2/11/2021	2/11/2021	COVID-19 Vaccine EUA; Got vaccine around 5:30pm 2/11/21. About half hour later, face felt a little weird like when you are coming off of novocaine at the dentist. Tip of nose & cheeks sort of numb. Head felt heavy/pressure. Didn't think much of it, but still feeling it the next day (19 hours after shot). Face just feels funny. I feel the same way when I am around a lot of balloons or rubber tires since I have a latex allergy. Sort of affecting my vision as well, seems to go out of focus every now and then.
1025625	2/12/2021	MN	67	F	2/9/2021	2/10/2021	On 02-10-21 at 6 PM I started having a reaction when both my ears felt plugged and within a short time noted decreased hearing. By 9 PM I also had a severe headache with eye pain and dizziness and started to have chills and fever. The chills and fever lasted during the night even with the use of tylenol and ibuprofen. The highest the fever was 100.6. On 02-11 continued with ear problems, headache and eye pain and dizziness. Also at about 10 AM I thought I had an episode of hallucinating when I saw a man walk into our house. When I asked who he was he disappeared. I have had no more episodes like this. This morning I continue with headache and eye pain, dizziness and ear problems. My left arm at the site is pink about quarter size and itches. The symptoms are less painful than 02-11-21.

1026062	2/12/2021	CA	48	M	12/18/2020	12/18/2020	Within 30 seconds pain on my arm and it increased slightly. I was able to do my work. But every time I was stable and tried to use it again I felt pain again. Pain was always there - it was tolerable. I was told to take Ibuprofen about three hours later. Second day, I could feel it but I didn't take medication. It slowly went away. No swelling, nothing. On January 4th started having symptoms nose bleeding; diarrhea; cold sweats; had a fever - but I didn't take it to know what it was. I very tired/ extremely sleepy; my eyes started feeling warm- these symptoms crept up on me. It started around 10:00 am and within an hour an a half I had to tell my boss and they told me to leave work - but I couldn't drive. I stayed in my car and just slept and I was extremely tired. I had a coworker keep an eye on my because I looked really bad. I slept two or three hours in my car. I was still tired and I couldn't drive yet. So I stayed in my car a little longer until I felt stronger and drove home. I had started coughing and knocked out - but I was beginning to coughing a lot on drive home- the first hour I couldn't sleep because I was coughing so much - lasted an hour. Chest coldness for a couple of days - cold chest. It wasn't tight. Next day, January 5, 2021 - went to doctor and they ordered COVID test. Dr thought I had a stomach virus. Diarrhea continued for two days. Weak and fatigue for 5 days. My Fever - temperature was on the first day was one day only. Second day, I did have a lot of fatigue and I was coughing a lot. The fatigue lasted 10 days.

1026109	2/12/2021	WA	44	F	1/29/2021	1/30/2021	Received 2nd dose of Pfizer vaccine on 1/29/2021. The day after the vaccine patient started experiencing bilateral itchy eyes. She went to urgent care and they gave her eye drops (unknown medication) but they made her sleepy so she discontinued. Patient presented to employee health and was recommended to take 10 days of oral anti-histamine without improvement. Re-presented to employee health 2/9/21 reports of increased eye itching and that itching was migrating down to her neck. She denied itchiness of the throat, rash, or redness. Employee health sent patient to urgent care.
1026125	2/12/2021	TX	59	F	2/10/2021	2/10/2021	Both of my eyes swelled and I had a subconjunctival hemorrhage in my left eye that covered 3/4 of my eye and my eye was so swollen it was almost closed. The blood from the hemorrhage moved under my skin like a bruise over my cheek bone and across my nose and felt my face burning for over an hour. The under skin hemorrhage dissipated after about 15 minutes and then I could feel blood running down my throat and could taste it. A severe headache started just a few minutes after the hemorrhage. I have also experienced other normal Covid vaccine symptoms and became very sick from them, Both of my are sore and still swollen and still a have a bloody eye 2 days later.
1026143	2/12/2021	WI	62	F	2/9/2021	2/12/2021	This was my second dose of the COVID vaccine. I had no reactions to the first dose. After the second dose on 2/12/21, I had the standard body aches and slight fever. As I got ready for bed, I took 2 of the chewable Allergy tablets before bed as I had done about 5 other times over the course of 6 months to relieve ear stuffiness that accentuates my tinnitus and impacts my sleep. I never experienced any reaction after taking it those days in previous months. I took the tablets at 8:45 p.m. on 2/11/21. At 2:00 a.m. on 2/12/21, I woke up from feeling very dizzy and nauseous. I was drenched in sweat and shaking. I opened my eyes and the room was spinning wildly. This went on for 45 minutes. I eventually started throwing up. I began feeling better after the vomiting stopped.

1026212	2/12/2021	IL	65	M	1/20/2021	1/21/2021	<p>History Chief Complaint Patient presents with ? Elevated Blood Pressure ? Dizziness multiple times a day Patient who presents to the emergency department today for evaluation of hypertension, head pain, blurry vision, and neck pain. He states about 6 months ago he had open heart surgery. Since that time he states that he has been having intermittent episodes of blurry vision usually lasts a few minutes and resolve on their own. Today however, he notes that the blurry vision lasted for greater than 5 minutes and he started to become concerned. During that time he also began to experience some pain in his neck and a headache in the back of his head. He took his blood pressure at that time and noted that his systolic blood pressure was in the 190s. This alarmed him and so they called EMS. When EMS arrived they rechecked his blood pressure again and his systolic blood pressure was over 200. Upon arrival here to the ER he states that he is feeling much better and his blood pressure appears to be better as well. At this time he states he still having some right shoulder pain and a little bit of right-sided neck pain but he does state that he had his Covid vaccine yesterday in his right arm. Currently patient states he still has a little bit of a posterior headache but it is much improved. He denies any fevers, body aches, chills, cough, chest pain, shortness of breath, palpitations, lightheadedness, nausea, vomiting, abdominal pain, diarrhea, constipation, dysuria, hematuria, or swelling of the lower extremities. He has no known drug allergies. ? ED Course: I discussed physical exam finding with patient. Apparently most of his symptoms have already resolved at this time. His blood pressure is back down to 142/98. I still advise since he was having some weird blurry vision I would like to get a CBC, CMP, troponin, EKG, and a chest x-ray. Patient agreeable to this plan of care. We will also continue to monitor his blood pressure to ensure that it does not spike back up. Patient's work-up was unremarkable. His blood pressures down to 123/60 and states he is feeling much better. This point time it sounds like what happened was a hypertensive urgency. I advised him he needs to contact his PCP and schedule close follow-up discuss if anything further needs to be done. At this time though he is safe to be discharged home with strict return precautions. ED Course Procedures Clinical Impressions as of Jan 20 2235 Hypertensive urgency</p>

1025002	2/12/2021	VA		F	1/23/2021	1/26/2021	Wobbly; Sees double; BP dropped; Fluid behind ears; Lower back pain; Ear infection; Severe Vertigo; Dizziness; A spontaneous report was received from a consumer who was also a 81-year-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced severe vertigo (vertigo), dizziness, ear infection, fluid behind her ears (middle ear effusion), being wobbly (gait disturbance), seeing double (diplopia), lower back pain (back pain), and blood pressure dropped (blood pressure decreased). The patient's medical history included arthritis and migraine. Products known to have been used by the patient included fluticasone propionate/ salmeterol xinafoate, botulinum type A, duloxetine hydrochloride, hydrochlorothiazide (HCTZ), umecidinium bromide, atorvastatin calcium, gabapentin, raloxifene, sumatriptan, telmisartan, cetirizine hydrochloride, cholecalciferol, calcium, zinc, probiotics, apoeaquorin, and galcanzumab-gnlm. On 14 Jan 2021, the patient saw an ear doctor for ear pain. Treatment included steroids and eardrops that were antibiotics. On 23 Jan 2021, prior to the onset of the events, the patient received the first of two planned doses of mRNA-1273 (Lot number: 039K20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 26 Jan 2021, approximately 3 days after the mRNA-1273 vaccine was given, the patient noted she started getting severe vertigo or dizziness. On 28 Jan 2021, she saw her physician who attributed the dizziness to an ear infection that went undiagnosed. She also had fluid behind her ears. On 28 Jan 2021, a different doctor informed her that her eardrops were not going to touch the ear infection she had and prescribed amoxicillin. She reported that she still has dizziness. She stated that she was still wobbly and sees double. She then saw an ophthalmologist for her double vision and his concern was that it was not an eye issue more of a head issue and should be checked for a transient ischemic attack (TIA) or stroke. She then went to the emergency room (ER) to get it checked out and left the ER after waiting over 2 hours. The triage nurse at the ER told her that she was beyond any help since it was after 90 minute window if she had a stroke. She was attempting to get a CT scan of her head done. She was given pain medication as well for lower back pain. She was taken off the HCTZ because blood pressure dropped

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>

after getting the vaccine. Consent to contact was obtained. Treatment information included amoxicillin, meclizine and pain medication. Action taken with mRNA-1273 was not reported. The outcome of the events, severe vertigo, and/or dizziness, ear infection, fluid behind her ears, being wobbly and seeing double, lower back pain and blood pressure dropped, was not resolved.; Reporter's Comments: Based on the information provided the event of ear infection is unlikely related to the vaccine administration as event was pre-existing , Although a temporal association exist between the other events and mRNA-1273, critical details is lacking as patient is of an advanced age and has an undisclosed cardiac condition (on treatment with HCTZ ). Hence, there is not enough information to adequately assess association with mRNA-1273 at this time.

1025157	2/12/2021	WA	45	F	1/29/2021	1/29/2021	The night of vaccination I got a headache, severe nausea and diarrhea. This continued through Sunday. Sunday evening I felt a greater pain and heat at injection site. I went to the bathroom to look at it and noticed not only did I have what looked like a band of a rash around my arm but also my cheeks looked to have a rash. I also started to feel throat tightness. Not like I couldn't breathe but just a little tight and harder to swallow. I took an antihistamine immediately. Arm rash lasted for 3 days after Sunday. Headache and nausea were gone at this time but I still had severe diarrhea. Diarrhea continued for the rest of the week. It wasn't always urgent? but any moment was diarrhea. For example some days I may have had only 2 bouts of diarrhea while other days I had over 10. I had tried anti diarrhea meds all week with no change in condition. It did not seem to help at all. I went to urgent care a week from the day of vaccination. They took fecal samples, gave me an rx for bentyl (which I found out I couldn't have filled due to my eye issues). My first day without diarrhea was February 10th. Diarrhea was replaced with nausea and cramping. It is now February 12th in the am. I am feeling mostly ok at this time but am not sure how I will once I'm up for awhile. Test results from samples were received feb 9th and negative for anything infectious.
1025298	2/12/2021	LA	50	F	1/29/2021	1/30/2021	Left side of face started going numb and tingling, jaw hurt and felt still, began rapid breathing and had watery eyes, then left side of body had less sensation
1025193	2/12/2021	MN	38	F	2/9/2021	2/9/2021	I began with having tremors/chills a few hours after receiving the vaccine. I then developed a fever and pain, redness, swelling and warmth at the injection site. Second day fever was up to 103.6, worsening symptoms. Today (day 3), continued fever, very severe headache (can hardly open eyes or stand up), aches all over, appetite loss, shaky, chills, nauseous, hard to get out of bed.
1025491	2/12/2021	CO	70	F	2/10/2021	2/10/2021	Arm hurt at site of shot, Very Tired, Very Thirsty (drank 3 full glasses of water in a couple minutes), Weak leg, (briefly, Aching, Dry eyes even with home humidifier on furnace, ribs hurt for about 5 min. and wheezing upon awakening at 4:45am, most symptoms gone by about 7:30am, Thursday.

Per patient, she woke up feeling nauseous went to bathroom became faint when she turned on the light and passed out. Per patient she believes she hit her head on the bathroom since. 1x1.5 inch bruised are noted to left forehead. Per patient she was seeing a bright spot and blurry vision to left eye for 45 minutes following the fall. At time of assessment patient experiencing mild headache and fatigue. Patient took 600mg ibuprofen at 4AM.
1025453	2/12/2021	MA	78	F	2/9/2021	2/9/2021	I started having a headache and felt listless and tired. body aches. lack of appetite. fever of 100. took a tylenol. I woke up at 5am the 10th and I was shaking and having chills and I was hot and cold... I was dizzy and my eyes hurt. My arm was hurting. I took another tylenol. at 6am I called my NP daughter for advice and she told her it was a reaction of the vaccine. my fever was 102.5. I was advised to take more tylenol and to rest. the fever broke later that morning but I was still experiencing those side effects. 3 days later I'm still not 100%.
1025460	2/12/2021	CA	72	M	1/19/2021	2/3/2021	Patient went to bed totally fine and woke up saying he could not see in one eye. I rushed him to the emergency hospital they ran cat scans, MRI, heart tests etc. He stayed overnight while they checked. The next day we went to eye doctor who told him he had a eye stroke. He would regain some of his site not all of it. Something to do with blood clot or loss of blood to the eye. I was not satisfied with that so made another drs appointment for the next day with a different eye doctor. The first eye doctor gave us some blood test to do so we did it then. Later that evening we got an emergency call form the first eye doctor to get back to the hospital right away he could lose sight in the other eye.. They found some high c-reactive protein. Normal is 8 his was over 40. They put him on heavy steroids and did biopsy on both temples of his eyes. This started last Wednesday morning. He was released from the hospital Monday Morning to see his regular doctor that afternoon. Test results for the eye would be Tuesday and all other vital tests came back fine thank goodness. On Tuesday the biopsy tests also came back negative so they are stopping steroids. I think they were looking for auto immune issues. Today we are going to Rheumatologist

1025478	2/12/2021	GA	68	F	1/29/2021	1/31/2021	I got my COVID Vaccine shot on Friday, January 29th at 2:00 pm. By Sunday, January 31st at 5:00 pm I had a reaction to my Right Eye. On Monday, February 1st I went to my Eye Doctor thinking I had something in my eye that I couldn't get out on my own. It turned out I had developed an eye ulcer. I have NEVER had any problems with my eyes before. I was put on 2 medicated eye drops (Durezol 2x daily for a week and Gatifoxacin 4x daily). I had a follow up appointment one week later, February 9th and it was determined that the infection had deminished, but my eye was still dry and I needed to put drops (Refresh Tears) in daily for and additional week. I would like to report that this may have been a side effect from the shot.
1025168	2/12/2021			U			On Feb 9 and Feb 11 I had an allergic reaction with rash, hives, swollen eyes and tight scratchy throat and needed IV drugs to stop the spread and relieve the symptoms. I was in the ER 2 times in a 48 hour period.

1026783	2/12/2021	MS	33	M	2/1/2021	2/1/2021	I noticed a headache in the very top of my head within an hour of getting the vaccine. I thought it was normal because everyone I know said they got a headache from it. Over the next few hours, the pain moved down the back of my neck and became a burning sensation at the bottom of my skull. The pain was not excruciating but was constant. I thought it would eventually go away. I'm a pilot and fly for a living. Two days after receiving the vaccine I flew my plane and immediately noticed something was wrong with me. I was having a very hard time focusing. Approximately 2 hours into my flying I felt sudden and extreme pressure in my head and nearly blacked out. I immediately landed and stopped flying. Two days later I tried flying again and the exact same thing happened again after 20 minutes. The burning in my neck intensified and was now accompanied by dizziness, nausea, disorientation, confusion, uncontrollable shaking, and tinkling in my toes and fingers. I immediately went to my hometown doctor and he diagnosed me with vertigo. He prescribed me meclizine on Friday 02/05/2021. I took the medicine as prescribed all weekend with no relief. Monday 02/08/2021 I made an appointment for that Wednesday at the Institute. During Wednesday 02/10/2021-02/11/2021 I had roughly 10-15 test performed on me including balance, eye and hearing test, CT scan, MRI, and measured my spinal fluid pressure. The physician determined on 02/11/2021 that I had an allergic reaction to the Pfizer COVID vaccine the severely increased the pressure in my spinal cord and brain stem. That pressure causes my vision problems and ultimately ruptured my left inner ear breaking off several crystals in the process. I cannot fly with this condition. I'm currently taking Diamox to reduce the pressure in my spinal cord and brain stem.

1027171	2/12/2021	IA	66	F	2/10/2021	2/10/2021	At 4:55, patient received a COVID-19 Pfizer vaccine. At the time of administration patient expressed she had experienced a previous reaction to a pneumonia vaccination (unknown time frame) and that she did not like to receive shots. She requested that the person administering the vaccine count down before giving shot. Patient appeared nervous and was breathing heavily before she received her vaccine. Patient was instructed to sit and wait 15 mins. after vaccine administration in case of an adverse reaction. At time of check-out from the pharmacy (15 mins. after vaccination), patient expressed to pharmacy intern that she felt a "little dizzy" and that she had experienced "slurred speech" immediately after having received the vaccine, however had not communicated this to pharmacy staff. Pharmacy intern immediately took patients blood pressure and it was 176/99 mmHg and 162/101 mmHg during first two blood pressure checks. The pharmacy staff requested patient to remain within the pharmacy premises so that she could be monitored for more time. She then was checked every 5-10 minutes for approximately 2 hours. During this time, she described vision changes, dizziness, and a strange "fogginess" around her head. Additional blood pressure monitoring was conducted for results of 158/100 mmHg and 195/100 mmHg. Pharmacy Manager discussed options with patient, including having her go to an Urgent Care facility or calling 911, so that paramedics could assess her. patient expressed she wanted to be taken to the hospital, therefore intern called 911. Paramedics arrived shortly after and determined patient had not experienced a stroke. Her neurological exam was negative. Paramedics stated that patient was most likely experiencing an allergic reaction. The paramedics then proceeded to take patient to the hospital at her request around 7:00 PM. Multiple pharmacists and pharmacy interns spoke with her during this time frame of ~2-2.5 hours, took her blood pressure, and assessed her condition.

1027230	2/12/2021	WI	66	F	2/1/2021	2/1/2021	Onset of mild swelling of upper eyelids about 15-20 mins after vaccine injection, 2/1/2021, with mild itch sensation around mouth about another 15 mins. later. Next day started to have itch sensation all over face slowly spreading to ears, eyelids still mildly swollen around noon. Took Benadryl 25 mg without change but on progression. Took another Benadryl 25 mg 1/2 hour later with resolution of symptoms. Started slowly having recurrence of same symptoms today, 2/12,2021, with improvement after Benadryl 25 mg. Symptoms reoccurring again about 6 hours later, better again after another dose of Benadryl 25 mg.
1027256	2/12/2021	WA	65	F	1/21/2021	1/28/2021	On January 28, she had severe itching and redness, rash, swelling at the injection site around 6:30 PM. She put ice on it and hydrocortisone cream. The next day, the redness, swelling and itching extended to a large area on the upper arm location and she also started to have pressure under both eyes. She then started to experience a red rash on other parts of her body to include her right arm, shoulder, back. She describes these rashes as hives. She took Benadryl and applied ice. In the morning, she had a red rash on both of her thighs. On January 30, she had less swelling and no noticeable itch. Later in the afternoon, she had more itching, pain, redness occur in the left arm again along with the abdomen, chest and both sides of her neck, under her arms and on her legs. She took Benadryl and repeated later in the evening before going to bed. She also used hydrocortisone cream. On January 31, had the same experience. February 1, she had tingling on her back along with neck, head. She took Benadryl and used hydrocortisone cream. February 2, her left lower eyelid began itching but no redness or swelling. This continued on February 3 but was less. Nothing on February 4th and then on February 5, she had a slight itch rash on her left arm near her armpit that was responsive to hydrocortisone. She has not had any symptoms since then.

1027269	2/12/2021	HI	53	F	2/5/2021	2/5/2021	After receiving 2nd doss of COVID 19 Lot #043L20A developed facial numbness, flushing, on right periorbital region, spreading to Lateral periorbital area near the right eye. Side effect occurred after the 15 minute wait following the vaccination. She returned to clinic after having left the clinic setting, reporting the side effect. She was assessed by Dr Temperature 96.8 F, pulse 80 Beats per minute. Dr. provided client with Benadryl 25 mg oral. Symptoms began to resolve after 15 minutes of monitoring, with just mild residual numbness. Cleared to drive home. Dr. instructed pt. to seek further care if Sx. return, worsens, or if numbness fails to resolve within 72 hours. Dr. received a call from the vaccine recipient today, one week after receiving the vaccine reporting that symptoms have persisted and have worsened despite steroid treatment. Pt continues to have right upper lip numbness that has spread to right cheek and corner eye. Reported intermittent visionary blurriness and mild right droopy lip. She had 10-yr history of episodes of right-lip numbness to chemicals/smoke/irritants, but typically resolve in 1 day. This is the most serious and prolonged reaction she has had. Dr. has discussed with pt. that it is plausible that it is a neurological reaction to PEG component . Need further follow up patient.

1026015	2/12/2021	OR		F	1/24/2021	1/24/2021	Had headache that was similar to migraine; Feeling foggy; Diarrhea; Episode of nausea; Extreme fatigue; Muscle ache; Rash inside armpit; Anaphylactic reaction; Tingling in arm; Itching; Rapid heartbeat; Started feeling hot; Petechia eye; Tiny broken vessel on both ankles; A spontaneous report was received from a consumer who was also a female patient over the age of 55 but under 60 years of age who received Moderna's Covid-19 vaccine (mRNA-1273) and who experienced anaphylactic reaction, tingling in arm, itching, rapid heartbeat, started feeling hot, rash inside of armpit, petechia eye, tiny broken vessel on both ankles, headache similar to migraine, nausea, extreme fatigue, feeling foggy, muscle ache, and diarrhea. The patient's medical history was significant for anaphylactic reaction to cephalosporin antibiotics. No other medical history was provided by the patient. Concomitant product use was not provided by the patient. On 24 Jan 2021, prior to the onset of symptoms, at the County Health Department, the patient received the first of two planned doses of mRNA-1273 intramuscularly into her upper left arm. Because of her past medical history, the patient was observed for 30 minutes at the facility for any adverse reaction. When the observation period ended the patient went to her car and sometime later began having a delayed reaction. She reported experiencing the following symptoms: "tingling in arm", "itching", "rapid heartbeat", "started feeling hot", "rash inside of armpit", "petechia eye", and "tiny broken vessel on both ankles". The patient went to an Urgent Care Clinic, where she was treated with an injection of diphenhydramine and an oral prednisone. She was given a prescription for diphenhydramine, and prednisone. The patient was informed that she had an anaphylactic reaction to the vaccine. On 25 Jan 2021, the patient stated she had a "headache similar to a migraine", "episode of nausea", "extreme fatigue", "feeling foggy", "muscle ache", and "diarrhea". She was being followed up by an allergist. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the events, anaphylactic reaction, tingling in arm, itching, rapid heartbeat, started feeling hot, rash inside of armpit, petechia eye, and tiny broken vessel on both ankles, and headache similar to a migraine, episode of nausea, extreme fatigue, feeling foggy, muscle ache, and

At around 1035 hours the patient was given 0.3 mg of epinephrine and her BP was then 81/37 and a HR of 55. Medics arrived at 1040 hours and the patient was sent to a hospital.
1026351	2/12/2021	ID	54	F	1/15/2021	1/1/2021	Patient reports large "crater" or "divot" in left deltoid after receiving Moderna first dose. "Crater / divot" was visualized in clinic and is substantial. Nickel sized divot noted upon visualization.
1026358	2/12/2021	CO	34	F	12/30/2020	2/3/2021	I started experiencing allergic reaction to all of my facial/body topical products on 2/3/21. I break out in hives/swelling/ redness/ itching at site and some times burning and swelling/hives around my eyes and throat. I have been just taking Benadryl, which does take away the symptoms within a couple hours.
1026368	2/12/2021	OH	38	F	1/29/2021	2/7/2021	I received the Moderna COVID 19 vaccine on January 29, 2021. On the night of February 7, 2021, I noticed a redness on the upper left arm, where I received the injection. At first, it extended 5 inches by 10 inches. As of today (February 12, 2021), it is about 6 inches by about 10 inches. Sometimes, it felt warm to the touch and itched a little. It seemed redder before I took my evening shower than at other times of day. It was never painful to the touch. I contacted my primary care physician, on Tuesday February 9 2021, and had a visual examination. Dr. recommended that I apply an ice pack to the affected area 3 times a day for 5 minutes at t time and also that I take Tylenol 3 times a day. This morning (February 12, 2021), I went in to the doctor's office for a follow-up, where the nurse prescribed IC Cephalexin capsules (500 mg), to be taken 4 times a day. For now, we are continuing to monitor the condition of my arm.

1026513	2/12/2021		33	F	2/10/2021	2/10/2021	Mild muscle and eye aches starting at 6:30pm on 2/10 (day of vaccination), progressing to moderate-severe by 11:30pm and treated with Tylenol. Moderate response to medication. Continued for approximately 36 hours, again responding moderately to Tylenol and later addition of Aleve. Almost completely resolved about 8pm 2/11 with some lingering mild fatigue. No fever recorded but also did not check often. Also mild soreness at the injection site not yet resolved, and mild swelling at the injection site lasting ~8hr (noted before bed 2/10, resolved before morning).
1026630	2/12/2021	PA	48	F	2/4/2021	2/5/2021	After the first vaccine I experienced some pain on the left side of my neck into my jaw. The day after the second vaccine I noticed a lump above my left clavicle. That evening the lump was larger and visible. The next day the lump became even larger and at one point the swelling in my neck seemed like it might impede my airway. After using a warm compress the swelling came down a little. I called the on-call doctor who recommended a follow up in the office. It wasn't until 2 days later that it wasn't visible anymore but could still be palpated. I had an appointment with my physician on Tuesday just to make sure it was a swollen lymph node. She advised it was soft and moveable and most likely a swollen lymph node but to keep an eye on it and if the swelling didn't go down in two weeks to get further testing.
1026694	2/12/2021	MD	59	F	2/11/2021	2/11/2021	About 30 minutes after shot, I got a warm sensation. I started to break out in cold sweats, I felt extremely nauseous. Had slight tunnel vision. Lasted about 30 minutes then I was fine. Just felt very cold the rest of the evening.

1026613	2/12/2021	CO	70	M	1/30/2021	2/7/2021	<p>None of my health care providers have been able to explain the cause of my sudden loss of vision in my left eye at approx. 10:15 p.m. on 7 Feb 2021. At approx. 3:00 a.m. on 8 Feb I called my ophthalmologist's answering service and my ophthalmologist called me back shortly thereafter. She told me I should go to the ER which I did at approx. 4:00 a.m. where blood tests were done, an ultrasound of my left eye, CT scan of my head, and MRI of my head were performed all with negative results. When my vision was tested at the ER using the standard wall chart, I was unable to see the largest letter on the chart with my left eye. I saw my ophthalmologist at approx. 1:40 p.m. the same day after my 6 1/2 hour ER visit. I was diagnosed with Central Retinal Vein Occlusion. Both of my eyes were dilated and photos were taken of each eye. I was given an injection of Avastin in my left eye. As of today, 12 Feb 2021, I am still functionally blind in my left eye. I can see general large objects but am unable to see details or read written words either near or far. Prior to approx. 10:15 p.m. on 7 Feb, my vision was as it had been for several years prior with little if any degradation. I typically have an annual eye exam by my ophthalmologist but due to Covid-19 my last eye exam was 9 Dec 2019 at which time there was nothing to suggest that I would have such loss of sight in either of my eyes. I am a healthy person who takes no or very little medication when prescribed. I have never been hospitalized (other than this ER visit) or diagnosed with any significant medical condition. In late Dec 2020 following routine blood tests, I had a teleconference "physical" with my PCP at which time I was declared to be healthy. Upon leaving the ER at approx. 10:30 a.m. on 8 Feb my "end of visit vitals" were recorded as blood pressure 110/63, BMI 20.92, weight 150 lbs., height 5'11", temperature 97.6 F, pulse 67, respiration 16, and oxygen saturation 95%. Late last year I had my usual flu vaccination without any side effects. After almost 2 weeks, I do still have a bruise at the Pfizer vaccine injection site on my left arm and I experienced mild muscle soreness the evening after my vaccination and the following morning. Normally I have no adverse reaction to vaccinations.</p>

1022899	2/11/2021	OK	29	F	1/4/2021	1/1/2021	anxiety attack; 2 mins after the shot left arm felt heavy and was hard to move, tingling/dead feeling; 2 mins after the shot left arm felt heavy and was hard to move, tingling/dead feeling; 2 mins after the shot left arm felt heavy and was hard to move, tingling/dead feeling; in the evening arm swelled/swelling went down to size of pin hole; there was a welt at the vaccination site / there was still a little knot on arm; fever; night sweats; body rash/ rash beneath eyes; blister sores; swelling of eyes; arm was painful and is still; This is a spontaneous report from a contactable consumer. A 29-years-old female patient, a registered nurse, received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 Vaccine, Lot number BK9231, in Hospital, via an unspecified route of administration in left arm on 04Jan2021 at 14:00 at single dose for COVID-19 immunization. Medical history was none. The patient was not pregnant at the time of the vaccination. Concomitant medications included ibuprofen and cetirizine hydrochloride (ZYRTEC). The patient reported that 2 mins after the shot, her left arm felt heavy and was hard to move and, on 04Jan2021 at 14:15 she had tingling/dead feeling; in the evening arm swelled and there was a welt at the vaccination site. On an unknown date in Jan2021 she had fever at 102 °F for 48 hours and swelling went down to size of pin hole; her arm was painful and was still sore, there was still a little knot on arm. On 07Jan2021 she experienced an anxiety attack; 20 days after, in Jan2021 the patient experienced night sweats. She also experienced body rash and little blister sores on her body and both arms, swelling of eyes and rash beneath eyes. The events resulted in doctor or other healthcare professional office/clinic visit. No treatment was administered to the patients for the events. On 25Jan2021 the patient underwent COVID-19 test via Nasal Swab which showed negative results. The event "Fever" resolved after 48 hours, whereas the outcome of all the reported events was unknown at time of the report.

1023507	2/11/2021	NY	50	F	12/28/2020	12/31/2020	Chills; lymph nodes swollen on chest; lump in throat; muscle aches pain at injection site; nightmares; euphoria; insomnia; waking up often red eye; Nasal Swab positive; Nasal Swab positive; This is a spontaneous report from a contactable nurse reported for herself. A 50-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), from lot#Ek5730, on 28Dec2020 04:00 PM at single dose for COVID-19 immunization. Medical history included hypothyroidism. Concomitant medications included levothyroxine sodium (SYNTHROID). The patient was not pregnant at time of vaccination. The patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. No COVID prior vaccination. On 31Dec2020 the patient tested positive for the SARS-COV-2 virus (via nasal swab). The outcome of the event was unknown. On 27Jan2021 the patient experienced chills, lymph nodes swollen on chest, lump in throat, muscle aches pain at injection site, nightmares, euphoria, insomnia and waking up often red eye. The outcome of these events was reported as recovered and no treatment received. Lab data included Polymerase chain reaction: Positive on 31Dec2020.; Sender's Comments: Based on the current available information, the events Drug ineffective and COVID-19 are unlikely related to BNT162B2 vaccine. The events occurred 3 days after vaccination, when vaccine was not expected to achieve the effect. The case will be reassessed if additional information becomes available.

1023049	2/11/2021	OR	52	F	12/31/2020	1/3/2021	On the 3rd - I started noticing my left eye swollen; on the 5th day day it felt weird - and it's getting bigger. My voice changed like a horse - hoarse throat. And when I swallowed it was like a piece of food in my throat. At work, my left eye is swollen and my lower lip was swollen too and they took me to patient room at work and examined me. Asked me to go home from work and my husband took me to ED on January 5th- I had gotten hives - started feeling itchy all over my body. At Emergency room they gave me Prednisone to stop the swelling. My throat was swollen and they gave me blood tests, too. Prednisone helped some - took that for one week. (Still missed work on the sixth because my eyes were still swollen.) Had a previously scheduled doctor appt for something else and my doctor told me the hives will come back after Prednisone so he told me to take Claritin for two weeks. All my symptoms resolved after that.
1022730	2/11/2021	NY	41	F	2/9/2021	2/9/2021	swollen top left eye lid. eye pain in left eye. foot pain in left foot.

1023054	2/11/2021	IN	52	F	2/9/2021	2/10/2021	As to be expected several hours after vaccine my arm become sore. Then at 12:30am I woke to severe chills, slight headache, sweats as well, body aches all over my body and I took my temperature and it was 103.4. I don't think I have ever had a fever that high before. I took some Tylenol extra strength and tried to go back to sleep but I couldn't I was afraid. This went on for several hours and my temp ranged from 102.3-103.6. I tried to drink liquids too. I called off of work. That day I laid around hot and cold, body aches, my chest hurt a little to take a deep breath, fatigue and weakness were unbearable at sometimes. My fever spikes probably that high 3-4 times yesterday. I had fluids and soup. I alternated Motrin and Tylenol all day. I tried to rest and maybe sleep but just couldn't close my eyes despite being tired/weak. By 7-8pm I was still weak but felt better My temp was around 99-100. I went to be around 10pm and woke up at 2am with really bad heartburn that I couldn't lay down I had to sit in my recliner chewing 4 Galvascon tabs. Sipping water and felt my chest hurt and wondered if I was having a heart issue. But i relaxed and finally by 5 am when my alarm went off.. I took my temp it was 100.2. I called off work again today and I laid down to sleep a few more hours. Now I feel better and still weak My temp has gone down.
1023081	2/11/2021	CA	42	F	2/5/2021	2/6/2021	Fever 104 an bleeding around left pupil with red vessels of eye. No changes in vision, no nausea, no vomiting, no swelling

1023088	2/11/2021	NC	30	F	1/12/2021	1/12/2021	She reports with a few minutes she felt light headed, dizzy and mentally disconnected. Symptoms included feeling nonspecific discomfort, hot, cold, palpitations, nausea. She states her chest cavity felt strange and can best describe it as internal burning. She states breathing was strange, and was 'almost' SOB. She felt palpitations. They seated her in a chair for 15 minutes and observed her for 35-45 minutes. Her VS were normal. She denies pruritis, urticaria, flushing, sweating, cough, wheeze, oral/facial/throat/tongue swelling, red/watery eyes. She went home and continued to feel uncomfortable and restless. She had one emesis. She took a Tylenol pm at 19:00 and slept until about midnight. She reports the restlessness and discomfort stopped, but she then felt flulike symptoms (malaise, myalgias) for the next 3 days. She noted onset of edema at the injection site day 1, but no erythema or dermatitis.
1023101	2/11/2021	PA	73	F	2/10/2021	2/11/2021	Resident uneventful evening/night. Ate breakfast, baseline status. Found by staff to be unresponsive at 0945 this AM, almost 25 hrs after vaccine administration. BP at that time 77/30, recheck 81/35. No respiratory distress, oxygen saturations WNL. Remained afebrile. Over the next hour, she did open her eyes once, but remained non responsive to staff. Daughter at bedside. Over the next few hours, slowly responding. Was awake and responsive, eating ice cream. PCP has been notified, ongoing monitoring to occur. Spoke to Physician associated with RCAT Care Center. She does not feel this was an adverse/significant side effect of the vaccination as manifested thru extreme fatigue and exhaustion.

1023339	2/11/2021	TN	51	F	1/19/2021	1/19/2021	2 hrs after 2nd injection, felt like i was burning from inside out; skin red; flushed; rash; scratch throat; body aches; dizziness; headache; lymph nodes tender; eye swelling; blurred vision; blisters on the trunk of my body as well as lips and gums; blisters on the trunk of my body as well as lips and gums; blisters on the trunk of my body as well as lips and gums; tooth pain; jaw pain; i also had leg and bilateral foot pain x 4 days; all my mucos membranes were red, irritated and blistered; all my mucos membranes were red, irritated and blistered; This is a spontaneous report from a contactable nurse (patient). A 51-year-old female patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL1283), via an unspecified route of administration on 19Jan2021 10:45 at a single dose on left arm for COVID-19 immunization. Medical history included allergies: sulfa. Concomitant medication included bupropion (BUPROPION). The patient previously received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: unknown), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient experienced 2 hrs after 2nd injection, 'felt like I was burning from inside out', Skin red, flushed, rash, scratch throat, temp, body aches, dizziness, headache, lymph nodes tender, eye swelling, blurred vision, 'blisters on the trunk of my body as well as lips and gums', tooth pain, jaw pain. All of these symptoms lasted 3 days (as reported), blisters and gum issues lasted 4 days (as reported). Patient also had leg and bilateral foot pain x 4 days. All mucous membranes were red, irritated and blistered. The adverse events were experienced on 19Jan2021 12:30. Therapeutic measures were taken as a result of the events which included Benadryl, steroid injection. The outcome of the events was recovering (as reported). Adverse events resulted in Doctor or other healthcare professional office/clinic visit. The patient was not pregnant at the time of vaccination. Facility where the most recent COVID-19 vaccine was administered was Hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19.; Sender's Comments: Based on the information available, a

1023346	2/11/2021	FL	72	F	1/21/2021	1/22/2021	<p>This was scary like waking up with Bells palsy/her neck froze up/when she woke up she could not look up, down, left or right/It was like her neck was frozen or paralyzed, the muscles would not move; the muscles would not move/She was doing anything to loosen the muscles; shooting pain in her head; She was in a lot of pain in her head and neck.; her neurologist confirmed it was a muscle issue; This is a spontaneous report from a contactable consumer who reported for herself, a 72-year-old female patient who received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number and expiration date unknown), via an unspecified route of administration in the left arm, on 21Jan2021 at the age of 72 years, at around 16:00 at a single dose for COVID-19 immunization. Medical history included her left eye had a virus that was finally taken care of back in Mar2020 but took a year and a half to heal. She had 5 surgery on that eye from an unspecified date. Also, her left lymph node got filled with fluid and was swollen but the doctors were not concerned about it. She would see an ENT for this. The patient has been seeing a neurologist who has done brain scans and MRI's due to the loss of peripheral vision do to eye problems. The patient has no allergies and is basically healthy. Concomitant medications include unspecified "natural stuff". The reporter stated she had a pretty bad reaction with the vaccine and it took 3 days to get over, her neck froze up. She woke on 22Jan2021 with the frozen neck. She got the first shot on Thursday, 21Jan2021, and on Friday morning, 22Jan2021, when she woke up she could not look up, down, left or right. It was like her neck was frozen or paralyzed, the muscles would not move. Any effort to move her neck would send shooting pain in her head. She applied a heating pad, took Aleve, she took a couple of them, a massager, biofreeze, and stayed in bed. She was doing anything to loosen the muscles. The next morning she was able to look up and down but still not left or right. She did the same thing for treatment that day. On Sunday, 24Jan2021, she was better, was able to move her head 3 of 4 directions. She continued with the treatment she had been using and by Monday, 25Jan2021, her muscles loosened up and her neck worked again. She was sure it is muscles and when she called her neurologist confirmed it was a muscle issue. She was in a lot of pain in her head</p>

---

and neck. The patient was under care for her neck and head and wondered if this happened because this was a weak area, she did not know if related. The patient remarked she was scared to get the second dose due to the problems she had with the first. She heard that the second dose was the one with worse side effects. She was in bed 3 days with this first one. It was reported that the events did not require a visit to Emergency Room, and required visit to physician office. Patient called the neurologist due to the pain and was told to go to acute care to evaluate but she didn't go. The patient stated that this was scary like waking up with Bells palsy and was wondering if she would ever get better. She has never had anything like this happen to her before. She has to be attributed it to the shot. The patient needed guidance on getting the second dose, and had questions about side effects. The outcome of the events was recovering. Information on the Batch/Lot number has been requested.

1023358	2/11/2021	CA		F	12/19/2020	12/19/2020	encephalitis-like symptoms; Hearing loss; memory loss; parathesias; visual disturbances; taste disturbances; dizziness; Lsided chest pain; staggering; elevated SBP 190-200; severe L-sided chest tightness; pre-syncope; elevated BP; DDimer was elevated; fell; intermittent memory lapses; nausea episodes; cant smell that last 1-2 hrs; L neck /head pain; L neck /head pain; Left axilla lymphadenopathy; rhinitis; lightheaded/lightheadedness; had an episode of pain all over; SOB; This is a spontaneous report from a contactable physician (patient). A 46-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot/batch number and expiration date were unknown), via an unspecified route of administration from on 19Dec2020 at a single dose for COVID-19 immunization. Medical history included ovarian cancer at age 29, food allergy to clams and escargot, and allergy to sulfa. The patient's concomitant medications were not reported. The patient previously took bactrim and experienced allergies. On 19Dec2020, immediately after vaccine had rhinitis, lightheaded, given Zyrtec and water and observed for a duration of 30 min. Three hours postvaccination on 19Dec2020, at home had an episode of pain all over and SOB (shortness of breath). 3 days later (22Dec2020), patient had L (left) neck /head pain and left axilla lymphadenopathy. On 23Dec2020, she fell in the shower. On the same day (23Dec2020) the patient had intermittent memory lapses, lightheadedness, nausea episodes, can't smell that last 1-2 hours a few times a day. Symptoms worsened on 03Jan2021, with severe L-sided chest tightness, pre-syncope, was seen in the ER with elevated BP. DDimer was elevated, CT Scan of Chest/Abdomen showed L axilla lymphadenopathy, negative for PE. CBC, Electrolytes WNL (within normal limits), still on 03Jan2021. Observed in ER for 7 hrs. and then discharged home. Intermittent symptoms continued. On 08Jan2021, patient had another severe episode while at work. She was noted to be staggering, and again was complaining of left-sided chest pain. She was taken to the ER by her colleagues on 08Jan2021 and noted to have elevated SBP 190-200. On 08Jan2021, patient underwent CT head negative, MRI negative, w/u (workup) for pheochromocytoma negative and COVID negative. She was started on prednisone and Norvasc

1023452	2/11/2021	GA	47	F	1/23/2021	1/23/2021	itching in her eardrums, her face, nose and everything/inside of her ears/between her fingers, hands, feet/back/sides/itching all day; one hive came up around the injection site; sneezed 3 or 4 times/sneezing 5-6 times all day/sneezing all day; arm was itching where she got the injection site at; This is a spontaneous report from a contactable consumer (patient). A 47-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL0142), intramuscularly on the upper left arm (also reported as in humerus area), on 23Jan2021 11:00, at single dose, for covid-19 immunization. Medical history included allergies to shellfish and medications; allergic to cats and dogs; had to go to the emergency room with an allergic reaction; hypothyroidism from 2008 and ongoing; asthmatic from an unspecified date and ongoing (diagnosed with asthma as a kid, (maybe at 5 years old); asthma was well controlled and she has an asthma inhaler she uses like once a month); light GERD from 2018 and ongoing; recovering from a meniscus tear in her knee that occurred on 21Aug2020 - she had surgery for it on 23Oct2020; anterior uveitis of the eyes and; partially blind in her eyes. Concomitant medications included adalimumab (HUMIRA) and methotrexate - both from an unspecified date and ongoing for anterior uveitis of the eyes which the patient clarified was a condition where her retina swells and its defined as an autoimmune problem. She informed that she was partially blind in her eyes but something about the methotrexate and Humira in which she was able to see now. The patient stated that she received the first dose of the COVID-19 vaccine last Saturday, 23Jan2021 at 11 AM. Later that evening of 23Jan2021, she started itching in her eardrums, her face, nose and everything, and one hive came up around the injection site. She has been extremely itchy since she took it. Also, she sneezed 3 or 4 times later that evening of 23Jan2021. It's pretty unusual for her to sneeze. She stated she used to take allergy shots, so she doesn't really sneeze at all. Between the time of 10:40- 10:45pm that night, on 23Jan2021 she sneezed three consecutive times. Then she went to lay down, and she noticed on 23Jan2021 that her arm was itching where she got the injection site at. She noticed she had one hive at the injection site. She confirmed she only had one hive. She did start to

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

itch all over- her face and nose was itching. She has had an allergic reaction before, (medical history) and it wasn't a type of reaction where she needed more than one hand to scratch; it was just a subtle itch. She informed that she should have been aware when she started sneezing because she never sneezed. She has been sneezing 5-6 times all day. Then she took Benadryl at 18:00 which was helping. She waited the allotted 15 minutes after taking it and she was fine; she had no problems at all. But as soon as it wore out, she began itching and sneezing. After an hour she took another because the inside of her ears was still itching; the itching went deep down into her ears. She had itching of her face, arms in between her fingers, hands, her feet (only the top of her feet, not the bottom), and her back. She was itching a little bit on her sides. The itching was basically all over, but she only had one hive. She had one hive at the injection site, so she assumed it was probably due to the vaccination. Then the hive was gone. However, she still feels itching mainly in her nose, arm and back, just like that night following the injection. She was still itching for some reason. She got up on Sunday 24Jan2021 and everything was gone. She confirmed the hives, the itching, everything was gone. She didn't take anything on Sunday. Yesterday, 26Jan2021 she noticed a little slight itch, but she didn't pay any attention to it and didn't worry about taking any Benadryl. Today, 27Jan2021, she has been itching and sneezing all day. Like right now, her foot was itching but the itching has kind of subsided a little bit. But all day her nose has been a little itchy. She added that she was allergic to cats and dogs (she doesn't own any pets), so if she gets in the vicinity of any cats or dogs, her nose starts itching. Her nose has had the same kind of itching and sneezing all day long. She hasn't had any testing. She didn't go to an emergency room only because it wasn't bad enough. If her throat was itching or swelling, then she would have been ready to go to the ER at 1am. Also, if she would have had shortness of breathing or her throat/tongue started itching, she would have gone to the emergency room. She stated that once her ear stopped itching, she was fine. She wanted to know if her experience was reported as a side effect of the vaccine. She mentioned that she definitely wants to take the second dosage, but she was a little apprehensive. She was scared it may be worse with the second vaccine.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							Now that she received the vaccine, she was unable to access an HCP at her job and primary care facility. So, she called her primary care physician who prescribed her an EpiPen in case she receives the second dose of the vaccine. Her doctor also instructed her to take Benadryl a day or two after the injection. She did call (privacy) since they were the ones who did the injection. She informed that she did all her research beforehand because she was a little apprehensive to get the first vaccine. She already had to go to the emergency room with an allergic reaction before. She told one of the nurse practitioners about her itching all the time and; she was told that that was common. She explained that, everybody that she has come into contact with that has had this vaccine, no one has had any problems with itching. Itching was not mentioned on any of the information she has read, the research she has done, the news, or if she goes on the website there wasn't any mention of itching. There were things like headaches and other symptoms but nothing about itching and hives. She then requested to speak to someone about itching being a side effect of the vaccine. She was a little apprehensive about getting the second vaccine so she would like further information. The final outcome of the adverse events was unknown.
1023574	2/11/2021		61	F	12/22/2020	12/24/2020	Pt reports two days after vaccination eyes became "itchy, irritated, and glazed" and at times "painful". Symptoms would "come and go". Received second dose of Moderna COVID-19 vaccine on 1/21/21 with same symptoms 2-3 days after that dose that have continued off and on since then.

A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), Batch/lot number: EL0142, via an unspecified route of administration on 11Jan2021 at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. Patient received the 1st dose on 11Jan2021 and she felt normal and had no underlying conditions. After the shot she instantaneously felt a shooting pain across the chest and then went to above her left eye. It felt like a migraine and felt like a piercing pain on the back and side of her head hours later and was intermittent for a couple of days. It became an intermittent headache for 2 weeks. She also instantaneously within a few minutes felt a numbness on her left arm and hand. It felt weird and she couldn't describe it, more like she felt with pressure and heaviness which lasted for 2 days. Later that night she also felt bloating and severe cramping that was so severe she couldn't walk for 4 days and come and go intermittently. She was rolling over her bed in pain. She was so tired, weak, and short of breath she couldn't do anything. She also had about 10 episodes of diarrhea with 3 of them being bloody diarrhea over the weekend, the last episode of bloody diarrhea was on the 18th, after which her stool was clear, normal looking. She couldn't eat anything because of this. No one in her facility that she knew of had similar side effects as her. She was terrified and very very afraid. She was also frustrated because she was not sure if it was the vaccine or not.

This week she was just starting to get back to normal and feel better. She consulted with HCPs and did tests like Complete blood count, stool sample, abdominal X-ray, and COVID tests that all came back normal. She was still on the fence on whether or not she could get the 2nd dose because she came in there normal and came back like heck afterward. Patient stated she was a little concerned about whether or not she should get the second vaccine based on the symptoms she had from the first one. Patient further stated the first time she had the shot, she experienced the side effects. It started off with shooting pain across her chest and then pain in her head and then she had bloatedness with a little bit of nausea and then she had burning in her stomach. Patient stated, actually, she had more bloatedness in the stomach, more than nausea it was more like she was very bloated and that lasted for about two weeks. And she also had pain, as soon as she gave her injection, she had pain all across her chest and then she had a instant headache. She also ended up having bloody diarrhea. She had several tests afterwards from her doctor to figure out other possible causes, they did culture and they took her lab and they did an membrane X-ray of her abdomen and everything came back normal and fine and she felt totally fine until she had the shot and then all of a sudden everything fell apart and she felt terrible for two weeks. She had severe abdominal cramping, She thought like she was dying and fatigue, major fatigue. But she had one more question, she was wondering if anyone else has had similar experiences after this vaccine. Patient wanted to know if she should get the second vaccine. After receiving the first Covid vaccine she experienced pain across her chest and severe pain on left side of head. She wondered if the vaccinator had hit a nerve when injecting the vaccine. She then began to experience bloating, cramping, bloody diarrhea and severe fatigue, which lasted for about 2 weeks. She underwent testing by having stool samples and X-rays, but all tests came back negative. About treatment, patient stated, yes and she also have severe abdominal cramping. The outcome of the events was unknown. The reporting nurse (patient) considered the events Shooting pain across my chest, Headache, Bloatedness; I had more bloatedness in the stomach; Burning in my stomach, Nausea, Bloody diarrhea, Severe abdominal

1022077	2/11/2021	MI	48	F	1/15/2021	1/1/2021	headache; Headache 'in the back of head, the right side of her face behind her eyes', started getting a migraine.; could be sinuses; Dizziness; Sweating; lymph nodes swollen; she tends to get hot flashes, she is currently going through menopause; This is a spontaneous report from a contactable consumer, the patient. A 48 year old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot Number EL3248 ), intramuscular in the left arm on 15Jan2021 at 06:34 as a single dose, for COVID-19 immunization. The vaccination was administered at a Hospital Facility. Patient contact her doctor who told her, she absolutely needed the COVID-19 vaccine. Medical history included ovarian cancer 2014 (stage 3B and 3C), lymphoedema 2015, (lymphedema after aggressive chemo/ told she would always have lymphedema), and menopause from an unknown date and ongoing (tends to get hot flashes). There were no concomitant medications. On 15Jan2021 (around noon), the patient experienced Lymph nodes swollen/her lymph nodes in her throat were swelling up, dizziness, and sweating. Patient explains she tends to get hot flashes, she is currently going through menopause. However, she ran to the store and she was really sweating heavily and felt dizziness and just ended up going home. She felt it was better to be at home if she was having a reaction. By Saturday, 16Jan2021, she woke up and felt fine. The swelling of her lymph nodes in her throat went away. The dizziness and sweating went away. On 19Jan2021 (Tuesday Evening) the patient experienced Headache 'in the back of head, the right side of her face behind her eyes', started getting a migraine. Also states it could be sinuses. She didn't know if this could be related to the COVID-19 vaccine and a reaction to it or her sinuses. On Jan2021 patient experienced Hot flashes. No other vaccines were given within 4 weeks. The clinical outcome of Dizziness, Sweating was recovered on 16Jan2021, the outcome of Headache/migraine was not recovered, and the outcome of lymph nodes swollen, hot flashes and sinuses were unknown.

1022066	2/11/2021	OR	71	M	1/13/2021	1/24/2021	<p>Contrast head CT scan showed a lacunar infarct in the M1 region from MCA; Bell's Palsy; This is a spontaneous report from a contactable physician reporting for himself. A 71-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EL2437), intramuscularly on 13Jan2021 11:00 on right arm at single dose for COVID-19 immunization. Vaccination facility type was at Clinic. Medical history included Myocardial infarction from 2019, Prostate cancer from 2016 which biochemical recurrence caused his PSA to bump up, Subclinical hypothyroidism, prevention of coronary artery disease, prevent platelet aggregation, urgency incontinence, asthma symptoms, High Blood Pressure from 2009 and ongoing, Aortic insufficiency from 2008 and ongoing. Ongoing concomitant medications included Carvedilol from 2011 for high blood pressure, rosuvastatin from 2015 for prevention of coronary artery disease, acetylsalicylic acid (ASPIRIN) from 2019 for prevent platelet aggregation, tamsulosin from Dec2020 for urgency incontinence, levothyroxine from 2011 for Subclinical hypothyroidism, montelukast from 2011 for asthma symptoms. The caller stated that he was a physician and emeritus professor. He received the Pfizer-BioNTech COVID-19 vaccine 2 weeks ago and developed Bell's Palsy on 24Jan2021 after receiving this first dose. He had already reported this reaction but he would like to know if there was any safety information on receiving the second dose after this type of adverse reaction. Patient had "mentioned" the reaction to his HCP but he had not spoken with her about specific guidance on whether or not to receive the second dose. Patient wished there was a way he could see more information regarding patients who have reported Bell's Palsy as a reaction to the mRNA COVID-19 vaccine to see if it could be a trend related to mRNA in the vaccines or if it was statistically insignificant. Patient visited the Emergency Room on 25Jan2021. Patient had a Contrast head CT scan on 25Jan2021. The results were read by the radiologist. The neuro radiologist also read the results and made a revision. He had two different reports, it showed a lacunar infarct in the M1 region from MCA. Not causing facial paralysis. There was no defined cause of the paralysis. Patient was asking if we have a resource on the significance of Bell's Palsy following a vaccine. He</p>

1022056	2/11/2021	NY	71	M	1/24/2021	1/1/2021	his face was feeling funny/his face was paralyzed on the left side/ Bell's Palsy; Pain at the injection site; This is a spontaneous report from a contactable consumer (patient's wife). A 71-year-old male patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number: EL3248), via an unspecified route of administration on 24Jan2021 12:30 at single dose in right arm for COVID-19 immunization. Medical history included Diabetes, Blood pressure high, High cholesterol, Enlarged prostate. Concomitant medications taken within two weeks before the event onset included irbesartan, verapamil, metformin, topiramate, omeprazole, tamsulosin, clonazepam, simvastatin, acetylsalicylic acid (BABY ASPIRIN), all were ongoing. Vaccination facility type was Hospital. The patient received the Pfizer covid vaccine first dose on Sunday 24Jan2021, On Monday (25Jan2021) afternoon, his face was feeling funny, by the time he got home, his face was paralyzed on the left side. The injection site was on his right arm. The reporter called paramedics and he went to the Emergency Room, and was diagnosed with Bell's Palsy. No history prior to vaccination. All his tests were negative in the hospital, EKG, CT, all tests negative in Jan2021. wasn't a stroke or anything like that. One doctor said it could be related to the vaccine and the other said he didn't know. The reporter wanted to know if he could go back for the second dose, if one dose could provide any protection. Consumer calling about the Pfizer COVID-19 vaccine (later referred to as just shot or COVID shot by caller) for her husband, and says the reason why she called was her husband got Bell's Palsy from it, and she didn't know if he should still go for a second shot. She said his face was all paralyzed right now, he got the COVID-19 shot on Sunday, then Monday night he went to the ER and was diagnosed with Bell's Palsy, all tests were clear that it was not a stroke and had to be from the shot. The patient's face was feeling funny, and when he got home his face was paralyzed and she called 911. She said he was admitted from the ER overnight on Monday night (25Jan2021), then she picked him up on Tuesday night. She said he was diagnosed with Bell's Palsy, and they gave him medication, which was Prednisone and patches to keep his eye closed, and another med called Valacyclovir, which was an antiviral medication, and

some eyedrops. She said his vaccine card just says first dose, patient number, (City and State name), and has a date on the back for his second shot which was scheduled for 14Feb2021. Treatment Valacyclovir: Caller says that this was in a (Pharmacy name) bottle and that label told instructions to take it and said no refills, discard after 26Jan2022, it was a week's worth of pills. Prednisone 10mg. Caller said this was also in a pharmacy bottle that said take 5, then 4, then 3, then 2, then 1. The label said discard after 26Jan2022. She said that the eyedrops were over the counter lubricant eye drops for his left eye. Caller said the patient took a medication for electrical activity in the brain, so they did a MRI and a CAT scan and they all came back negative on the tests, and his heart tests came back negative (Jan2021). No further details provided about electrical brain activity medication or test results. Caller said that the doctors sent her husband home and said it was Bell's Palsy, likely a result of the vaccine, that there was nothing wrong with him, they can't say for sure, they said it could be coincidental. She said they probably can't say it was the vaccine that gave it to him, some doctors said yes during the stay at the hospital and some said they couldn't say. She said that there were quite a few doctors there, it is a big hospital, that worked in the stroke unit. Caller said that she would like to know if there were any product recommendations about whether her husband should get the second dose. It further reported that on 25Jan2021 at Lunch time his face felt funny and by 17:00 left side of face was paralyzed. He was treated in the ER of (Hospital name and Address). as if he had signs of stroke. Reporter seriousness for Bell's palsy was Hospitalization. The dates when patient was in hospital for Bell's palsy was from 25Jan2021 to Unspecified date. Reporter stated patient also experienced pain at the injection site in Jan2021. MRI, EEG, EKG and Sonogram, all clear and All negative in Jan2021. The outcome of the event "his face was feeling funny/his face was paralyzed on the left side/ Bell's Palsy" was not recovered, of the other event was unknown.

1021998	2/11/2021	OH	86	F	1/21/2021	1/22/2021	Numbness in face, legs; Slight headache; Whole chest froze up; It has been an effort to talk, she was really working hard to talk; Muscle tightness around her whole face; Legs weren't steady enough; Didn't feel well; She was very weak; Could only stay awake for very short amounts of time; She never had trouble with her stomach like this before; Lip has a slight droop on left side of her face; Felt like she was having a heart attack; Felt extreme exhaustion; Not able to eat; She thought she has low blood sugar; This is a spontaneous report from a contactable consumer (the patient). An 86-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EL3249, expiration date not reported), via an unspecified route of administration (left arm) on 21Jan2021 14:50 at a single dose for COVID-19 immunization. Medical history includes therapy on her back from the past, from an unknown date. Concomitant medication included melatonin to sleep and, paracetamol (TYLENOL) to sleep. The patient received the first dose of the vaccine on 21Jan2021 at around 2:50 PM, the next morning on 22Jan2021, she felt extreme exhaustion, she'd get up and have to get back to bed, not able to eat, and she thought she has low blood sugar. She got up and had a bowl of cereal. On an unspecified date, the patient also reported numbness in face, legs and slight headache, and need to eat all of a sudden or pass out, and these has gone on for five days now (at time of report). The patient also reported that her lip has a slight droop on left side of her face which was concerning her. The patient reported that after numbness and not eating, she had some ice cream and her whole chest froze up, and it felt like she was having a heart attack. Her chest felt like ice which never had happened before. It has been an effort to talk, she was really working hard to talk. The patient explained she got the vaccine 5 days ago (from the time of report) and reported she had muscle tightness around her whole face, she had a slight droop on the left lip, a slight headache right across the eye brows, her legs feel a little numb off and on, she got feeling of tiredness but that passes, she had the need to go eat suddenly or she will get very weak. The reason for the call was she was wondering if she should she go for the second vaccine when 5 days after having the vaccine she was experiencing numbness. Slight droop on the left

lip started but never looked close until the time of report, not a lot but the lower lip on the left side it is slightly droopy, with slight headache right across the eye brows. Her legs felt a little numb off and on, and she stated that about 3 days after the vaccine, she was afraid to take a shower because her legs weren't steady enough. They are still that way at the time of report, but this did go away for a while on a day and she was able to take a shower. She also didn't feel well after the vaccine. On the day of the vaccine, she had a good dinner and felt good; but the next morning she was very weak and could only stay awake for very short amounts of time. She was in bed and couldn't stay up and this is not like her, she did not like to be in the bed. She got the feeling of tiredness but that passes and she can stay up for longer periods of time. She had to go eat or she gets very weak, she didn't feel like eating in the beginning. It was on the 4th day after the vaccine she would have to get a bowl of cereal all of a sudden or she would feel like she was going to pass out. She never had trouble with her stomach like this before where she felt the need to have to go and eat. She explained she never had trouble with stomach, she never had headaches, and never had a vaccine before. Muscle tightness around her whole face started 2 days after getting the vaccine and was getting worse. Her face felt really tight almost numb feeling. The outcome of the events was unknown.

1021839	2/11/2021	CA	28	F	1/6/2021	1/6/2021	After my 2nd dose administration, I sat in an observation tent with 4 resident doctors. This is protocol at my hospital to assess for any adverse reactios. About 10 minutes later, I started to feel both of my arms (from should all the way to tips of my fingers) start to get tingly with an intense vibrating sensation. I tried to calm myself down, however numbness began to occur to both BUE seconds after. Next thing that happened, bilateral fingers became visually contracted however numb and I could not move my fingers. I also got a tingly/prickly sensation to my cheeks all the way down to my chin after the hand numbess. The resident doctors quickly took me by wheelchair to a private room where they checked my vital signs. BP was elevated with systolic in 190's, HR around 120s, and my limbs were all cold. By this time it was around 6pm and they were trying to calm me down as I started to have a panic attack. My parents came to pick me up at 7pm when my vitals were stable. I rested at home, and the contraction to my fingers/numbess did not subside until 8:30pm. The following day, my left arm (injection site) had a soreness level of 9/10. Tylenol was used to relieve pain.

1022063	2/11/2021	FL	71	F	1/27/2021	1/27/2021	<p>Her head felt funny dizzy, like full headed like she was going to pass out/like she could pass out; Dizzy; Her head felt funny dizzy, like full headed like she was going to pass out; Head became funny, and her body felt funny; Her blood pressure was 160/("something, I don't remember, but it was high"); Her heart was going to pound out of her chest "blow right out of my chest."/her pulse was in the 90s at that point; This is a spontaneous report from a contactable consumer (patient). A 71-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL1283), via an unspecified route of administration at left arm on 27Jan2021 10:30 at single dose for covid-19 immunization. Medical history included she had Grave's disease in the past and her thyroid was irradiated, hypotension, arthritis, stress, macular degeneration, glaucoma, hypertension, Blood cholesterol abnormal, Dry eyes, other medication allergies. Concomitant medications included vitamin b complex (B COMPLEX) for Stress, liothyronine sodium (CYTOMEL) for Hypotension, ezetimibe for cholesterol, fish oil for Macular degeneration and Glaucoma, hydrocodone bitartrate/paracetamol (LORCET) for Arthritis, xantofyl/zeaxanthin (LUTEIN ZEAXANTHIN) for Macular degeneration and Glaucoma, levothyroxine sodium (SYNTHROID) for Hypotension, carmellose sodium (THERATEARS) for Dry eyes, triamterene for high blood pressure, tocopherol (VITAMIN E) as something good to take, latanoprostene bunod (VYZULTA) for Glaucoma, and Multivitamins took once daily by mouth took for 15 or 20 years as feel she should take, all of them were ongoing. The past drug history included before starting latanoprostene bunod (VYZULTA) for Glaucoma, she was on other products that she reacted to including 'Timero!'; 'Represso'; and Bimatoprost (LUMIGAN). During the 15 minute waiting period after administration, patient stated at around 11 minutes she felt as if her heart was going to pound out of her chest "blow right out of my chest", she became dizzy, head became funny, and her body felt funny. Patient stated that they called for the paramedics in which they ran an electrocardiogram (EKG), her pulse was in the 90s at that point, and her blood pressure was 160/("something, but it was high"). Patient stated that they had her wait an additional 20 minutes or so and then she left, but it was about an hour</p>

-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

and a half before these effects went away. Patient asked if she should receive the second dose of the vaccine. Heart rate was back down to 90 bpm and her EKG was okay. They told her to wait for 15 minutes in her car; she was sitting talking and she had a couple of minutes left on her wait time when suddenly and she grabbed her chest and her heart, her head felt funny dizzy, like full headed like she was going to pass out/like she could pass out. She put her head on the steering wheel and her friend signaled the paramedics to the car. The paramedics examined her, took her blood pressure and it was a little high 160 over something. The feeling went away and she sat there for about 20 minutes until she was able to drive. One hour to one and one-half later she felt normal. The outcome of the events was recovered on 27Jan2021.

1022445	2/11/2021	GA	54	M	2/8/2021	2/8/2021	<p>A 54yr old male patient had an appt at 4pm. 4:00 pm The patient decided not to get vaccine after he arrived. His wife received hers and told him it was fine to get the shot. The patient agreed. 4:50 the patient received the vaccine. the patient kept stating he was nervous and appeared very anxious. 4:55 patient was sitting in booth with wife and daughter and employee heard the family yell "Daddy" Employee saw the patient slumped over in booth. Employee alerted some one who was in the observation area who then called the Emergency Dept. STAT to the Observation area. 4:56 RN and RN responded to the area. See RN statement below. I was called to the cafeteria by RN for a possible reaction to a vaccine. When I arrived in the cafeteria patient was sitting in the seat with his head leaned on the back with his eyes closed. I asked him how he was feeling and he responded "I feel ok". He stated he hadn't eaten or drank anything that morning so he was given a Diet Coke and picked out a snack from the basket. He ate some crackers and drank some Diet Coke and stated he felt fine. His wife then stated that every time he is around needles he passes out. He said he felt better and was fine now. I told them when he got up if he felt weak or dizzy to call me back and I returned to the emergency room. Emergency Nurses stayed with patient until they were sure he was fine and able to leave under his own power with his wife and daughter. 2/9/2021-09:30 Follow up call made to patient by Emergency Dept. Manager. Patient stated he was fine and hadn't experienced any other symptoms. ED manager instructed patient the come to the ED or seek medical care if he experienced any other symptoms. Patient stated he understood and will comply. 02/10/21 08:30 call and spoke with patient . Patient states he feels fine , no other symptoms.</p>

1022650	2/11/2021	AL	37	M	2/10/2021	2/10/2021	Pt. was at least 15 minutes post receipt of his second dose of Moderna COVID vaccine. He began complaining of dizziness and a headache. We monitored him for over an hour and during that time, he continued to c/o dizziness, frontal headache, photophobia, and worsening when opening his eyes are trying to look straight ahead. We had him isolated in a dim room and had air blowing on him as he complained of being hot. His O2 Sat, pulse , and BP all stayed stable and within normal range. Pt. denied sx of swelling around face/neck or difficulty breathing. RR was stable and unlabored at all times. Pt. refused EMS services and after some time, insisted he needed to get up and leave. Our staff and his co-worker assisted him out of the facility and to a vehicle where we was transported off the premises. We were informed later through his supervisor that he got worse after leaving and went to the hospital where he "seized." He is reportedly stable at this time but further information on his condition is unavailable.
1022639	2/11/2021	CT	65	F	2/10/2021	2/10/2021	Vac administered at 10:30am yesterday. In Observation >10:45am.. no side effects at that time. While in a store buying flowers... approximately 11:45am... experienced sudden and overwhelming onset of profuse heat and perspiration. Eyeglasses immediately fogged up, perspiration ran down my back and ran under my face mask. I felt lightheaded and faint. My husband confirmed that my back was "on fire". Last night, I was awakened by extreme chills and shivering... every muscle and joint tense and painful. This continued for some time and then I became feverish with bed cloths and bedding soaked. Had a temp of 102 @7:30 am with HA and muscle & joint pain.
1022633	2/11/2021	NY	58	F	2/4/2021	2/5/2021	Received vaccine on 02/04/2021 and on 02/05/21 started with left droopy eye lid and ringing in the right ear. Continues with both symptoms today.

1022083	2/11/2021	OR	62	M	1/18/2021		evidence of endothelial inflammation and anterior chamber cells and KP on endothelium; evidence of endothelial inflammation and anterior chamber cells and KP on endothelium; evidence of endothelial inflammation and anterior chamber cells and KP on endothelium; This is a spontaneous report from a contactable physician. A 62-years-old male patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EK9231), via an unspecified route of administration on 18Jan2021 at single dose for covid-19 immunisation. Medical history included diabetes and graft was 2.5 years old, partial thickness transplant (deep anterior lamellar keratoplasty) for treatment of keratoconus. Concomitant medication included trazodone, rosuvastatin calcium (CRESTOR), zolpidem tartrate (AMBIEN), gabapentin, metformin. No COVID prior vaccination. Known allergies: Buspar. The patient previously received first dose of bnt162b2 on 28Dec2020 for COVID-19 immunization and experienced Cornea transplant rejection and inflammation/subepithelial infiltrates noted 1 week after the first vaccine. No other vaccine in four weeks. The patient experienced after 2nd vaccine, evidence of endothelial inflammation and anterior chamber cells and KP on endothelium. Clinical course reported as: Cornea transplant rejection. Graft was 2.5 years old. Partial thickness transplant (deep anterior lamellar keratoplasty) for treatment of keratoconus. Signs of inflammation noted one week after each vaccine. Subepithelial infiltrates noted 1 week after the first vaccine. Resolved with Pred Forte. However, after 2nd vaccine, evidence of endothelial inflammation and anterior chamber cells and KP on endothelium noted on follow-up examination. Placed on stronger topical steroid with Durezol. Patient asymptomatic during entire process and this was found on routine follow-up exam and not because patient noted any symptoms. Vision not affected. Outcome of events was recovering. The doctor's office appointment was a routine appointment unrelated to receiving the vaccine. The temporal relationship with the COVID vaccine was reconstructed by the patient afterwards after thinking about it in retrospect. No COVID tested post vaccination.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation. The impact of this report on the benefit/risk profile of the Pfizer product

1023375	2/11/2021	IA	35	F	1/29/2021	1/29/2021	Became unresponsive; Looked like having a seizure; Felt light headed; BP extremely low; Profusely sweating; Heart rate extremely low; A spontaneous report was received from a pharmacist, concerning a 35-year-old female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced felt light headed, became unresponsive, looked like having a seizure, BP extremely low, heart rate extremely low, and profusely sweating. The patient's medical history, as provided by the reporter, included high blood pressure. Products known to have been used by the patient, within two weeks prior to the event, included hydrochlorothiazide/lisinopril. On 29 Jan 2021, five minutes prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot Number: 025L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. On 29 Jan 2021, the patient felt light-headed five minutes after receiving the vaccine. He then became unresponsive but was breathing and had a pulse. The reporter stated it looked like the patient was having a seizure; his eyes rolled upward, his left arm shook, and he did not respond to touch or voice. It was reported that 911 was immediately called and responded within a couple of minutes. The patient's blood pressure and heart rate were extremely low, and he was profusely sweating. The reporter stated that the patient came to and still felt very light-headed. The patient was then taken to the emergency department. Medical tests and laboratory results were unknown, but the reporter stated that a magnetic resonance imaging (MRI) was possibly performed. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not provided. The outcome for the events, became unresponsive and looked like having a seizure, were resolved on 29 Jan 2021. The outcome for the events, felt light headed, BP extremely low, heart rate extremely low, and profusely sweating, was unknown.; Reporter's Comments: This case concerns a 35-year-old, female, with medical history of high blood pressure, who experienced a serious unexpected event of syncope, seizure, and non-serious unexpected events of dizziness, hypotension, hyperhidrosis, and heart rate decreased. The events occurred 1 day (5 min) after mRNA-1273 (Lot# 025L20A). Treatment information was not provided.

							Concomitant medications included: hydrochlorothiazide/lisinopril. Based on temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Additional information has been requested.
1023576	2/11/2021	IN	83	F	2/9/2021	2/10/2021	Bad headache, very stuffy nose, I couldn't breathe and almost went to the hospital. Ears were ringing, my eyes were ready to pop out of my head. Temples hurt, lymph glands were swollen, sore throat. Mostly in upper part of anatomy above collar bone. It made me very weak, I had trouble getting out of rocking chair to answer phone. So I took another Tylenol. I usually only take 1-2 Tylenol a day and that was my second one by the middle of the day. I had to lay down and I live alone so I was nervous and had phone beside me and debated calling 911 which I have never done. I dozed and when I woke up about a couple of hours later it was much better. Still had headache and a little stuffiness but anybody can handle that. Also, I was very nauseated and couldn't eat but I did drink water.
1024846	2/11/2021	NJ	50	F	1/8/2021	1/8/2021	15 minutes after vaccination, I began to feel nauseous , headache and tired. This lasted about 3 days and also very painful injection site (much more than with influenza vaccine). I felt much better on the 4th day but on the 5th day began having chills, dizziness, ongoing severe headache , dizziness and lethargy, this lasted 5 more days. Total 9 days. I had a teleheAlth visit and was tested for covid, influenza and RSV, all were negative. Oddly enough, the next day , after both the first and second doses, I developed a style in my left eye
1024840	2/11/2021	CO	32	F	2/3/2021	2/4/2021	102 F fever intermittent 24 hours, beginning 6 hours after injection. NSAIDs and antihistamines do not improve symptoms. Severe headache causing nausea, appetite loss, blurred vision, hypersensitivity to light - affecting ability to leave house, drive, work, lasting 8 days after injection so far and have not subsided. Severe fatigue lasting 8 days after injection and so far has not subsided.
1024836	2/11/2021	CA	48	F	2/10/2021	2/10/2021	Second dose. Fever of 99, whole body aches, skin everywhere feels rashy, chills, fatigue, eyes feel puffy and stingy. I?m on day 2 of side effects.

1024682	2/11/2021	FL	80	F	2/11/2021	2/11/2021	Patient had episode of intense right eye pain as well as hypertension 170/2/110's with no previous history of HTN.
1024806	2/11/2021	CA	45	F	1/20/2021	2/1/2021	12 days post vaccine I experienced nausea, headache, lightheadedness, blurred vision. I waited to see if it would go away. I had lab work done, went to multiple appointments with 2 different clinics and now I'm set for a CT scan to rule everything out. I live a healthy lifestyle. I exercise and eat healthy. I don't do drugs. I drink seldomly. To date, all of my labs are normal and the symptoms are the same as when I used to get migraines, although instead of a 1 hour migraine this one is lasting now 11 days and counting. I am miserable, I call in sick and lay in bed all day. The symptoms have not lessened.
1024691	2/11/2021	WA	32	F	2/11/2021	2/11/2021	Headache and nausea with in 10 minutes, eye burning and headache similar to whiplash within 1 hour.
1024797	2/11/2021	AR	52	F	2/10/2021	2/10/2021	It started with a bit of a weird headache about 3 minutes after the shot. Then about 7 minutes after I started having a weird tingly itchy feeling around my mouth and left cheek. Shortly after that, I had a weird itchy, tingling sensation in my throat. One of the pharmacy gentlemen administering shots gave me Benadryl immediately when I shared it with them. I waited an additional 10 minutes after the initial 20 minutes. The itching around my neck lasted for about 2.5 hours. I was fine, but today (the next day) I've been very itchy around my ears, eyes, neck, chest, and upper back. I did send an email message to my doctor about this as well. I happened on this, as I was looking at the CDC site.
1024793	2/11/2021	GA	42	F	2/8/2021	2/9/2021	Fever of 101 by temple for over 24 hours. Temp at site of injection 102.9. Muscle aches, neck pain, pressure behind eyes, severe fatigue. Oliguria (I was drinking ice water regularly and it took about 12 hours for my urine stream to return to normal)
1024753	2/11/2021	NM	19	F	12/30/2020	12/31/2020	I was high in fever, I could not walk without my vision being blurry and dizzy. After the 2 does it took a week before my fever and symptoms went away however before that happened I could not walk I was literally tied to my bed if I walked I would have to hold on to something my leg strength was gone.

1024684	2/11/2021		35	M	2/11/2021	2/11/2021	PT fainted post vaccination. He was sitting in chair looked nervous conscious. He then fell out of chair and hit his head on the ground. When assessed he was rigged, eyes were flickering in head and was not responsive. Lasted for about 30 seconds. He then regained consciousness and was AxO times four. Felt cold and shaken.
1024830	2/11/2021	VA	39	F	2/8/2021	2/9/2021	I had a migraine beginning Feb 9 AM. I have chronic migraines that almost always occur on the left side of my head, but this one was on the right side, which is unusual for me. The migraine pain was more severe than normal. I also had a stiff right jaw and eye pain primarily on the right side. I took 100 mg Imitrex in the afternoon of Feb 9 and it reduced the pain very effectively (which is also unusual for me). On Feb 10 AM, the migraine returned or a new one started. The pain was also in the right side. I took 100 mg Imitrex and it reduced the pain somewhat effectively. The migraine pain returned Feb 11 AM and hurt on both sides of my head. I took 100 mg Imitrex this evening (Feb 11) and it is helping so far. In addition, my left arm was sore around the injection site beginning when I got the shot and stopped this morning.
1023737	2/11/2021	WI	37	F	2/5/2021	2/6/2021	First shot in right arm on Jan. 8th, broke out with tiny blister like pimples all over my face. They cleared up in 2 days after shot. Second shot in left arm Feb. 5th, broke out again but on my bottom lids of eyes and a sty in my left eye. The pimples on lids are cleared up, but the sty is still there.

1023959	2/11/2021	TN	72	F	2/5/2021	2/5/2021	Immediately after the vaccine had a red spot on her wrist that was itching. Later that night her wrist started itching more and had 3-4 areas that blistered up and itching.. The right eye upper eyelid and underneath was itching really bad. Monday, 2/8/21, she called her NP and told her that she was breaking out all over her body and she needed a steroid shot. She went to a fast pace clinic and they would not give her a shot, told her to take Benadryl, antihistamines and Pepcid AC. She continued to break out and she is broken out from her head to almost her feet. She went and saw her doctor who told her to take a stronger dose of Benadryl, gave her a Medrol dose pack, but still having itching, and the break out. They are red and itchy. Her doctor also gave her the cortisone cream to put on it, but she is covered and cannot use the cream all over her body. The rash looks like the COVID rash that she has seen online. Does have a return apt with her doctor in a week.

1023700	2/11/2021	IA	48	F	2/9/2021	2/9/2021	Thirty minutes after receiving COVID vaccine, Jen started feeling numbness and tingling on the left side of her face and neck and left sided facial drooping. She went immediate to ER. Reports high blood pressure in the ER. Highest reported was 210/138. In the evening her BP was down to 140/98. Yesterday morning at Dr office it was 128/80. Receives relief of symptoms with Benadryl. She took 50mg 3 times on 2/10/21 and at 8 a.m. today. Reports her lips and eyes are swollen this morning, but it improves with Benadryl. Reports she feels tightening in her face when talking and had hives on her chest. Again, this improves with Benadryl. Continues to have left sided facial droop. She is seen at a physical therapy office due to some ongoing neck/shoulder pain. She was seen by them yesterday and noted the facial droop.
1023633	2/11/2021	MN	60	F	2/3/2021	2/9/2021	On Tuesday she woke up with a headache that gradually worsened. The headache was behind the right eye, the right ear, and the teeth on the right side also hurt. Nothing helped taking Acetaminophen; Ibuprofen. She went to sleep around 4:00 am finally, and then woke up 6 hours and the headache was gone. Then you had hives located behind the right ear and down the neck, into the right shoulder. They are also in her scalp. They have now down to the tops of her legs, hips, and back and are spreading. She called her doctor who called her in some prescriptions.

1024341	2/11/2021	TN	26	M	2/4/2021	2/4/2021	Patient presented with puffy eyes approximately 4 minutes after vaccination. Was alert and oriented to time, person, and place upon questioning and was able to engage in conversation. Parent (mother) of patient was present who gave patient's medical history and reported allergy to grass with similar reaction. Blood pressure was taken and found to be 150/80. Mother reported patient had not taken his blood pressure medicine yet that day but his normal is 115/70 with medication. While nurse was assessing patient's pulse (patient's pulse was WNL at 85) and other nursing staff was obtaining medication to administer if needed after assessment, patient became unresponsive to verbal commands and his upper body became limp. At 1054, a one time, single dose of 50 mg of diphenhydramine IM was given in the left deltoid. On site EMT arrived on the scene at 1055, completed assessment, and confirmed giving diphenhydramine was the best course of action. At this time, 1055, patient became responsive to verbal commands and was oriented to time, place, and person. At 1056 O2 sat was at 97%, pulse 70, and at 1100, BP was 110/70. Patient stayed for observation 30 more minutes and remained stable. Patient and parent were educated on side effects of diphenhydramine, to watch for any returning symptoms of allergic reaction throughout the day, and if/when to head to the ER. Recommended patient not receive 2nd dose of COVID vaccination.
1024692	2/11/2021	WA	45	F	2/10/2021	2/10/2021	Severe pain all down my right arm into hand and up into jaw and severe headache on right side behind me eye, moderate chills, mild nausea maybe due to the pain. Symptoms started 2/10/21 at 6pm and progressively got worse to the point of being unable to sleep. Took Tylenol at 1:30am and the pain decreased and was able to sleep some, 4 hrs later symptoms returned. Took more Tylenol. 2/11/21 5:57pm still have mild sore arm, mild headache off and on and mild chills.
1023608	2/11/2021	IN	56	F	1/14/2021	1/21/2021	Patient awoke in middle of night with eye pain. Went to Ophthalmologist, who diagnosed patient with Ocular Sclerosis. 1024070	2/11/2021	WI	28	F	2/11/2021	2/11/2021	At 0954 EMS requested by medical standby at City Hall for the COVID vaccination clinic with report of an allergic reaction. Upon arrival found patient who received the vaccine sitting up in a chair, breathing normally and complaining of being itchy and chest tightness. Patient also complained of pain in chest when taking a deep breath. At 0955 25 mg of Benadryl was given to the patient by liquid oral route prior to arrival of EMS. Patient did say that itch had improved but still feeling tightness in the chest. Vitals were done by EMS at 1012 which were as follows: BP 164/120, HR 104, RSR, O2 sat 97%, RR 20, Effort normal. Patient was given a 2nd dose of 25 mg of Benadryl at 1030 because she; This patient did have a similar reaction after receiving the 1st COVID vaccine on 01/14/21 but symptoms. Additional information for Item 18: reported itching returned. The itchy feeling did subside after the 2nd dose of Benadryl. 2nd set of vitals at 1020 were as follows: BP 140/86, HR 101, RSR, O2 sats 96%, RR 16, normal effort. Patient did contact her father to respond to the scene to discuss options. Patient did not want to be transported to the hospital and decided to go home with her father and that he would keep an eye on her until symptoms subside. Patient stated she would seek medical attention if things change for the worse. Upon leaving, the patient was given 2, 25 mg Benadryl tabs from the health department to take home and use if needed. Patient did sign a release with EMS. Patient's vital signs prior to leaving at 1032 were as follows: BP 143/82, HR 89, RSR, O2 sats 97%, RR 16, normal effort; symptoms subsided without the use of Benadryl. Patient was observed for approximately 1.5 hours after receiving the 1st dose of COVID vaccine and was able to go home without incident.
1024023	2/11/2021	NC	47	F	2/4/2021	2/8/2021	My blood pressure which has been stable became elevated. I experienced severe headache for a full day, a little blurred vision, bp 160s / 100s. My bp remained elevated for several days, is normal today at last check. I saw my primary care provider yesterday and we are monitoring things for a week to see if this passes. If not further testing or medication adjustments may be needed.

1019508	2/10/2021	NY	36	F	1/5/2021	1/5/2021	After she received the vaccine she started to feel itchy and had redness at injection site. She remained itchy for several days, but it would come and go. About two weeks after the shot; she started to break out into hives on her arms, then spread to her legs, back and head. Her palms got red. She took claritin and it gave her short-lived relief. She got prescribed a medrol dose pack, she completed two packs and still no relief. It helped while she was on it then symptoms came back once she stopped. She has an itchy throat, swollen face. She also has diarrhea. Symptoms have not been for over a month and seem to be getting worse. Following up with an allergist and her PCP today. Dr. then prescribed Solu Medrol, IV which she had last week. While, she was receiving the treatment, she felt better. As soon as the IV was done. She started to break out again. Today she came into work, and her eyes were blood shot. She also has pressure in her chest and has a hard time swallowing. She had hives on the inside of the mouth, and alongside her tongue. She will be seeing an allergist and an infectious disease in the upcoming days.
1019479	2/10/2021	IN	49	F	1/22/2021	1/24/2021	Mild Headache and a rash that started on my lip and spread to my cheek, my eye and forehead. The rash it blistery kind of looking, little bit blister and they would open and bleed and then close back up. It was also burning. It start continually spread more. I went yesterday 02/09/2021 to a Dermatologist he treated me for a contact kind of dermatitis as if he was unsure if it was linked to vaccine or not. He gave me two steroid injections in the office and prescribed a cream Elidel 1% . The medications seem to be clearing up my face today.
1019456	2/10/2021	ME	47	M	1/30/2021	2/1/2021	Since receiving Moderna shot #1 vaccine I have experienced three gout attacks. It is unusual for me to have this many gout attacks in such a short time period. Additionally, physical activity has been very challenging since receiving the shot. I fatigue and become short of breath very quickly. During the first workout that I did, on 02/01/2021, after receiving the shot I became extremely dizzy, my eyes became light sensitive and my hands trembled; symptoms lasted for approximately 45 minutes.

1019329	2/10/2021	PA	46	F	1/30/2021	1/30/2021	<p>Covid vaccine time line 1st Moderna vaccine on 1 2 21 (Sat) given at PMH at 5:10pm. Tired x 3 days with some cognitive issues noted (very slight..like forgetting things I never do?was slowly resolving but never completely went away. I did not even mention this to anyone because I was not sure it was the actual vaccine, or just my brain.) 2nd Moderna vaccine on 1 30 21 (Sat) given at PMH at 2:40pm. Immediately had more pain in L arm, swelling in upper arm and redness, fatigue. --Sun. 1 31 21: woke up with a low grade fever, increased fatigue, chills, nausea, diarrhea, headache, body pain, joint pain (it hurt to even shower). Fever got higher?max 100 (I think, as I was taking Tylenol at this point) and fatigue got worse by nighttime. --Mon. 2 1 21: Called out of work due to reaction but fever was lower around 99 and less fatigued (ie I could get off of the couch, clean a bit, take care of my son). Still rested a lot, had diarrhea, nausea, headache off and on t/o day. --Tues. 2 2 21: Had a planned day off anyway. Same symptoms as Monday and same energy level. Felt positive about going back to work on Wed. --Wed. 2 3 21: Woke up feeling the best of the past days and went to work. Still fever of 99 and I noticed I was ?off? all day. Example: I forgot my schedule book and Id tags at home (I NEVER do that). Made weird ?forgetting? mistakes. By 1pm I was EXHAUSTED and having diarrhea, nausea, chills, and headache. Called the Employee Exposure Line and my manager. Went and got COVID test at request of EL and contacted immunologist and primary MD. Immunologist is on vacation x 2 weeks and covering MD deferred to whatever primary said. Dr. covered for my primary MD, Dr. She asked me to touch base with her on Thurs after results from COVID test, but she recommended that I rest ?and let my body adjust to the vaccine?. --Thurs: 2 4 21: Up at night from 2:30am on and off with nausea, diarrhea, chills, headache, weakness, shaking, brain fog, sweating. I am also having some anxiety at this point. COVID test negative. I did send a message in MyChart to Dr. as requested. She called me later in the day and instructed me to drinking fluids and rest. She ordered blood work which I did go and do. Also contacted Urgent Care though MyChart and spoke with a CRNP about my symptoms. She felt that they were a reaction to vaccine and my anxiety. --Friday: 2 5 21: Called out of work again due to all of above symptoms. Diarrhea has</p>

resolved and no longer any fever, however fatigue, lightheadedness and dizziness, headache, ?brain fog?, and cognitive symptoms remain. I am off balance and have difficulty concentrating and reading. I did communicate with my neurology office and they stated that it is ?just a reaction to the vaccine?. --Sat: 2 6 21: Called Employee Exposure line to report same symptoms as above. Same headache (almost migraine? Having an aura?) I am not sure why I feel so foggy. Did have some ?clearing? of my head in the afternoon. --Sunday: 2 7 21: Woke up feeling worse immediately. Horrible headache, lightheadedness, off balance, difficulty focusing and concentrating. No fever. Called Employee Exposure Line to report symptoms and they recommended that I call the Urgent Care MD again. Called urgent Care MD through MyChart again and tried to go into see her at Healthcare, however it was snowing hard and I slipped 3 times so I called the Healthcare and made apt for Monday 2 8 21 for 10:30am. --Monday: 2 8 21: Headache, lightheadedness, fatigue, off balance, difficulty with multitasking as of this AM. Went to Healthcare and saw CRNP. She wrote for Augmentin for possible sinus infection and I filled at the pharmacy. She instructed me to see my neurologist regarding possible neuro symptoms from COVID injection reaction. I communicated with workers from comp team. I am allowed to see the neurologist from the Dr. office. I called their office and office manager tried to refer me back to primary. I insisted that I see the lady as I was referred from CRNP at Worker?s Comp. They were agreeable to a telemed appointment as soon as I get my claim number. I am exhausted, have a headache, and difficulty focusing at this point. Sore throat started this AM and is way worse tonight. B swollen glands near carotids. Started Augmentin. --Tues: 2 9 21: Cont headache, lightheadedness, fatigue, off balance, difficulty concentrating, difficulty with lights and sounds. Trouble reading. Saw neurology this AM at 10am in the office as opposed to telemed visit and had a MRI at 12pm. She diagnosed a fair amount of things including vaccine reaction possibly causing intractable headache, migraine, dizziness w/o vertigo. Wants me to start to Propanolol for the headaches. Need to pick up from the pharmacy. Out of work until 2 15 21 and then a partial return to work? Not sure how that works. Hopefully just feeling

1019837	2/10/2021	FL	65	F	1/28/2021	1/31/2021	On 01/30/2021 at 08:00 had an extreme headache. Then having extreme difficulty keeping my eyes open, like I was trying to drift off to sleep. Immediately there after, I started vomiting. These symptoms lasted 4 days extremely fast and hard. Tylenol was take for the headache and helped very little. I slept a lot and I couldn't eat or drink anything witching vomiting it back up. Even my regular meds with a little water came back up. The evening of the 4th day, I was able to keep clear broth down and crackers helped with the nausea some. The following week, I still didn't feel quite right and kept fighting off sleep. Today is the 10th of February and toe nausea has returned. Getting out of bed, I dry heaved for an hour. I feel if I eat anything it?s going to come back up. My theory is that the side effects didn't go away the week I felt somewhat better and had resurfaced, starting out slowly like before. I called my primary at the VA and we discussed what I was already doing i.e. a bland diet until I feel better.
1018332	2/10/2021			F	12/1/2020		hives in her upper thigh, toes, eyelid; Throat closed; This is a spontaneous report from a contactable consumer (patient). A female patient received first dose of bnt162b2 (Pfizer-BioNTech COVID-19 mRNA vaccine, Lot Number and Expiration Date unknown) via an unspecified route of administration in Dec2020 at single dose for COVID-19 immunisation. The patient's medical history included allergic to Penicillin. The concomitant medications were not reported. With the COVID-19 vaccine, patient had a reaction of hives in her upper thigh, toes, eyelid; went to sleep, when woke up it was pretty much gone with Benadryl. Patient have throat closed. For second dose, patient wanted to know if it be needed the EpiPen or tell ambulance just in case. Her second injection was on Sunday. As per the verbatim the patient had not administered the second dose yet. The outcome of hives in her upper thigh, toes, eyelid was recovering. The outcome of throat closed was unknown. Information on the batch/Lot number has been requested.

1019847	2/10/2021	MA	77	M	2/9/2021	2/9/2021	I had my (Moderna) first dose yesterday. Within ~6 hour the soreness level of the shoulder joint (but not especially the site of the jab) zoomed up to intense. So much so, that simply lifting my arm slow-motion to the level of my eyes caused intense pain spasms. Last night and this morning were equally severe. Within the last hour or so, the pain level has diminished a bit. NOTE: I know how people rate pain is super subjective. In my case working as a geologist in a quarry a number of years ago, I was struck and pinned by a large boulder. The ER crew would not give me a pain killer, so that they could monitor how the Jaw of Life was working (it broke, the boulder was too heavy), so I not surprisingly passed out several times from the pain level before being extricated. Needless to say, this compound fracture of the tibia and fibula accident was a 10 of 10 pain level. Yesterday's CV-19 jab pain level was an 8-9 of 10. Nothing I read before yesterday's jab, Fauci et al, prepared me for this pain level. So, is this normal??? My POV is, I think, atypical in this matter of pain. Should I be concerned about a return to normalcy right now (today / tomorrow) as well as for the second dose?? I HOPE THAT A MEDICAL PERSON WILL RESPOND TO THIS EMAIL - NOT SOME BOILER PLATE WORDS. If you want more details, feel free to phone me

1018419	2/10/2021	OK	56	F	1/7/2021	1/9/2021	dizziness while lying in bed after turning over onto her back/ dizziness when standing up quick, turning over onto her back or side while in bed, and getting out of her car; had been a few times while lying in bed that her vision was affected when this dizziness comes on; This is a spontaneous report from a contactable consumer (reported for herself). A 56-year-old female patient (not pregnant at the time of vaccination) received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number: EK9231), via an unspecified route of administration on 07Jan2021 15:00 at single dose in right arm for COVID-19 immunization. Medical history included Hypothyroidism, No Allergies to medications, food, or other products. Concomitant medication received within 2 weeks of vaccination included levothyroxine. Facility where the most recent COVID-19 vaccine was administered in Workplace clinic. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Vaccine was given on a Thursday afternoon, on Saturday morning, the patient experienced a dizziness while lying in bed after turning over onto her back. She only experienced the dizziness when standing up quick, turning over onto her back or side while in bed, and getting out of her car. She had never had any trouble with dizziness. There had been a few times while lying in bed that her vision was affected when this dizziness comes on. To date she was still having problems. The events started on 09Jan2021 06:30. No any treatment received for the adverse events. The events were non-serious per the reporter. Prior to vaccination, the patient wasn't diagnosed with COVID-19. Since the vaccination, the patient hadn't been tested for COVID-19. The outcome of the events was not recovered.

and burned bright red face feeling sunburned in Jan2021. Events were described as follows: patient received the first dose of the vaccine on 22Jan2021 and she had a few mild symptoms. She did not feel really good for a day or two but it was nothing that alarmed her, she was tired and wiped out. She always took a shower since she had arthritis and it gets her joints going. On 24Jan2021 after she got out of the shower, her face felt hot and it was red. She didn't think too much about it and it went away pretty soon. She did not connect it with the vaccine. On 25Jan2021 she took a little longer shower and the same thing happened, but it was 10 or 12 times worse in regards to her face feeling hot and was red. She was drying off and getting dressed and reported her face felt funny and it was really hot. When she looked at it was bright red like she had the worst sunburn, it felt like a sunburn. Her face was red and eyes were red bloodshot and it lasted about half an hour; her face got real flushed like a real bright sunburn and her face was burning and burned bright red. She started putting on cold wet wash cloths to help cool her face down and when the wash cloths got warm, she would wet it again to cool her face down some more. She was alarmed but about 30 minutes later it started lightening up a bit and pretty soon it was back to normal. Her face felt different in the afternoon, it was a little red. She worked out in yard and last summer she got an insect bite on her forehead that turned gray, it was the size of silver dollar. After the hot flush thing this morning, that gray spot came back. Her doctor said it might take a while for it to go away. Her face felt warm like it has been sunburned. Her throat was dry since she has been waiting on the phone for an hour. Her face feeling sunburned/hot was about 95% gone, barely there. Her face getting red started on 24Jan2021 morning and it was almost gone. Treatment included ponds face cream and it was very soothing. Patient just wanted to know what to do about this flushing of her face and if it was dangerous what she can do. She would like to know if she should be worried about this, it only happened when she took a shower. She was asking if there was anything she can do before she can get the second injection, so it does not happen again or what to do if it does happen again. Final outcome of tired and wiped out, eyes were red bloodshot and face was burning and burned bright red/her face feeling

1019029	2/10/2021		87	F	1/18/2021	1/18/2021	migraine aura/migraine that was strong enough that she could not see; flashing lights; blocked vision/migraine was strong enough that she could not see; This is a spontaneous report from a contactable consumer reported for herself. A 87-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL1284), via an unspecified route of administration on left arm on 18Jan2021 at SINGLE DOSE for covid-19 immunisation. The patient medical history was not reported. Concomitant medication reported as unspecified (Caller states that she does take a few medications but nothing has changed with those in years, so she does not think anything else is relevant). Historical vaccine include flu shot and does have reactions. Caller stated she received Pfizer COVID shot first dose and within an hour she had migraine without the headache but did have the vision blocked out. It resolved after some time. she wanted to know the ingredient of the vaccine to see if she should take the second dose. Caller states that she had her first Pfizer COVID Shot on 18Jan2021. Caller states that she didn't have any of the ordinary reactions, both the caller and her husband had the shot and neither of them got a sore arm or swelling at the site. Caller states that after they stayed for a half an hour, and when they were driving back to, the caller started to get a migraine aura. Caller states that she has had them before, but not often, and she has not had one for about 10 years. So caller states that her aura started while they were driving, and then the caller's husband dropped the caller off at the grocery store. After being dropped off, caller states that her migraine came on strong. Caller states that her migraine was strong enough that she could not see, she was experiencing flashing lights, and blocked vision. Caller finally turned to another customer to ask if he could see the cucumbers in front of them. Caller states that she waited outside for her husband to get her. Caller states that migraine probably lasted for about 45 minutes. Caller is wondering if this could have been from the shot or not. Caller states that she does have reactions to flu shots sometimes, but not like this. Outcome of the events was recovered on 18Jan2021.

A 33-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection; Lot #: EK9231) intramuscularly on 09Jan2021 at 14:00 (at the age of 33-years-old) as a single dose in the right arm for COVID-19 immunization. Medical history was reported as none. Concomitant medications included drospirenone/ethinylestradiol (OCELLA) taken as an oral contraceptive (OCP) from 04Jan2021 to an unspecified date and cetirizine hydrochloride (ZYRTEC ALLERGY) taken as a premedication for 3 days prior to 2nd dose. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection; Lot #: EK5730) intramuscularly on 19Dec2020 at 13:00 (at the age of 33-years-old) in the left arm and experienced tingling of left arm, paresthesia of tongue, heart racing, feeling of lump in my throat and anaphylactic reaction. The patient previously received Bactrim on an unspecified date and experienced allergy. Prior vaccinations within 4 weeks were reported as not applicable and it was reported that the patient had not received any other vaccines around the time of the COVID-19 vaccine. The patient experienced "tongue tingling" on 09Jan2021, "tachycardia/heart racing", "HR (heart rate) was around 105-110) and bounding for about 1 minute" and "nausea" in Jan2021. It was reported that "I was re-dosed with the vaccine dose on 19Jan2021 (as reported) at 2pm. I took Zyrtec (Cetirizine) for 3 days prior. About 5 minutes after the vaccine was administered, I had tongue tingling that lasted approximately 5 minutes, I took 25mg of Benadryl and the tingling did not reoccur." It was also reported that "nausea occurred immediately after vaccine administration". The patient stated that her "heart was racing approximately 6-7 minutes after and lasted about 1 minute". It was reported that none of the events were considered serious due to being life-threatening or due to persistent or significant disability/incapacity. The adverse events did not require a visit to the emergency room or physician office and did not require medical intervention. The patient was not hospitalized due to the events. The</p>

patient was not admitted to an intensive care unit. It was reported that the patient did not have any bilateral wheeze/bronchospasm, stridor, upper airway swelling, respiratory distress, tachypnea, increased use of accessory respiratory muscles, recession, cyanosis, grunting, dry cough, hoarse voice, difficulty breathing, sensation of throat closure, sneezing, rhinorrhea, measured hypotension, shock, capillary refill time greater than 3 seconds, reduced central pulse volume, decreased level of consciousness, loss of consciousness, generalized urticaria, generalized erythema, angioedema, generalized pruritus with skin or without skin rash, localized injection site urticaria, red and itchy eyes, diarrhea, abdominal pain or vomiting. Relevant tests were reported as not applicable. It was also reported that a culture was not performed. The clinical outcomes of the events "tongue tingling", "tachycardia/heart racing", "HR (heart rate) was around 105-110) and bounding for about 1 minute" and "nausea" were all recovered/resolved on unspecified dates. The reporter considered that there was a reasonable possibility that the events were related to BNT162B2.

1018989	2/10/2021	FL	67	F	1/18/2021	1/18/2021	Got a bumpy itchy rash on both legs which is still present; sweating; arm began to hurt then throb and go numb a bit; arm began to hurt then throb and go numb a bit; The patient was cold; clammy; the first blood pressure was 90 over something/second blood pressure was 70 over 40 something; diarrhea; tired; This is a spontaneous report from a contactable consumer (patient). A 67-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: 3247), via an unspecified route of administration in the left arm on 18Jan2021 10:00 at a single dose for COVID-19 immunization. The patient's medical history was none. There were no concomitant medications. The patient was not pregnant at the time of vaccination. The patient was not diagnosed with COVID-19 prior to vaccination and had not been tested for COVID-19 since the vaccination. On 18Jan2021 10:10, the patient's arm began to hurt then throb and go numb a bit. On 18Jan2021 10:15, the patient started sweating. She stood up to try and feel better. The patient's husband called the nurse over and they called the paramedics because they said the patient was cold, clammy, and still sweating. The patient sat down again and they put leads on me to check her heart rate, blood pressure (BP), and oxygen on 18Jan2021. Her heart rate and oxygen were fine but the first BP was 90 over something. A few minutes later, she closed her eyes and could have fallen asleep right there. Her second BP was 70 over 40 something. She opened up her eyes and tried to stand up again. After a few more minutes, her BP came up and was OK. They refused an ambulance and went home. She had diarrhea at home on 18Jan2021. She ate, walked and felt better. She just experienced the normal tired and hurt arm in the afternoon on 18Jan2021. She rested the balance of the day. On Wednesday (20Jan2021), she got a bumpy itchy rash on both legs which is still present but with cream, it was OK. No treatment was received for the adverse events. Outcome of the "the first blood pressure was 90 over something/second blood pressure was 70 over 40 something" was recovered on 18Jan2021 and of the remaining events was recovered on Jan2021.

1018863	2/10/2021	NC	87	F	1/6/2021	1/23/2021	COVID; COVID; This is a spontaneous report from a contactable consumer. An 87-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 06Jan2021 maybe about 11:30am at single dose for COVID-19 immunization. Medical history included ongoing lung disorder started maybe 10 years ago or more, ongoing eye disorder onset may have been about 1 year ago, Carpel tunnel surgery on Jan2021 which was done on both wrists, ongoing weight decreased about 2 years ago, patient had cancer and has had some problems; they were going to the health clinics at the time and she had a horrible cough; she thinks, but does not know, if they did a bronchoscopy; but she saw some doctors and a cancer specialist. The patient had unknown concomitant medications for Thyroid. The patient was diagnosed with COVID 23Jan2021 and hospitalized in response which is ongoing. She is scheduled to get the second dose of Pfizer COVID-19 Vaccine on 27Jan2021. The patient body temperature is usually about 97.5 or 97.6 degrees Fahrenheit; but on Saturday: 23Jan2021 her temperature was 101.5 degrees Fahrenheit. Patient had her son take her to the hospital where they did the COVID test and it was positive for COVID; so she was admitted to the hospital for this on 23Jan2021. She is hospitalized at the same hospital where she was administered the first dose of Pfizer COVID-19 Vaccine and the hospital staff were shocked that she had gotten one of their Pfizer COVID-19 Vaccines. The patient was at the hairdresser's on 22Jan2021 who said the patient did not look good then; that she really looked sick; but apparently the patient did not have any symptoms 22Jan2021. It was not until unknown time on 23Jan2021 that her temperature went up; patient feels like her reaction is to the fever; where she just wants to sleep all the time. Patient probably does not have any energy. Caller does not hear her coughing when she talks to the patient. Caller clarified that to her awareness the patient's potential exposure to COVID positive persons would have been through the grocery store; or the health plex gym where caller and the patient go together but the patient said the health plex gym machines are spaced out well and there are no known exposures to COVID positive persons. Outcome of events was unknown.

1018745	2/10/2021			F	1/20/2021	1/1/2021	dizzy; achy; her eyes began to ache; she felt feverish but she did not have a fever; she just felt lousy; This is a spontaneous report from a contactable consumer (patient). A 91-year-old female patient received first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number and exp date not reported), via an unspecified route of administration on 20Jan2021 11:00 for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient felt fine right after receiving it at approximately 11:00 am. On 21Jan2021, the next day around 11:30 am, she began to feel dizzy and achy and her eyes began to ache. On an unspecified date in Jan2021, she felt feverish, but she did not have a fever and she just felt lousy. The patient states on an unspecified date (Friday) she felt better but still a little dizzy and achy. Patient was instructed to call the number listed on the FactSheet to report her experience. She would like to know if her symptoms were normal and would like to know what she should do about her symptoms. She asked if she should receive the second dose of the vaccine. She was scheduled to receive second dose on 10Feb2021. She just wanted to call so that her symptoms can go on record for what people are experiencing after receiving the Pfizer COVID vaccine. Caller states the fact that everyone gets the same dosage no matter their size was amazing to her. She had been bragging to her neighbors and others how the first dose of the vaccine was a piece a cake and then she started to experience side effects 24 hours after receiving the vaccine. The outcome of events was unknown. Information on the lot/ batch number has been requested.

1019031	2/10/2021	TX	68	F	1/25/2021	1/25/2021	Pin prickly feeling in different areas of her body; Headache; Funny feeling on the top of her head and down her forehead and around her right eye, like a numbing sensation; Stinging feeling in sinus cavity; This is a spontaneous report from contactable consumer (patient) A 68-years-old female received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) from lot#292673 on left deltoid (reported as left shoulder) on 25Jan2021 11:21 at SINGLE DOSE for covid-19 immunisation . Medical history included diabetes from 11Sep2001 and ongoing , ongoing cardiac pacemaker insertion Put in about 7 years ago , ongoing blood cholesterol increased Diagnosed about 24 years ago , ongoing blood triglycerides increased. She is allergic to statins. Concomitant medication included alirocumab (PRALUENT) 1 mL at 1ml injection every 14 days for High cholesterol (Injection on side or top of her leg. She has been taking for about 4 year).The patient experienced headache on 25Jan2021 with outcome of recovered , funny feeling on the top of her head and down her forehead and around her right eye, like a numbing sensation on 25Jan2021 with outcome of unknown , stinging feeling in sinus cavity on 25Jan2021 with outcome of recovered , pin prickly feeling in different areas of her body on an unspecified date with outcome of unknown. Clincial course reported as follows:She got the first dose of the vaccine today and while she was sitting in the observation area, she started getting a headache. It was close to noon and she just blew the headache off since she was a diabetic. She started getting a funny feeling on the top of her head and down her forehead and around her right eye, like a numbing sensation. When the feeling hit her sinus cavity, it was like a stinging. She started drinking water and she had lunch. Within an hour it started getting better and within 3 hours it was a lot better. She has a pin prickly feeling in different areas of her body but did not have the numbness sensation. She tried to report this online. She only had one virtual visit with her doctor. Treatment: declines any, she was drinking plenty of water to try and flush some it out of her system.

1020865	2/10/2021	IN	68	F	2/8/2021	2/8/2021	About 4-5 hours after the injection my arm was slightly sore to the touch. Later on that evening it started to swell and get hard and hot to the touch. The next day around 4 o'clock I started getting very cold had the chills, my whole body ached, and I was so sleepy I could hardly keep my eyes open. I took my temperature a couple of hours later and it was 101.7, my normal is 97. I took four Advil, and within a couple of hours my temperature started going down. Then within a couple more hours the chills stopped the coldness stopped and the aching stopped I took my temperature again and it went down to 100.6. When I got up the next morning my temperature was back down to normal and everything felt fine. My injection site has gone down in size and is starting to itch. It's not as hard and not as hot as it was

1020772	2/10/2021	VA	41	F	1/1/2021	1/31/2021	This 41 yo female received her first Pfizer COVID vaccine (Lot EL1284) on 1/7/2021. She reports being in good health, had no illness exposures (does work in hospital with children), and had no recent travel. She reports following her Covid vaccination, she had a sore arm at vaccine site for 4-5 days with no other issues. On 1/31 (day24) while putting on lipstick to take a selfie to send to her friend she noticed the right side of her lower face (lip area) felt "weird"- tingled and the corner of her mouth would not smile symmetrically with left. Her friend commented something was off with this picture. The next day this droop worsened with loss of facial lines/wrinkles on right (nasolabial fold), had tingling/numbness to lips and corner of mouth and inability to smile on right. This prompted her husband to bring her to the ER on 2/1/2021. She denied any fever, headache, weakness to arms/legs, no SOB/CP, dysphagia or speech issues or trauma. ER providers exam noted normal CN evaluation but documented mild right sided decrease in nasolabial fold vs left and loss of taste to anterior right tongue. She had no involvement of eye or forehead. She was diagnosed with early Bell's Palsy and treated with oral steroids and anti-virals. AS of 2/10/2021 with use of medications, she advised her facial weakness/droop had resolved but still has tingling. Her smile is symmetrical at this time. No c/o on loss of taste. Has diagnosis of Bell's Palsy. IHD case 9967.
1020967	2/10/2021	AR	44	F	2/9/2021	2/9/2021	I received the second dose of my vaccine yesterday morning. I waited 15 minutes and then left to go home. It took me 25 minutes to get home. As soon as I walked in the door, I noticed itching all over my body. I looked in the mirror and noticed a red rash with some hives, that covered my throat and chest area. My eyes were itching as well. I have had severe anaphylactic reactions in the past that required several hours in the emergency room, so I knew to take an antihistamine right away. The rash took at least a couple of hours to fade away; however, the itching of the eyes and body lasted until this morning. I did experience some occasional wheezing until 3 or 4 this morning. I am okay now.

1021614	2/10/2021	CA	34	F	2/10/2021	2/10/2021	February 10, associate goes to the clinic with her appointment for 7:06 AM. She completely bypassed the registration door where they could've verified her immunization card and her time frame on when to get the vaccine and went straight to the conference room. Individual, who oversaw documenting the vaccination, was currently helping a person before her since they were anxious regarding the second shot. After she was assisted, they went on with patient. They verified her birthday, allergies, side effects from the first dose and verified that she answered all the questionnaire but missed the part where it said Moderna on the first dose and was sited down to get vaccinated. Her immunization card it didn't say Moderna either and only had the lot number with the date administered written down. The student that oversaw her vaccination was the College ADN. (She was new to our clinic and was usually in the Moderna Clinic) and was under the supervision of RN for that room. She did go through her 7 rights and in the end, she told associate that she is giving her the Pfizer vaccine 0.3 ml and then administered it. After administration, associate then told them that she had Moderna first dose and thus this situation was sent back to EH Manager. The associate was placed in observation for 30 minutes and no reactions were seen and the associate was able to go home but her contact info was taken. Upon investigation, patient told us that she knew it was a Pfizer Clinic since it said Pfizer on the registration and the EUA form is also for Pfizer but since she placed Moderna for her first dose she still came and thought that we would know that she is Moderna. Patient information was taken down and then reported to the Director.

1021201	2/10/2021	CA	25	F	2/5/2021	2/5/2021	Within 15 minutes my vision began to blur, I became shaky and disoriented. My heart rate increased and it felt as though my blood pressure decreased rapidly. After 30 minutes my symptoms had worsened and I was so disoriented I was not able to seek medical attention while being observed. I exited the building and once I got into my car my face (specifically under my eyes and on my cheeks) began swelling and a red burning rash appeared. By the time I got home (10 more minutes) I needed Benadryl immediately, I was not able to complete my sentences and all other symptoms had become more intense. I continued to take Benadryl every 4 hours for the next few days due to the symptoms consistently rebounding. I had one episode of throat tightness but it passed without use of my epipen. I checked my pulse and blood pressure frequently with the lowest reading being 93/60. Lethargy, shakiness, confusion, high heart rate all are still present after 5 days. The rash went away after 48 hours.

1021138	2/10/2021	NY	37	F	2/6/2021	2/7/2021	Woke up at 1:00 am in a sweat, sore and achy. Had a headache that got worse as the day went on. This headache turned into a migraine. I was so sore I couldn't get out of bed. It got worse throughout the day. I had a fever and chills. At 48 hours my head was still in a fog, eyes wouldn't focus, dizzy and hurt especially when I coughed or sneezed. Arm, armpit were swollen and sore. At 60 hours my head was better but still sore. I was told not to take medication and the ?ride it out.?
1021122	2/10/2021	NH	67	F	1/22/2021	1/29/2021	Acute flare of uveitis R eye. Ocular pain, redness, photophobia
1021079	2/10/2021	NM	40	F	2/9/2021	2/10/2021	Patient noticed mild swelling to upper lip around 0630 am. Several hours later, the patient developed swelling to left upper eyelid and left cheek/jaw. She reports slight irritation to her throat, with no evidence of tongue or throat swelling. Denies cough, difficulties breathing, or shortness of breath. Also having nasal congestion/runny nose, which has been intermittent for the past week. The facial swelling had already improved upon my evaluation of the patient. She did not take any medications for the symptoms prior to her arrival. She was given a prescription for Zyrtec 10 mg daily and Pepcid 20 mg BID x 10-14 days with strict return precautions for any signs of worsening.
1021074	2/10/2021	NY	33	F	1/18/2021	1/25/2021	On Sunday, January 24th, I woke in the morning (6 days after vaccination) with a 3x2 flat red ring around injection site. The following morning, Monday, January 25th I woke with extreme red inflammation of my left eye. An ophthalmologist diagnosed the condition as nodular scleritis. My infectious disease doctor reported a component in the Moderna vaccine to have molecular mimicry to shellfish, to which I am extremely allergic. The nodular scleritis was treated with a course of Prednisone at 40mg tapered over 10 days, which lessened the redness and swelling gradually. My infectious disease doctor advised that I should not receive the second dose of Moderna.

1020062	2/10/2021	IN	21	F	2/8/2021	2/9/2021	My first dose of the vaccine was on 1/14/2021. I had a mild headache and experienced dizziness and nausea the night of receiving the vaccine. My second dose of the vaccine was 2/8/2021. I felt tired the night of receiving the vaccine and went to bed a 8pm. I woke up at 6:10am on the 9th with a severe migraine, severe nausea and dizziness. I ate a small amount and laid back down. I got out of bed at 9am and noticed both of my eyes and face were swollen and my throat was swollen. At this point I called my doctor and spoke to a nurse on the phone, she was short saying I needed to go to ER. Personally, I did not feel it was necessary at the time so I took a Benadryl and Ibuprofen. Throughout the day I continually got worse experiencing the same symptoms as the morning including sharp chest pain, restricted breathing, a low grade fever of 100.4, severe lower back pain and leg numbness. I took more ibuprofen and placed heat on my back. I took ibuprofen PM and woke up the morning of the 10th feeling better. Still have headache, lower back pain and swelling but is better than yesterday. I will notify my doctor today of the event that occurred yesterday (2/9/2021).

1020733	2/10/2021		80	F	1/27/2021	1/28/2021	The night after receiving dose 1 of the vaccine, she didn't want to eat dinner, was starting to spit up saliva, and noted a new headache, and asked her daughter to sleep with her that night considering she was feeling poorly. She was restless all night, and then at ~5am her L arm began to twitch; she was still alert at this time but didn't realize her arm was moving. Shortly after this she lost consciousness, her eyes rolled back in her head, and she developed a frank GTC seizure. Her daughter called an ambulance, and by the time she was on the way to the hospital, she was awake and alert again. At the hospital, she was initially talking and able to answer most questions appropriately. She was noted to be afebrile, hemodynamically stable, without an O2 requirement, though with tachycardia to the 110s. She was found to have a leukocytosis to ~16, thrombocytosis to ~550, and LDH elevated in the 600s. Over the following day, her mental status declined and she became agitated and disoriented to place/time. CT chest revealed b/l multifocal pneumonia, for which she was started on pip-tazo. She underwent MRI brain (DWI sequence only) which did not reveal any obvious CVA. LP was performed on 1/29 at ~10PM; as far as we can tell, she had only received pip-tazo for antibiotics at this point. CSF studies revealed 220 WBCs (14% PMNs, 76% lymphs, 10% monos), 14 RBCs, Glu 59, Prot 145; GS 2+ WBCs, no orgs; india ink stain negative; Cx pending at time of transfer. Given concern for bacterial or viral meningoencephalitis she was transitioned to vancomycin/ceftriaxone/acyclovir. Patient was then transferred to another Hospital for further management. Micro was all negative or pending at the time of transfer. Shortly after admission to hospital she was intubated. Spine MRI was notable for longitudinally extensive transverse myelitis. All infectious workup has been negative with just two more pending studies for tuberculosis; autoantibody panel pending. She is now able to follow commands with eyes and mouth, but has not been able to move her arms or legs. We do not have high suspicion that this syndrome is related to the vaccine, given that progressive neurological symptoms started the week before vaccine, but thought it prudent to report given the time course.

1020005	2/10/2021	AZ	65	F	2/6/2021	2/8/2021	Shot given 10:19pm on 2/6/21. Noticed rash on 2/8/21 11:55am. Rash was bilateral on face along madibles from TMJ to about 1" from lips and was 2" superior from jaw line towards the eyes. Rash was very red over skin area with multiple darker spots and by 2/7/21 those spots appeared open though no blisters or pustules were seen. Rash had burning sensation which was relieved by Vaseline. Once doctor was seen (PA), Tacrolimus ointment was prescribed BID. Rash no longer burns 2/9/21 pm and it appears to be resolving. Spots are still evident but erythemic area is gone.
1020295	2/10/2021	MI	52	F	2/1/2021	2/4/2021	On February 4, 2021, patient woke up at 3 a:m, left eye kept opening and closing, vision was blurry, and left side of face numb by lips and jaw. She took 2 Benadryl and took a nap Thursday afternoon. She went to the ED later and was told it may be Bells' Palsy but was referred to PCP. She is on 5 mg Prednisone but rheumatologist increased dose and put on 5 day regimen. She saw PCP and he told her she had Bell's Palsy and just to follow regiment prescribed by rheumatologist.
1020550	2/10/2021	MI	44	F	1/28/2021	2/10/2021	fever 103.5 with chills, pounding headache, insomnia at first transitioning into extreme fatigue. bp 129/93 heart rate 115. Headache with flush face and arms and legs super heavy feeling on Sunday. Tuesday night experienced facial and head swelling, started in the middle of my forehead gradually filling up my entire head and face. Wednesday my whole face/eyes and head swollen, with tightness on my chest. My primary care provider prescribed methylprednisolone tablets USP Dosepak 4mg. I did take Benadryl and tylenol Tuesday. I also applied ice packs to my head and face. Headache still comes and goes with brain fog. Slight swelling remains on my forehead and eyes.

1020468	2/10/2021	NY	23	F	2/8/2021	2/9/2021	I am almost a licensed pharmacist so I am aware of what was going on with my body* I started with a sore arm and fatigue on the day of vaccination. The following morning I woke up and got dressed and used the restroom. I proceeded downstairs to make my coffee. As I was doing so I became dizzy and nauseous. I sat down on the floor and then I lost my vision and hearing. I broke out in a profuse sweat and had no concept of time. My boyfriend was with me and said it took 5-10 minutes before I began to normalize. I apparently had shallow breathing and turned pale white including my lips, I slowly regained awareness although I never fully lost consciousness. 911 was called and paramedics arrived. by this time I had begun to normalize with most of my vision returning. I ended up declining to see medical attention because I normalized and told the paramedics I would seek attention if it came back. * please note the physician listed is my PCP but I was not seen for this reaction.

1017092	2/9/2021	GA	78	F	1/9/2021	1/11/2021	little depressed; not feeling like herself; weak; tired; This is a spontaneous report from a contactable nurse (patient). A 78-year-old female patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL0140 and expiry date unknown), via an unspecified route of administration on 09Jan2021 at a single dose for COVID-19 immunization. The patient received the first dose on the left arm on 19Dec2020 10:30 (lot number: EL0140). Medical history included hypertension. There were no concomitant medications. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient had no side effects after the first vaccine except for a little tenderness which went away. On 11Jan2021, after receiving the second dose, she felt really tired but which went away. On 20Jan2021 (last Wednesday), she started to feel tired, weak, and not feeling like herself. On 22Jan2021, the patient was a little depressed. She did not have a headache. Her blood pressure was fine and she never had a fever. She had an X-ray back in Sep2020. Her vision is good. She is not hurting anywhere. She doesn't feel as strong. She doesn't understand the tiredness, weakness, and depression. Outcome of the event tired was recovered on 11Jan2021, of the events doesn't feel like herself and weak was not recovered, and of the event depression was recovering. The reporter assessed all the events as related to the bnt162b2. The events depression and doesn't feel like herself were reported as serious: medically significant while the other events were reported as non-serious.; Sender's Comments: A possible contributory role of bnt162b2 in triggering the onset depression and doesn't feel like herself cannot be excluded, considering the plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1017089	2/9/2021	NY	71	M	1/22/2021	1/22/2021	walking is still very bad; lower back pain; he reported lower back pain, that has migrated more to the right hip and into the glute; he reported lower back pain, that has migrated more to the right hip and into the glute; it might be kidney pain; arm pain; This is a spontaneous report from a contactable other Health Professional (HCP). A 71-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL3302), intramuscular on 22Jan2021 15:10 at 0.3 mL, single (0.3ml by intramuscular injection left shoulder) for COVID-19 prophylaxis. Medical history included ongoing high blood pressure (diagnosed about 21 years ago), ongoing gout (Diagnosed about 2 years ag), ongoing ankle spur right foot, ongoing diminished cartilage both knees, joint pain. The concomitant medications included torsemide. The patient reported adverse event (AE) after his first Pfizer-Biontech covid19 vaccine at 15:10 on 22Jan2021. He reported arm pain starting 3 hours after vaccination until noon the next day (23Jan2021). When he woke up on 23Jan2021 he reported lower back pain, that has migrated more to the right hip and into the glute. The pain inhibits walking, standing, etc. He did note that he is >300lbs and has had joint pain in the past, but the hip pain is new. He also thought it might be kidney pain, as he takes a daily diuretic. He stated he has been treating with Aleve twice a day, but that walking is still very bad. The patient is an optometrist that was calling about the Covid-19 vaccine and said that he did not know if the Lot number written on the vaccination card is EL3302, E13302, or EI3302. He got the vaccine on 22Jan2021 and reported that he got a sore arm about 3 hours after receiving the injection. He woke up with a sore lower back pain. He is 5ft 9.5 and 310 lbs and he is on Torsemide, a pretty strong diuretic. He woke up with the back pain and stated that it moved right and middle to his buttocks, a little lower than the end of his spine and to the right. He did not think it was his kidneys. He said that Torsemide can make kidneys work overtime. His knees were pretty shot, the left worse than the right. No further details provided. He was upset to know that he has shrunk a 1.5 inches over the years. He has been taking 2 Aleve a day since Saturday, this morning was his 4th pill. He said that it is really odd when he stands equally on both feet his lower back hurts. He has to sleep on his right side and that it hurts more when

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							he sleeps on his back and on his left side. He was fearful doing eye exams next to his patient and how the lower back pain would affect him. Reporter considered seriousness for Lower back pain was Medically significant. The outcome of event lower back pain was not recovered; of event arm pain was recovered on 23Jan2021; of other events was unknown.; Sender's Comments: Based on the time association, the possible contribution of suspect vaccine BNT162B2 to the event low back pain cannot be excluded. The ongoing gout and concomitant drug torsemide may also play contributory roles to the event. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.
1016735	2/9/2021	DC	68	M	2/6/2021	2/6/2021	Pt notes that he was very anxious prior to the administration of the vaccination and did not go to sleep the night before. Following administration of the vaccination pt reports to no immediate reaction during the 20 minutes observation. Upon arrival at home he noted some chills and went to sleep and when he woke up he describes his face became "slightly swollen"(involving areas under his eyes, around his cheeks, glands under under his neck) with no lip/tongue/throat swelling and no difficulty with eating/drinking/breathing. He reports that after about 1.5 hours the swelling resolved.
1016687	2/9/2021	FL	77	F	2/8/2021	2/8/2021	Client reports having a headache over left eye about 1 1/2 hours after injection. Client woke up on 2/9/2021 to a swollen face. 1017096	2/9/2021	CA	83	F	1/25/2021	1/25/2021	<p>pain in my chest/stomach; pain in my chest/stomach; she couldn't sleep last night at all she was awake all night; had strange visions flashing in my head while trying to sleep; acid reflux/burping up acid; This is a spontaneous report from a contactable consumer (patient). An 83-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: TL9261, expiration date not provided), via an unspecified route of administration on 25Jan2021 16:30 at a single dose for COVID-19 immunization. The patient has no medical history and there were no concomitant medications. On 25Jan2021, the patient experienced having acid reflux, pain in her chest/stomach that lasted all night last night and was worse when lying down. When she burped, it relieved some pressure. She had strange visions flashing in her head while trying to sleep on 25Jan2021. The patient was wondering if she was having a reaction from the vaccine. On 25Jan2021, after over an hour after the vaccine, she started having severe pain in the chest and stomach area and she couldn't sleep last night at all. She was awake all night, burping up acid. She was wondering if those were reaction to the vaccine, should she go see her doctor or what should she do about that. She got her first dose on 25Jan2021 and she started having chest and stomach pain the same day at about 6 PM. She was burping acid all night and early in the morning of 26Jan2021 and she was having these strange things like pictures going to her head that were weird. She was not sleeping but they were strange images, they were strange, they weren't normal. She says with that added in it sounds crazy. She has her vaccine card that says she should get the next one 15Feb2021. She wanted to avoid catching the corona. She had drank acid yesterday and she was wondering if that was causing her to have acid reflux. She clarified that she drank a lot of acidic liquids on 25Jan2021 and she was wondering if that might have had something to do with it, like orange juice and cranberry juice so she is wondering did that have anything to do with it, the acidity maybe made her stomach have acid reflux because she has had that in the past. She asked if she should go to the doctor. The outcome of the events was unknown.</p>

1017102	2/9/2021	FL		M	1/1/2021	1/1/2021	eye infection; This is a spontaneous report from a Pfizer sponsored program. A contactable consumer (wife) reported that a male patient of an unspecified age received the first dose of bnt162b2 (UNSPECIFIED TRADE NAME, Solution for injection, lot/batch number and expiration date not provided), via an unspecified route of administration on Jan2021 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Caller reported that her husband received the 1st dose of the Pfizer vaccine 2 weeks ago (Jan2021) and he had an eye infection unrelated to the vaccine. Caller was asking if he can take antibiotics and asking if that would be contraindicated with the vaccine that he got. Caller also mentioned that her husband was afraid to take antibiotics and wanted to know if it was okay to take antibiotics which was prescribed by his Doctor. Her husband was also an healthcare professional but he was an Orthopedic Surgeon and it's not his field. The reported wanted to know if that would reduce the immunity that he got from the vaccine. The patient developed the eye infection a week ago (Jan2021). He had not taken the antibiotic before. Second dose would be on 01Feb2021. The outcome of the event was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: The eye infection is most likely an intercurrent condition and unrelated to suspect vaccine BNT162B2.

1017158	2/9/2021	IN	67	M	2/8/2021	2/8/2021	Client anxious about receiving first dose. Said he checked with his doctor as he has multiple antibiotic allergies. His doctor told him to get a COVID vaccine. He received the vaccine and was asked to wait 30 minutes. After a 15 minute wait, he stated he felt chest tightness, swelling in his eyes, face and neck. His blood pressure was elevated at 180/100 and his heart rate was 150. He felt hot/cold and felt he was going to pass out. Cool cloth to forehead and comfort position. after 5 minutes his blood pressure back to 140/80 and pulse down to 100. He continued to state his face/neck and chest were swelling and felt tight. He continued to talk without lack of oxygen. He asked an ambulance be called. He was taken to a local hospital for evaluation and was released home. No medications were given and no face/neck swelling were noted by healthcare workers. Family states he is home and doing well.
1017206	2/9/2021	IN	55	F	2/7/2021	2/7/2021	A sudden hot rush came over me all over and I felt tightness in my chest, my eyes started running continuously, I got really congested in my face/nose and my throat felt thick, my heart was racing; it really scared me the nurse gave me Benadryl, I refused the epi-pen because I was starting to feel better and by 2 pm I was good to go
1016267	2/9/2021	MI	39	F	2/2/2021	2/2/2021	Systemic: Other- lost vision, elevated blood pressure and pulse, returned to normal quickly thereafter administration

1015637	2/9/2021	NJ	84	F	1/14/2021	1/14/2021	some bruising near my eye; area was a little tender; Afib started to act up; blacked out; Hit forehead on the door jamb; A spontaneous report was received from a consumer who was a 84-years-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced area was a little tender, Afib started to act up, blacked out, hit forehead on the door jamb and had some bruising near eye. The patient's medical history, as provided by the reporter, included atrial fibrillation with premature ventricular contractions (PVCs), and three cardioversions in the past 30 years. Concomitant medications reported included metoprolol, alprazolam, apixaban, amlodipine besylate, telmisartan, atorvastatin, ubidecarenone, multivitamin, vitamin B2, fish oil and cranberry extract. On 14 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly in the left deltoid for prophylaxis of COVID-19 infection. On 14 Jan 2021, after receiving the vaccine, the patient had no pain or soreness, but the area was a little tender if you pushed, and she waited one hour in the hospital afterwards. As the patient was getting ready to leave, she felt a little lightheaded. She was driven home, she ate lunch and then worked in the yard for a little bit. As she came inside, her Afib started to act up, she took an extra half of metoprolol, and had supper. She took half an alprazolam before going to bed. That night, as she got up to use the restroom, she had a strange feeling in her head like everything was going away. As she walked into the hallway, she blacked out and hit her forehead on the door jamb. Her forehead was all right but there was some bruising near her eye. She went back to bed and fell asleep. On 15 Jan 2021, when the patient woke up in the morning, her rate was still acting up. At about 9:30am to 10:00am, everything improved, and her heart felt normal. Everything seemed to resolve in approximately 25 hours. Treatment also included acetaminophen/diphenhydramine (no details when it was taken). She contacted her cardiologist since receiving the first dose of the vaccine. The cardiologist encouraged her to take the second dose of vaccine with diphenhydramine and have someone stay with her that night in case something happened again. Consent given for Safety to follow up. Action taken with mRNA-1273 in response to the events was not reported. The outcome of events,

							<p>Afib started to act up, blacked out and hit forehead on the door jamb, were resolved on 15 Jan 2021. The outcome of the events, area was a little tender and had some bruising near eye, were not provided.; Reporter's Comments: This case concerns a 84 year old female patient with medical history including atrial fibrillation with premature ventricular contractions (PVCs), and three cardioversions in the past 30 years. Concomitant medications reported included metoprolol, alprazolam, apixaban, amlodipine besylate, telmisartan, atorvastatin, ubidecarenone, multivitamin, vitamin B2, fish oil and cranberry extract. She experienced serious unexpected events of Atrial fibrillation and Loss of consciousness and NS unexpected events of Contusion, Head injury and Vaccination site pain. The events occurred after first dose of the study medication administration after she went back home. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. However, her medical history of heart condition and medication she took could remain a confounder.</p>

1015410	2/9/2021	IN	66	F	2/2/2021	2/5/2021	left eye pain and redness, red patches and swelling under left eye started out slight and has swollen bag under eye, itchy eyes, redness and tingling in the area has also moved to my upper eyelid and eyebrow/temple area. Left cheek and left side of head are tingling.
1015471	2/9/2021		62	F	2/5/2021	2/7/2021	initial symptoms started at ~ 8-12 hr post inj on FRI: fever, chills, fatigue, muscle pain (generalized), back pain from sacrum to occiput, through cranium to behind eyes, nausea, loose stools, exhaustion, arm swelling (6" diameter) with bandaid indented becoming hard (feeling a little like cellulitis). routinely measure pO2 and body temp--both spiked; resp rate went from normal pattern of 10-12 to 25; night time HR went from low 60's to the 100's; pO2 went from 96-98 to 89-91 (Innovo PulseOx)Treated with sleep (slept from 8PM night of shot until 48 hours after the shot), fluids, hot water bottles, arnica (I can't take NSAIDS), vit C, zinc megadoses; by ~36 hours post injection I started wheezing and coughing deeply but non productive, both nasal passages were/open, feels as though phlegm is stuck at bronchi. By 48 hours, I was feeling better except chest, ribs, head, and neck and was experiencing 1-3" episodes of spasmodic coughing, wheezing, SOB; Occurred every 20-30 minutes and leaving me physically exhausted. Sunday night slept with 4 pillows; went to see acute respiratory care clinic, evaluated, COVID-PCR was negative, temperature was normal by statistics (I tend to be colder; baseline temps between 32-33oC and over past week has ranged between 35-39oC). Sent home with albuterol inhaler, mucinex (which I take at night), and flonase (my nostrils remain clear). Current status: extreme fatigue, high resting HR, minimal activity (walking) increases it to the 100s--not normal for me), and continued episodic bronchospasm (uncontrolled) with SOB and diaphragmatic, skeletal pain. Deep diaphragmatic breaths also trigger. Am also treating with hot water bottles to anterior and posterior chest walls, and nebulizer treatments with eucalyptus, thyme, and rosemary. Still megadosing on C and Zinc. Expect to return to work tomorrow (missed 2 days) as neurologic and orthopedic physical therapist /exercise physiologist.

1015645	2/9/2021	AZ		M	1/1/2021	1/20/2021	muscle weakness; fever; oxygen level of less than 90; blurred vision; his legs are still kind of weak; his arm still aches on the left side where he got the shot; slurred speech; had no balance; frozen fingers; had no strength in his legs or arms; hallucinations; This is a spontaneous report from a contactable consumer (patient) received via Medical Information Team. An 87-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration at arm left in Jan2021 at single dose for COVID-19 immunization. The patient medical history included a minor hearing impairment from an unknown date and ongoing. The patient's concomitant medication included vitamin C from Jan2021 and ongoing. On 20Jan2021, the patient experienced hallucinations (the first day or two), slurred speech, he had had no balance, frozen fingers (2 fingers on each hand and his thumb), he had no strength in his legs or arms. On an unspecified date also experienced blurred vision, slurred speech, muscle weakness, fever, oxygen level of less than 90, his arm still aches on the left side where he got the shot. The patient outcome of hallucinations, slurred speech, frozen fingers was recovered, the outcome of he had no balance, he had no strength in his legs or arms was recovering, the outcome of his legs are still kind of weak and his arm still aches on the left side where he got the shot was not recovered, the outcome of the other events was unknown. Information on the lot/batch number has been requested.

1016218	2/9/2021	TX	41	F	1/27/2021	2/3/2021	Vaccine was on 1/27 and although I experienced local reaction ok arm, it eventually began to fade. One week after injection I began feeling my arm burn and itch, and on Thursday 2/4 it started getting red again as if I were just injected. It has spread each day and the rash is over a large part of arm. I went to urgent care on 2/6 and they checked CBC and D Dimer to ensure there was no infection or blood clot. I was advised to return if it did not go away in 2 days, apply ice packs, and to keep an eye on how it was spreading. If it continued to go around the arm vs upwards, it was simply a reaction to vaccine. (As opposed to infection) I also emailed my PCP w pictures of progression and was advised to wait it out. It is almost a week later and it continues to grow slowly. Extremely hot to touch, painful, constant burning itch. Some days it is hard around injection site like at beginning. The redness seems to calm down at times throughout the day,, but come back. The redder it is, the hotter the skin is. Believe it may simply be a sign my body is working, but even doctor was surprised it went away and came back worse. Realize this isn't life threatening,, but VSafe stopped texting me on 2/3 so I have not been able to submit this reaction to them. Feel it is important this side effect is recorded.

1017951	2/9/2021	IN	56	M	2/5/2021	2/5/2021	I got the shot at 3pm. I started feeling "off" in stomach/chest around 7-8pm. By 3am, my stomach/chest did not feel good at all and I had trouble sleeping. It was definitely not heart related. By 8am I felt chills coming on. By 9am I was fully dressed, with two blankets on, and lying on couch shaking for 20-30 minutes. Later a fever started and it reached about 102.3 before subsiding late afternoon. By 8pm, I felt blah but fever was gone. During that entire time I felt achy overall (similar to what I felt like 2 hours after running a marathon). I didn't have headaches (and rarely do), but area around my eyes were heavy and tired. Weirdly, at times, the top 1/2 of both ears hurt. I experience about every symptom I had as when I had Covid and went to hospital for 26 days except for the breathing issues.
1017957	2/9/2021	AZ	25	F	2/7/2021	2/8/2021	Swollen lymph node (or unknown lump) behind the left collarbone; painful on it's own and painful to touch. Lymph node swelled up to about the size of a cherry and has stayed that size. Began at about 11 AM on 2/8 and has continued through now (~4 PM 2/9). Intense muscle aches, worse two days after the vaccine, instead of just one day after. Aching of the muscles around the eyes (the ones you would use to squint and the top of the cheeks), the scalp, neck (the base of the skull and trapezius), biceps, aching around the wrist joints, hip flexors, quadriceps, and ankle joints. Found relief with 500 mg acetaminophen throughout the day.
1017964	2/9/2021	FL	50	F	1/21/2021	1/22/2021	Besides brain fog, frontal headache and right arm pain, I felt lightheaded about 5 hours after the vaccine on Thursday 1/21. Went to work at hospice on the Covid unit for 12 hours on Friday 1/22. Felt really foggy and unable to concentrate at work. After work I was relaxing at home trying watching television but not able to focus when about 09:30 I started to not feel my big toes and started to have muscle twitching (no fever, no chills). By 11pm my all body was shaking like if I had Parkinson?s disease. My neighbors drove me to the ER. My blood pressure was 160/100 (my norm is 100/60), and Parkinsonian syndrome. I got scared as the heart is a muscle and I did not want my heart to go into irregular rhythm . Better to be safe than sorry.

C/o eyes feeling funny and tearing. next c/o chest pressure and tingling started down legs. Breathing labored and flushed skin. Epi administered and assisted to ER.
1018049	2/9/2021	CA	29	F	2/8/2021	2/8/2021	Client was vaccinated on 02/08/2021. Client stated that she felt pain ,tingling, and numbness at the injection site and felt like it crawled up to her left side of face and head behind her left ear. The numbness and tingling was also down her left arm. No facial droop was noted. Client denied visual change. Client was placed on oxygen and 911 was called for assistance. Client was seen at ER department. She was evaluated, had blood work done and released with Dx of headache due to paresthesia.

1018100	2/9/2021	SC	78	F	2/5/2021	2/6/2021	Late Saturday I noticed my lip dropping to the right and by morning my right eye was dropping. On the way to theER my eye felt like it had sand in it and I had to hold my hand over it and my mouth and lips felt like I had a shot of novicane and it was hard to pronounce certain words. I have to eat small things because it is difficult putting food in my mouth and I can not feel the food in my mouth on the right side and if food gets over there it gets between my gums and my cheek, to drink I have to position a straw in my mouth on a certain point and some goes back down in the straw.
1018130	2/9/2021	CO	72	M	1/21/2021	2/2/2021	10 days after my vaccination, the cornea transplant I had done it my right eye was rejected. My ophthalmologist and I believe there is a correlation between the vaccine and my cornea rejection incident since vaccines fight foreign matter in the body and the transplant is a foreign material. In addition, the cornea had be perfectly accepted for 4.5 years and only got rejected after the vaccine. This is only a suspected adverse reaction but seems to be the most likely cause for the rejection. We are treating it with large doses of steroid drops. After one week of the drops there appears to be no improvement. If there is no improvement over the next week we are considering surgery to redo the transplant with a new cornea.
1017938	2/9/2021	GA	86	F	1/29/2021	2/8/2021	Vaccine was given on 01-29-2021 at 3 pm.On 02-05-21 patient stated she noticed her vision was blurry at night when she was reading in bed--this happened 3 nights in a row and on 02-08-2021 she said her vision was blurry driving home during daylight. Had Heart palpitations on 02-08-2021 and again on 02-09-2021. On 02-08-2021 she was in shower and noticed her left arm was itching where it had been sore from getting injection and when she looked in the mirror she noticed how swollen and red it was. Stated it was very warm to touch, red and very itchy. PC today on 02-09-2021 to Health Dept requesting advice on what she could do to help it.Had taken some Benadryl the night before.Had attempted ER visit on 02-08-2021 but was there x 3- 4 hrs and was never seen so she left.

1018149	2/9/2021	WA	46	F	2/9/2021	2/9/2021	0930- she complained of sever neck pain and asked for Ibuprofen, 0945- nausea, blurred vision, leg spasms, she took 12.5mg of Benadryl, 1030- BP slightly elevated, dizziness, numbness in face and arms, flushing- took 25 mg Benadryl per house MD. had her lye down and within 2 hrs most of symptoms resolved. at 1530 continued to c/o facial numbness. sent home with co-worker so she didn't need to drive.
1018179	2/9/2021	TX	28	F	2/7/2021	2/8/2021	Fever, chills, bloodshot eyes, extreme fatigue, swollen lymph nodes (mostly left side), swollen sore left arm
1018408	2/9/2021	CT	47	M	1/13/2021	1/14/2021	Just over 24 hours after receiving shot, I had a pressure located at the top of my right eye. Not the lid, not the sinus area above, the actual eyeball. I'm an optometrist, so the following day, one of my partners examined me and found no cause. It was uncomfortable for the remainder of the day as well as the next. Saturday, 3 days after getting shot, I felt extreme pressure within the right eye. No vision problems, no pain with eye movements, no peripheral vision loss; just a lot of pressure/soreness. I spoke with a colleague in a specialty eye care practice. Since symptoms continued, though milder the following day, he ordered a CT scan. I had the scan Jan 21 (8 days after receiving first vaccine dose). I took Aleve and a sinus decongestant (though pain did not feel like sinus pain and was not located within sinus area) No other symptoms occurred and it reduced in severity and now asymptomatic since Jan 24.
1018484	2/9/2021	AZ	62	F	2/9/2021	2/9/2021	I was sitting in my sofa watching television and felt this odd dizziness overcome my head. I felt nauseated and hot. I closed my eyes for a few minutes and when I hope Ed the the intense dizziness subsided. I still feel a little dizzy, very tired and switch from feeling hot to very cold.

1018558	2/9/2021	WA	64	F	2/3/2021	2/5/2021	37 hours after Pfizer injection, experienced severe abdominal pain that caused me to have vasovagal syncope. Started sweating, and I lost my vision, then must have fallen on the floor. When I came to, felt very headachy and nauseous. went to urgent care - they ordered an abdominal scan for 2/8/21 but scan did not reveal the cause of the pain. 8 hours later on 2/5/21, started feeling asthma like symptoms. Throat felt tight, voice became hoarse, kept having to cough because airway was starting to feel thickened. went to ER, they took vitals and told me that i wasn't having an allergic reaction because my symptoms were outside the time frame for an allergic reaction. After 3 hours there, they sent me home. Next morning felt like I was having heart palpitations. that feeling eventually went away if I walked around. But the following two mornings, I had the same feeling.

1017860	2/9/2021	AZ	68	F	2/5/2021	2/6/2021	<p>Patient awakened in the morning with pain and swelling in the right knee with marked tenderness laterally and local swelling in the same area. Over the next 12 hours she developed a moderate synovial effusion of approximately 20 cc with pain in the knee becoming generalized and had trouble walking and decreased range of motion consistent with the effusion. . The pain seemed to subside somewhat later in the day but she still had trouble walking. On the second night of 2/6/2021 she was able to sleep but had continued discomfort, swelling and difficulty walking on 2/7/2021. The pain became even worse during the night of 2/7/21 and she was unable to sleep. In the early morning she took 5 mg hydrocodone and got some relief.. She continued to have pain and swelling through the day. By the evening of 2/7/21 she was somewhat better. The morning of 2/8/21 she awakened with less pain, less effusion, and was able to walk better. She slept well that night. On the morning of 2/9/ she awakened with no pain. The effusion was gone and the knee felt stiff but no longer was painful. By afternoon she was walking without pain and complaining of slight stiffness. The only other side effect was pain at the injection sight for 2 days which was mild to moderate. The R knee never felt warm and was never red. . I have an infrared camera and the temps recorded on the right knee were no higher than the left knee. No other joints were involved and she had no recent right knee injury. No chills, fever, nausea or other problems. No headache, No myalgias. No vision or auditory prob.ems. The sense of smell remained normal. She is my wife and I was considering getting a CBC, Sed Rate, C-reactive protein and possibly an arthrocentesis and evaluation of the fluid. Since she improved markedly and quickly no tests were done. I will report any follow-up problems. It just seemed very strange to have a painful swollen joint with no redness or warmth that was fairly severe and then almost totally resolve within 24 hours between the 3rd and forth day. .</p>

1017463	2/9/2021	WV	45	M	1/27/2021	1/27/2021	Let me start by my wife also works at Tech and got the shot right before me. So, I was comparing my symptoms to hers. We both complained about pain and swelling at the injection shot but my swelling was much worse than hers. You could tell that my shoulder was swollen just by looking at my arm with my shirt on. So, I knew from talking to everyone that took it that my injection shit should hurt for a couple days so I thought that everything was normal. Then after about a week it had not gone away and even started to hurt worse. I have gotten to the point that when I have any type of physical activity my shoulder starts killing me. It's real sharp pains that cause me to stop what I'm doing and sit down and hold still until the pain fades. So after about 11 days from the day of the vaccine my wife walked into the kitchen where I was trying to make dinner and had stopped and closed my eyes standing there in pain. She said, if it hurts that bad you need to see a doctor. So the next day I visited my doctor and he didn't really know what was causing it. It had been 12 days since the injection and you can still slightly feel the place in my arm. He gave me a medium dose of steroids and a antibiotic to see if something like that will help. Early on I was putting ice packs on it and taking hot showers with the hot water stream directly on my shoulder. One strange thing about it is it only hurts after/during activity and the pain is at other locations like running up my neck and around the back of my shoulder. I feel like it's something with the joint or nerves because of that. The only thing that seems to help is my not moving it.

1017728	2/9/2021	NY	60	M	1/19/2021	1/31/2021	Temporary paralysis of left eyelid which was a symptom of Bells Palsy. At the same time I experienced a very disturbing sensation of having no saliva in mouth or throat. I was completely dry and unable to produce saliva. This is my description of the event: I woke up around 3am with rapid heartbeat, lightheadness, and upon opening my eyes I realized my left eyelid was drooping and I was unable to open it. At the same time I experienced extreme dryness in my mouth and throat where i had absolutely no moisture/saliva and was unable to produce any for approximately 20 minutes. I walked to an emergency, which was just 2 blocks away, to get checked out. I told the attending nurse and physician what my symptoms were. Luckily by the time I was admitted to the ER the symptoms began to dissipate. My eyelid was slightly droopy but moving and i was able to produce saliva again. I explained that I've never experienced symptoms like this before in my life and that I believed this was from the vaccine. I had been experiencing symptoms every day since receiving the shot.... from headaches, to fatigue, to tightness in my chest, a cough, pain in my larynx that towards my chest, pain in my upper left abdomen, strange sensations in my legs, brain fogginess, and some swollen lymph nodes.

1017614	2/9/2021	ME	33	F	12/31/2020	12/31/2020	Several hours after vaccine administration, I began to get a headache. That headache intensified over the next 24-36 hours. A severe headache resulted with a painful, stiff neck, occasional fever, occasional diarrhea, confusion, vision changes, and increased imbalance. These symptoms lasted for about 1 week before I sought medical treatment at a virtual urgent care appointment on 1/5/21. They referred me to an in-person urgent care facility that day. At that facility, they said my symptoms were very concerning and said I needed to seek immediate medical assistance at the ED and offered to call me an ambulance. My husband drove me to the ED from the urgent care facility. At the ED, they treated me with a migraine work-up but eventually discharged me with instructions to follow-up as I was "diagnostically unclear" at discharge. After a week, my symptoms had not improved at all and so my previous ED physician suggested that I return to the ED (after being unable to get care in a timely manner in an outpatient setting). At the ED on 1/12/21, they again treated me with a migraine workup but also conducted a CT scan and a COVID test. When both tests came back negative, they conducted a lumbar puncture procedure. Those results came back positive for viral meningitis. As I had no other illness or known exposure to any other virus at that time - and given the timeframe of the vaccine administration - my care team concluded that this was a rare reaction to the COVID vaccine. I was discharged with instructions to follow up with my PCP and a neurologist. My follow-up neurology consult is scheduled for 2/19/21.
1017604	2/9/2021	FL	71	F	2/3/2021	2/6/2021	On 02/06/2021 at 12:10 pm at church . I start having severe nose bleeding for almost 1hr. Went to ER. By ambulance .. My blood pressure was 178/93. Then started having severe nose bleeding 02/07/2021at 11pm . Bleeding was very severe it less about 45 min . When I pressure my nose blood pour out both eyes and mouth . Bp was 168/90 I take very small dose of bp meds . Atacand 8 mg for last 13 years . It has been control last 13 years. I weight 107 pound . I walk 4 mile 1 1/2 hrs a day and yoga at night for 1 hr. Eat very healthy diet . All this severe nose bleeding started 3 days after Covid Vaccine received . I am lucky this bleeding didn't happen in my brain .it's very scarily.

1017540	2/9/2021	MN	64	F	1/22/2021	1/25/2021	On 1/25 awoke with loss of peripheral vision in the right eye. This has persisted despite high dose IV steroids.
1011357	2/8/2021	MD	63	F	2/5/2021	2/5/2021	Received the vaccine at 9:45 a.m. on 02/05/2021, felt fine until around 3:00 pm, when I noticed that my right arm started hurting and then my knees became very achy and by the time I got home, I was feeling pretty bad. I took Tylenol along with my regular medications on Friday night. During the night I had trouble moving, because my body hurt so much and I had to keep peeing, which made it worse because I was having issues with moving, my eyes felt like they were bulging out of my head and I was very cold, so I did not want to get from under the covers. All day Saturday, I was in the bed sleeping. My daughter was worried that I was dying and wanted to take me to the hospital, but I told her it was the medicine working. I was sick until around 3 or 4 p.m. on Saturday, when I could feel a little difference in the way I was feeling. Sunday morning, I felt better, got up and went to the grocery store and came back in for the day, My head felt a little fuzzy intermittently during the day, but I did not do much and felt better.
1011505	2/8/2021	AL	67	M	2/3/2021	2/6/2021	pt states he has altered sense of smell. Says he has a constant smell of burnt molasses. Pt called his physician friend and was told just to keep an eye out for any other symptoms.
1011626	2/8/2021	TX	47	F	2/2/2021	2/2/2021	Patient complained of visual changes, shakiness, N/V and fatigue. Remained in Observation Area (clinic) extended by per RN. VS assessed frequently. EMS called due to patients condition not improved but worsening and transported to ER. Patient noted similar reaction with first vaccine. Patient had COVID in September.

1011616	2/8/2021	AZ	43	F	1/27/2021	1/27/2021	I received the second vaccine on 1/27/2021, at 255pm. Around 730pm that night I started to feel very lethargic. My normal temperature is usually around 95-97 degrees. When I woke up at 430am, my temperature was 99, the lethargy was much worse, I had the chills. I called into work, and then went back to bed until around 10am, when I woke, and was drinking coffee, i suddenly started having visual hallucinations (only had this once with a on old antidepressant as a teenager). I took my temp and it was 100degrees. By 130pm, my temperature was 103 degrees, with severe chills, lethargy. I slept 20 hours total that day. I eventually took 1000mg of Tylenol sometime the evening of 1/28/2021. I was very ill the entire night, but felt 98 % better on 1/29/2021. Following the first vaccine, on 12/29/2021 at 605pm, I was very tired for 7 days. The 5th day after the vaccine, i had coughing, chest heaviness, sinus congestion fairly significantly. I felt like I was on the verge of becoming ill. The Tuesday following the vaccine, I got a COVID19 test out of concern, but it was negative. Eight days after the vaccine, I had a sudden severe migraine at 930 am the caused immediate double vision and extreme pain.

1012381	2/8/2021	MA	24	F	1/25/2021	1/25/2021	felt herself losing consciousness; Low blood pressure following event (50/20); My vision went blurry first; This is a spontaneous report from a contactable consumer (patient). A 24-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in the left arm on 25Jan2021 at 09:30 at a single dose in the workplace clinic for COVID-19 immunization. Medical history included asthma and history of vasovagal syncope following vaccinations; this adverse reaction to the vaccination directly aligns with other episodes that have occurred to her following vaccinations/interactions with needles (ie. blood draws). The patient had no COVID prior to vaccination. The patient is not pregnant. Concomitant medication included levonorgestrel (MIRENA). On 25Jan2021 at 09:30 (after getting the vaccine), the patient felt herself losing consciousness, her vision went blurry first and she was able to brace herself by lying down against a wall, and low blood pressure following event (50/20). Blood pressure and pulse rose over the next 25 minutes. 15 minutes more of observation was completed. The patient did not receive treatments for the events. The patient was not tested for COVID post vaccination. The patient recovered from the events. Information on the Batch/Lot number has been requested.

1010572	2/8/2021	NV	73	F	1/19/2021	1/20/2021	<p>she has probably shrunk in height; 5am on 21Jan2021, for the whole day i had a fast heart rate, 125bpm; blurry eyes; dizziness; Her blood pressure was also up; In the morning of the 20Jan2021 I was weak; This is a spontaneous report from a Pfizer-sponsored program, received from a contactable consumer (patient). A 73-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number: EL1283, expiry date: 30Apr2021) solution for injection, via an unspecified route of administration on 19Jan2021 10:02 at a single dose for Covid-19 immunization. Medical history included ongoing Seasonal Allergies (probably started in the last 4-5 years; reoccurs every year from about Oct through Mar), ongoing high blood pressure since like 2006 or 2004, ongoing Iliac artery stent placed started couple of years ago, anxiety from 2010 and ongoing (her cardiologist put her on Xanax around 2010-ongoing). Concomitant medication included ongoing alprazolam (XANAX) since 2010 for anxiety. She gets the flu shot every year and has never had a problem with the flu shot. She got her last flu shot in Oct2020, no adverse events with that or other flu shots historically. On the second dose of Pneumococcal vaccine, it swelled her arm up from the injection site all the way down to her wrist; she went to the urgent care for that. They gave her some medicine and eventually the adverse event went away. She experienced some side effects following that injection. The patient reported that in the morning of the 20Jan2021, she was weak and just kind of rested. She did not have any other side effects until 21Jan2021. At 5am on 21Jan2021, for the whole day she had a fast heart rate, 125bpm, she woke up with her heart rate up, fast heartbeat, then down to 110 and then just toggled a little bit, she had blurry eyes so she could not really focus her eyes, weakness and dizziness. These events continued all throughout 21Jan2021 but her heart rate came down, it was running in the 90s and she was weak all day. Her blood pressure was also up on 21Jan2021. She thinks the blurry eyes, with her eyes being squirrely was related to her heart rate being up and blood pressure being up. She feels like she recovered completely from these events by this morning 22Jan2021. She feels good, strong and her eyes are clear today, felt better than yesterday but not 100%. She</p>

how many people had a problem with the first dose. She still had a punchy feeling, had no energy. She could lay down and fall asleep at almost anytime. Height: about 5'2", she jokingly stated she was shrinking monthly. Her chills started Thursday night and by Saturday morning they were completely gone. When she tried to turn a corner and reported she did not have her peripheral vision right since she kept running into door frames. She was a little better, sometimes she could walk a straight line and sometimes she veers. Headache was ongoing. She did not have it today, it was not a severe headache, it was more irritating than severe. Her arm felt like a boil where they gave her the shot. Her fever went away Saturday night or Sunday morning. She felt like she was not in her own mind, like she was drifting, so time lines for side effects are hard to recall. Her arm was still sore. Heartbeat would accelerate for a few seconds was occasionally still happening, it happened last night. She called the hospital (facility where it was received) back the next morning and she was told she could come if she wanted to but it was suggested to stay home and sleep it off. She told them she could not drive and was half delirious, she was told she could call an ambulance to come get her. She confirms she did not call ambulance or go to the hospital. When querying indication, she was told there was a new strain of COVID that was easier to catch. The outcome of events chills was recovered on 23Jan2021, vomiting was recovered on 22Jan2021, joint pain was recovered on 24Jan2021, fever recovered in Jan2021. The outcome of events balance impaired NOS, dizzy, vaccination site swelling, Peripheral vision defective was recovering. The outcome of event headache, sneezing, feeling of total lack of energy, feeling abnormal, sleep excessive and pain in arm was not recovered. The outcome of rest events was unknown.

1011946	2/8/2021	AL	30	F	2/5/2021	2/6/2021	Incredible arm/shoulder/lymph node pain starting 10 hours post-vaccination lasting about 60 hours. About 12 hours post-vaccine, uncontrollable muscle spasms began and lasted approximately 2 hours. In this time, arm/shoulder/lymph node were extremely swollen. During the muscle spasms, I experienced my first or two "attacks". Speaking and thinking became difficult - at times I felt as though I was trapped in my own head unable to speak or move how I wanted (motor function was possible but sluggish and requiring assistance to become ambulatory). The worst of this lasted about 4 hours, though my brain remained some level of "foggy" 48 hours post-vaccination. 1-2 hours into these neurological issues, I lost the ability to feel throughout my whole body. I could tell there was a sensation on my skin, but I could not tell if it was hot/cold/pain/pressure. I could not feel if I was swallowing, drinking water, or breathing, though I could move enough to perform these activities. Vision was hazy during these attacks and for a while after. The worst of all these effects lasted 3-4 hours. It then took about 5-6 hours to regain all feeling, though my brain was still foggy/hazy. Heavy swelling lasted several hours, then became moderate swelling, and after 48 hours, there was little to no swelling. About 22 hours post-vaccination, I had another one of these "attacks", not including the muscle spasms. This second attack was identical to the first in every way, except it was slightly less severe. Recuperation time was again 5-6 hours. It is currently about 70 hours post-vaccination and most symptoms except moderate arm soreness are gone. During both attacks, BP and temperature were normal, heart rate slightly elevated (80-85 bpm). Other non-severe effects included fatigue, slight chills/flush.
1011846	2/8/2021	MI	76	M	2/2/2021	2/3/2021	Patient went to Emergency Room @ 5PM day following vaccine with difficulty moving eyes and drooping cheek.

1011808	2/8/2021	NY	66	F	2/5/2021	2/6/2021	About 24 hours after the 2nd dose, I had extreme nerve sensitivity on the left side of the face. This pain and sensitivity to touch went from my forehead above the eyebrow down to my chin. It included my left eye. It also seemed to affect my throat. The left gland popped and the left side of my throat was very sore. This issue responded somewhat to Advil but never fully went away and only dissipated for about an hour in between Advil doses. It lasted about 30 hours. I hadn't read or heard anything about a reaction like this so wanted to provide the information.
1012052	2/8/2021	CO	78	F	1/27/2021	1/27/2021	This 78-year-old female has a history of allergic reactions to ciprofloxacin and latex. She received a COVID-19 vaccine this morning at approximately 11 AM. In a matter of minutes after receiving the vaccine she developed tingling to the left side of her lower lip as well as some pressure in her tongue and behind her eyes. She reported a sensation like her face was swelling. She denies difficulty breathing, difficulty swallowing. There is been no nausea or vomiting. She was observed in the vaccine area, and then ultimately referred to the emergency department after approximately 40 minutes of symptoms. No chest pain or chest pressure. No rash.

1010535	2/8/2021	MI	68	M	1/12/2021	1/12/2021	feeling really weak; feeling so run down; real bad headache; aches and pains; Nausea; Diarrhea; This is a spontaneous report from a contactable consumer (patient). A 68-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE lot number: EK9231) via an unspecified route of administration on the right arm on 12Jan2021 at a single dose for COVID-19 immunization. Medical history included rheumatoid arthritis and asthma both were ongoing. There were no concomitant medications. The patient reported 10 minutes after receiving the COVID-19 Vaccine on 12Jan2021 he developed a real bad headache. He said his headache was followed by aches and pains, nausea, and some diarrhea. Clarified by Saturday, 16Jan2021, his symptoms had mostly cleared up. He was feeling really weak on 13Jan2021. His doctor checked him over on his 13Jan2021 appointment. He said his doctor told him there had been a lot of reports of side effects from the COVID-19 Vaccine. He said his doctor wanted him to just keep an eye on if any symptoms got worse. He said from 13Jan2021 his headaches were starting to go away, and were less frequent. He said from 13Jan2021 he was still feeling pretty achy, and had occasional diarrhea. He said by 16Jan2021 his headache, ache, pain, nausea, and diarrhea had resolved. He said he was still feeling really weak. He said he was feeling really run down on 13Jan2021, so went to his doctor again on 19Jan2021, and was given a B12 shot. He was told to stay home from work on 20Jan2021. Reported he went back to work on 21Jan2021, and 22Jan2021. He said he was told by his boss that he needed to report his side effects from the COVID-19 Vaccine. Reported he was scheduled to receive his second COVID-19 Vaccine shot on 02Feb2021. He asked if he should go for his second vaccine dose or should he wait. Reported he did not have any blood work performed when he went to the doctor on 13Jan2021 and 19Jan2021. The facility where the vaccine was administered was in a Public Health Department. There was no history of all previous immunization with the Pfizer vaccine considered as suspect. There were no additional vaccines administered on same date of Pfizer suspect. The events resulted to a physician Office visit. The patient did not receive any other vaccines within 4 weeks prior to the COVID

1010598	2/8/2021	NC	26	F	12/30/2020	12/30/2020	<p>mental confusion; inability to speak/tried to say things and it was a jumbled, meaningless string of words; felt very cold; tingling around the mouth; aura like a bad migraine; bright spotty vision in the peripheral right field; bright spotty vision in the peripheral right field; thought she was having a stroke; EKG showed peaked T waves, common with dehydration and high potassium; EKG showed peaked T waves, common with dehydration and high potassium; EKG showed peaked T waves, common with dehydration and high potassium; likely a severe migraine; This is a spontaneous report from a contactable nurse. A 26-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; lot number: EK9231, expiration date was unknown), intramuscularly on the left arm on 30Dec2020 at 14:45 at a single dose for COVID-19 immunization. The facility where the most recent COVID-19 vaccine was administered was at the workplace clinic. Relevant medical history included COVID-19, which was diagnosed prior to vaccination and migraines (before). The patient had no allergies to medications, food, or other products. Concomitant medication included melatonin. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 30Dec2020 at 15:45 or 1 hour after the vaccine injection, the patient had an aura like a bad migraine and she had bright spotty vision in the peripheral right field for 15-20 minutes; the patient has had migraines before, but they're not common for her. Two hours after the vaccine, on 30Dec2020 at 16:45, the patient had mental confusion and an inability to speak; she tried to say things to her husband and it was a jumbled, meaningless string of words. She also felt very cold and she had tingling around the mouth. Her husband thought she was having a stroke and called 911 on 30Dec2020. All her vitals were stable, and within 10 minutes she could speak again. On 30Dec2020, the patient's electrocardiogram (EKG) showed peaked T waves, common with dehydration and high potassium. She was encouraged to go to the emergency room (ER). Instead of taking the ambulance, she drove herself several hours later. The patient wanted someone to tell her it wasn't a stroke. After a brief neurological exam on 30Dec2020, the doctor said it was likely a severe</p>

migraine and wrote the reason for her visit as a vaccine reaction. This took place in the late evening to early morning, and she missed one day of work. The events did result in an emergency room/department or urgent care visit. The reporter assessed the events as non-serious. The patient did not receive any treatment for the adverse events. Since the vaccination, the patient had not been tested for COVID-19. The patient recovered from all the events on 31Dec2020.; Sender's Comments: Based on the close temporal relationship, the association between the event stroke with BNt162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

1010688	2/8/2021	GA	67	F	1/20/2021	1/20/2021	face got even hotter/her face felt warm; mild allergic reaction; scalp itchiness moved to the back of her neck down the middle of her back; eyes started to itch; arm soreness/it felt like a bruise; arm soreness/it felt like a bruise; This is a spontaneous report from a contactable consumer(patient). The 67-year-old female patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL3246), via an unspecified route of administration in the right arm on 20Jan2021 14:05 at single dose for COVID-19 immunization. Medical history included gastroesophageal reflux disease (GERD), hot flashes, Cholesterol, clear her lungs, eyes(disorder), hair(disorder), high cholesterol, heart(disorder), arthritis in hip and knee, face felt warm from 2015, quit smoking, back pain. In 2015 she had a reaction to a cortisone shot in her knee and experienced her face felt warm. She got a spinal epidural last Jan2020, she had gone to an allergist prior to the spinal epidural to take a five hour test for allergy to dexamethasone and had a very mild reaction with face warming so she did get the spinal. When she got a flu shot her arm would be sore when she moved it. Her last flu shot(Infs Fluorix Quadrivalent) was on 24Sep2020 at his 67-year-old. she usually didn't have issues with vaccines but she was going to make herself wait the 30 minutes due to her weird reactions. She had a lot of weird reactions to medications and always had to wait 30 minutes for Penicillin and sulfa. Penicillin put her in a coma for two days when she was 7 years old. She has never had penicillin since then. with Sulfa she got an immediate rash and itching but that was 20 years ago. She couldn't take pain killers and lots of other medications including clindamycin; Neurontin; gabapentin; carbamazepine; endocet; metoprolol; tamalor. The pain medication issue happened in 2003 and the metoprolol issue happened in 2008. Ongoing concomitant medication included aloe vera for hot flashes and GERD, acetylsalicylic acid (ASPIRIN) for high cholesterol and heart, biotin for hair, cod liver oil to clear her lungs(like a heart supplement), famotidine for GERD, chondroitin sulfate sodium/glucosamine (GLUCOSAMINE AND CHONDROITIN) for arthritis in hip and knee, lansoprazole for GERD, latanoprost for eyes, lovastatin for blood cholesterol, xantofyl (LUTEIN) for eyes , zeaxanthin from 21Jan2021 for eyes and

----------	-------	-------	---------	-----	----------	------------	--------------

multivitamins(women over 50) for supplement. On 20Jan2021, the patient experienced a mild allergic reaction to the vaccine, only had a mild reaction, she had a mask on and when she got in the car and took off the mask, her face felt warm; Her reaction(face getting warm) was similar to what she experiences with a cortisone shot and dexamethasone before. The face feeling warm happened about 35 minutes after the vaccine(20Jan2021 14:40), then she got home and her face got even hotter; her scalp started to itch, it was really itchy; her eyes started to itch and then the scalp itchiness moved to the back of her neck down the middle of her back for about 2 hours. All of the itchiness went away after about three hours or 17:00PM on 20Jan2021; then a little bit of the scalp itching came back for about 45 minutes and then went away. All of the itching has been gone since evening on 20Jan2021. Later that night on 20Jan2021, she noticed she had a little bit of arm soreness; it felt like a bruise; when she laid on it hurt. 21Jan2021 it had gone away, too. The arm soreness wasn't even as bad as the flu shot. She was scheduled to receive the second dose of the Pfizer COVID 19 vaccine 10Feb2021. Outcome of arm soreness/it felt like a bruise was recovered in 21Jan2021, of other events was recovered on 20Jan2021.

1010682	2/8/2021	TX	23	F	1/9/2021	1/22/2021	<p>Bell's Palsy; progressed to left facial drooping; loss of taste on anterior part of tongue; decreased tear production in my left eye; started with left neck pain; This is a spontaneous report from a contactable other health care professional (HCP) (patient). A 23-year-old female patient not pregnant received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration Left arm on 09Jan2021 at 04:30 PM as a single dose for COVID-19 immunisation, lot number: EL1283. Medical history was reported as none. Concomitant medications in two weeks prior to the vaccination included oral contraceptive pill (OCPs). Patient received first vaccine dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 19Dec2020 at 04:00 PM at Left arm for COVID-19 immunisation, lot number: EK5730. Patient did not receive other vaccine in four weeks prior to the COVID vaccine. On 22Jan2021 03:00 PM (Symptom onset was 2 weeks after second vaccine) patient initially started to experience left neck pain, and then progressed to left facial drooping, loss of taste on anterior part of tongue, and decreased tear production in her left eye. Presentation consistent with Bell's Palsy. Patient started a course of methylprednisolone the day of the report with no improvement yet. Events resulted in Doctor or other healthcare professional office/clinic visit. Patient had no COVID prior vaccination. Patient was not tested for Covid post vaccination. Patient had not recovered from the events, at the time of the report.; Sender's Comments: The events left neck pain, and then progressed to left facial drooping, loss of taste on anterior part of tongue, and decreased tear production in her left eye are considered possibly related to the suspect product based on temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

1010621	2/8/2021	NY	91	F	1/19/2021	1/20/2021	tingling around the mouth area and lips; her mouth or lips were moving in a way that she had no control over/It was just a feeling she was having; This is a spontaneous report from a contactable consumer (patient). A 91-year-old female patient received the first dose of BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE)Lot # EL3247, via an unspecified route of administration on 19Jan2021 18:00 at single dose at left shoulder for covid-19 immunisation. Medical history included osteoporosis from Aug2020, rash on her legs from Aug2020, (lower leg below the knee, she was using a steroid but she had stopped as she was told not to use it too often by her doctor and just use Vaseline to keep the skin moist. She was asked if she had used any steroids but she hadn't used it in the past week and maybe only once in the previous week but couldn't be certain it wasn't in the last 10 days. She resisted the urge to use Mometasone 0.01 as it damaged the skin.); allergies to Sulfa a few years before. The patient reported her daughter who died at 41 years old of breast cancer. There were no concomitant medications. There was no additional vaccines administered on same date of BNT162B2 and no prior vaccinations within 4 weeks.The patient previously took brimonidine tartrate/timolol maleate (COMBIGAN) a few years before and experienced allergies, the eye drops didn't her any good at all and was told not to use it anymore. She previously received flu shot most every year and never had a problem. She stated that evening on 19Jan2021 she felt fine and then the next morning on 20Jan2021 she experienced tingling around the mouth area and lips. Almost as though her mouth or lips were moving in a way that she had no control over. She looked in the mirror and saw no evidence of it moving but could feel it moving. It was just a feeling she was having. The feeling was about the same. The first 2 days was on just the right side but she has had now had 2 occasions where it was on the left side. This was not constant, just occasionally during the day. She wanted to know if this was a known side effect and will it go away. She wanted to know if she should receive the second dose of the vaccine considering these side effects.The outcome of the events was not resolved.

A 55-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EJ1685), via an unspecified route of administration on 30Dec2020 at single dose for covid-19 immunization. The patient took vaccine for work, and to get back to a normal life. The patient's medical history and concomitant medications were both reported as none. Shortly after her first dose of the vaccine, she developed nipple drainage. She didn't know if it was coincidental or what. She hadn't noticed it prior to the vaccine. She a work up with a mammogram and ultrasound. There were no masses or anything else. They showed no reason to have the drainage. She was unsure of her weight, but would get 140 or 150 lbs. With the first vaccine, she experienced a sore arm. It started the evening of the 30Dec2020 about 4-6 hours after the vaccine. That resolved, and she recovered completely. She also experienced a metallic taste in her mouth. It happened initially on 30Dec2020. She recovered completely. It only lasted a couple of hours. They were both not serious. She had noticed an increase in the itchy and watery eyes on an unknown date. It was ongoing and persisting. The patient underwent lab tests and procedures which included mammogram: normal, ultrasound breast: normal, weight: 140 or 150 lbs, all on an unknown date. The outcome of the nipple drainage was unknown, the outcome of the events sore arm and metallic taste was recovered on 30Dec2020, the outcome of the events increase in the itchy and watery eyes was not recovered.

1010485	2/8/2021	NY		M	1/7/2021	1/8/2021	acute optic neuritis; A spontaneous report was received from a male patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced acute optic neuritis. The patient's medical history was not provided. No relevant concomitant medications were provided. On 07 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot: 011L20A) in the left arm intramuscularly for prophylaxis of COVID-19. On 08 Jan 2021, the day after administration, the patient stated he started to develop an adverse reaction that eventually culminated in acute optic neuritis. He mentioned that he was unsure if the vaccine caused it. He had a CT scan, MRI scan and lumbar puncture with results pending. He also stated that every diagnosis that could cause optic neuritis came back negative. The only change was receiving the vaccine before his symptoms started. On 22 Jan 2021, the patient reported his eye was getting better, but his vision was still not fully repaired. Treatment for the event included prednisone. Action taken with mRNA-1273 in response to the event was not reported. The outcome for the event, acute optic neuritis, was unknown. Follow-up received on 22 Jan 2021 included: update the reporter address, lot number, treatment and status of event.; Reporter's Comments: This case concerns a male patient who received their first of two planned doses of mRNA-1273 (Lot 011L20A), and who experienced the serious unlisted event of acute optic neuritis. Based on the current available information and temporal association between the use of the product and the onset of event on the day after vaccination, a causal relationship cannot be excluded and the events are considered possibly related to the vaccine.
1010394	2/8/2021		38	M	2/4/2021	2/4/2021	12 hours after shot, red swollen eyes, fatigue, body ache, tenderness and swelling of left arm. 1010583	2/8/2021	NM		M	1/1/2021		<p>The typical sore arm; puffy around my eyes/little puffy under his eyes; sensation around his eyes/felt a sensation on the side of his eyes; This is a spontaneous report from a contactable consumer (patient). A male patient of an unspecified age received his first dose of bnt162b2 (BNT162B2 reported PFIZER-BIONTECH COVID-19 VACCINE; unknown lot number and expiration date), via an unspecified route of administration on Jan2021 at a single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient inquired if his symptoms after the first dose of the vaccine are normal, was this a reaction to the vaccine and if he should get the second dose. He mentioned that he got the first dose of the covid vaccine earlier this week (Jan2021) and he had "the typical sore arm" but went on to report that about 3 hours afterward, he felt a sensation on the side of his eyes and below them so he asked his wife, "am I puffy around my eyes". He had no severe reaction or anything like that. He had no shortness of breath or rapid heartbeat or anything. He did not have any of those issues at all. Like any other shot, he had a sore arm. Then about 3 hours after he got it, he noticed a sensation around his eyes that last for about 20 minutes. He thought it had something to do with vaccine. His wife said he looked a little puffy under his eyes. He knows there is a "glad" under the eye area. He reported that he looked at the common side effects but didn't see his reaction so he doesn't know if he should be concerned. In the instructions for the vaccine it said there could be an issue with skin mucosa, but he had no swelling of the lips, throat, face, or anything. He wants the second dose. Obviously if someone had a severe reaction, they would not get the second shot. He inquired if he should be concerned about or not, if this is a side effect. The outcome of the events was unknown. The following information on the batch/lot number has been requested.</p>

1012383	2/8/2021	MI	69	F	1/16/2021	1/1/2021	<p>felt like she was having the onset of pneumonia; muscle and body aches; muscle and body aches; ongoing congestion in one nostril/stuffiness; felt tired and run down; feeling itchy/Her head, neck and back are very itchy; rash/like a fever type rash; This is a spontaneous report from a contactable consumer (patient). A 69-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection, lot number: EL3249, unknown expiration), via an unspecified route of administration in the left shoulder area on 16Jan2021 at 11:15 AM at a single dose for COVID-19 immunization. Medical history included COPD (has it for lots of years) and nickel sensitivity. She does not have any reactions to her previous unspecified vaccines but had a normal reaction like sore arm. Concomitant medication included bimatoprost (LUMIGAN). The patient previously received flu vaccine and pneumonia vaccine, both for immunization in 2020 around the end of Sep or beginning of Oct. The patient reported side effects regarding the COVID vaccine and said she was a little confused and unsure if she was having a problem or if she should see a doctor. On 16Jan2021 at 11:15 AM, she had the first dose of the COVID vaccine and afterward she had a lot of effects which were mostly muscle and body aches in Jan2021. She also experienced some ongoing congestion in one nostril but saw this as just more congestion and that she was having to blow her nose more in Jan2021. She did the (app name) report but didn't report the stuffiness. She did report that in the first few days she felt like she was having the onset of pneumonia and felt tired and run down (Jan2021). Two days ago, she started feeling itchy (Jan2021) and she didn't know what it was, she didn't know if she ate something or what. Now she has developed a rash (Jan2021) which is ongoing until now. Her paperwork said the rash would happen right away if it was caused by the vaccine. The patient wanted to know if this is something she should be concerned about and if the rash could appear or started this long after she had the vaccine. Her second dose is due on 06Feb2021. The patient wanted to know if the vaccine contains nickel or any metal substances in it since she had compared her rash to her nickel sensitivity. The patient wanted to know if rash is a side effect from the vaccine and how long it will last. She didn't put rash down for the safety check</p>

either as she didn't know if it was caused by the vaccine. Today her rash, she is so itchy. She does have it on her neck and certain areas but not everywhere. It looks like what would happen after a bad fever. It is not raised but is like a fever type rash. She did note that she had an increase dose of a medication eye drops (Lumigan; Lot: T and a 0 or O followed by 544, and NDC: 0023320503. Expiry: Jan2022) around the time the rash started but after getting the vaccine. Her head, neck and back are very itchy. She mentioned that she waited 2 days and did not put this event in the (app name). She would have reported it yesterday, but she didn't get one yesterday. She also noted that it was very dry there and cold and a person is going to get dry skin. She does have an allergic to metal and wondered if that was in the product. In her neck area, it looks just like when she would wear a cheap necklace. No treatments received. The events did not require emergency room or physician office visit. The patient has no prior vaccination within four weeks. The patient had not yet recovered from events rash/like a fever type rash and congestion in one nostril/stuffiness; while unknown outcome for the remaining events.

1010603	2/8/2021	MN	51	F	1/19/2021	1/20/2021	Fever; Chills; Headache; Severe neck Pain; Muscle ache; Joint pain; Malaise; Fatigue; Nausea; Dizziness; Insomnia; This is a spontaneous report from a contactable healthcare professional reporting for herself. A 51-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) (lot number EL3302/expiration date: not provided), via intramuscular route of administration, on 19Jan2021 04:15 PM (at the age of 51 years old) as a single dose in the right arm for COVID-19 IMMUNIZATION. Relevant medical history included Hashimoto's Thyroiditis and hypothyroidism. The patient had known allergies to levofloxacin, amoxicillin, levonorgestrel and ethinyl estradiol and pineapple. The patient previously received the first dose of BNT162B2 (lot number EJ1685) via intramuscular route of administration on 29Dec2020 at 04:15 AM (at the age of 51 years old), as a single dose in the left arm for COVID-19 IMMUNIZATION. On 05Jan2021, at 01:00 PM, the patient experienced headache, bodyaches, confusion, nausea, no appetite, fatigue, malaise, loose stools, joint pain, muscle pain, kidney pain, and watery eyes. The patient did not receive treatment for these events and has recovered from the events. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medication included thyroid (ARMOUR THYROID) and naltrexone. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines (besides the first dose of BNT162B2) within 4 weeks prior to the COVID vaccine. On 20Jan2021 at 04:00 AM the patient experienced fever, chills, headache, severe neck pain, muscle ache, joint pain, malaise, fatigue, nausea, dizziness, and insomnia. The patient did not receive any treatment for these events. The outcome of the events fever, chills, headache, severe neck pain, muscle ache, joint pain, malaise, fatigue, nausea, dizziness, and insomnia was recovering. Since the vaccination, the patient had not been tested for COVID-19.

1010980	2/8/2021	MA	25	F	1/6/2021	1/6/2021	Brain hemorrhage (inflammation, swelling); Dizziness; Difficulty with coordination; Difficulty with balance; Vision changes in left eye; Drift in left arm; Issues going through daily routine; Neurological symptoms; Was confused; Headaches; Very nauseous; A spontaneous report was received from a consumer, who was a 25-years-old, white female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced the events, very nauseous, neurological symptoms, headaches, dizziness, difficulty with coordination, difficulty with balance, vision changes in left eye, drift in left arm, issues going through daily routine, confusion, and brain bleed. The patient's medical history, as provided by the reporter, included gluten allergy. Products known to have been used by the patient, within two weeks prior to the event, included ethinylestradiol/ ferrous fumarate/ norethindrone acetate. On 06 Jan 2021 at 10:30am, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 06 Jan 2021, after receiving the vaccine, the patient became very nauseous through 08 Jan 2021. On 09 Jan 2021, the patient started having neurological symptoms. She started having headaches, dizziness, difficulty with coordination and balance, and vision changes in the left eye (not specified). She reported that she had a "drift" in the left arm and described it as "when you try to manipulate the arm, but it does not go where you want it to go". On 11 Jan 2021, the patient still had neurological symptoms, issues moving left arm, colliding with objects all day, and issues going through daily routine. On 12 Jan 2021, the patient was seen by a neurologist and magnetic resonance imagining (MRI) was scheduled. The MRI revealed inflammation, and brain bleed and swelling. The patient was sent to the emergency room and admitted on 19 Jan 2021. Treatment for the events included calcium carbonate for nausea, ibuprofen for headaches and diphenhydramine. Action taken with mRNA-1273 in response to the events was not reported. The event, very nauseous, was considered resolved on 08 Jan 2021. The events, neurological symptoms, headaches, dizziness, difficulty with coordination, difficulty with balance, vision changes in left eye, drift in left arm and issues going through daily routine, confusion, and brain bleed were considered not

							resolved. Follow-up received on 23 Jan 2021 included patient details, medical history, lab tests, concomitant medications, hospitalization, and updated events.; Reporter's Comments: This case concerns a female patient, who experienced a non-serious unexpected event of dizziness, coordination abnormal, balance disorder, visual impairment, movement disorder, loss of personal independence in daily activities, and neurological symptom, and non-serious expected event of nausea, and headaches. The events of nausea occurred 1 day (same day) after first dose of mRNA-1273, lot # unknown. The event of neurological symptoms, dizziness, coordination abnormal, balance disorder, visual impairment, loss of personal independence in daily activities, and movement disorder occurred 3 days after first dose of mRNA-1273, lot # unknown. Treatment for the events included, Tums, nausea, ibuprofen and Benadryl. Based on the current available information and temporal association between the use of the product and onset of the events a causal relationship cannot be excluded.

1010710	2/8/2021	TX		F	1/1/2021	1/1/2021	<p>it seemed she was so close to anaphylactic reaction; slight itching; swollen eyes; itchy throat; super red ears; generalized hives; rash; progressive hypersensitivity reaction; anxious; This is a spontaneous report from a non-contactable nurse(patient). An adult female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) in Jan2021 at single dose for COVID-19 immunization. Medical history included skin asthma with severe eczema and severe allergy when she moved. Day 1 to 7 post-vaccine, there was no reaction, the patient was super fine. The patient remembered that on Day 4, she had slight itching relieved by loratadine (CLARITIN), just like her usual allergy symptoms. From Day 8 to Day 12, she had progressive hypersensitivity reaction that led to her swollen eyes, itchy throat, super red ears and generalized hives. It started as a rash similar to her usual allergy. She ended up going to urgent care by herself since her husband was at work, because it seemed she was so close to anaphylactic reaction (?). At first, loratadine was working but at the time of report, it did not work for the events. She was not admitted because there was no shortness of breath. The patient was on close monitoring for progression of symptoms starting on 22Jan2021. She was anxious and was having second thoughts of getting the second dose of the vaccine. According to her, she had skin asthma with severe eczema, so maybe, the vaccine was not to be recommended to persons with severe allergies like her. She had severe allergies when she moved and was planning to see an allergologist soon. The outcome of slight itching was recovering, of the events were not reported. No follow-up attempts are possible. Information about lot/batch number cannot be obtained. No further information expected.; Sender's Comments: Based on the time association and drug's safety profile, the event anaphylactic reaction is possibly related to suspect vaccine BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and</p>

1011222	2/8/2021	PA	83	F	1/5/2021	1/17/2021	My mom received the Covid 19 vaccine on Jan 5, 2021 and became very about a week later. I was informed that she tested positive for Covid 19 on January 14th. One January 17th she became very tired and weak and would not eat. Hospice called me and told me that she was in a decline state. I saw her on January 25 and 26 and she was just sleeping and could not open her eyes. Her vitals were good and she seemed to understand when I talked to her - she would squeeze my hand and moan but she could not talk or open her eyes. My mom passed away on January 27, 2021 just 22 days after receiving the Covid 19 vaccine. She was very think to begin with and being to weak and tired to eat resulted in her losing even more weight. Some of the other residents were given fluids to help and they recovered. My mom was not given fluids. I believe there were 20 deaths in her care home for the month of January when they vaccinated. This was an alarming number of deaths for the home. The facility had very few Covid deaths in 2019 and 2020. I asked every week if they had any Covid and or Covid deaths and this amount was shocking to me and the workers there.

1014459	2/8/2021	WA	37	F	12/31/2020	1/1/2021	The next day of vaccine I got a rash it started on my arm then it progress to my body except my face, palm of my hands & bottom of my feet. 7 days later I got ptosis on my left eye. I went to the doctor on 1/3/2021, 1/8/2021 & 1/25/2021. The doctor got me on medication 50mg of Benadryl every 4hrs 25 mg of atarax every 8hrs , added topical cream. peterson oral & pepcid twice a day. Everything went away after 30 days.
1014452	2/8/2021	CA	74	F	1/21/2021		1) on eve of vaccine 1/21/21 I had a slight headache, stuffed nose, stiff neck, malaise, slight stomach upset. Drank plenty of water. 2) next day 1/22/21 I had a feeling of being poisoned or having undergone chemo therapy (which it was). Overall poor body feeling/ malaise. Had a 1st of 5 scintillating scotomas at 9:45 a.m. For 4 days following the vaccine, I had 5 scintillating scotoma/ocular events lasting 22 minutes each on 1/22, 1/24, 1/26 & 1/27. On 1/24/21 at 1 p.m., I had an optica/visual kalledoscopic focus (dysfunctional vision) lasting for approx. 30 seconds followed by a scintillating scotoma at 4 p.m. TOO MANY UNUSUAL SCARY OCULAR EVENTS!
1014413	2/8/2021	NM	61	F	2/3/2021	2/4/2021	I woke up early the morning following the vaccine with pain in my left hand. It was hugely swollen and I could not bend my fingers. I went into the bathroom and found the the left side of my face and my left eye were black and blue. The hand then turned black and blue. Today is day 5 following the vaccine and the hand and eye are only marginally better. As background, a year ago I had a benign lipoma cut out on my face, left side just above the brow. The face looked identical then as now. About 18 months ago I had surgery on the left hand to correct a trigger thumb. Again, the hand then looked exactly like it does now. On day three after the vaccine, a knee replacement scar on my right leg had turned purple. No bruising nor sensitivity anywhere else on the knee--just along the line of the scar. That surgery was 10 years ago. Unlike the other surgical sites, it has now returned to normal flesh color.
1014506	2/8/2021	CO	34	F	1/8/2021	1/9/2021	Patient reports that she experienced redness, burning and strain in her both eyes beginning 24 hours after vaccination. She reports that symptoms lasted for 3 days after onset.

1013249	2/8/2021	NJ	50	F	1/27/2021	1/31/2021	Stroke like symptoms like Loss of balance, loss of words, mixing up words, headache, nausea, distance in vision off, muscle aches
1013247	2/8/2021	MN	74	M	2/4/2021	2/4/2021	Patient received his first dose of Moderna on 2/4/2021 at approx 1300. Patient called on 2/5/2021 stating he had some tongue numbness and eye swelling about 30 minutes after the injection. He did not seek emergency care, did not take any OTC medications. Phone call to patient 2/8/2021 he states on his ride home after the first injection he noticed that the top of his tongue became numb and he developed some swelling around the edge of my eyes and the back of my tongue felt thick. He went home and took a nap. When he woke up, he felt great. No swelling around eyes, tongue was not numb nor did it feel thick any longer. Patient tells me he has had a reaction like this before to a chemo enhancing medication, he does not remember the name. Patient states he still wants to receive the second dose.
1014411	2/8/2021	AK	64	F	1/5/2021	1/5/2021	I had extremely high blood pressure; my heart was throbbing. I was told to go to ER at work but I didn't and went home and rested. That went on for days. I called my doctor and she put me on Metrozal to help with heart rate and BP and that brought that back down again. I'm taking this every day now in addition to my other blood pressure medicine. It has helped. I had headaches; I had terrible dreams and couldn't sleep. My eyes turned all dark - like when you need to drink water (underneath eyes). Had a terrible thirst. I drink water constantly. I had bruising on various parts of my body - legs; arms etc. It's calmed down with all these symptoms within a couple of weeks.

1012557	2/8/2021	NC	80	F	1/16/2021	1/1/2021	<p>Amyloidosis; felt a sweep over her stomach up her body and up to her head; Eyes swollen; hands hurt; sharp pings up and down legs; This is a spontaneous report from a contactable consumer (patient). An 80-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK9231), via an unspecified route of administration on the left arm on 16Jan2021 13:45 at a single dose for COVID-19 immunization. Medical history included ongoing diabetic and previously took the flu shot one time and started having right arm pain across her chest over to the left side right after getting it. So she don't take it anymore and takes a bunch of herbs. The patient's concomitant medications were not reported. The patient reported that she has a disease, amyloidosis on an unspecified date, where there is a build up of protein in the body. She didn't know that there is protein in the shot and doesn't know the affects it has with her condition. She found out the day after getting the first Pfizer C-19 (clarified as COVID-19) shot that there was protein in it. The patient wanted to know the affects it has with her condition and if it will affect her getting the second dose and if it covers the new virus and booster shot. The patient got the vaccine on 16Jan2021 and found out about the protein in it the next day when it came across her phone. The patient received it at a school, where they vaccinated 1,169 residents. They text her to inform her she could get the vaccine. They also have the health department there. No other vaccines given that day or 4 weeks prior. On an unspecified date in Jan2021, the patient took 1 Tylenol about 15:00 that afternoon and seated herself in the chair about 17:45, then she felt a sweep over her stomach up her body and up to her head. She stood up and walked around to see if she was going to faint and she did not faint. She walked through the house and nothing else happened. The patient mentioned that her eyes have been swollen and her hands hurt, that's where the protein build up comes in the body. Has pings up and down her legs, they are sharp pings that lasted through on to Tuesday. She took 1 Advil to help and as of yesterday (as reported) no pings. Her hands still hurt, because this condition forms chains in the body and the chains are around the hands like carpel tunnel. The protein normally should leave the body and with this condition it doesn't and it leaves chains. When</p>

1014837	2/8/2021	WA	36	F	1/18/2021	1/19/2021	Started having symptoms about 26-30 hours after vaccine, headache, nausea, vomiting and hives to my chest and arms. The following day hives increased to chest, armpits and abdomen - went to be evaluated., was having allergic reaction. Was given Solumedrol IM injection and Rx for prednisone dose pack and Claritin, also told to take Benadryl. The following evening hives increased to chest, abdomen, back, arms neck and hairline. Called in to work the next day and instructed to continue Rx treatment of prednisone, Claritin and to take Benadryl every 6 hours and advised to not get second injection. Took medications as prescribed at home but hives continued to spread with some mild swelling to eyes, face and lips. By Sunday hives had improved to my chest, and and legs but started moving to my feet. Monday hives had improved by about 50 percent, did call in to work and continue take Rx?s with Benadryl every 6 hours. On Tuesday, most all hives had disappeared, except to lower legs and feet. Hives completely gone on Thursday.
1014486	2/8/2021	WA	44	M	2/2/2021	2/7/2021	Near vasovagal syncope 5 days after 2nd dose. 5 days after my second COVID vaccine, I was outside in snowy, cold weather about a mile from my car. I had stopped moving to rearrange some items. While stopped, I started to feel lightheaded, develop tunnel vision, and feel faint, almost to the point of blacking out. I put my head down and legs up and felt somewhat better. I then attempted to return to my car. I could go 100-200 yards at a stretch, before having to purposefully fall down and elevate my legs. I traveled the mile back to my car like this (slowly). I could not check my pulse because my hands were too cold; my respiration rate was elevated. At the car, I drank fluids and warmed up and began to recover enough to get home.
1014792	2/8/2021	OR	34	F	2/6/2021	2/6/2021	Blurry vision, racing heart, dizziness, hot/clammy, chills after being really hot, anxiety all within 20 mins from injections. At 7:30 when home, cold, dull ache at base of skull.

1014620	2/8/2021	CO	72	M	1/8/2021	1/29/2021	My dad experienced a neurological lapse that lasted a few days, but most certainly for 30 minutes while on FaceTime with me. He closed his eyes, and began rubbing his head. He wasn't making much sense, and then stood up and faced away from the camera. He asked "are you with me?" And then didn't respond when I told him we were behind him. He began stumbling and I shouted for my mom. She called 911, they ran an EKG which was abnormal (due to his heart conditions), however the CT Scan and all blood work and tests at the hospital came back normal (outside of a much lower than normal heart rate) so they discharged him. He does not recall the entire morning. He has been fine since, as far as I know, but has been instructed not to drive. He followed up with his cardiologist a few days later and he believed it was neurological. The neurologist immediately dismissed the idea that this could be the vaccine, despite my pushing. So I am filling this out to ensure all bases are checked. My dad got the second dose of COVID vaccination this afternoon

1012803	2/8/2021	ME	43	F	2/4/2021	2/5/2021	Vaccinated 2/4/21. On 2/5/21 in the AM, she developed a dull headache, sore throat and injection site pain/swelling. She felt that the pain went into the lymph nodes and into her back. The headache, pain and sore throat worsened over the afternoon. By the time she got home at 4:30pm she had whole body aches and was feeling really bad. She developed facial and eyelid swelling. She applied ice. Her eyelids swelled so much that they cracked. Her face has a dry, red rash. She later got up to take bedtime medications and she passed out. She began vomiting. She declined an offer to call the ambulance or to go be seen by a doctor. She took tylenol for pain and zofran for vomiting. On 2/6/21, she developed diarrhea. She was
1012796	2/8/2021	MI	48	F	2/3/2021	2/4/2021	Around 9:30 pm on 2/4/2021 my right cheek felt numb and was tingly. This persisted through the evening and my right jaw started to feel the same way. My right ear felt like it had to pop. I went to my doctor she stated she didn't know what was wrong but she could prescribe me a steroid and to take Tylenol or Motrin fir pain. Later that evening I went to emergency and they repeated the same thing; however, I had a high blood pressure at the doctors office 181/91 and then 141/91. At emergency it was 171/80. I left emergency with the same pain and no answers. The following morning I felt better. Around 3:30 my right cheek and jaw started to feel numb with a tingly sensation. My ear was hurting and later on in the evening I had a massive headache and blurred vision. I stayed in bed all day 2/7 and had the same symptoms. As of 2/8 my jaw and ear have massive pain and I have a slight headache. My blood pressure keeps fluctuating and my left cheek area feels tight.

1012634	2/8/2021	FL	75	M	1/28/2021	1/29/2021	Got vaccine on 1/28/21, felt tingly in his lip. At the night progressed he had muscle weakness, lip tingling, eyelid droop, loss of bowel and bladder function, moreso bladder. He was slow in his responses, and his wife noticed that was getting weaker and could not get up from the bathroom. She feels it was more muscle weakness than anything. On 1/29/21 he was bad most of the day 1/30/21 he started to come out of it little and knew what she was saying. Now today 2/8/21 he is about 93% back to his baseline. Nothing taken, but did speak to the doctor and he at that time told him not to take the 2nd vaccine.
1012756	2/8/2021	FL	67	M	2/4/2021	2/5/2021	Waking up at 3:30am Friday the 5th it was difficult to open my eyes, like my eyes were glued shut. When I finally opened them everything looked crystallized, I couldn't see the tv which was on but it was brighter in that area, I couldn't make out anything. I closed my eyes for a few minutes and opened them with the same results. I closed my eyes about 4 times and then finally I could make out everything. The only thing different that I took was the vaccine and a packet of Thera Flu. Nothing else has happened since except a sore arm which lasted 4 days
1013123	2/8/2021	KY	72	F	1/26/2021	1/26/2021	About 5 hours after getting the vaccine, I developed a headache on 1/26/21. Somehow the vaccine seemed to inflame by nose and sinuses. I went from a headache to a pressure headache from below my eyes to the top of my forehead. Today, is 2/8/21 and I still have a headache. I have contacted my doctor, on 2/1/21 and she prescribed Celecoxib 200 MG for a week. On 2/4/21 I developed a lot of drainage at the back of my throat. I would like to know if I should take the second vaccine? Dr. has recommended that I hold off at this time.
1012675	2/8/2021	MD	35	F	1/25/2021	2/5/2021	Rash on upper left temple and swollen lymph nodes around left ear started on Friday. Headaches resembling a tension headache radiated up the left side of the face and skin is sensitive to the touch through the weekend. Diagnosed at shingles and antiviral medication prescribed on Monday. Visiting Ophthalmologist as rash is near eye.

1012888	2/8/2021	MO	50	F	2/3/2021	2/3/2021	I had an initial feeling of being high. My vision became distorted. My fingers became tingly. My breathing felt heavy. I felt heavier and heavier. They asked me if I wanted to lay down. I said yes. I was also very dizzy. My blood pressure was 135/83 and pulse was 125. my blood sugar was 102. I drank a bottle of water and laid down for 20 to 30 mins. Then sat in the chairs. I had to wait for the vision disturbance to wear off so I could drive. it also gave me ADD symptoms for 48 hours. Very hyper. Then I had the flu for 5 days. The dizzy wore off on the 6th day. Should I get the 2nd shot?

1013239	2/8/2021	MI	78	F	2/5/2021	2/6/2021	double vision, little dizzy, headache - yesterday had her 2nd vaccine SYMPTOMS DURATION: 2 days. Patient states she got her first COVID vaccine on 2/5/21 and had a slight headache but no other symptoms. Today, she was sitting the car when she started to have double vision. She reports dizziness/lightheadedness that is moderate. Patient states the double vision isn't everything but random things and at random times today. Denies dehydration, fever, or injection site abnormalities. No headache today. Reports that last week at her PCP's office her BP was slightly elevated and she thinks her BP may be elevated right now but does not have a cuff with her to check. Went to the Emergency Department on 2.6.21 - admitted overnight until the 7th. DETAILS OF HOSPITAL STAY: DX: Diplopia [H53.2] Blurred vision, bilateral [H53.8] HOSPITAL COURSE: 1. Double vision post COVID vaccine. Unclear etiology or if related to vaccine reaction. Resolved. CVA ruled out. Could be migraine associated. Advised patient to talk to PCP about migraine prophylaxis and see ophthalmology as outpatient. 2. HTN 3. HLD Advised patient not to drive till cleared by ophthalmology Inpatient workup included myasthenia gravis panel which is still pending The patient is a 78-year-old right-handed woman who received her first Pfizer COVID vaccination February 5. This morning she developed double vision. Images were horizontal she does not know if they were binocular or monocular. She saw couple with 1 child and it appeared that they had 2 children. She looked at her son and saw 2 heads on 1 body. She saw 2 traffic lights. Each time she saw diplopia, it lasted for maybe 1 minute, and after blinking it went away. The double vision was not associated with headache, facial numbness or weakness, numbness or weakness in her extremities, speech change or imbalance. She recovered from each episode. She has had torn retina twice in each eye. Those were each associated with flashes of light in floaters. She did not have a fever today. She has never had double vision before. Review of systems: She admits to a history of headaches. She said she had catamenial headaches and sinus headaches.

1012963	2/8/2021	FL	27	F	2/4/2021	2/6/2021	Two days after my second dose of the vaccine, I noticed a small swollen area on my left eyelid. The following day, about 24 hours after I first noticed the swelling, my eye began swelling even more. Then the next morning it was even more swollen. I scheduled an Appt with my ophthalmologist and he confirmed that it was not an infection, but was an allergic reaction. I have no known allergies except contrast dye and have never had seasonal allergy symptoms. I could barely open my eye this morning. The symptoms have improved with Benadryl and a steroid topical.
1012944	2/8/2021	CA	53	F	2/5/2021	2/7/2021	SWELLING OF THE FACE AROUND BOTH EYES WITH ITCHING AND LIPS SWOLLEN AROUND SUNDAY MORNING AT 2:00 AND BECAME WORSE LATER THAT MORNING. EXTREME TIREDNESS. TOOK BENADRYL TO RELIEVE THE ITCHING AND SWELLING.
1012996	2/8/2021	FL	74	M	1/14/2021	2/3/2021	Began developing a fuzzy eye sight in right eye; progressively worse, unable to focus. On Wednesday 2/3/2021 I noticed a large amount of long and moving floaters in the right eye, swirling, growing and then fading - like someone poured a stream of ink in water. By Friday 2/4/2021 unable to focus from right eye and went to Ophthalmologist for eye exam; He made arrangements to send me to a clinic in and I will see them on Wednesday 2/10/2021. I don't know whether or not this is related to the COVID vaccine but it is the only unusual event that has occurred in the last 45 days.
1013158	2/8/2021	IN	67	F	2/3/2021	2/6/2021	Restless legs; blurry vision; headache; nausea; lots of confusion; dizzy; metallic taste in mouth
1012906	2/8/2021	VA	56	F	1/29/2021	2/5/2021	Significant left eye twitching, with involuntary eye closure for a second, that occurred every 3-10 minutes starting 2/5/21-2/8/21. Minimal occurrence on 2/8/21. Instructed to see hospital Ophthalmologist today.

1008969	2/7/2021	GU	60	F	1/14/2021	1/26/2021	I woke up with a red patch on my left arm about 2" in length and 1" wide. It was about 2" down from where I received the vaccine. It itched a little, but not constantly. There was swelling in the red patch. The itching was mostly in the morning. I didn't do anything about it, just kept an eye to see if it grew. It might have grown a little more during that day. Two days later the redness and swelling was still there, but it seems to be dissipating. I didn't record when the redness and swelling stopped. It probably stayed red for about 3 days, although I can still see where it was.
1010100	2/7/2021	PA	50	F	2/3/2021	2/3/2021	Patient reported tingling left side of tongue. Paramedic notified for assessment. Symptoms resolved without intervention. Paramedic supervision continued during time in observation room. Pt left building at 17:45. VS stable; BP 179/100; P 100; RR 14; Pulse Ox 98% in RA. No medical intervention required.

1009518	2/7/2021	FL	39	F	1/11/2021	1/18/2021	1 week after covid shot on 1/18/21, I missed a day of work for stiff neck followed by a headache. Over the next 3 weeks, my headache increased in nature, and accompanied with stiff neck, stiff hips and I could only lay on my back to sleep. The headache was mainly on my right side behind my eye. I tried a high dose of naproxen, as well as massage, chiropractic and got no relief. Finally on February 2nd, I went to the urgent care associated with my primary care provider because my primary care provider was not available.

1008912	2/7/2021	CA	54	F	12/30/2020	12/30/2020	Slight dizziness, blurry vision: immediate - 2 days after 1st vaccination Slight fatigue - 2 days - 5 days after 1st vaccination Sore, swollen arm - 6 -10 days after 1st vaccination Increase in environmental allergic reactions (itchy eyes, runny nose) - 5 days after 1st vaccination until current Increase in food sensitivities (eczema, dry and cracked lips) - 5 days after 1st vaccination until current Sore, swollen arm - immediate - 2 days after 2nd vaccination Low-grade fever and intense fatigue - 1 day after 2nd vaccination Slight fatigue - 2-4 days after 2nd vaccination
1010040	2/7/2021	ME	57	F	12/29/2020	12/29/2020	Lower lip left side (vaccine in left shoulder) became tingling, numb, pins and needles feeling 45 mins to 1 hour after shot, and eyelids were puffy and slightly sagging. Lip felt that way for 3-4 days.
1009983	2/7/2021	CA	42	F	2/4/2021	2/7/2021	This morning after breakfast (around 9:00-9:30am) my right eye started feeling strange, but looked fine. The sensation was a sense of pressure or slight numbness. After about 20 minutes, that sensation disappeared and then my right arm started feeling strange, too, as if my joints were swelling and the ulnar nerve was irritated. The right forearm near the ulnar nerve felt slightly numb to touch, as if I were touching Playdoh, or molding putty. All my joints started feeling swollen and heavy, my knees visibly showing swelling. I've done some work to alleviate the inflammation, but my right side arm and joints are still feeling heavy and a little warm, with some lingering weird feeling of Playdoh (molding putty) numbness when I touch the area. The numbness is not so noticeable when I'm not touching the area. It seems that it will go away with time and not too serious, but wanted to report in case others experience the same thing. Also, I should mention that the day after getting the vaccine (2/5/21), in the morning when I woke up (7:00am), I experienced an intense one-sided headache behind my right eye that lasted until I gave myself some acupuncture in the late morning. I also experienced extreme arm pain at the site of the injection the day after the vaccine which lasted until yesterday (2/6/21). This morning when I woke up (7am), I felt some local numb feeling (when I touch it, it feels like I'm touching playdoh) at the injection site on the left arm, with minor soreness.

1009527	2/7/2021	MI	38	F	2/4/2021	2/4/2021	Recieved 2nd moderna dose 02/04/2021 in my left arm at 10 a.m. approx. No symptoms besides a small headache throughout day. At 10:15 that evening I started to become chilled. By 11 p.m. I had uncontrollable shaking chills, accompanied by a fever of 101 and body aches. By 1 a.m. I was still having uncontrollable shaking chills and severe body aches and Body sweats. I had a sweatshirt on over a tee shirt and a heating pad on between the two with two comforters on. At 3 a.m. I had to take ibuprofen (800 mg) because my body hurt too bad to even touch my skin. My eyelids hurt. My toes hurt. My ears hurt. My fever was up to 103. I fell asleep finally and woke up at 730 a.m. feeling much improved besides some mild chills. I made the wrong decision to go to work. I arrived at work at 830 and by 10 a.m. I started to get chilled again, achy and feeling like I was going downhill again. I decided to go home. By the time I got home at 11 I had chills again, fever of 101 and body hurt. I slept until 3 p.m. at which time I woke up chilled and wanted to take a hot shower. My other half noticed I had hives on my face (which I documented in photos). I took a benadryl and went back to sleep. Woke up again at 7 p.m. tried to eat something but had no interest and just wanted to sleep. Throughout the night I would get the sweats that would drench through my t shirt. The following day, 2 days post 2nd dose I slept all day. Not as chilled but very tired. Noticed injection site was now red and swollen, again documented in pictures. Slept all day. Today injection site has gotten slightly larger based on markers I marked on my skin, but not as red. Not too energetic but much improved.
1009890	2/7/2021	SC	43	F	2/5/2021	2/5/2021	Rash and itching from head to waist 2 hours after vaccine. Benadryl 50mg oral taken and cool compresses applied. An hour later rash was somewhat better but visual. Pepcid 20mg oral taken 2 hours after benadryl. Same result. 12 hours later itching again and rash still visual so benadryl 25mg oral taken. Mostly the rash disappeared. It's day 3 post vaccination and the rash is in a few places however I am not treating it. The rash was like hives and appeared on my arms first and within minutes my face was covered along with my neck. Took about 20 min to spread to my abdomen and back.

1009885	2/7/2021	IN	75	F	1/13/2021	1/21/2021	Vaccine given 1/13; symptoms began 1/21-burning and intermittent blurry eyes/double vision, drooping left eyelid, drooping left side of mouth, fatigue; went to ER on 1/22, blood work, EKG, MRI normal, ER MD didn't know the cause but if symptoms persisted, go to internal medicine MD; symptoms improved but saw Dr. on 1/28. She referred me to a neurologist. By 1/31, most of my symptoms had cleared. On 2/4, neurologist exam showed weakness in facial muscles, diagnosed condition as viral Bell's Palsy. Following medical exams, I read CDC report which referenced Bell's Palsy in Unsolicited Adverse Events section. Am sending this report
1007745	2/6/2021	CO	74	M	2/4/2021	2/4/2021	extreme fatigue, muscle weakness, dizziness, possible visual blurring, intermittent fever,
1007848	2/6/2021	MA	77	F	2/6/2021	2/6/2021	Patient complained of dizziness and said she was going to pass out. Observation nurse called site clinical lead over, at that time the patient was responding to verbal cues. Mask was taken down and she was guided to take slow deep breaths, continued to report feeling as though she was going to pass out. Site clinical lead then noted patient with fixed gaze to the size, clenching hands and rigid posture. Observation nurse called for EMS assistance. Patient breathing slowed, mouth open, eyes remain fixed to the size with rigid posture for 5-10 seconds. Patient did not respond to any verbal cues. Site clinical lead and observation nurse lowered patient to the floor, at which point patient became responsive. Responded correctly to reason for visit to site, location and how she was feeling. Denied history of seizures or stroke. Reported feeling anxious and needing to use the bathroom. Did not appear to lose bowel control at any point. Patient was very diaphoretic and pale, but alert overall. Cold compresses applied to forehead and back of neck while patient remained supine. EMS arrived and had patient sit up, at which point she again became very pale and reported feeling as though she was going to pass out. EMS transported to hospital for further evaluation.

1007398	2/6/2021	NY	24	F	1/21/2021	1/28/2021	<p>On January 21 I received my first dose of Moderna vaccine on my left arm. After the vaccine I had a red lump that was hot and a bruise that only lasted 2 days. Everything was fine until the January 28th when I developed a large red lump during the day while at work that was severely itchy and hot. When I got home from work I had a low grade fever. I made an appointment with my primary care for the next day which was Friday the 29th. My doctor told me she believes I had cellulitis. I was given an antibiotic 2x a day for 7 days. She drew a purple circle around the area and told me that if it goes outside the marked area or I feel any new symptoms, to go to the emergency room. Saturday morning on the 30th i woke up to my entire arm red and hot. I felt like I had a huge sunburn. I couldn't put my sweatshirt on because it was so hot. The emergency room doctor told me I was fine and to keep taking the antibiotics that were given to me yesterday from my primary care doctor. After the emergency room I went to work and started to feel dizzy and nauseous. My hands became sweaty but the rest of my body was cold. I started having a butterfly feeling in my chest. My Apple Watch alerted me that my heart rate was over 100 bpm. That night before bed I had another low grade fever. On Sunday the 31st I noticed the red area was gone but instead it was a dark purple. I felt okay Sunday besides a rapid pulse. Monday February 1st I woke up out of a dead sleep sweating, butterfly feeling in my chest and dizzy. I tried to take my pulse while laying down but it was so fast I couldn't keep up with it. I put my Apple Watch on which alerted me immediately that my pulse was 152 bpm. I slowly got up but then I passed out falling off of my bed. I couldn't get any words out because my heart was beating so fast that I couldn't breathe. I was sweating horribly and had a hard time walking. Had absolutely no strength in my left hand, my arm was purple/red, cold and numb. My arm felt like someone punched me repeatedly and gave me a dead arm. I called my primary doctors office and they were able to get me in that afternoon. All morning my pulse was spiking and then drastically dropping. About an hour and a half before I went to the doctor everything was fine. I was able to talk but still struggled with breathing while talking. The doctor ordered an EKG which came back clear. My pulse and blood pressure was also fine. The doctor told me she believed all of the</p>

1007969	2/6/2021	AL	75	M	1/26/2021	1/29/2021	<p>symptoms I had were from the medication I take at night (doxazosin-to relax my muscles and help with sleep.) She also told me she believed some of it was my mental health issues taking over. She told me the cellulitis looked fine and sent me home. Later that day I felt exhausted and when I woke up from a nap, I had a fever of 100.5. Took Tylenol and it dropped to 99.5 but wouldn't go any lower. February 2nd I woke up to a large red ring outside of the purple marker, numb finger tips and butterfly feeling in my chest. All day I received alerts that my pulse was falling and spiking. I sent my primary doctor an email and she told me she didn't think it was cellulitis anymore, maybe a hematoma but she wasn't sure. Since January 28th I still struggle everyday with the butterfly feeling in my chest, blurry vision, low grade temps, alerts of pulse, dizziness and breathing difficulties. My arm is always hot, my finger tips are numb and sometimes the strength in my hand is gone. The top of my arm is always a dark purple with red blotches and other times my entire arm is red and hot. When my pulse is very fast, I have a hard time talking, remembering what I was going to say and focusing. I've had multiple coworkers ask me if I'm okay because I'll randomly stop talking and stare off and then I'm alerted that my pulse has either spiked or dropped drastically after spiking. My pulse is never consistent. It is always ranging from 57-155bpm. I realized at first I may have what they call ?COVID arm? but my symptoms haven't gotten any better. No answers have been given to me or a diagnosis. The first diagnosis that they thought was cellulitis. Then it was ?in my head and behavioral.? Then it was a hematoma. Now it's an ?I don't know.? I have tried Benadryl for the itching, ice packs for the days that I'm swollen, Tylenol for the fevers and pain but I never have any relief.</p> <p>Very sore left arm starting on 01/27/2021 - on 1/29/21 woke up with very blurry eyes and pink eye - called my pcp and she prescribed eye drops to be used for 7 days. The blurry eyes lasted 2 days and gradually cleared up - My eyes are still slightly blurry. eights days after the covid shot - my heart started beating at a fast pace - lasted for a few minutes . at random it beats fast and then slows to a normal beat.</p>

1007692	2/6/2021	IL	25	F	2/5/2021	2/5/2021	felt fine besides soreness after vaccine. My 9pm I felt dizzy, had a headache, and started feeling nauseous I took some Tylenol and ibuprofen and a snack (can't take it on an empty stomach when nauseous Was able to fall sleep but woke up at 2am very shaky, nauseous, and with extreme joint pain. I went to get a snack so I could take more pain reliever and I passed out and briefly blacked out my vision. When I came to, all the lights in my apartment were on but I had to use my hands to feel where my bed was so I could get back in. My TV was on but I realized that I couldn't hear it. All I could hear was a buzzing/wooshing sound and realized my hearing was gone and when I scratched my head and I couldn't hear the sound on my scalp. It came back about 30 minutes later but happened again the next time I stood up. By around 4am I was in so much joint pain I couldn't lie down anymore and had to run a bath so I could relieve some of the pain. I'm still in a lot of pain but I don't have the nausea anymore as strongly.
1007660	2/6/2021	VA	50	M	2/3/2021	2/4/2021	Painful swollen lymph nodes along left clavicle noticed 2/4/21 at 6pm still present and painful. Swollen lids under eyes (mild) noted on 2/6/21 have now subsided after 2 hours.
1007629	2/6/2021	VA	44	M	1/26/2021	1/30/2021	Patient reported right sided facial drooping on 2/1/2021 stating that it began three days prior to him reporting it. MD documentation: Pt unable to blink right eye, lift right brow and right side of mouth is drooping. PERLA. Pt denied right sided weakness/headache. Pt has demonstrated elevated blood pressures since receiving Covid 19 Vaccine not previously demonstrated.

1007564	2/6/2021	MS	63	M	2/5/2021	2/5/2021	My oxygen levels dropped below what they had been previously as I am recovering from Covid infection tested positive 20 October 2020. If I do anything at all other then set my oxygen levels would drop into the low 80's. I have also been monitoring my sugar levels. I am not diabetic but did so because in ICU was using steroids which elevated sugar levels. I continued to monitor it at home because I had to do injections for several weeks after leaving the hospital. Have not had to use insulin til the other day. Vision is very blurry. Had that problem in the hospital but it has gone away but since I had the first vaccine everything is now blurry. Left leg hurts to put weight on the heel. I have nerve damage to the left leg but this is a unique issue. I'm running a low grade fever 100.2 - in the morning it is normally 96.5-97.6 and this temperature was in the morning the day after the shot. Neck is very sore. I have rods from C3-C6 and the pain is in the muscle glands closer to the surface. It is almost like it is attacking all areas of the body I previously had issues. I spent October 25 - November 13 in Hospital, majority of time in ICU.
1007549	2/6/2021		73	F	1/28/2021	1/29/2021	On 1/29 eyes itching occasionally and blurriness but resolved by 1/31. Has hx of dryes and will be following up with eye doctor 2/21.
1007535	2/6/2021	FL	67	F	2/5/2021	2/5/2021	Swollen dry eyes, by next day red in both eyes and very sore and painful
1007515	2/6/2021	MA	51	M	2/5/2021	2/5/2021	Drank fluids around 8pm followed by unusually early fatigue and somnolence 2 hours early, awoke before midnight cold, shivering, aching in larger muscles and joints from neck to ankle including shoulders, back, hips, and thighs, could not get warm wearing many layers and blankets, then headache after 3am with hot dry sore throat and awoke more short of breath than usual, eyes crusted, slightly dizzy on rising, am finding myself with poor attention this morning filling out this form incorrectly needing more corrections than usual. The first dose was much milder but lasted 6 days. This second dose seems much worse and am expecting it to last several days more.

1007471	2/6/2021	OK	72	M	1/30/2021	1/30/2021	was aching bad at thirty minutes a doctor looked at me and gave me a Zyrtec. I was feeling better at One hour. Three hours after itching was back eyelids burning, I took a claritin 10mg Had to take one every thee hours to stop the same. My blood pressure stared to clime and stayed his through the next day . It was a high as 187/115 I called the heart doc on call I told him I took extra carvedilol he said not to take any more and if blood pressure went over 200 to go to closest ER. It started to go down about 1:00am on the 2 of Feb. I Went to see doctor he said to see heart Doc before taking second injection I have continue to itch all over and takin multiple claritin and Zytrec. The itch is still bad today.
1007448	2/6/2021	VA	53	F	1/27/2021	1/28/2021	Most Severe to Least: All appeared within a day or two after the injection -- none are normal for me and I have O- blood Loss of smell (10 days - still muted) Blood vessel burst in my right eye (large red stain eye for five days -- still a small line near the top of the cornea) Two (2) to three (3) Days: Coughing Chills Sneezing Runny nose Sore joints Itchy warts on face (four in forehead area) - five days (one small and flatter one still remains)
1007404	2/6/2021	TX	40	F	1/15/2021	1/15/2021	After injection waited in medical observation due to medical conditions, developed Severe Headache, blurry vision, & Increased Blood Pressure.
1007396	2/6/2021	CA	50	F	2/1/2021	2/1/2021	My face started to swell and feel slightly numb. I could see my cheeks in my vision and my eyes were very puffy. I didn?t see medical attention because I could breathe normally but I self monitored for a few hours to make sure my breathing was ok. I immediately took Benadryl and continued to monitor. It took about 3-4 days for the swelling to go away by massaging my face and continuing Benadryl.
1008022	2/6/2021	TX	52	F	1/28/2021	1/28/2021	Between 2-3 hrs after injection, almost all moisture was gone from both eyes & they remained extremely dry, requiring eyedrops multiple times daily. Currently on RX Prednisolone Acetate drops, Erythromycin ointment & otc Refresh Celluvisc eye gel drops.
1007409	2/6/2021	CA	47	F	2/4/2021	2/5/2021	Arm started to feel sore 5 hours after injection But next evening at 8 pm noticed huge red circular rash and darker smaller inside circle like bulls eye. I took photo.

1008617	2/6/2021	OH	37	F	2/5/2021	2/5/2021	Patient presented with chills, upset stomach, blurry vision, lightheadedness and the feeling that she would pass out. These symptoms presented less than 2 minutes after receiving her Pfizer vaccine. Her blood pressure was slightly elevated when EMS evaluated patient. The feeling resolved after 15 minutes and the patient went home.
1008807	2/6/2021	CA	44	F	2/5/2021	2/5/2021	Patient stated feeling lightheaded and tingling sensation on left leg after receiving second dose of Pfizer Covid vaccine. Client was sitting on waiting area post vaccine for 15 minutes. EMT responded and alerted lead RN. Vitals taken at 1310: blood pressure 116/82, pulse 72, oxygen 99. Alert and oriented, stated symptoms began after vaccine. No prior history of tingling sensation in extremities. Stated tingling on left leg, mobility intact, no radiation or pain past leg. Allergies to amoxicillin and no current medications. Client given water and instructed to drink small sips. Per client no breakfast this morning and had two cups of coffee. Client denied chest pain, shortness of breath, palpitations, vision changes, headache. RN client asked to stay under observation longer and that EMT would recheck vitals prior to her leaving. EMT reassessed at 1325. Per client feeling better, was returning to work after leaving facility. Instructed to get food and rest. Last set of vitals: blood pressure 120/80, pulse 62, oxygen 99. Client left facility with a steady gait.
1008802	2/6/2021	CA	61	F	2/5/2021	2/5/2021	Client had completed 15 minute wait post vaccine when EMT approached her to ask how she was feeling prior to allowing her to leave. Client wanted to leave without being assessed and EMT informed lead RN. Lead RN assessed client and convinced client to allow staff to take vital signs prior to her leaving. Vitals at 1302: blood pressure 132/80, pulse 66, oxygen 98. Per client no shortness of breath, chest pain, nausea, changes in vision, or headache. Client alert and oriented. No known allergies and current medication trazodone. Per client was feeling well enough to go home, someone was driving her home. Declined to wait a few more minutes. Emergency room precautions given. Client left facility with a steady gait at 1304

1008544	2/6/2021	TX	68	M	1/25/2021	1/26/2021	Beginning about 12 hours after receiving the vaccine I started having really bad headaches, behind my eyes radiating to the back of the head. At about 15 hours post vaccine I had chills, fever. The chills and fever were bad enough that in addition to sleeping under two blankets I had to put on a thick fleece ?hoodie? and pulled the hoodie over my head. I developed about 48 hrs of nasal congestion, and some retrosternal chest pain. I had one episode of nausea with vomiting about 8:00 am the next morning. I had to take two 325 mg Tylenol every 4-6 hrs to deal with the headache and fever. The most severe symptoms of headache and fever subsided in about 24 to 36 hrs after the vaccine was administered. I had a lot of fatigue for several days, along with aches and pains. It took me about 5 days to really start feeling normal again, but the fatigue lingered for a few more days.
1008515	2/6/2021	DE	27	F	1/22/2021	1/23/2021	After the 1st dosage of the moderna vaccine, I started to notice my left eye twitching randomly throughout the day. It has happened more than 10-15 times a day, everyday since my first dosage. No pain, no treatment, no irritation, no redness, no swelling, no itching.
1008207	2/6/2021	CA	68	M	1/22/2021	2/1/2021	Neck pain near the top of the neck at the base of the skull slightly to the right of the center began around Feb 1. Began taking Ibuprofen, but it did not go away. Thought I had muscle strain, but surprisingly there was no stiffness or loss of motion. Tried massage, heat, and cold packs with limited relief. Began interfering with sleep over the next few days. On the evening of Feb 4, I noticed a strange sensation on the right side of my tongue as if I was losing taste or feeling there. At 3 AM got out o bed due to neck pain and noticed right eye felt strange and was drooping. When I got up at 8 AM I saw eye droop and smile was only on one side of mouth. Called my doctor and was directed to an advice nurse who told me to go to the ER right away, since this could be a stroke or Bell's Palsy. Went to ER and was diagnosed as Bell's Palsy after blood tests, EKG, CT scan, and tests of limbs. Given medications and and released with prescriptions sent to CVS for prednisone and valacyclovir.

1005347	2/5/2021	FL		M	1/21/2021	1/21/2021	Fainted; Unconscious; A spontaneous report was received from a consumer who was also a 73-year-old, male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced fainting and unconscious. The patient's medical history was not provided. Concomitant medications were levofloxacin, metformin, amlodipine and lisinopril. On 21 Jan 2021, prior to obtaining his vaccination, the patient took levofloxacin, metformin, amlodipine, and lisinopril. On 21 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 012L20A) intramuscularly for prophylaxis of COVID-19 infection. On 21 Jan 2021, within minutes of receiving the vaccine, the patient fainted with his eyes open and was unconscious. His health care provider told him he was dehydrated and that might be why he fainted. Action taken with the second dose of mRNA-1273 in response to the event was not reported. The outcome for the events, fainting and unconscious, was considered resolved on 21 Jan 2021.; Reporter's Comments: This case concerns a 73-years-old male patient, who experienced medically significant unexpected events of Syncope and Loss of consciousness. The events occurred within minutes after first dose of mRNA-1273, lot # 012L20A. Concomitant medication included levofloxacin, metformin, amlodipine and lisinopril. Treatment details were not provided. Based on the current available information and temporal association between the use of the product and onset of the events a causal relationship cannot be excluded. Of note, dehydration was reported as potential contributing factor.

1005288	2/5/2021	IL	36	F	1/28/2021	1/28/2021	Moderna COVID-19 Vaccine EUA. Approximately 1 hour after the shot on Thursday, January 28th, the left side of my face was mildly numb from the eyebrow down to the jawline. On Friday, I felt the numbness behind my left ear and left jaw. On Saturday, I felt the numbness around my left ear and jaw. Monday, I went to an urgent care facility. The doctor recommended that I take Advil and apply a warm compress but the diagnosis was NOT Bell's palsy. He hypothesized my trigeminal nerve was triggered by something, not explicitly attributing it to the vaccine injection. Tuesday, I had soreness on the left side of my neck. Wednesday, my lymph node in my left armpit is sore. Thursday (2/4/21), I had soreness on the left side of my neck. Friday, I still have soreness on the left side of my neck and left upper chest area.
1005274	2/5/2021	IA	60	F	2/2/2021	2/3/2021	fever (101.5) chills, nausea, red stinging eyes
1005259	2/5/2021	OH	30	M	1/28/2021	1/29/2021	major muscle cramp in his right leg - followed by his eyes rolling back and slurred speech - it happened at 4:30 p.m., 5:30 pm and 7:30 pm - each time it lasted for several minutes
1005243	2/5/2021	MD	67	F	1/29/2021	2/5/2021	On the way home from vaccination (1/29/21), felt like something stuck in her throat but resolved within hours. One week later (2/5), woke around 2am with same feeling, but at time of report (10:0am, 2/5), she has taken Allegra and using throat lozenge and feels throat symptoms are improving. She reports that she does battle environmental/seasonal allergies, has been experiencing post nasal drip and some intermittent itchy eyes and scalp this week so this could be related to allergies. She also c/o red "rash" at injection site about the size of 50 cent piece which she first noted today - denies pain or swelling. Writer advised she continue daily allergy medicine, consider using Benadryl as directed on the day of 2nd vaccination, and at any time between now and following administration of 2nd vaccine, if she should have worsening symptoms to seek care immediately. Also recommended 30 minutes observation period following 2nd vaccine - due 28 days from 1/29/21. She verbalized agreement with all.

1004208	2/5/2021	TX	73	F	1/16/2021	1/16/2021	Neuropathy in the finger / Neuropathy in the right arm; chills; Nausea; Headache; A spontaneous report received from a consumer concerning a 73-year old, female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced chills, nausea, headache, neuropathy in the finger and right arm. The patient's medical history was not provided. Concomitant medications reported included rosuvastatin and eye drop. On 16 Jan 2021, approximately 0 days prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (batch number 041L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. On 16 Jan 2021, the patient experienced chills, nausea and headache, all of which resolved within 36 hours on 18 Jan 2021. She took 3 Tylenol, and a Zomig to help with the symptoms. On 24 Jan 2021, the patient began to experience neuropathy in her finger and right arm, which she reported as it was getting worse. Action taken with mRNA-1273 in response to the events was not reported. The events, chills, nausea and headache, were considered resolved on 18 Jan 2021. The outcomes of the events, neuropathy in the finger / neuropathy in the right arm were unknown.; Reporter's Comments: This spontaneous report concerns a 73-year-old female patient who experienced a serious event of neuropathy in the right finger and non-serious events of chills, nausea and headache. The events of chills, nausea and headache occurred on the same day after the administration of the first dose of the vaccine mRNA-1273 vaccine (Lot #: Unknown, expiration date-Unknown). Neuropathy occurred 8 days after the administration of mRNA-1273 vaccine. Treatment administered included Tylenol and Zomig for chills, nausea and headache with resolution. The events of chills, nausea and headache are consistent with the safety profile for mRNA-1273 vaccine. Based on the information provided, including temporal association and in the absence of any other etiology, a causal association cannot be excluded for all reported events. Causality for the event of neuropathy is also confounded by the patient's advanced age. Main field defaults to 'possibly related'

This 30-year-old male patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine) (Lot number: Unknown), first dose, via an unspecified route of administration in the left arm on 21Jan2021 at 13:30 (at the age of 30-years-old) as a single dose for COVID-19 vaccination. Medical history included prehypertension from an unknown date and unknown if ongoing and attention deficit hyperactivity disorder from an unknown date and unknown if ongoing. The patient had no history of syncopal events. The patient did not have any known allergies. Concomitant medication included amphetamine aspartate, amphetamine sulfate, dexamphetamine saccharate, dexamphetamine sulfate (ADDERALL) and lisinopril (LISINOPRIL). Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient previously received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine) (lot number: Unknown), dose #1, via an unspecified route of administration on an unspecified date in the left arm as a single dose for COVID-19 vaccination. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 22Jan2021 at 15:30, the patient experienced lightheadedness, dizziness and waves of weakness and fading vision approximately 24 hours post administration of the second dose of the vaccine. He stated it felt like he was about to pass out while sitting/resting. No therapeutic measures were taken as a result of the events. The clinical outcomes of the lightheadedness, dizziness, waves of weakness, fading vision and felt like he was about to pass out while sitting/resting were unknown. It was also reported that since the vaccination, the patient had not been tested for COVID-19. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.

1004467	2/5/2021		69	F	1/20/2021	1/1/2021	<p>extremely nauseated; my eyes kind of crossed; Well after the shot I could barely even walk from the first tent to the second tent; UTI; This is a spontaneous report from a Pfizer-sponsored program. A contactable consumer (patient) reported that a 69-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not provided), via an unspecified route of administration on 20Jan2021 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The reported stated she receive the first dose of the COVID-19 vaccine on Wednesday 20Jan2021 and she had a "strange" reaction on 20Jan2021. Specifically, she states, "as soon as she pushed it in, I became extremely nauseated, my eyes kind of crossed and I had to sit in my car for 4 hours afterwards because I couldn't drive. They had 2 tents set up. Tent 2 was for people who had previous reactions or allergies and tent 1 was for people who had no reactions. Well after the shot I could barely even walk from the first tent to the second tent I stayed there for 45 minutes and then I could barely even walk to my car." Caller wants to know if she should get the second dose of the vaccine. She was started on the antibiotic sulfamethoxazole;trimethoprim (BACTRIM) on 22Jan2021 for a UTI which started after receiving first dose of COVID-19 vaccine in Jan2021. She would like to know if it is okay to use this medication since she just received the vaccine. She reported that she submitted her urinalysis the same day that she received the vaccine on 20Jan2021. The patient underwent lab tests and procedures which included urinalysis: with unknown results on 20Jan2021. Therapeutic measures were taken as a result of UTI. The outcome of the events was unknown. Information on the lot/batch number has been requested.</p>

1007086	2/5/2021	FL	46	F	2/5/2021	2/5/2021	Within a few minutes of vaccine, I got a severe piercing headache and nausea / vomiting which we attributed to nerves and I went to go home without reporting. During the drive the headache and nausea got worse and my extremities and face began to tingle. My chest felt tight. My body was shaking. My colleague noted weak pulses and pale complexion. I am a doctor and gave myself epinephrine 0.3 mg IM and within 60 to 90 seconds the symptoms improved dramatically. I had my husband pick me up at the office and went home. The headache and nausea worsened on the drive but then settled down significantly. I rested for a few hours, then took oral pred 20 mg at about 2:45. I noticed that my headache was back and very intense at about 3:15 pm. No nausea this time, but my left eye began itching and it was very tight / hard to breathe. My extremities began tingling and I had spasms / tremors of my muscles. I injected another 0.3 mg epi into my thigh and followed with dex sodium phosphate 4 mg IM. Symptoms resolved within about 2 to 3 minutes. I took 40mg more of oral pred. I also took 10 mg of pepcid PO. I am still feeling well now with no headaches or other symptoms at this writing (7:30 pm), but I have another doctor with me and we are 2 minutes from the ER if needed. I am marking unknown below since it has only been a few hours without symptoms.

1007196	2/5/2021	TX	64	F	1/11/2021	1/11/2021	Intense pain at injection when I went to bed. Developed chills/fever, dry cough, sore throat, headache, body aches, fatigue, red eyes, sleeplessness, anxiety, fever dreams. Felt like I had Covid all over again for 3 days. Injection site was red, feverish, and raised. At 6 days, red circle was no longer raised, but 5 inches in diameter. Treated by alternately taking Tylenol and Ibuprofen, just as I had with Covid. Circle was gone on 7th day. Extreme fatigue and cough lasted for about 3 weeks.
1007197	2/5/2021	NC	29	F	1/30/2021	1/30/2021	Broke out into a full body itchy rash several hours after receiving vaccine. Went to emergency room for visual examination. Was determined to be a mild allergic reaction, and benadryl was administered. Was evaluated at primary care doctor after rash did not go away after 2 days. No additional treatment was administered. Rash went away after 4 days. Also, 12 hours after receiving the vaccine I had severe fatigue, chills, nausea/vomiting, and headache. Was treated at home with advil and promethazine. These symptoms went away around 36 hours after vaccine was administered.
1007228	2/5/2021	CA	25	M	2/4/2021	2/4/2021	Almost 12 hours post-injection, I experienced a rapid onset fever, soreness, muscle aches, dizziness, high blood pressure, headache. Upon awakening the following day (today, 20 hours post injection) severe allergies around eyes. 24 hours post injection, all day today, fatigue, severe dizziness, soreness, headache, high blood pressure, loss of appetite, and labored breathing.
1007286	2/5/2021	FL	51	M	2/5/2021	2/5/2021	Intermittent blurred vision began 15 minutes post injection and continuing upon filing of this report (11.5 hrs) facial flushing, headache

1012078	2/5/2021	MA		M		1/22/2021	Report involves two products - COVID-19 Moderna vaccine (Moderna) and Invega Trinza (Janssen). Patient is my brother and I am company employee. Patient began Invega sustenna Dec-2016 and transitioned to Invega Trinza 2 years later. Patient has been on same dose of Invega trinza for at least a year. Regimen has been followed per prescribing instructions (per psychiatrist). Patient received first dose of Moderna COVID-10 vaccine at his place of employment on 24-Dec-2020. Last/most current dose of Invega Trinza was 15-Jan-2021. Patient then received 2nd dose of Moderna vaccine AM of 21-JAN-2021 (same location). Patient began severe pain in eyes, chills, myalgia (beginning 01:00 22-Jan-2021) and had to call in sick to work on 22-Jan-2021. Patient went for COVID-19 test on 22-Jan-2021 and result was negative. By 23/24-Jan-2021 patient began displaying symptoms of psychosis to family. Work colleagues noted that week of 25-Jan-2021 he was "not himself". Suicidal ideation (in emails) began 01-Feb-2021, symptoms intensified and currently 04-Feb-2021, patient is missing, endangered and in state of psychosis. Since patient is missing, I will serve as reporter in this case At the time of this report company was notified at 20:53 UTC and Moderna will be notified next after completion of this report.

1005897	2/5/2021	SC	83	F	1/19/2021	2/1/2021	My mom became very disoriented for 2-3 full days. She couldn't remember her birthday, where she was, her doctor's name, etc.... We took her to her doctor and she thought she had a stroke. We went to the ER for every test possible. She became disoriented and also had to put adult briefs on her. On Sunday she was driving and on Monday she was totally disoriented. My dad called and I rushed home 2 1/2 hours away. This was a terrifying event. She was glossy eyed and couldn't read. She didn't have any paralysis; thank goodness. It was all pretty much mental.

1005988	2/5/2021	WA	40	F	1/14/2021	1/14/2021	Shingles: Approximately 3 hours after receiving vaccine, experienced redness and tenderness under eyebrow of right eye.; Tenderness under eyebrow of right eye/pain behind right eye that did not go away for more than 5 days; Shingles: Approximately 3 hours after receiving vaccine, experienced redness and tenderness under eyebrow of right eye.; This is a spontaneous report from a contactable healthcare professional (HCP). A 40-year-old female patient received first single dose of BNT162B2 (Pfizer- BioNTech, Solution for injection, batch/lot number and exp date not reported), via an unspecified route of administration (vaccine location: right arm) on 14Jan2021 16:00 for COVID-19 immunization. Vaccination facility: Hospital. The patient had no relevant history. The patient was not pregnant at time of vaccination and at the time of reporting. The patient had no known allergies. The patient did not have Covid prior vaccination. Concomitant medication (other medications in two weeks) included multivitamin (unspecified). There was no other vaccine in four weeks. On 14Jan2021 19:00, the patient experienced shingles: approximately 3 hours after receiving vaccine, experienced redness and tenderness under eyebrow of right eye. Experienced pain behind right eye that did not go away for more than 5 days. Sought medical attention and ophthalmologist diagnosed shingles on 20Jan2021. The adverse events resulted in Doctor or other healthcare professional office/clinic visit, and Emergency room/department or urgent care. Treatment for the adverse events included antiviral medication and steroid drops. Patient was not Covid tested post vaccination. The patient had not recovered from the events at the time of reporting. Information about lot number and expiry date for the suspect product will be requested in follow-up attempts.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events herpes zoster, eyelid pain and erythema of eyelid cannot be excluded. The information available in this report is limited; information on previous occurrences of shingles, if any, would aid in case assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of

1005990	2/5/2021	NC	80	M	1/19/2021	1/19/2021	irregular heartbeat; Belching; Gas; Stomach cramps; felt antsy; his blood pressure went up the day he took the vaccine to 200/93; He was anxious feeling; sharp pains in his right eye; Ears Felt Funny; This is a spontaneous report from a contactable consumer (patient). An 80-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EK9231; expiry date not reported), via an unspecified route of administration on 19Jan2021 11:00 at single dose for COVID-19 immunization. Medical history included high cholesterol and blood pressure abnormal from an unknown date and unknown if ongoing. Concomitant medication included propranolol hcl for blood pressure and an unspecified cholesterol pill. The patient previously received influenza (Flu shot) on an unspecified date (years) ago for immunization and experienced light headed. The patient reported that his blood pressure went up the day he took the vaccine to 200/93 and he was real concerned about that. He took a blood pressure pill and was having some sharp pains in his right eye (he had 3-4 at different times). He was anxious feeling and could hear it blowing in his ears (which happens when his blood pressure is high). He stated he has never had his blood pressure that high and has never had any heart problems. The patient asked, whether he was in the danger zone, the danger zone of having a stroke and if they should take their second dose. The patient wondered if they could just take the first dose only. It was further reported that he took the vaccine yesterday or the day before (19Jan2021) at 11'o clock. He didn't have any problems, he just got home. Then 11'o clock at night he had fallen asleep during the day and woke up at that time, 11'o clock and he felt Antsy, his blood pressure was up, his ears puffed real high, he's on Blood Pressure medication. He Clarified further that his First Dose was on 19Jan2021 at 11 o clock during the day. Then 12 hours later that same day, he woke up, and that's when he felt antsy and the blood pressure being up. Normally he takes his Blood Pressure 2-3 times a week but that day it was like 190/80 something. When he saw it, he sat down, and thought if he relaxed it would go down. He went back over in 45 minutes or an hour later and it was 200/93, he thought he had sharp pain in the right eye during that time as well. He Never had that before, he had pain in eye before, but not like this. He then told

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

himself maybe he should take a blood pressure pill, because he was concerned he didn't want to stroke out. He took a Blood pressure pill and then relaxed for an hour later he checked it was 189/82. He waited some more, and it kept coming down. He stayed in the recliner all night. Then on 20Jan2021 he checked and it slipped to 140/55 at about 5 o'clock. The Blood pressure kept coming down 10 to 15 points every hour. The last one he took later that day was 118/65. He explains that his Blood pressure normally runs 120/65 to 140/70 normally. His blood pressure medication is only 10mg, its a low dose, he is a Healthy Person, he walks every day, his weight is good. The blood pressures provided were from 11AM to 11PM at night of 19Jan2021. It was the same day when he felt the ears feeling funny, and the sharp pain in the right eye, he has never had that before. He also forgot to mention that the next day he had a lot of stomach irregularities, he had cramping, it was uncomfortable, this was on 20Jan2021, he was also belching, and had gas. It went away that evening lasting 4-5 hours, it started in the morning 10 o'clock went till 3 or 4PM. The BP value of 140/65 was from today, before lunch. The right eye sharp pain went away during the night, after he took his blood pressure pill, he didn't notice it anymore after. He doesn't know if the vaccine caused this. He couldn't tell any difference even with the pain. The ears feeling funny, he took his blood pressure a couple times a day. The monitor is showing an irregular heart beat, he didn't notice that before. He has had no positive COVID test or Antibody Test prior to the vaccine. The patient recovered from sharp pains in his right eye, ears felt funny on 19Jan2021, stomach cramps, belching, gas on 20Jan2021 while the outcome of the rest of the events was unknown.

1006013	2/5/2021	NY	79	M	1/7/2021	1/20/2021	meningoencephalitis; Severe headache; severe nausea; migraine; small subarachnoid hemorrhage postulated; This is a spontaneous report from a contactable Physician (patient). A 79-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration Left arm on 07Jan2021 at 02:30 PM as a single dose for COVID-19 immunisation, lot number: EL3249. Medical history included hypertension, hypercholesterolemia, hypothyroidism and dust allergy. Concomitant medications in two weeks prior to the vaccination included levothyroxine sodium (SYNTHROID), chlorthalidone and rosuvastatin calcium (CRESTOR). Patient did not receive other vaccine in four weeks prior to the COVID vaccine. On 20Jan2021 at 04:00 PM patient experienced severe headache with severe nausea requiring emergency room (E R) visit and intravenous (I. V) morphine, toradol and ondansetron. Computed tomography angiography (C T A) of head performed on unknown date was normal. Pain unbearable. Lumbar puncture (L P) not done. Pain persisted four days later, though diminished. Diagnosis (Dx) uncertain but possible migraine with right (r) eye preference or small subarachnoid hemorrhage postulated. Another troublesome possibility could be vaccine reaction (meningoencephalitis). Events resulted in Emergency room/department or urgent care. Treatments received included IV morphine, zophran (as reported), ketorolac tromethamine (TORADOL) and metoclopramide hydrochloride (REGLAN). Patient had no COVID prior vaccination. Patient was not tested for Covid post vaccination. Patient recovered with sequel from the reported events.; Sender's Comments: Based on temporal association, a possible contributory role of BNT162B2 cannot be excluded for events meningoencephalitis, headache, nausea, migraine and subarachnoid hemorrhage. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1006023	2/5/2021	WA	70	F	2/1/2021	2/1/2021	Tickle high up in nose- right eye swelled- and face got puffy and bright red- occurred about 20 minutes after vaccine. Took Benadryl and puffiness remained or about two hours.
1006042	2/5/2021	TX	43	M	1/19/2021	1/22/2021	I have eye inflammation; both eyes. The optometrist prescribed Lotemax 4 times a day for the inflammation. I have my second shot in a week and would like to know if it's safe to get it.
1006103	2/5/2021	TX	53	M	1/13/2021	1/30/2021	On Saturday, January 30, 2021 I began experiencing an altered sense of taste with a metallic taste all through my mouth and tingling in my mouth. I mostly felt ill throughout the day with low-grade fever, fatigue, body aches. This continued on Sunday, January 31, 2021 and Sunday evening, I noticed a small droop in the upper lip on the right side of my mouth. When I awakened, Monday, February 1, 2021, I had full right-side paralysis of the face, severe right eye, right jaw and right ear pain, severe fatigue, continued body aches. After going to the ER where tests were performed to rule out stroke and sepsis, I was diagnosed with Bell's Palsy.
1006175	2/5/2021	TX	25	F	1/5/2021	1/5/2021	As soon as I got the vaccine I was able to taste the vaccine,. Within 5 minutes I felt dizzy and within 15 minutes I couldn't feel my arm. I got a rash throughout my whole arm, and was warm to touch as well as a tingly sensation in my whole arm. It passed on to my right arm and started losing sensation and the tingly feeling started as well. Within 45 minutes I started breaking out throughout my whole body, within 1hr 15min. my legs felt weak and I couldn't walk. I felt dizzy, the whole room was spinning. They were going to send me to the hospital but I didn't want to go and I went home and injected myself with an EPI pen. and also took 2 Benadryl's. I started feeling my throat close but not all the way, I could feel I was having an allergic reaction. I just had a really bad headache and went to sleep from the Benadryl. I woke up with my eyes little swollen, and a rash on my left arm and chest area, my whole body was very itchy. This lasted for two days. The doctor at my work said if it got worse to go to ER and or urgent care. They didn't recommend me getting second dose.

1000602	2/4/2021	MI	95	M	1/20/2021		My arm is little sore; This is a spontaneous report from a contactable consumer reporting for himself. A 95-years-old male patient received BNT162B2 Pfizer-BioNTech COVID-19 Vaccine, via an unspecified route of administration on 20Jan2021 at single dose for COVID-19 immunization. The patient also received apixaban (ELIQUIS), 2 dose forms (DF) every day, via an unspecified route of administration from an unspecified date at an unknown dose as blood thinner. Medical history included a bone spur in the left foot that causes the patient to limp a bit, although he is still able to move around a little bit ("he is surprised that he is still plodding along"), cardiac pacemaker insertion, body weight sometimes increasing, a trouble with his vision, so he has a restricted driver's license: he can only drive during the day time. The patient is also a hearing aid user from an unknown date and has central nervous system stimulation from an unknown date ("I have Neuraxis"). His wife says that "he has them every day". Past drug history included warfarin sodium (COUMADIN) used for years as blood thinner. The patient's concomitant medications were not reported, although the patient stated he takes a lot of medications. The patient reported that the vaccine "worked beautifully", but only after the shot he could read on the information sheet that the he should have told the provider about all his medical conditions, if he has a bleeding disorder or is on a blood thinner. Now he's reluctant to take his pills because of this warning. He feels fine, he doesn't have any problems with the shot. He only stated that his arm was little sore but that's to be expected. The patient would like to know if he can continue to take his blood thinner. On an unknown date the patient underwent lab tests connected with some kind of surgery or his pacemaker whose results were unknown. The action taken with apixaban in response to the event was unknown. The event outcome was unknown at the time of the report. Information on the lot/batch number has been requested.

1001470	2/4/2021	CA	43	F	1/8/2021	1/8/2021	Allergic reaction; Itchiness on right side of head, forehead, and eye; Itchiness on right side of head, forehead, and eye; Cluster headaches; This is a spontaneous report from a contactable consumer (patient). This 43-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number EJ1686) via an unspecified route of administration in the left arm on 08Jan2021 at 11:00 at single dose for COVID-19 immunisation. The patient was not pregnant. Relevant medical history included migraines. Concomitant medications included magnesium, vitamin B12 and vitamins NOS (MULTIVITAMIN). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient previously took neomycin sulfate/polymyxin b sulfate (NEOSPORIN) and experienced allergy. On 08Jan2021 at 20:00, the patient experienced allergic reaction, itchiness on right side of head, forehead, and eye and cluster headaches. The events resulted in Doctor or other healthcare professional office/clinic visit. Corrective treatments taken as a result of the events included diphenhydramine hydrochloride (BENADRYL), famotidine (PEPCID) and sumatriptan. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, she has not been tested for COVID-19. The patient recovered with sequel from the events on an unspecified date.

1001449	2/4/2021	OR	68	F	1/14/2021	1/14/2021	Fuzzy; Unsteady; Weak/Not very energetic/Fatigued; Lightheaded/Dizzy; Chest tight; My eyed began swimming with a sensatoin of shutters being opened and closed in front of me/could not see very well; Eyes very photosensitive; Chills; Headache; This is a spontaneous report from a contactable consumer (patient). This 68-year-old female patient received the 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EL3247), via an unknown route, on 14Jan2021 (at 08:30) at single dose on the left arm for COVID-19 immunization. Relevant medical history included orthostatic intolerance, myalgic encephalomyelitis and chronic fatigue syndrome (ME/CFS). Relevant concomitant medications included hydrocortisone (CORTEF), levothyroxine sodium (SYNTHROID), fludrocortisone acetate (FLUDROCORTISON) and pyridostigmine. No other vaccine was received in four weeks. On 14Jan2021, after vaccination, she began to feel unsteady, weak, lightheaded, chest tight, and dizzy. Her eyed began swimming with a sensation of shutters being opened and closed in front of her. She could not see very well, eyes were very photosensitive. Layed down and slept, rested in a dark room most of the day. She had also chills and headache. But nightfall she felt mostly recovered, although not very energetic. About one week later, on 20Jan2021, it all happened again, all at once. She also rested for the day and slowly recovered. But this time it hasn't all gone away. She is still weak, fuzzy, unsteady, fatigued, she had headache, and 'my eyes are not right' (as reported). Pre-vaccination and post-vaccination COVID tests were not performed. No treatments were given for the events. The outcome of the events 'unsteady', 'weak/not very energetic/fatigued', 'Lightheaded/Dizzy', and 'chest tight' was not recovered while the outcome of the remaining events was unknown.

1001430	2/4/2021	NH	50	M	1/9/2021	1/10/2021	<p>Bell's Palsy/ Facial paralysis/ Droopiness on the rightside; Light sensitivity; Tearing; Felt like flu; Sore; A spontaneous report was received from a 50 year-old, male patient who received Moderna's COVID-19 vaccine and experienced sore, felt like had the flu, light sensitivity, tearing of his right eye, Bell's palsy (right eye won't blink on its own, lip and speech issues). The patient's medical history was not provided. Concomitant medications were not reported. On 09 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot number: 025J20A), intramuscularly in left arm, for prophylaxis of COVID-19 infection. On 10 Jan 2021, he was sore, felt like had the flu. On 13 Jan 2021, he experienced light sensitivity, and tearing of his right eye. On 19 Jan 2021, he went to the emergency room and found with facial paralysis, droopiness on the right side. He was diagnosed with Bell's palsy (right eye won't blink on its own, lip and speech issues). Treatment included Valtrex. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the event, sore, felt like had the flu was considered resolved on 11 Jan 2021. The outcome of the event, Bell's palsy (right eye won't blink on its own, lip and speech issues) was not recovered. The outcome of the events, light sensitivity, and tearing of right eye was unknown.; Reporter's Comments: This case concerns a 50-year-old male patient. The medical history is not provided. The patient experienced a medically significant and unexpected event of Facial paralysis and unexpected non-serious events of Influenza, Pain, Photophobia and Lacrimation increased. The events of Influenza and Pain occurred approximately one day after receiving their first of two planned doses of mRNA-1273 (Lot number: 025J20A). Photophobia and Lacrimation increased occurred approximately four days after the first dose of mRNA-1273 (Lot number: 025J20A). Event of Facial Paralysis was diagnosed approximately ten days after the first dose of mRNA-1273 (Lot number: 025J20A). Treatment included Valtrex. Based on the current available information and temporal association between the use of the product and the onset of the events, a causal relationship cannot be excluded and the events are considered possibly related to the vaccine.</p>

1001516	2/4/2021	CA	64	M	1/15/2021	1/15/2021	fever 101.3; bad headaches like migraines; back of neck was stiff and sore; back of neck was stiff and sore; body ached and felt funny; body ached and felt funny; had no appetite and had to force himself to eat; felt woozy; watery mouth; his body was tingling; Chills; This is a spontaneous report from a contactable consumer (the patient). A 64-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number EL1283), via an unspecified route of administration in the left arm on 15Jan2021 at 13:00 (at the age of 64-years-old) as a single dose for COVID-19 immunization. Medical history included he had gotten sick way before talk of COVID. In late Dec and Jan he was sick and didn't feel better until Feb (unspecified dates prior to vaccination). He went to numerous doctors. He didn't have the flu. They weren't sure what he had. They gave him ibuprofen (MOTRIN) to take. He also had a really bad sinus infection. In Mar2020, he had really bad problems with his eye. His right eye could only move halfway towards his nose. It would not move to the right the all. Then his left eye was twisted. His mouth tasted sour. He does not taste food. This was all prior to receiving the vaccine. Concomitant medication included gabapentin from an unspecified date 6 years ago and ongoing for nerves. He also concomitantly took medication for blood pressure, diabetes, and cholesterol. He declined to provide details. The patient received the first dose of the vaccine on 15Jan2021 around 13:00. He had reactions to the vaccine. He felt the injection site that was given in his left arm. That evening, 15Jan2021, he felt woozy, his mouth was watery, his body was tingling, and he had chills. The next day was concerning. On Saturday, 16Jan2021, he had a fever of 101.3, bad headaches like migraines, watery mouth, the back of his neck was stiff and sore, and his body ached and felt funny. He had no appetite and had to force himself to eat as nothing tasted good (16Jan2021). He was scheduled to take the second dose. He was unsure if it was 21 or 22 days after the first one. He asked if he should get the second dose. The clinical outcome of felt woozy, chills, fever 101.3 was recovered on 17Jan2021. The clinical outcome of watery mouth was recovered with sequelae on 16Jan2021. The clinical outcome of his body was tingling was recovered on 16Jan2021. The clinical outcome of bad headaches

							like migraines, back of neck was stiff and sore, body ached and felt funny, had no appetite and had to force himself to eat was recovered on 18Jan2021.
1001203	2/4/2021	KY	46	F	2/2/2021	2/2/2021	Dizziness, nausea, fatigue, blurred vision, feeling of forgetfulness. I almost feel like I drank a glass of wine. Just worn out. the first day I had diarrhea.
1001463	2/4/2021	LA	25	F	1/22/2021	1/22/2021	Roughly 90 minutes after my vaccination my left eye got itchy and swollen; Roughly 90 minutes after my vaccination my left eye got itchy and swollen. Both the eye itself and the area around the eye swelled; the eye was still a bit puffy and swollen; This is a spontaneous report from a contactable healthcare professional (patient herself). A 25-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EL8983; expiry date: unknown) via an unspecified route of administration in the left arm, on 22Jan2021 at 17:00, at a single dose, for COVID-19 immunization. The patient has no relevant medical history. Concomitant medications included vitamin B complex (VITAMIN B), colecalciferol (VITAMIN D), and loratadine (CLARITIN) and unspecified birth control (BC) pills. The patient previously received codeine and experienced allergy. The patient is not pregnant at the time of vaccination. The patient was not diagnosed with COVID prior vaccination. The patient did not receive other vaccines within four weeks prior to COVID vaccination. The vaccine was administered in the hospital. On 22Jan2021, roughly 90 minutes after vaccination (at 18:30) the patient's left eye got itchy and swollen. Both eyes and the area around the eye swelled. It went down upon icing and taking two over the counter Benadryl. However, the next morning, the eye was still a bit puffy and swollen. The events were considered non-serious. Outcome of the events was recovering. The patient has not been tested for COVID-19 since vaccination.
1001142	2/4/2021	MI	58	M	2/3/2021	2/4/2021	Blurred vision in right eye, spots as if I had looked into a bright light, double vision in a small spot of my eye, then headache began to occur above right eye and progressed to the base of my neck on the back right side of the skull. After about 45 minutes the blurred vision began to subside but the headache remains.

1001125	2/4/2021	MD	48	M	12/30/2020	1/2/2021	Starting the next day, I had an increased sensitivity to motion sickness. This is unusual as I am a paramedic and work in an ambulance for a living. I also suffered 2 nights of insomnia. On the evening of the third day, I developed joint aches, fatigue, and a series of normal bowel movements (five in 2 hours). The next morning I added a lost of balance and a slight right side facial droop around my eye (no numbness). Later that day I developed nausea and vomiting, a single period of cold chills followed by a period of a hot flash. However, I never developed a fever. By day five, all of my symptoms resolved with the balance issue being the last. Also of note, early on, my blood sugar was elevated, blood pressure was elevated, and pulse elevated.
1001092	2/4/2021	IL	33	F	2/2/2021	2/3/2021	In the middle of the night, Wednesday morning, my eyelids were swollen. Left eyelid more than right eyelid. Then waking up at 11:30am Wednesday, the swelling was still there, right eyelid more than left eyelid. I took a tablet of Cetrizin antihistamine at around 12:30pm. Around 4pm, the swelling was still there, now left eyelid more than right eyelid. I took Benedryl at around 11pm, but upon awakening in the morning (Thursday), the swelling is still present, still left eyelid more than right eyelid. No pain, but there is tenderness of the left eyelid. I had mild fever, chills, muscle pain, fatigue, headache in the middle of the night after receiving the second dose of the vaccine on Tuesday. This has subsided. Mild headache still remains.

1002161	2/4/2021	SC	22	F	2/2/2021	2/3/2021	Severe injection site pain (aching) approximately 3 hours after injection on 2/2. Took 400 mg ibuprofen at 2200 to take the edge off of the pain in order to fall asleep. Beginning at 0600 on 2/3: Temp of 100 F, chills, body aches, headache. Took 400 mg ibuprofen at 1000 which lowered temp and reduced other symptoms for approximately two hours. Symptoms returned at 1200 with temp reaching 100.2 F along with chills, headache, and body aches that were more intense in the shoulder/neck area. Used a heating pad along my back, shoulders, and neck which helped with the body aches. Slept from 1500 to 1800 and woke up with an intense frontal headache with pain shooting through my eyes as well. Temp was 100.7 F. Took 400 mg ibuprofen which made the symptoms more bearable. Tried to stay hydrated by drinking water throughout the day. Also had two servings of soup. Symptoms seemed to lessen by 2200. The only symptoms lingering today, 2/4, are a slight headache, fatigue, and mental fog. Otherwise, condition has improved tremendously.
1002119	2/4/2021	MN	54	F	2/2/2021	2/3/2021	Patient described a bloodshot eye, or apparent broken blood vessel in her left eye, on the same side as the arm where she received her vaccine the day before. She did not have pain or other symptoms. She exchanged an email with her doctor who doubted it was related to the vaccine and advised her to keep an eye on it. No clinic visits or other medical care. Patient does not take a bloodthinner or have a bleeding disorder.

1001918	2/4/2021	OR	26	F	1/13/2021	1/14/2021	Went to ED on 1/14/21. emailed caregiver for information. As far as what happened, I received my 2nd dose of Pfizer on Jan. 13th @ 05:15 at hospital and started feeling symptoms roughly six hours later, symptoms being nausea, chills, splitting headaches, muscle fatigue, feeling tired and joint pain. I had understood that these side effects were common and not to worry, however, the next day on Jan. 14th around 11:00am, I blacked out at home. Luckily, my partner had caught me before I fell to the ground, but he stated that my eyes had glazed over, my breathing was shallow, and I hardly had a pulse. He was getting ready to do chest compressions, but I had come out of whatever fog that had knocked me down and became responsive. Around 12:00 pm I had arrived at the ED where they had given me a bag on NS, Zofran for the nausea and Toradol for some inflammation management. I believe I discharged from the ED around 15:20.
1001912	2/4/2021	PR	34	F	2/20/2020	1/20/2021	After the fever of 40C, chills, tiredness, nausea, headache. Started to feel pain on the left side of my face. Next day the pain has spread to my neck and ear. On day number three they felt numb, day number four lots of pain on my jaw. Day number 5 I couldn't even swallow and had difficulty breathing. When I looked in the mirror the left side of my face was very swollen like a ball and my face looked like it was paralyzed. I went to the ER where I was seen, but it remains the same days afterwards. My cheek doesn't look the same, looks bigger and the eye is droopy, my neck and ear hurts, it is difficult to swallow. My left arm is numb and swollen.

1000011	2/4/2021	MI	25	F	1/13/2021	1/13/2021	Hives on back, arm, knee, toe and hands; Itching on different parts of body; This is a spontaneous report from a contactable consumer, the patient. A 25-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EL3248), via intramuscular route of administration on 13Jan2021 at 13:35 (at the age of 25-years-old) as a single dose in the right arm for COVID-19 vaccination. Medical history included asthma that is fairly mild (the patient has rescue inhaler that she does not use very often, she uses it once every few months as needed. Diagnosed in early childhood when she was 4-5 years old). The patient had no relevant family medical history. Concomitant medications included an unspecified medication, the patient reported she has been taking it for years, but did not provide further information. Historical vaccine included flu shot in Nov2020, which was greater than 4 weeks prior to receiving the COVID-19 vaccination. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 13Jan2021 at 15:00-16:00, the patient experienced itching on different parts of body. On 14Jan2021 at 10:00, the patient experienced hives on back, arm, knee, toe and hands. The reported clinical course was as follows: Initially, on the first day, she had itching not at injection site. It was on different parts of her body. The following day, she developed hives on her back, arm, knee, toe and hands. The patient reported it is not very severe, she did not have any fever, swelling, or shortness of breath. The patient reported some of the areas have gone down and some have inflamed more. The patient did not undergo any relevant test and reported just visual examination. The patient went to urgent care (physician office) and they said it was potentially caused by the COVID-19 vaccination. The patient was prescribed steroids by the urgent care as treatment for the events. The patient received one steroid injection of Methyl Prednisone into her buttocks and then was prescribed prednisone 10 mg tablets. The clinical outcomes of the itching on different parts of body and hives on back, arm, knee, toe and hands were not recovered. The patient was inquiring if she should get the second dose.

1000215	2/4/2021	SD	45	F	12/30/2020	12/31/2020	<p>impairing her from driving/ bothering her while driving; panic; nauseous; increasingly more and more dizziness with visual disturbances; increasingly more and more dizziness with visual disturbances/She feels things are moving that aren't; This is a spontaneous report from a contactable physician, the patient. A 45-year-old female physician received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot: EK9231, Expiry: Apr 2021), intramuscularly in the left deltoid on 30Dec2020 at 16:30 (at the age of 45-years-old) as a single dose for COVID-19 immunization. Medical history included heartburn. Concomitant medications included (dexlansoprazole) DEXILANT for heartburn from an unspecified date (reported as a year and a half). The patient did not receive any other vaccinations within 4 weeks prior to the vaccine. On 31Dec2020, the patient experienced dizziness with visual disturbances. She was having increasingly more and more dizziness with visual disturbances where today (20Jan2021) she felt nauseous from that. It was impairing her from driving because she felt things were moving that weren't and made her panic on the interstate, as of an unspecified date. It. Initially it was bothering her while driving, but now she noticed it while sitting at her desk or when she ate. It was all the time now. The reporter assessed the events "increasingly more and more dizziness with visual disturbances/she feels things are moving that aren't" as being between disabling and medically significant. The patient did not visit the emergency room or a physician's office, although stated it probably did require it. The patient queried whether to receive the second dose today as her symptoms were worsening. The clinical outcome of "increasingly more and more dizziness with visual disturbances/she feels things are moving that aren't" was not resolved, and of nauseous, "impairing her from driving/ bothering her while driving" and panic were unknown.; Sender's Comments: Based on a compatible temporal relationship causality between events dizziness with visual disturbances and BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as</p>

A 74-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL8982), via an unspecified route of administration on left upper arm on 16Jan2021 14:00 at a SINGLE DOSE for covid-19 immunisation. Medical history included anticoagulant therapy from an unknown date and unknown if ongoing. Concomitant medication included rivaroxaban (XARELTO). The patient had the first dose of the vaccine on 16Jan2021. He has had a headache that has come and gone and after taking over the counter medication they seem to have eased up a little. Saturday night was pretty bad and Sunday night he took Excedrin before he went to sleep and when he woke up he took another half and that seemed to keep it at bay. He took two halves today and it seems to be holding the headache back. He stated it feels more like an allergy headache, the left side of his temple by his left eye is where it radiates from. He asked if other people got headaches and how long do the headaches typically last and will they eventually go away. He reported his headaches were getting lighter, but the headaches get worse at night. The patient also stated when they give the shot they don't discuss the side effects. He said they give you a sheet that lists the side effects but he stated that 25% of people having headaches is pretty significant and this should be highlighted on the sheet. He said he took 1/2 of an Equate Headache Relief caplet, and then took another 1/2 of the Equate Headache Relief caplet later. He said he tried regular Tylenol (clarified as Equate brand Acetaminophen 500mg), and the Equate Acetaminophen 500mg didn't do anything for his headache. He stated he didn't have the Equate Acetaminophen 500mg box, any longer. Therapeutic measures were taken as a result of headache (headache). The outcome of the event headache was recovering while the event headaches get worse at night was unknown.</p>

999902	2/4/2021	CA		F	12/26/2020	12/26/2020	Heart murmur; Increase in her blood pressure 190/105; Tightness in chest when breathing; Blurry vision; A spontaneous report was received concerning a female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced an increase in blood pressure 190/105, blurry vision, tightness in the chest when breathing and a heart murmur. The patient's medical history was not provided. No relevant concomitant medications were reported. On 26 Dec 2020, approximately 30 minutes prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 037K20A) intramuscularly for prophylaxis of COVID-19 infection. On 26 Dec 2020, the patient received the Moderna vaccine and after 30 minutes, she experienced an increase in her blood pressure (190/105), blurry vision and tightness in the chest when breathing. She remained at the site for an hour for observation and then was brought to the urgent care. An electrocardiogram (EKG) was performed and treatment included oral lisinopril. She was sent home, and she also stated that she had a heart murmur. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the events, increase in blood pressure 190/105, blurry vision, tightness in the chest when breathing, and a heart murmur, were not reported.; Reporter's Comments: This case concerns a female patient, who experienced a serious unexpected event of blood pressure increased, and non-serious unexpected event of chest discomfort, vision blurred, and cardiac murmur. The events occurred 1 day (15 min) after first dose of mRNA-1273, lot # 037K20A. Treatment included lisinopril. Based on the current available information and temporal association between the use of the product and onset of the events a causal relationship cannot be excluded.

The events were considered non serious. Information on the lot/batch number has been requested.
1000907	2/4/2021	NY	32	F	1/15/2021	1/23/2021	I developed hives on 1/23/21 and currently still have them. Itchy skin over my entire body from the bottom of my feet, to my toes, palms, eyelids, etc. Skin turns red and raised. Initially I took 2 pills of Benadryl every couple of hours, but the symptoms only lessened slightly and were still there. I went to Urgent Care, on 1/28/21 and was prescribed 50mg prednisone daily, which I took for 5 days (as prescribed). Symptoms continued and did not lessen. I went to Allergist 2/3/21, who prescribed an antihistamine and reported to follow up in a couple of days if symptoms are still present.

1000176	2/4/2021	IN	81	F	1/14/2021	1/14/2021	<p>Starred to get blurred vision like a migraine; Fever/temperature was 99.8 then later that day it was 103; Sweat some during sleep, which was pretty normal; No sleep; This is a spontaneous report from a contactable Consumer (patient). An 81-years-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EL1284; Expiry Date: 30Apr2021) on 14Jan2021 at SINGLE DOSE in the right arm for covid-19 immunisation, so she did not get the virus. Medical history included Inflammatory bowel disease. There were no concomitant medications. she was allergic to Sulfa. She had no sleep the first night on 14Jan2021. The next day on 15Jan2021 she had a fever. Her temperature was 99.8 then later that day it was 103. She took an Aspirin. Friday night on 15Jan2021, she slept alright but sweat some, which was pretty normal. Saturday morning on 16Jan2021, her temperature was fine but she starred to get blurred vision like a migraine. She took another Aspirin and it went away. Later that day her temperature was normal at 97.2. She was a pretty active person. After she had the shot around 8 AM-10 AM in the morning, at 12 or 1230 she went out and took down her Christmas lights and she thought she felt good so she was going to trim her plants and she wondered if that had anything to do with her adverse events. Her arm did not hurt or anything. She is wondering if her activity had anything to do with disrupting the medicine? She was using that arm a lot, she probably should not have done it. She will not do it again. The outcome of Starred to get blurred vision like a migraine was recovered on 16Jan2021, of other events were recovered on 15Jan2021.</p>

1000602	2/4/2021	MI	95	M	1/20/2021		<p>My arm is little sore; This is a spontaneous report from a contactable consumer reporting for himself. A 95-years-old male patient received BNT162B2 Pfizer-BioNTech COVID-19 Vaccine, via an unspecified route of administration on 20Jan2021 at single dose for COVID-19 immunization. The patient also received apixaban (ELIQUIS), 2 dose forms (DF) every day, via an unspecified route of administration from an unspecified date at an unknown dose as blood thinner. Medical history included a bone spur in the left foot that causes the patient to limp a bit, although he is still able to move around a little bit ("he is surprised that he is still plodding along"), cardiac pacemaker insertion, body weight sometimes increasing, a trouble with his vision, so he has a restricted driver's license: he can only drive during the day time. The patient is also a hearing aid user from an unknown date and has central nervous system stimulation from an unknown date ("I have Neuraxis"). His wife says that "he has them every day". Past drug history included warfarin sodium (COUMADIN) used for years as blood thinner. The patient's concomitant medications were not reported, although the patient stated he takes a lot of medications. The patient reported that the vaccine "worked beautifully", but only after the shot he could read on the information sheet that the he should have told the provider about all his medical conditions, if he has a bleeding disorder or is on a blood thinner. Now he's reluctant to take his pills because of this warning. He feels fine, he doesn't have any problems with the shot. He only stated that his arm was little sore but that's to be expected. The patient would like to know if he can continue to take his blood thinner. On an unknown date the patient underwent lab tests connected with some kind of surgery or his pacemaker whose results were unknown. The action taken with apixaban in response to the event was unknown. The event outcome was unknown at the time of the report. Information on the lot/batch number has been requested.</p>

1000526	2/4/2021	NC	48	F	1/15/2021	1/15/2021	Right eyelid feels heavy; She slept all day Sunday; Extreme fatigue; Flushed feeling; lightheaded/dizzy; lightheaded/dizzy like she was going to pass out; Had a heavy feeling in her throat and chest/Had a heavy feeling on her face- had removed her mask but it still felt like she still had it on; Had a heavy feeling in her chest; Tingling sensation on her lips; Tingling sensation on the right side of her face, and cheek; Severe burning in her right ear; Sore throat on the right side; When she was speaking it sounded like she had a thick tongue; Tongue feels swollen; Pain at the base of her skull on the right side; Pain on the right side of her forehead; Pinpoint pain that went down the right side of her spine; Metallic taste in her mouth; felt off; Pain at the injection site; It was so bad that it would wake her up if she rolled over; This is a spontaneous report from a contactable Nurse reporting for herself. A 48-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Batch/lot number: EL3248), via an unspecified route of administration on 15Jan2021 at single dose (Once by injection in the right arm) for COVID-19 immunisation. The patient medical history was not reported. Historical vaccine included Hepatitis B vaccine. There were no concomitant medications. On 15Jan2021, after 15 minutes of monitoring she was fine. 5 minutes later or so (after 20 minutes), she had a flushed feeling and was lightheaded/dizzy like she was going to pass out. She returned to her office. She had someone check her blood pressure which was fine. It was 110/60. Normally it runs low in the 90s. Again, she thought she looked flushed. It was reported she had a heavy feeling in her throat and chest and on her face. She had removed her mask but it still felt like she still had it on. She had brought Benadryl with her, as she has had a reaction to the Hepatitis B vaccine before. She took the Benadryl since she felt off. She thinks this first part of what she experienced triggered everything else. By the time she got home, she had a tingling sensation on the right side of her face, on her lips and cheek. She had severe burning in her right ear. She also had a sore throat on the right side. Heaviness in her throat and chest- resolved late Saturday to early Sunday (Jan2021). Her husband noticed on Friday evening (15Jan2021) when she was speaking it sounded like she had a thick tongue. Saturday morning it was more normal. Her

tongue does feels swollen. She also developed pain at the base of her skull on the right side. This started about 2 hours after the vaccine. She had pain on the right side of her forehead. She had pinpoint pain that went down the right side of her spine. She also developed a metallic taste in her mouth. She had pain at the injection site. It was so bad that it would wake her up if she rolled over. On 17Jan2021, she slept all day Sunday and also had extreme fatigue. On 18Jan2021, her right eyelid feels heavy on 18Jan2021. She does not think any of these are serious, but stated they are concerning. Vaccination card does not have the NDC or expiration date on it. Patient asked is getting the second dose of the injection recommend. She is leaning towards no but wanted to see what was recommended. She has reached out to her primary care about this. Outcome of the events flushed feeling, lightheaded/dizzy, lightheaded dizzy, like she was going to pass out was recovered on 15Jan2021. Outcome of the events when she was speaking it sounded like she had a thick tongue was recovered on 16Jan2021; Outcome of the events pain at the base of her skull on the right side, pain on the right side of her forehead, pinpoint pain that went down the right side of her spine, extreme fatigue, pain at the injection site was recovered on 17Jan2021; Outcome of the events Had a heavy feeling in her throat and chest/Had a heavy feeling on her face- had removed her mask but it still felt like she still had it on, and Had a heavy feeling in her chest was recovered on Jan2021. Outcome of the events severe burning in her right ear, sore throat on the ride side, tingling sensation on her lips, tingling sensation on the right side of her face and cheek was recovering. Outcome of the events tongue feels swollen, metallic taste in her mouth, right eyelid feels heavy was not recovered. Outcome of the events it was so bad that it would wake her up if she rolled over, she slept all day Sunday, and felt off was unknown. The reporter considered the events as non-serious. Causality assessment for events for felt off, she slept all day Sunday, It was so bad that it would wake her up if she rolled over was not reported. Causality assessment for all other events was reported as related.

1000524	2/4/2021	FL	72	F	1/18/2021	1/19/2021	tends to have low blood pressure; Dizziness; she lies down and then gets up she is dizzy; tired; she might have almost fainted as the room was spinning; This is a spontaneous report from a contactable consumer, the patient. A 72-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EL1284, expiration date 0Apr2021), via an unspecified route of administration in the left arm on 18Jan2021 at 09:30 (at the age of 72-years-old) as a single dose for COVID-19 vaccination. Medical history included Reflux esophagitis, COPD and a root canal on 14Jan2021. Historical vaccinations included the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 28Dec2020. Past drug history includes sore arm after COVID-19 vaccination on 28Dec2020. It was unknown if the patient has any allergies to medications, food, or other products. The patient's concomitant medications included oral famotidine (FAMOTIDINE) 20mg twice daily for reflux, (tiotropium bromide) SPIRIVA 2.5mcg, two puffs once daily by mouth for COPD, latanaprost (LATANAPROST)125mcg; one drop each eye at night for Glaucoma, (TIMOLOL) 5% one drop twice daily to each eye and (LORATADINE) 10mg; take once daily by mouth as needed for allergy. The patient did not receive any other vaccine within four (4) weeks prior to the vaccine. The vaccine was administered to the patient at the hospital. On 19Jan2021 the patient experienced dizziness and feeling tired. The patient further described that she had the vaccine on Monday and since yesterday, when she woke up, she has a lot of dizziness; and again this morning when she woke up. Also, when she lies down and then gets up she is dizzy. Mentions she didn't see dizziness on the list of side effects. She knows that is a side effect of COVID. She is asking is dizziness is a side effect of the vaccine wants to know if she should call her doctor. She continued and mentioned that she noticed when she was waking up on 19Jan2021 she was so dizzy that she couldn't get out of bed. Adds she thinks she might have almost fainted as the room was spinning. Mentions she tends to have low blood pressure but this is not typical. As far as side effects from the vaccine she mentions she is tired. The tiredness started after the second dose and has continued through today but not as bad. The clinical outcome of dizziness

1003188	2/4/2021	MA	25	F	1/29/2021	1/30/2021	Urticarial rash over whole body including face, moderate swelling of lips eyes beginning 8pm 1/30/21. Rash most concentrated over trunk and thighs, center of face around nose. Worsened overnight (1/30/21-1/31/21) despite use of benadryl 2 tablets (50mg) night prior and every 4-6 hours following. care provider seen 1/31/21 9AM, prescribed prednisone (first dose 11AM) and advised continuing benadryl 2 tablets 4-6 hours. Prednisone 10mg TID x 3 days, 10mg bid x 3 days, 10mg qd x 3 days. Continued Benadryl every 4 hours. Rash on body and face peaked 1/31/21 3pm, mild improvement overnight to 2/1/21. 2/1//21: Rash increased in intensity on distal LEs (feet/ankles) and UEs (wrists). Appearance of petichiae on trunk, lateral thighs. 2/2/21: Rash improving, fatigue. 2/3/21: rash nearly resolved, petichiae remain 2/4/21: Rash resolved petichiae improving.
1003184	2/4/2021	VA	35	F	1/29/2021	1/29/2021	After receiving the shot at approximately 1600 (and waiting the 15 minutes at the clinic site), I returned to my desk for work. Around 1740, I noticed a slight headache, which are abnormal for me, so I thought I might have been slightly dehydrated and increased my water intake, as well as ingested 8 ounces of gatorade. The headache gradually got worse and by the time I left work at 2000 (8PM), it was so bad on the (primarily) right front part of my head (around my temple and behind my right eye), noise, light, and even my own walking hurt terribly. I have never had a migraine in my life and rarely even get headaches, but the pain of this headache far surpassed any I have experienced before and based on what others tell me, might have been a migraine. By the time I got home around 2100 (9PM), I took two extra strength Tylenol tablets and went to bed. When I awoke in the morning around 0900 (9AM), I had a slight headache that dissipated after I took two more Tylenol tablets and did not return.

1003176	2/4/2021	CO	37	F	12/30/2020	12/31/2020	I got the vaccine on 30th of Dec. Had a sore arm, runny nose, woke up the next day to puffy eyes and bruises under my eyes (still hasn't gone away) Since then I have had GI issues. Constipation. It aggravated my face. I had nausea. I had a rash on my arm and on my chest the following Tuesday. My face were tingling and very flush. I had a lot of allergy and sinus issues. Sinus pressure. This all unfolded the first few weeks after receiving the vaccine. I do have fibromyalgia. I had allergy testing done. I am allergic to bee stings. Was having a lot of vaginal issues. Watery eyes and have hot flashes followed by chills. Hives on chest. Difficulty swallowing. Rapid heart rate. I have seen three doctors that have told me my hear rate was fast. Glands have been swollen for two weeks. The night after I got the shot it was really rough with body aches.

Remained in an upright position. c/o suborbital ocular twitch x 20 seconds which was observed by this writer. Visual onset of mild swelling L upper cheekbone. Treated with cold pack to area, Benadryl 25mg IM PRN to RD, decrease in environmental stimuli, reassurance, and direct observation x 15 mins. Interventions effective; no further swelling, no s/sx anaphylaxis, anxiety & other symptoms relieved. Client observed with steady gait "I'm better~~
1002282	2/4/2021	FL	75	F	1/21/2021	1/21/2021	Came home after vaccine, and felt bump in her arm where the injection was. Didn't think too much of it. The next morning her cousin came over and compared notes, and verified she had the bump. She kept rubbing it and massaging it to break it down, and got a little sore, but nothing severe. No sickness, a little pain over her eye. Then on Friday 1/29/21, noticed a small spot on her arm, by Saturday got bigger, and today it has started moving to the bottom side of her upper arm. Is applying ice and it's getting better. Has been exercising it and stretching it as literature she found to do that.
1003702	2/4/2021	AZ	35	F	2/2/2021	2/2/2021	painful arm extrem pain that i could not move. Develoood rash all over body like hives and small bumps that same night of vaccine got worse net day and third day seems like its the same. Dr gave me steroid shot to see if rash would calm down did not help. Vert fatigue started day 2 of vaccine and diarrhea. Day 3 fatigue worsen seems like my airway is forsing to breath. mg face is numb under my eyes like between eyes n cheek bone and nose seems numb. I feel weak and even dizzy today on day 3. Not feeling myself

1003679	2/4/2021	CA	33	F	2/3/2021	2/4/2021	During a routine follow up call to staff, reported swelling on both her eyes and lips as well as severe pain on her jawline and headache. Staff advised to seek medical help. Unknown if staff went to urgent care/er. As of 7pm, staff txted she is recovering but did not confirm/deny if medical assistance was sought.
1003669	2/4/2021	MD	58	F	1/26/2021	1/26/2021	After my shot, I stayed at the facility for 15 minutes. When I started my drive home, I noticed a medicinal taste coming from the back right side of my mouth. Approximately 10 minutes later I had a numbing/tight feeling in my right jaw. This quickly traveled to the right half of my mouth, the right side of my nose, my right cheek, my right eye (even behind the eye/a lot of pressure), above my right eyebrow, and to my right ear. I called the health department. They said they could not give me medical advice and I should call my doctor or go to the ER. I called my doctor. In the meantime, the numbing/tightening somewhat subsided. However, it was still quite there and noticeable. By the time I went to sleep that night, the numbing/tingling had just about all gone away. The next day I still noticed it in the corner of my right, my mouth and right cheek. By that evening it was entirely gone. My doctor's nurse called the next day. She said my doctor still suggested that I get the second shot. However, I'm very nervous to do so. I wrote on a previous page that the time of my shot was 2:20. That was my appointment time. The time of my shot was 2:37 pm.
1003645	2/4/2021	AR	48	F	1/23/2021	1/31/2021	A few bumps or rash appeared on fingers and elbows on day 8 after vaccine. By day 11 it had continually spread. It had spread to inside and outside of both hands,painful on thumbs. On my elbow there was a half dollar sized round circle with lots of hard little bumps. It is also on both my knee caps and top and bottom of both feet. On day 11 I went to Dr and two doctors couldn't diagnose rash. But they did give me a cortisone shot.Today is day 12. Inflammation and pain in fingers and elbow has lessened but the deep itching still lingers. I've only had it on my extremities except for 3 bumps under 1 eye. They are small bumps interior of skin and no blisters. Bottom of feet hurt and make it sore to walk on.

1003327	2/4/2021	VA	25	F	1/31/2021	1/31/2021	Approximately five minutes after receiving the shot, I began to feel a burst of pain rush through my entire left arm. A few seconds afterwards, I started to feel nauseated. Immediately, I felt weak, light-headed, and tired. I began to sweat profusely, as well. I could barely move my arm to flag down one of attendants who was monitoring us. She asked me what was wrong, and I tried to describe what was going on, but I could barely talk or keep my eyes open. She radioed for help and the paramedics came over to me. They wanted to move me to a private room and asked if I could walk. I tried to walk there, but I started to fall so one of the paramedics hoisted me up to help me. They asked me some questions while they were waiting for a stretcher, all of which I could hear and understand, but I was unable to response to. The stretcher came and I laid down, but I was already starting to feel better by then. I was very out of it, but I think this entire process took maybe 10-15 minutes. I laid there for maybe another 15 minutes, and I began to be able to talk again and open my eyes. I tried sitting up and that went alright. I answered some questions for them while they took my blood pressure, monitored my pulse, and took my temperature. After another 15 minutes or so, I felt well enough to walk back to my office in the Health Department. I didn't have any other problems for the rest of the day.
1003511	2/4/2021	OR	55	F	2/2/2021	2/3/2021	Woke day after vaccination with slightly red right eye. Woke 2nd day with very red right eye. Little watery but no pain.
1003334	2/4/2021	CA	31	F	1/29/2021	1/30/2021	Swelling and mild pain/discomfort under both eyes in exact location where I had filler injections 16 months ago. Swelling peaked Saturday evening (1/30), then improved through 1/31 and completely gone by 2/1. Spoke with doctor on Saturday 1/30, who advised cold compress on the area. Did cold compress that evening.

1003479	2/4/2021	UT	60	F	2/4/2021	2/4/2021	About 3 PM she received her second vaccination for Covid. She states that she has a history of adverse reactions to flu vaccines that are anaphylactic like in the past. She usually premedicates with Benadryl and steroids. Today she did take 100 mg of Benadryl prior to her vaccination. Shortly after receiving the vaccine, she did feel like her throat was getting a little bit tight but she did not feel like it was true anaphylaxis. However she then felt very off. After this vaccine her throat started to feel tight, and she stated she did not feel well overall. She did have some tunnel vision and was shaky. At about 1730 her heart rate drops to the 30s, she started feeling itchy, and then she went into a coughing fit and started to feel her throat close. She received 0.3 mg IM epinephrine, 20 mg IV famotidine, 125 mg IV methylprednisone, 0.5 mL of nebulized racpinephrine, and 500 mL NS bolus. She has since recovered and is stable on room air.

1002579	2/4/2021	CA	47	F	2/2/2021	2/2/2021	Immediately upon having the injection administered, my heart rate sped up. I sat down within the waiting area for monitoring thinking that if I sat down for a bit, that it would maybe pass . Within about 7 minutes of that, I began to feel the back, left side of my throat go numb. I began to get very dizzy after that and I alerted one the pharmacy Nurses, that was on duty. She asked for me to open My mouth so that she could see if my throat was swelling & said that she didn't see anything and I was told by her that it may just be anxiety that I was experiencing and she asked me to take a few sips of water and to try and relax a bit. She resumed helping others, while I continued to sit there. It was then when I experienced a heavy onset of chest tightness and the inability to breathe. The left side of my face and jaw went numb & that's when I really knew something was wrong. I was taken outside for some fresh air and realize that I was so nauseous, more dizzy, very weak upon standing and I told the same nurse and another young lady that was assisting me that I felt like I was going to pass out and to please call EMS for me . At that time, I lost temporary feeling in all 4 limbs and I began to experience heart palpitations . I was having some trouble swallowing and I was laid down and. My blood pressure was taken. Blood Pressure was 235/130 and it was taken several times until emts arrived. It was then 200/120 and 180/112 by the time help arrived. Overall I experienced burning sensation in chest and abdomen, facial weakness and numbness left side fever loose stools weakness, shortness of brEath and chest tightness blurred vision felt like I?m out of touch with reality Malaise restless and the loss in feeling in my Limbs are slowly returning body And muscle and joint aches and pains and wheezing bouts

1002554	2/4/2021	PA	62	F	2/2/2021	2/2/2021	Had the second Moderna injected placed on 2/2/2021 in the late morning, and within 2 hours started feeling sore and achy. By 5:00, my eyes were itchy and burning like they were on fire, then my throat, nose, ears, and then my hands swelled up and itched and felt like they were on fire. I also had chills. I took Tylenol and Benadryl and also felt the need to increased my Flovent HFA 220 mcg from once a day to twice a day on Tuesday and Wednesday. I continued to take Tylenol and Benadryl when and as the symptoms reappeared. I only needed Benadryl Wednesday night and woke up this morning with a bit of a headache. Took Tylenol and went to work today. I feel tired and my hands still hurt this afternoon(Thursday 2/4/2021) .
1002493	2/4/2021	ME	38	F	2/4/2021	2/4/2021	I was standing in my home and had a sudden onset of heart palpitations, dizziness, hot flash, and vision began to go black. I quickly got down on the floor. I started to feel better after a few seconds, but I stayed sitting on the floor for 30 minutes.
1002467	2/4/2021		39	F	1/28/2021	1/30/2021	Two days after receiving the vaccine patient experienced flu-like symptoms, body aches, nausea, and swollen lymph nodes in the armpit. The next day she had eye and jaw pain, and burning up and down her arm which she believes is the start of shingles
1002401	2/4/2021	MO	30	F	2/1/2021	2/1/2021	Pfizer-BioNTech. I suffered from chills, headache, joint and muscle aches, and nausea. The symptoms were severe from 7:30 pm on Monday, the day of the dose (vaccine received at 9:30AM), until 5:30 PM Tuesday (approximately 22 hours). The symptoms were relieved by taking extra strength tylenol every 4 hours. The symptoms were lessened, but still present until 9:30 AM on Wednesday. I was still suffering from a minor headache all day Thursday. I also had soreness in the injection site, there was no swelling or redness that I noticed; the soreness was mostly gone by Thursday. I have had a left eyelid twitch in the past (randomly), it returned after the vaccine and was very bothersome. Today is Thursday and the eyelid twitch is still bothering me.

1002900	2/4/2021	AZ	61	F	2/1/2021	2/2/2021	Extremely sore left arm for days 1-3, On third day awoke with debilitating dizziness, nausea and headache. Dizziness was so extreme any movement sent my head spinning and I began sweating and experienced nausea. Had to go to the hospital for treatment. Dizziness continued on the fourth morning but subsides after taking 25mg of Meclizine HCL. headache continues as well. Other side effects: Complete loss of appetite Blurred vision in right eye
1003041	2/4/2021	AZ	66	F	2/3/2021	2/3/2021	About 15 hours after receiving the vaccine, I started with muscle aches. Then I got uncontrollable chills followed by a high fever. Woke up about three in the morning with a headache over my right eye that was unbearable. Took some Tylenol and woke up this morning and just have a slight headache
1002995	2/4/2021	KY	54	F	1/5/2021	1/8/2021	3 DAYS POST INJECTION DEVELOPED MODERATE TO SEVERE CASE OF SHINGLES. (SCALP TO FOREHEAD AND AROUND RIGHT EYE). NEW LESIONS STILL APPEARING ON THIS DATE OF REPORT (2/4/21). PRESCRIBED VALACYCLOVIR 1000 MG PO TID X 14 DAYS.
1002406	2/4/2021	FL	65	F	1/27/2021	1/31/2021	Developed Shingles on my forehead, scalp and eye
1002685	2/4/2021	MI	71	F	1/29/2021	1/29/2021	Eye twitch with visual shaking Migraine headache
1002967	2/4/2021	CA	43	F	2/2/2021	2/3/2021	Moderna COVID-19 Vaccine EUA: Around 4pm, began having normal side effects of fatigue, headache. That night at 12:30am, woke up with temp (99.9) and had chills. Was shaking so badly from them, i was having uncontrollable hand tremors and couldn't use my finger to type on my phone. Was awake for the rest of the night. In the morning had a 101 , also had loss of appetite, extreme fatigue, nausea, headache, weakness. But the adverse event I'm reporting is blurred vision. I think it began around 12pm on Wed, so almost 24 hours the shot. It was primarily my left eye. There was also a great deal of pressure from behind the eye. It was difficult to read. After about 2-3 hours it passed. It returned briefly again in the evening, although more mild. Today (2/4/21) when I woke up, my vision is fine and the pressure behind the eye is gone.

1002926	2/4/2021	WA	27	F	2/3/2021	2/4/2021	I woke up at 1:30am with nausea, chills, sweating, and diarrhea. I went to the bathroom and vomited, my vision started darkening. After some time sitting on the toilet I stood up to wash my hands and reach for a hair tie to put my hair up because I was sweating profusely. I felt my vision darkening again and fell to the ground. I never lost consciousness and laid on the ground for a few seconds. I felt my stomach begin to churn again so I got up and sat on the toilet and began having diarrhea again. I texted my sister to come upstairs and bring me a Tylenol and some peppermint oil for my stomach. I took 1000mg of Tylenol, rolled peppermint oil on my stomach and stayed sitting with a cold towel on my head. I was then able to stand up and go back to bed at around 3am (shortly after taking the Tylenol). The next morning I woke up at around 8:30am, still feeling fatigued and mild chills. The diarrhea and nausea are gone.
1002891	2/4/2021	OH	36	F	2/2/2021	2/2/2021	within an hour after getting vaccine severe headache started. continued thoughtout rest of day. by evening my left eye swollen red couldn't see out of it, severe headache, severe body aches, chills, low grade fevers off and on extreme fatigue, unable to get out of bed without being dizzy and nausea
1002877	2/4/2021	FL	56	M	1/13/2021	1/15/2021	Uveitis (underlying condition occurring once every 2-3 years, I was NOT in a flare up at the time of the injection), and mouth ulcers (underlying condition occurring 2-3 times a year, I was NOT in a flare up at the time of the injection). For the Uveitis I went to my eye doctor and started a prednisolone regimen and am still on it. I received the 2nd does (lot EL9264) yesterday on 3 Feb at 09:00am. The mouth ulcers were treated with oral medication-Valtrex. 2nd dose does not seem to have aggravated the above noted reactions. Other symptoms common to the injection are occurring but seem more intense after the 2nd dose (aches, low energy, some minor coughing)

1002772	2/4/2021	NJ	55	M	2/3/2021	2/3/2021	Patient presents to ED for evaluation of suspected allergic reaction. Patient was seen immediately upon arrival due to clinical status. Hemodynamically stable with suspected allergic reaction secondary to Covid vaccine. Patient was given Benadryl/Pepcid/prednisone. Patient was observed in the ED for period of 2 hours with near complete resolution of symptoms. Patient is comfortable with discharge home at this point. Will give the patient prescription for Benadryl and EpiPen if needed. Patient already has information for allergy/immunology and will follow up. Results of diagnostic testing and preliminary diagnosis discussed with patient and family members (if present) at the bedside who expressed understanding and agreed the plan of care. Patient will be discharged from the ER to follow up with primary care physician. The results of pertinent diagnostic studies and exam findings were discussed. The patient's provisional diagnosis and plan of care were discussed with the patient and present family. Vitals are stable. Patient is alert and oriented, no acute distress and nontoxic appearing. Patient was given discharged instructions and all questions were answered. The patient and/or present family expressed understanding of the diagnosis and plan. The patient understands their need and responsibility to obtain additional follow-up as instructed. Strict return precautions were given to the patient. The risks of medications administered and prescribed were discussed with the patient and family present.

1002719	2/4/2021	TX	47	F	1/15/2021	1/15/2021	Employee began complaining about a "cold feeling" in her rt arm followed by numbness and "pins and needles" like sensation. She also complained that her rt arm was feeling swollen and red. Mild redness noted upon assessment but no obvious swelling visually. Observed employee for 30 minutes after vaccine and symptoms persisted. Employee has a history of severe reactions to food and medications. Vital signs obtained and BP noted to be in 150s/90s, Hr in 90's, temperature and oxygen saturation were both within normal limits. Employee denied any feeling of swelling of face or throat, but was taken to emergency department onsite for further evaluation as her numbness continued to persist past 30 minutes observation. Employee reported that she was triaged only and was in lobby for about 2.5 hours after which time she left since she felt her symptoms were improved. She called her PCP when she arrived home and was instructed to take 25 mg of Benadryl orally. Employee reported that her symptoms completely resolved after that and that she had no subsequent symptoms.
1002820	2/4/2021	ID	59	F	2/2/2021	2/3/2021	~~Pfizer-BioNTech COVID - 19 Vaccine EUA" Developed a rash approximately one day after the injection. Worse on the top half of my body. But itchy everywhere. Upper chest and lower next is a visible rash. The rest I can feel bumps and they itch but not visible to the eye. Itching is worse on my face and neck, including my eyes and nose. I do not appear to have any other symptoms besides site pain.

1002725	2/4/2021	VA	45	F	2/3/2021	2/3/2021	Within about 45 minutes of receiving the vaccine I started getting mild hives spreading around the injection site and across my belly. I had mild wheezing and feeling of loose fluid in my brachial area of my chest. Now at 24 hr out, hives are head to toe, and I took diphenhydramine at bedtime in addition to my loratadine each AM. I've used my inhaler twice to see if that helped - it doesn't, so it's not a regular asthma attack. Today I have intermittently dealt with mild sweats, moderate chills, mild nausea, shakes (might be the inhaler as that sometimes makes me shake), headache fluxing between mild to moderate, eyes watering and lids swollen slightly with hives, injection site soreness, swelling about the diameter of a softball (interfering with ROM on left arm - I am an interpreter, so this interfered with work a lot today!), left arm from shoulder to elbow is hot to the touch, and I have had mild disconnects with my ability to focus/breaks in completing thoughts today. I am keeping my EpiPens close, just in case. I live 3 miles to the nearest ER, and someone is here with me just in case I need to go.
1002787	2/4/2021	PA	51	F	2/4/2021	2/4/2021	Numbness at left side of lip . Numbness almost like novocaine feeling at left cheek up towards left eye Tingling at back of the tongue
1002784	2/4/2021	OK	55	F	2/2/2021	2/2/2021	After an hour and a half to two hours after injection, I began to have an allergic reaction but it was slight. Cheeks turned red and under right eye was slightly swollen and slightly itchy it continued for about 45 min and then my feet and lower legs began to feel the same. The tops of my feet were red for approximately 10 min and then all symptoms subsided. No other problems afterwards
1002736	2/4/2021		46	F	2/1/2021	2/4/2021	Metallic taste, eyes watering, feeling jittery, eyes itching, needs to take deep breathe

997701	2/3/2021		36	F	2/2/2021	2/2/2021	Had tingling and numbness from vaccine site to fingers - left arm. Also had intermittent tunnel vision. Given Benadryl 50 mg po without relief. Taken to ED. Given Pepcid 20 mg IV and methylprednisolone 125 mg IV with improvement of symptoms. Discharged home.
996916	2/3/2021	NJ	81	F	1/18/2021	1/19/2021	trouble with dry eyes; infection in her eye; blood sugar 54 mg/dl two hours after dinner with insulin, 147 mg/dl after candy, 85 mg/dl after oatmeal without insulin, 196 mg/dl after; This is a spontaneous report from a contactable consumer (patient). An 81-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EJ6796), via an unspecified route of administration in the left arm on 18Jan2021 11:00 at a single dose for COVID-19 immunization. The patient's medical history included ongoing type 2 diabetes mellitus, bladder cancer from 2005 and ongoing (cleaned it out, but has to go for check ups every 6 months), stent in artery in neck on right side on 2011, atrial fibrillation (Afib), knee total replacement on 2010 and on 2015, and ablations on Jan2010 and on Jun2010. Ongoing concomitant medications included insulin lispro (HUMALOG) and insulin glargine (LANTUS) both for type 2 diabetes mellitus. She took her regular insulin last night (19Jan2021) at dinner time and her blood sugar went down to 54 mg/dl about 2 hours later. She ate some candy and it went back up to 147 mg/dl. This morning (20Jan2021), it was 85 mg/dl. She just had oatmeal without taking any insulin which is unusual for her. She just took her blood sugar again and it's 196 mg/dl, which after eating oatmeal is not really high. The patient want to know if anyone else had this response. She felt great afterward and didn't even felt it. She also had an incident with an infection in her eye yesterday (19Jan2021), but the doctor didn't think it was related to the vaccine. She just had one little tingle of it on an unspecified date and went right to the doctor and they gave her medication for the infection. She has plugs in both eyes so she has trouble with dry eyes on an unspecified date. Outcome of the eye infection was recovering while of the remaining events was unknown. Information on lot number/batch number was requested.

996596	2/3/2021	IA	25	F	1/8/2021	1/8/2021	Very itchy arm that has persisted, this far, to a month after getting the vaccine. At the injection site and around that general portion of my upper arm. Sometimes it's perfectly fine, sometimes it's red or pink and either will or will not be itchy as well. If I scratch at it too much, which I try really hard not to but it's really hard not to, and then the little rash-looking areas turns into a small area of mini skin hives. Still redish/pink and itchy. Then I try not to mess with it for the most part, but it's just consisted since then. Idk if this is a me problem, specifically cause I got some weird skin hive stuff going on actually on my eyes at night (randomly) that randomly occur. And that started way before I got the vaccine. With the hives on my arms, it will persist for a while at a time and go away before coming right back again as itchy as ever. It's been basically every single day since I got my vaccine that these side effects have been going on. #StillSupportIt lol. (:
996597	2/3/2021	CA	19	F	1/27/2021	1/30/2021	3 days after second dose of Pfizer vaccine, (01/30/2021), went to emergency room for facial droopiness and numbness on the left side. Was diagnosed with Bell's palsy in the ED. Currently taking prednisone (60 mg - once a day). Valtrax (1mg - 3x a day), Erythromycin eye ointment (.5% - 4x daily)

996734	2/3/2021	MA	86	F	1/12/2021	1/13/2021	<p>Congestive cough; Weakness; didn't have an appetite; legs felt stiff, or almost frozen; Severe muscle weakness/extreme weakness was only in her mother's lower body; tremendous fatigue/Tiredness; Couldn't walk; This is a spontaneous report from contactable consumers. An 86-year-old female patient (mother) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration at left arm on 12Jan2021 10:15 at single dose for COVID-19 immunization. Medical history included ongoing chronic obstructive pulmonary disease (COPD) for years; COVID-19 Virus from 23Apr2020 to an unknown date, patient was not on a vent or in the ICU but did receive plasma as part of her COVID-19 Virus treatment; ongoing cough. Caller's grandmother had Multiple Sclerosis. There were no concomitant medications. The patient received her first Pfizer COVID-19 Vaccine dose, and had significant side effects. Patient weight was 175 lbs as provided by caller, who stated her mother recently moved into an independent living facility, and gained weight because the facility has a really good pastry chef. Patient height, reported her mother shrunk, and was 5'5-1/2". Reported her mother couldn't walk after receiving the first dose. She said her mother was not able to walk the next morning, 13Jan2021. The caller stated she had to spend 3 days with her mother, after her mother received her first COVID-19 Vaccine dose on 12Jan2021. Reported she thought initially what her mother was experiencing was either neurological or muscular. She said it was like her mother's brain wanted her to move, but her mother's legs wouldn't move. She said her mother needed to use a walker and have someone hold her from behind. She said now, at a week later, her mother still was not back to normal. She clarified her mother needed a walker to maneuver around, but didn't need someone holding her from behind. Reported she assumed her mother may have had tiredness, weakness, severe muscle weakness from receiving the first COVID-19 Vaccine dose. She clarified if her mother wasn't able to walk after receiving the first COVID-19 Vaccine dose, then what her mother had was the epitome of weakness, and the weakness was only in her mother's lower body. She said her mother had tremendous fatigue on days 2, 3, and 4 after receiving the first dose. She said her mother was able to function</p>

as of 19Jan2021, but her mother couldn't keep her eyes open during that time period. Reported her mother developed a congestive cough. She said her mother's cough was not continual, but persisting. She stated her mother said the cough was there before she had her first dose of the COVID-19 Vaccine. The caller stated she disagreed with her mother. She said her mother has COPD, but her mother was not a cougher. She said her mother's cough now, reminded her of the cough her mother had when her mother had the COVID-19 Virus in 2020. She clarified her mother was tested on 23Apr2020 for the COVID-19 Virus, and diagnosed positive for the virus on 24Apr2020. The caller said she was perplexed by her mother's cough, and her mother will be seeing her doctor this Thursday, 21Jan2021. She said she gave her mother some Robitussin for the cough. She said her mother's cough was not persistent, but the cough was still there. She said her mother's cough was not constant, but her mother's cough was congested. She said she didn't know when her mother's cough started. She said she thought giving her mother the Robitussin doses was kind of insignificant, because her mother did not have a constant cough, where she needed to take the Robitussin. She said her mother didn't even use half of a normal sized Robitussin bottle. Caller stated she did not have the Robitussin UPC, Lot, and Expiration Date. Reported her mother has an annual lung x-ray and MRI, clarifying she believed her mother had both within the past 3 months. Reported her mother was concerned about receiving the second COVID-19 Vaccine dose. She said she told her mother that it was better to get the second dose of the COVID-19 Vaccine than to get the COVID-19 Virus again. Reported her mother had asked her primary care doctor if she should get the COVID-19 Vaccine, and her doctor told her absolutely. She said her doctor told her she needed to take the COVID-19 Vaccine even if she had the plasma treatment with the COVID-19 Virus in Apr2020. Reported she planned to stay with her mother after her mother received the second COVID-19 Vaccine dose. She said she didn't anticipate her mother having a reaction after the first COVID-19 Vaccine dose because people said most reactions are happening after getting the second COVID-19 Vaccine dose. She said now people are reporting having reactions after the first COVID-19 Vaccine dose.

Reported she thought her mother's side effect after having the COVID-19 Vaccine to be unusual, since most people say it feels like they have the flu, or they are tired, or they have a headache. Reported her mother not to be able to walk wasn't that her mother was not walking, but that her mother's foot wouldn't move. She said mother not walking was either neurologic or muscular, unless that is what extreme weakness is. She said she wondered if others have experienced what her mother has. She said if her mother was experiencing just extreme weakness, the extreme weakness was only in her mother's lower body, not in her upper body. She said her mother didn't have an appetite, but her mother was not too weak to put a spoon to her mouth. She said her mother couldn't move her legs, and her mother said her legs felt stiff, or almost frozen. She said if her mother had extreme weakness, and couldn't walk, what did that mean. She said if a person is really tired, the person can still move and get out of bed. She said her mother said she was really, really tired, and couldn't move. The caller said her mother said she couldn't move, and it took her mother 20 minutes to get her legs over the side of the bed. She said her mother not being able to move her legs could be extreme weakness, but observing her mother first hand, she said it looked like her mother not being able to move her legs was neurologic. She said her mother was strong in character and body, and her mother would do everything she could in her body to move, but it was like her mother's brain said "go", and her body said "not now". The outcome of the event Congestive cough was not recovered, of the other events was unknown. Information on the lot/batch number has been requested.

996777	2/3/2021	CA	61	F	1/6/2021	1/1/2021	She wore sunglasses in her house because the light bothered her eyes; Eyes felt dry; Loss of vision in right eye; Hole in her retina; Bad headache for 3 days; This is a spontaneous report from a Pfizer Sponsored Program. A contactable consumer reported similar events for 2 patients. This is 1st of 2 report. A 61-year-old female consumer (patient) received 2nd dose of BNT162B2 (Covid Vaccine, lot number: EL1248) on 06Jan2021 at single dose in the right arm for COVID-19 immunisation. Medical history was not reported. Concomitant drug included Multivitamin, Vitamin C, Vitamin D Zinc all from Mar2020 and ongoing. Historical Vaccine was 1st dose of BNT162B2 (Batch/lot number: EK5730) on 18Dec2020 in the right arm. Patient got COVID vaccine and a few hours later or the next day she started getting a hole in her retina and started losing her site in right eye. she went to the doctor as she has a hole in her retina. Again, this may be totally unrelated but she wanted to call and get this reported. She is going to see a retinal specialist this afternoon. After she had her COVID vaccine she had a bad headache for 3 days. She wore sunglasses in her house because the light bothered her eyes. She noticed this on 16Jan2021 because she was looking at paperwork and her eyes felt dry. She blinked a few times and had opened one eye alone, and she noticed that her left eye was fine but the vision in her right was not. This could have been going on longer. She just never closes only one eye. When both are open, her vision is normal. She saw the eye doctor yesterday, and that is when they said she had a hole in her retina. They said she will have to have surgery to close the hole. She knows she is at the right age for this to spontaneously happen, but just in case it is related, she wanted to report it. Outcome of the event Loss of vision in right eye was Not Recovered, for headache was recovered, for other events was unknown. No follow-up attempts are needed. No further information is expected.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021046804 same reporter, AE and drug, different patient

997554	2/3/2021	NJ	39	F	1/27/2021	1/27/2021	I received COVID vaccine #1 on 6 Jan 21. Shortly following the vaccine I turned very red and felt very hot. The next few days I experienced a very bad headache and flu like symptoms. On 9 Jan 21 my left eye felt very irritated and had redness. I was seen by optometry on 11 Jan 21 and was diagnosed with a corneal ulcer. I received COVID vaccine #2 on 27 Jan 21. I was observed for 30 minutes based on the first vaccine experience. I got very flushed, red, and hot and very itchy. I felt lightheaded and not right. I had hives behind my ears and on my chest. I notified one of the vaccine staff who gave me 25mg Benadryl by mouth and took my vitals. The staff observed me for another 45 minutes. Once I went outside the back of my throat felt very itchy. I felt like I had something in my throat and I had to keep trying to clear my throat. I got very red, hot, and itchy again. I went back inside to tell the staff. They gave me an epi pen injection into my right thigh and called the ambulance. I was taken to the ER to be evaluated. Two days later I noticed the back of my throat was very red and my uvula was large and elongated. I called the clinic and was given cough drops and Cepacol. I have been experiencing hives, redness, and feeling very itchy. To a point I have been having to take Benadryl. I took the 5 days of steroids and ended them on Monday. Yesterday, 2 Feb 21 I woke up and my right eye was bloodshot, irritated, and uncomfortable. I was seen at Urgent Care and prescribed Ofloxacin 4x a day for 10 days. They did not notice any scratches or anything. My right eye is still uncomfortable and red. I am currently on day two of the eye drops.

997619	2/3/2021	PA	45	F	2/2/2021	2/2/2021	Within 40 minutes my arm started to ache badly. About 15 minutes after that while I was driving my head started to feel strange - almost lightheaded. Within a couple of minutes my eyes involuntarily went to the left and the right and then my vision went black (this all happened in a matter of seconds). I stopped at a store and felt light headed and confused/brain fog. That continued at home for around 2 hours. The pain in my arm continued to get worse. I woke up several times throughout the night with pain in specific sites. Today I was unable to go to work because of the full body muscular and joint pain, muscular weakness, headache, pain behind the eyes, and feel like I have fluid in my head (kind of like when you have a cold). I had a significant reaction after the first dose as well (1/5/21 Moderna Lot 026L20A) but it was completely different - mainly arm pain, fever, chills, extreme fatigue, and what feels like fluid retention. I gained 9 pounds without changing anything diet/exercise following the injection. On day 10 a large red welt appeared on my arm at the site of the injection. On 2/1 my Endocrinologist sent me for lab work and urinalysis. Those results are not back. I likely would not have reported any of this if it wasn't for the visual occurrence with the mental confusion and lightheadedness. I have never experienced anything like that in my life.
997673	2/3/2021	NJ	66	F	2/2/2021	2/3/2021	Feeling cold with chills, stuffy head, slight headache 2/2, 5p (day of injection), woke up 2/3 9a, with stuffy head , slight headache, and black eye (allergic shiners?)
997678	2/3/2021		38	F	1/6/2021	1/12/2021	4 days post covid vaccine dose 1 I developed pain and lymphadenopathy in my right axilla (the arm the received the injection). 2 days later (6 days post vaccine) I developed an itchy area around the vaccine site, redness (approximately 3 in x 3 in), intense pain, and swelling. I was concerned this was a cellulitis vs delayed vaccine reaction and kept an eye on the area. I consulted a MD I work with who stated to keep an eye on the site. Symptoms began to subside 2 days later but it wasn't fully resolved until approximately 10-11 days post injection.

998902	2/3/2021	MD	60	F	12/29/2020	12/29/2020	Prolonged HA starting after receiving Pfizer COVID-19 vaccine on 29 Dec 2020-over 2 weeks. No fever/nausea/vomiting/photophobia/visual disturbances. Felt like a constant "vice grip". Not relieved with NSAIDS. Has a history of occasional migraines, but this HA presenting very differently. Resolved after 2 weeks. She did receive dose 2 on 1/19/2020 without recurrence of HA or ant concerning side effects.
998936	2/3/2021	CO	87	F	1/27/2021	1/28/2021	Patient presented to the emergency department for evaluation of lightheadedness after receiving second Moderna vaccine the previous day. Patient was eating breakfast when she started feeling lightheaded. Patient subsequently experienced some nausea. She does endorse a minor headache overnight, but none today. No visual changes no numbness or tingling extremity abnormal weakness in extremities. Patient received IVF and zofran with symptom improvement. Able to discharge home without further escalation of care
998943	2/3/2021	AZ	84	M	1/21/2021	1/21/2021	Blurred vision, off balance, low blood pressure. Sent to ER and was admitted to hospital. Tested negative for Covid19 on 1/25/2021 at hospital. Returned to community 1/26/2021 and was sent to the ER within hours of being back from hospital. He remains at the hospital and will be returning on hospice.
998947	2/3/2021	IL	58	F	2/3/2021	2/3/2021	Patient received 2nd dose vaccine as scheduled. 12 minutes after administration patient complained of nausea and a severe headache. The headache became more intense on the back of her head, and included tingling sensations, and radiated down her neck. Patient also was slow to answer our questions, as she said she felt "funny" . Patient stated that she does get migraines by her eye, but nothing like this. A provider was called in to evaluate patient, and provider advised patient be seen in ER. Patient transferred to ER within building via stretcher. Patient was evaluated, given some IV medications, and ok to discharge to home.

999069	2/3/2021	NY	51	F	1/29/2021	1/29/2021	On Friday, 1/29, after receiving the vaccine, I experience a headache, sharp right side pain in my neck, jaw, and ear. On Saturday, 1/30, I woke up, and the right side of my face was numb, and my right eye would not blink. I went to ER. When they took my vitals, I had high blood pressure and fever. They did a CT scan of my head and admitted me. I was diagnosed with Bell's Palsy. I was discharged on Sunday, 1/31, with medications: Valacyclovir 1 gram three times a day and Prednisone 20 mg three times a day. I was instructed to followup with a neurologist, immunologist, ophthalmologist, and my primary care physician.
999102	2/3/2021	ND	67	M	2/3/2021	2/3/2021	PATIENT WAS IN WAITING AREA AFTER THE VACCINE. HE HAD REDNESS IN HIS EYES, HAD DIFFICULTY BREATHING, RASH ON BOTH ARMS, AND WAS SLIGHTLY WARM TO TOUCH. WIFE REPORTED PATIENT HAS HISTORY OF ANXIETY ATTACKS, ASTHMA ATTACKS, AND ALLERGIC REACTIONS TO FOOD.
999105	2/3/2021	CA	68	F	2/1/2021	2/1/2021	I felt foggy and disoriented and tired within a half hour of receiving the vaccine. I felt pain in my arm traveling to my underarm. After an hour I felt like the inside of my skin was prickly and tingly, my face was flushed and burning. I was so tired I had to lay down. I just stared into space. There was ringing in my ears. My heart rate was a good 20 beats per minute faster than normal. By bedtime, my face was slightly swollen and I was unable to read because the letters were jiggly. I had a traveling headache from the side to the top of my head through my eyes. My breathing was more rapid and shallow. I felt intermittent chest tightness. And pain. The next morning, I felt better, but the prickly skin continued and my chest and back were sore. I had intermittent cramping in my feet and was sore in my joints. My arm was very tender. I was still tired and my heart rate was still elevated. I did not sleep well and got up frequently during the night to walk around. By the third day the prickly skin was almost gone, but I have had cramping in my chest and feet. I am very tired. I still have an occasional traveling headache.

999177	2/3/2021	PA	52	F	1/15/2021	1/15/2021	About 15 min after getting vaccine my lower lip started to feel a little tingly. About 45 min after that my chin started to feel a little numby/tingly. Within another hour the numby/ tingly feeling went up the left side of my face stopping at my eye. The feeling was similar to when nova cane is wearing off after dental work. I had this facial sensation until midnight when I went to bed. It also appeared that about an hour after the shot I noticed my tongue looked purpled which did not last long before it appeared to return to normal color. Exactly 2 weeks after the vaccine, my chin became numb and tingly and I felt a funny feeling in my right eye, almost like an allergy feeling. This lasted approximately 2 hours before dissipating. I have never had this happen to me before. On day 4 after the vaccine I did feel like I was getting sick and was fatigued this lasted for about 4- 5 days before feeling better and back to myself.

999387	2/3/2021	AK	45	F	1/11/2021	1/12/2021	The day after the second shot, I developed upper right sided chest pain and pressure, lateral to the sternum extending at times to mid-clavicular line. Sometimes it felt deeper than surface. I do have a scar from my port which was removed in 11/2020 and the location of the pain correlated at times with the scar but not consistently. I thought the pain was sore muscles since I had done some light weight exercises with my arms the morning of the vaccine. But the pressure aspect of it was different than sore muscles. And I could feel a localized pain when I swallowed or burped, like it was on the inside of my esophagus. The pain didn't seem to hurt with deep breaths. I thought it'd get better if it was related to muscles and the vaccine, but it just seemed to linger. I tried mylanta to test the esophagus theory and it improved. Then after a few more days of not resolving, I saw doctor. My biggest concern and fear at that visit was breast cancer recurrence. I was envisioning and enlarged node in my chest or lung. Eek! I had had a couple episodes at some point of painful swallowing prior to all this that I recalled in the visit so we opted to do an EGD. He also prescribed omeprazole which seemed to help. Had EGD done on 1-27-2020. Normal except for a loose GE junction which wasn't a surprise since I occasionally experience reflux. I'm seeing my oncologist next week for my usual 3 month visit. Thankfully the pain has almost resolved. Pressure is no longer there. Feeling way less anxious about cancer recurrence.
998442	2/3/2021	WA	26	F	1/8/2021	1/8/2021	received Moderna lot #025L20A at 1445. at 1503 she notified observer of nausea, dizziness, and spots in her vision. Moved to a dark quiet room and had her lay down. Per her report she has only gotten 3hrs of sleep the last two nights. Vitals stable at BP 126/88 (102), HR-65, 97%, and 36.8. Rechecked vitals throughout stay remained stable. Laid down for 15mins and then sat up. After feeling good sitting up she had water, juice and crackers. At this point she reporting feeling much better and headed home after 30mins in the first aid room and 45mins after getting the vaccine. Requested that tell staff about this prior to getting second dose.

998394	2/3/2021	KY	41	F	1/14/2021	1/16/2021	Will call back later this week with lot number. Two days later my body started tingling, I ended up leaving work early. I called the doctor who said and take some Benadryl and rest it off. I was nausea all weekend and slept most of the weekend. I went to work on Monday and worked through Thursday. Friday 1/22/2021 afternoon my body began tingling again, I became so weak that I couldn't walk. I had to leave work early and they made my husband come pick up because the staff at my job did not think I was safe to drive. I was nauseous again. I had major diarrhea and vomiting about a week after receiving the vaccine. This lasted around 3 days. I finally went into the ER on 1/24/2021. They treated me Magnesium and Potassium and 2 bags of IV fluid and said I was dehydrated and sent me home. I went from the ER and I could not sleep that night, the ER gave me so much Zofran it was just to much. I still continued to throw up at home. Went back to ER this time in on 1/25/2021 around 5AM I was losing feeling in my fingers and toes, they were completely numb. I was also still vomiting. They said I my electrolytes were still out of balance and gave more nausea medicine, medicine to help with the cramping and more IV fluids. I was sent home later that afternoon. I went to work on the 26th, I felt slow to react, trouble concentrating, very lethargic, and off balance. I was still nauseous but it was getting better with medicine. My eyes yellows turn straight yellow, I thought I had jaundice. I was able to work all day. I left work and when I pulled into driveway at home 7:01 PM and EMS was in front of my house 7:14 PM. I went inside and went to bathroom and my husband found me and I was having a full blown seizure, foaming at the mouth. EMS took my to ER and I was treated for a seizure and an elbow injury and went home. I have seen the neurologist and my physician since being discharged. They did more blood work. I have been having high blood pressure since then. I am trying to get an MRI scheduled that my neurologist ordered. They started Keppra 500 MG to control the seizures. I have been taking Tizanadine for muscle spasms from the elbow injury when I feel during the seizure. I did have an MRI 6 months ago.

998565	2/3/2021	NC	71	F	2/2/2021	2/2/2021	<p>Pt noted after approx 15 minutes a tingling/burning sensation of tongue At 4:45 pm. No associated SOB, facial swelling. She does have prior anaphylaxis reaction to pineapples for which she carries and epi Pen but has never needed to use. Cardiac exam RRR Lungs CTA bilat HEENT, no visible erythema of face or tongue and no noteable facial swelling. She was agreeable to 25 mg dose of diphenhydramine and another 15 minute observation. During this time, she began to feel anxious and a mild headache. Vitals at that time were notable for bp 178/81, HR 101 and o2 sat 98%. Still no SOB, facial swelling or other new complaint. She felt improvement in anxiety within 5 minutes, and repeat vitals in 10 min with BP 152/83, HR 89 and O2 sats 96%. She still continued with mild sensation change of tongue, but no facial swelling. She does have benedryl at home but I also sent her home with additional 25 mg dose in case she noted recurrent symptoms on the way home. She understands to seek emergency care with any worsening symptoms, or new SOB or facial swelling. She can also use her EPI pen if needed. She felt comfortable returning home- husband picked her up. I will call her to check in this evening and in the morning and will provide updated recommendations regarding second dose of vaccination. I spoke with patient at 8:09 pm - she was at home- feeling much better, however, she did take the second diphenhydramine on the way home, as she began to feel she was having some swelling between her eyes. No SOB Or trouble swallowing. This improved with the second benedryl and has not recurred. She will take an additional 50 mg benedryl before bed, and then she awakes before 6 am- if she has any residual symptoms she will take another dose. Again, she understands to seek emergency care with any worsening symptoms, or new SOB or facial swelling. She can also use her EPI pen if needed. She felt comfortable with this plan. We also reviewed current CDC guidelines and she understands at this time we would not recommend she receive the second Vaccination. She will continue to follow CDC in the event that this recommendation changes. I will submit a VAERS report after following up with her in the morning. ADDENDUM 2/3/21: I spoke with patient again on 2/3/21 at 07:45 am. She is feeling almost completely back to baseline this morning, but planning to take 25 mg diphenhydramine this morning as</p>

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							well. She does note mild headache, which is not abnormal for her. No residual tongue sensitivity or facial swelling. She noted that when she got home last night, she felt very sleepy and sedated from the diphenhydramine and went to bed, and did not take an additional dose of diphenhydramine last night. No SOB, trouble swallowing or any new complaint. No urticaria or itching. We reviewed current CDC recommendations to decline second vaccination given her moderate severe allergic symptoms within first 4 hours of first vaccination. She will follow up with PCP or kidney specialist if she has any continued concern with ongoing symptoms or new issues. She was very appreciative of the followup and care provided.

994742	2/2/2021	WV	70	M	1/23/2021	1/24/2021	On 1/24/2021 states on that Sunday his tongue became numb and developed pain behind right ear. Took ibuprofen, went to bed that even. When he awoke the next morning, Monday, 1/25/2021, the right side of his face was disfigured, puffy, and his mouth was drawn down. He drove to family member approximately 1 hour away and upon arrival, family member took him to local hospital. MRI was completed and returned with diagnosis of Bell's Palsy, which was confirmed by three physicians at the hospital. Was informed may take 6 - 8 weeks for full recovery. Was discharged with prescription for Lacrilube eye drops, Vibramycin, Prednisone (Deltasone), and Valtrex. One 1/29/2021 had follow up visit with neurologist and was told to discontinue Prednisone. Neurologist researched injection follow the 1/29/2021 visit. Client received call from neurologist on 2/1/2021 and was instructed was able to take second dose of vaccine, physician was not 100% sure same issue would not occur with second dose.
994729	2/2/2021	WY	80	M	1/26/2021	1/29/2021	Noticed facial drooping on the left side starting on Friday night and symptoms increasing. Went to urgent care on Monday morning. facial drooping increased over the weekend also left eye was irritated from lack of moisture and did not close or blink without extra effort. wore a patch and lubricated over the weekend. Diagnosed as Bell's Palsy at Lander urgent care medical clinic. Prescribed course of prednisone. Also Erythromycin ophthalmic ointment for the left eye and wear a patch until eye will blink and close normally.
994724	2/2/2021	FL	86	F	1/27/2021	1/31/2021	I have a face rash on either side of my nose, itchy eyelids.
994713	2/2/2021	OK	46	F	1/22/2021	1/22/2021	Client says almost immediately after taking the vaccine she started having blurry vision, face and throat started burning, and her throat started closing. She was given Benadryl 50mg IM After 10minutes her symptoms resolved except for a rash on her body. She was released to a friend to drive her home. She reports taking Benadryl 50mg every 4-6 hours for 48 hours afterwards.

994570	2/2/2021	IL	52	M	1/25/2021	1/25/2021	Afew hours after receiving the inoculation, I was extremely sleepy. I was sleeping at my job, and my boss had me go home early. I went to work the next day, however I was feeling weird, my sense of smell and taste were off, as the day continued I started having a headache, body aches, and general malaise. I went home early, again from work. But when I arrived to my residence I was having severe chills despite my efforts to try to keep myself warm. The chills lasted for more than 24hrs, preventing me from sleeping, my body aches were getting worse, my eyes were extremely red, and I did not feel like eating. Near the end of the day, the chills became sweats, and I was trying to balance between being hot and clammy, to chills. The next day I paid a visit to my primary care doctor. I was tested for covid - which was negative, I was tested for the flu - which was negative, and my lungs were clear so there was no reason for my doctor to believe I have a pneumonia.
994964	2/2/2021	CA	79	F	2/1/2021	2/1/2021	Had reaction in November to tetanus vaccine. Had flu vaccine with no reaction. Then had this vaccine, no reaction initially, came home, feeling fine but an hour later had flushing in her left ear, just creeping over to her eye and the side of her face. This lasted for about 15 minutes and left the feeling of something not quite right around her eye. Nothing compared to her reaction in November from a tetanus booster. Still has the feeling but not an adverse reaction. Then at 10:00 PM all of a sudden her face went really hot, and presumed she had a fever, started feeling badly. Started walking around the house, took Tylenol. That feeling lasted for about 30 minutes and resolved. Went to bed and did not feel anything but a funny feeling. All symptoms have subsided except for a weird feeling around her eye.

994507	2/2/2021	IL	41	F	2/1/2021	2/2/2021	Severe headache during the day after vaccine given. Then around midnight , woke up with extreme chills, body aches, weakness, nausea.. Got up to go to bathroom to throw up, at this time my husband was with me and when I got to bathroom, I passed out. He was holding me, stated my eyes were open and pupils very dilated. He had to wake me out if it (maybe just under 1 min) When I woke up, I vomited a little. Then until about 4 am I continued to have extreme chills, body aches and threw up a few more times. Still currently (9:30 am) feeling very weak and have a bad headache .
994494	2/2/2021	MI	40	F	2/1/2021	2/1/2021	My the skin of my jaw and chin started to feel numb. The sensation progressed rapidly to include numbness of my cheeks, eyebrows, and ears. The symptoms appeared rapidly after leaving the clinic (as I was driving away on my from work to home). Less than 30 minutes after receiving the vaccine. Both sides of my face were impacted equally.
994612	2/2/2021	WI	31	F	1/28/2021	1/29/2021	Approximately 2am of 01/29/2021 I became very over heated for about one hour. Around 3am I then became incredibly cold and shaking. Around 4am I got out of bed and stood for a few moments, then walked slowly around my room making my way to our bathroom. I noticed my vision was not right, almost like a fisheye affect and I felt dizzy. I made it to our master bathroom and sat down on a chair for a few moments before I completely passed out. I fell forward, face first on to the bathroom floor hitting the left side of my head. When I regained my conscious I was weak and shaking and was unable to call out to my husband. I slowly pulled myself up to the toilet trying to make some noise and my husband then came to my aide. As he talked I noticed his voice sounded much farther away than it really was. I also had a difficult time cognitively answering his questions about how I felt. I was pale, clammy, still shaking. This episode from the time I left my bed from the time my husband walked me back to the bed was about 45 minutes. My husband took my temp and I did not have a fever. The next five hours I alternated between feeling very cold and very hot. I spent the next 24 hours feeling completely depleted. I rested as much as I could and had a greater than normal appetite.

993505	2/2/2021	FL	70	F	1/15/2021	1/15/2021	<p>Yesterday and still today it felt like I burnt the tip of my tongue; poking my tongue with needles, very painful; My tongue was numb for 2-3 hours; Arm hurt; This is a spontaneous report from a contactable consumer (patient). A 70-year old female consumer received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 15Jan2021 at 10:21 at single dose in left arm for COVID-19 immunisation at the age of 70-year-old. Lot number was EL1284. Medical history included blood pressure, COVID-19 in Mar2020, loss of smell and taste in Mar2020, diarrhea in Mar2020, ongoing headache since Mar2020 (started with eyes, thought the patient had pink eye, she had a headache right at the time of report), chills in Mar2020. Concomitant medications included ongoing olmesartan for blood pressure. The patient received flu vaccine in Oct2020. The patient received her vaccine on 15Jan2021; she was informed to wait 15 minutes after getting the vaccine and she did. When she left the park about 2-3 minutes after waiting the 15-minute observation period she started to feel a sharp needle poking type feeling on her tongue, it was painful. Her daughter asked if she wanted to turn back around, but they did not. The feeling did not last long. She then added, later that day it felt like the tip of her tongue was numb. It stayed that way for at least 2 hours and then went away. On 17Jan2021, she woke up and she has the feeling on her tongue as if she drunk something hot and burnt the tip of his tongue. She has this burnt feeling sensation on her tongue and she had not eaten or drunk anything yet. Poking sensation on tip of tongue that was painful occurred like 17 minutes after she got the injection. It is like her tongue was being poked with needles. She later had numbness on her tongue, this lasted like 2 hours. It seemed like a numbing solution was administered with the vaccine. The way her tongue felt, it was as if there was a numbing solution in the needle with the vaccine. Her tongue was very numb for a while, but it then went away. On 17Jan2021, she started to feel the tip of her tongue was burnt. She looked at her tongue on 17Jan2021 and it was red. She has not looked at it the day of report so she did not know what it looked like. The patient initially stated, besides the tongue issue, she had no issues. However, she then later stated and clarified the only other issue she had was her arm hurt a little; it was not bad, but it did hurt; it did not</p>

993606	2/2/2021		65	F	12/30/2020	1/4/2021	<p>hallucinations; having stroke like symptoms; having intense headaches; felt exhausted; has pain in her arm; her vision affected/wavy lines throughout her eyes; numbness in her face, hands, and lips; This is a spontaneous report from contactable Nurse reporting for herself. A 65-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 30Dec2020 at single dose for COVID-19 immunisation. Patient age at time of vaccination was 65 years. The patient did not have reactions with other immunizations except a severe reaction with the measles, mumps, and rubella (MMR) vaccine when she was younger. She had seizures after receiving the MMR vaccine. The patient's concomitant medications were not reported. The patient mentioned she had a severe reaction. She described her adverse reaction by having intense headaches, having stroke-like symptoms in which she described as she cannot speak, having headaches, having numbness in her hands, face, and lips. She also felt exhausted. She also had some pain in her arm that she is not concerned about. She mentioned that she also has her vision affected, she couldn't drive, there were wavy lines all though her eyes. She started to have hallucinations such as seeing people that weren't there, seeing snow storms, and seeing things whipping throughout the wind. All the events started on 04Jan2021. She reported she was very sick in the hospital and is now getting well. However it was unknown if she was admitted to hospital (clarification pending). She wanted to know recommendations about the second shot of the COVID-19 vaccine because with her experience, she is not comfortable having the second shot of the COVID-19 vaccine. Information about lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any</p>

993611	2/2/2021			F	1/14/2021	1/14/2021	<p>appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p> <p>runny nose; itchy watery eyes, like allergies; itchy watery eyes, like allergies; fluid in her ears; allergies; only had a sore arm for a day; This is a spontaneous report from a non-contactable consumer reporting for herself. A 59-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date unknown), via an unspecified route of administration on 14Jan2021 at a SINGLE DOSE for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient stated she received her first Covid19 vaccine on the 14Jan2021 and everything has been great. She stated she only had a sore arm for a day, but now 5 days later (19Jan2021) she has a runny nose, itchy watery eyes, like allergies, and fluid in her ears. She stated she feels it was just allergies because she can take a Benadryl and it makes it quit. She stated Benadryl knocks her out though. She stated she would like to know if these side effects have been mentioned by others and being 5 days after given the dose. Therapeutic measures (Benadryl ) were taken as a result of runny nose, itchy watery eyes, like allergies and fluid in her ears. The outcome of the event sore arm for a day was recovered while other events were unknown. No follow-up attempts are possible. Information about lot/batch number cannot be obtained.</p>

993619	2/2/2021	FL	82	F	1/5/2021	1/9/2021	<p>Diarrhea; This is a spontaneous report from a contactable consumer (patient). An 82-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot Number: EH9899), via an unspecified route of administration in left arm, on 05Jan2021 at 13:30, at a single dose, for COVID-19 immunization. The patient's medical history included diabetes, arthritis, vitamin D, bones, gums, eye, joint pain lubrication, hair and nail growth and strength, control sugar, atrial fibrillation (Afib), heart, supplement, cholesterol, liver clean, and gastro problem. The patient's concomitant medications included apixaban (ELIQUIS) for Afib from 2019 (a year and three-fourths), metoprolol for heart from 2019 (a year and three-fourths), metformin hydrochloride (METFORMIN ER) for diabetes, berberine to control sugar, biotin from 2011 (for 10 years) for hair and nail growth and strength, Silybum marianum (MILK THISTLE) to make liver clean (two or three years), hyaluronic acid for joint pain lubrication, niacinamide for diabetes, chondroitin sulfate/ glucosamine sulfate (GLUCOSAMINE CHONDROITIN) for bones, Monascus purpureus (RED YEAST RICE) for cholesterol, colecalciferol (VITAMIN D3; UPC Number: 3373900373, Lot Number: 3162111, and Expiration Date: Jun2024) for vitamin D, probiotics for gastro problem, betacarotene for eye, ubidecarenone (COENZYME Q10) for gums, calcium/ magnesium (CALCIUM MAGNESIUM) for bones, and unspecified multivitamins as supplement and OSTEOPHASE for arthritis; all were ongoing. The patient her first dose of COVID-19 vaccine dose on 05Jan2021. The patient had experienced diarrhea ever since 09Jan2021 and is still continuing until today. The patient experienced a sudden onset of diarrhea and it has continued on and off since then; it is persisting or worse. She has seen a gastroenterologist, but they don't have any answers, sent stool cultures in Jan2021 but no results yet. The patient was asking if this is a documented adverse event. The patient is scheduled on 26Jan2021 for the second dose. With this experience, the patient was asking what to do with the second dose- if she should get the second shot. The patient had not recovered from the event.</p>

993620	2/2/2021	DC	71	F	1/15/2021	1/17/2021	right side of her face was swollen and was itching; eyes swollen/puffy; puffy underneath eyes/ like bags; swelling of right side of face/ right side of her face was swollen; This is a spontaneous report from a contactable consumer (patient). A 71-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE lot number: EL1284, expiration date: 30Apr2021) intramuscular on the right arm on 15Jan2021 at 30 ug, single for COVID-19 prophylaxis. Medical history included high cholesterol, high blood pressure, cancer survivor and allergic to walnuts. Concomitant medication included ascorbic acid, herbal nos, levoglutamide, lysine, magnesium, manganese, retinol, riboflavin, selenium, tocopherol, zinc (AIRBORNE) for supplementation therapy, HCTZ for high blood pressure, vitamins nos (MULTIVITAMIN [VITAMINS NOS]) for supplementation therapy, rosuvastatin for high cholesterol. The patient received 1st dose of vaccine on Friday and on 17Jan2021 evening, experienced the following: "swelling of right side of face, eyes swollen/puffy." She spoke with HCP office and was told to take Benadryl and Tylenol. She took the medication and the "swelling went down". She said she woke up this morning and had "puffy underneath eyes", "like bags", and "slight facial swelling." The patient ate at an Indian restaurant on 17Jan2021 at about 6:30-7:00pm and was unsure if her reaction was to the vaccine or food, since the food she ate could have been cooked with nut oil. She said that her eyes were still puffy and her face was still a little swollen. She went to see her doctor today 19Jan2021 and he was trying to figure out what could have caused this on his end. The patient said that the right side of her face was swollen and was itching. The left side did not appear to be swollen at all. Outcome of the event pruritus facial was unknown while recovering for the other events.

994080	2/2/2021	NY	89	M	1/13/2021	1/16/2021	<p>Tested positive for COVID-19; Weakness; Sweating; Shortness of Breath; A spontaneous report was received from a healthcare professional concerning a 89-year-old, male, patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and tested positive for COVID-19, experienced weakness, sweating, and shortness of breath. The patient's medical history included diabetes mellitus, hypertension, hypercholesterolemia, and benign prostatic hyperplasia. Products known to have been used by the patient, within two weeks prior to the event, included metformin, glimepiride, atorvastatin, acetylsalicylic acid, norvastatin, irbesartan, triamterene, finasteride, mirabegron. On 13 Jan 2021, approximately three days prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 16 Jan 2021, the patient experienced weakness, sweating, and shortness of breath. On an unknown date, the patient tested positive for COVID-19 and was admitted to the hospital for supervision. Chest x-ray results were negative. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the event, tested positive for COVID-19, was considered not resolved. The outcome of the events, weakness, sweating, and shortness of breath, was unknown.; Reporter's Comments: This case concerns a 89 year-old, male patient with history of diabetes mellitus, hypertension, hypercholesterolemia, who experienced events of tested positive for COVID-19, weakness, sweating, and shortness of breath. The events occurred 3 days after the first and last dose of mRNA-1273 vaccine administration. Based on the current limited available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded and the events are assessed as possibly related. However, the patient was positive for COVID and may provide an explanation for the events. Further information have been requested.</p>

993816	2/2/2021	CA	76	F	1/18/2021	1/1/2021	felt funny; eye lids tender; lips tingled; face was swollen more than before; This is a spontaneous report from a contactable consumer (patient). A 76-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiration date were not reported), via an unspecified route of administration in 18Jan2021 at 15:30 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient reporting on the COVID vaccine and who explained that she had a reaction to the vaccine. She had the vaccine yesterday (18Jan2021) about 03:30 in the afternoon and by the time she got home, within the hour, her lips tingled and she felt funny, and her eye lids tender. There was no one to call by that time and she did not think it was severe enough to go to the ER so she just took a Benadryl and went to bed. The patient woke up and her face was swollen more than before (onset reported as Jan2021). She doesn't think she is at the stage of life threatening, she can still breath, but doesn't know what to do at this point. Should she take more Benadryl or contact her healthcare provider. The patient asked if this makes her ineligible for the second dose. Outcome of the events was unknown. Information about lot/batch number has been requested.
994478	2/2/2021	TN	75	F	1/29/2021	1/29/2021	Began with nausea, followed by the worst and longest-lasting migraine headache that I have ever experienced on the evening of the second injection. Both the nausea and severe migraine lasted for 54 hours after onset. The first evening I also experienced teeth-chattering chills. Finally saw an improvement around 2:00 a.m. on Monday morning, February 1, when I woke up in a total sweat. By daylight on February 1, the nausea and migraine were gone, but I experienced mild dizziness and blurry vision. By Tuesday morning, February 2, I am more or less back to normal, although my vision is still a bit blurry and the dizziness still present if I move my head too quickly.

994346	2/2/2021	GA	33	F	2/1/2021	2/1/2021	The patient received the first dosage of the Moderna CoVid 19 vaccine today. The patient was informed that this will typically cause a sore arm and may cause symptoms of a upper respiratory type with some headache or achiness or even very minimal fever for the next 24 hours or so. Instructions were given to call me if symptoms become severe. Other instructions included taking Tylenol 325 mg 1 tablet 3 times per day as needed for aches and pains. It was reiterated that it is important to be sure to come back for the second dosage in 4 weeks and to continue to practice social distancing and wearing a mask and washing your hands frequently. Special mention was made to help the patient understand that maximal immunity to CoVid 19 infection does not occur until 2 weeks after the second dosage. Vaccine was administered in the deltoid of the left upper arm without incident. Waiting 30 minutes after the injection for evaluation and side effects was unremarkable except for the fact that the patient states that she had some slight blurriness in the left eye about 10-15 minutes after her injection but it went away after 1 or 2 minutes. She had no side effects from the injection at the time of her leaving.
994377	2/2/2021	FL	57	F	1/25/2021	1/25/2021	During the 15 minute observation time post vaccine on January 25, 2021, my eye lids were itchy (this is a typical allergic reaction for me). Reaction reported to Nurse. On Sunday, January 31, 2021, 4:00 pm, my face became red and blotchy, eyelids slightly inflamed. On Monday, February 1, 2021, 6:00 p.m., eyelids were swollen, area around the eyes were red, irritated and itchy. Hydroxyzine Pamoate 25 mg taken Monday evening would normally alleviate any signs of allergic reaction. On Tuesday, February 2, 2021, upon waking and throughout the day the area around the eyes were red, irritated, itchy and eyelids swollen with red blotchy skin on forehead and cheeks. Possible consumption of small amounts of soy lecithin (a known allergen) present in baked goods consumed on February 1 at 12:30 pm. Normally, I do not have an allergic reaction to small amounts of soy.

993788	2/2/2021			U			Conjunctivitis in right eye; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on an unspecified date (24Dec), at a SINGLE DOSE for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced conjunctivitis in right eye on an unspecified date. The outcome of event was unknown. Follow-up attempts are completed. The following information on the batch number has been requested.
996219	2/2/2021	WI	74	F	2/1/2021	2/1/2021	Client report having adverse reaction on 02/01/2021 at 12:28 about one hour after receiving COVID vaccine of unable to remember running a red light. She report loss of visual memory and no recall of passing through the intersection or seeing the buildings on the corners. Denies having blurry vision, blacking out, slurred speech or headache. Client had a virtual doctor visit and drove to have labs drawn today without issues.
995918	2/2/2021	NV	38	F	1/15/2021	1/16/2021	My left eye began twitching the day after and it has been non stop since then. Then my lip also began twitching. I have no existing medical issue and have never had this issue before.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
995921	2/2/2021	KY	65	F	1/26/2021	1/26/2021	Vaccinated at 1:20 PM on 1/26/2021. Approximately 15 min later I was in the waiting area, the nurse had been pre-notified to watch me for allergic reaction . In 15 minutes my symptoms were fast heart rate, lips burning, dark red facial flushing, ears flushing, and anterior neck flush, body tremors, a rapid response team notified to evaluate me. I was administered a 25 mg Benadryl tablet per mouth. I felt stabilized and chose to go to the ER within the building for further evaluation. Remaining stabilized, had a 4 hour wait until I was seen by emergency staff. My treatment was Solumedrol IV, Pepcid IV and Benadryl 25 mg po. I was placed on a heart monitor and a pulse oximeter to check my oxygen levels the entire time I was in the ER. 4 hours prior to being seen by the ER doctors I had a CBC, a BMP blood work, and an EKG. After medications were administered I was observed approximately 1.5-2 hours. I was discharged with a 5 day medicine regimen to follow. Prednisone 40 mg per day; Pepcid 40 mg per day; Benadryl 25 mg every 6 hours. On 1/27 I chose to take the Benadryl 25 mg only because I had received the Pepcid and Prednisone the previous night late. On the 28th I took the medicine as prescribed but only took Benadryl every 12 hours. I felt Benadryl 4 times a day would not be handled well with my body. On 1/30 I was able to take the Pepcid and Prednisone but had to discontinue the Benadryl due to waking up with a spinning sensation upon opening eyes and a loss of equilibrium upon walking. I completed my medicine regimen on 2/1. Today 2/2 I woke up with symptoms of watery eyes, flushed face, mild facial itching, after drinking one cup of full caffeine coffee developed an increased heart rate and nervousness, was medicated with Benadryl 25 mg po at 10:00 AM along with my blood pressure medicine and potassium. Also at that time my blood pressure was 150/80. Three hours later my blood pressure had come down to 130s/60s but felt extreme weakness and felt the need to lay down and rest with legs elevated. I continue with my day with increased heart rate with activity, so I have remained inactive for the rest of the day. Also on 6:00 AM on 1/27 I was awakened with a heart rate In the 160s, I called 911, paramedics came 5 minutes later. On arrival my heart rate had instantly went down to the 112-120 range. The paramedics explained they have been treating COVID

996444	2/2/2021	CA	40	F	12/28/2020	12/28/2020	I got chills; mild headache and just tired. It lasted and then I got sick on the 1st; Got tested for COVID January 3rd, 2021; On January 1 mild headache; tired and very congested but then real runny nose (went back and forth). On January 2, I got a fever - 101. Took Tylenol. On January 3, I got a fever. I was taking zinc; vitamins. My doctor prescribed medicine but I only took it twice as I didn't like how it made me feel - made it feel like I had something in back of my throat. I still have headaches - they aren't going away and neither is the tiredness. Yesterday, I woke up fine - but when I was at work started feeling very tired; and headache was so bad it felt like eyes were burning. Today I had a mild headache. I was staying at a hotel until the tests for COVID came back negative. I normally don't have headaches and fatigue.
996461	2/2/2021	MA	70	F	1/29/2021	1/29/2021	Swelling of right side of throat, right face and eye, chest congestion. (Get same reaction with sulfites but reaction more severe.) Throat swelling started within 15 minutes. Not sure if reaction so drove home. While driving, face and eye swelling. Took children's Benadryl (can't take adult Benadryl). Stopped symptoms. Wore off after 6 hours - swelling returned. Took generic 24-hour zrtex and symptoms stopped and didn't return.

996468	2/2/2021	NY	76	F	1/20/2021	1/20/2021	76 yo female with PMHx of CAD s/p CABG 2016, abdominal aortic aneurym, HTN, HLD, Asthma, Diverticulosis, Osteopenia. Presenting to the ED after having Pre-syncope. She reported that today morning she felt nauseated with episode of vomiting, burping and abdominal discomfort after having her lunch meal, headed out to receive her vaccine, she felt well till 10 minutes after the vaccine where a nurse noticed she is pale and less responsive, BP was measured back then and was ~70 ?, the patient reported that she was sitting when that happened, she felt lightheaded, sweating, blurry vision, nauseated. But denies any chest pain, sob, palpitation, weakness or numbness. She was out of balance and feeling weak till she came to the ED where she felt better after IV fluids.
996201	2/2/2021	IL	45	F	12/23/2020	12/25/2020	3 hours after the vaccine she started having pain at the injection site. The next morning she noticed she was having difficulty moving the R arm at the shoulder. She states that she has been having some paresthesias into the R arm on 12/24/2020. She states that these paresthesias extended from the right shoulder down to the hand and included some burning discomfort. She also states that on 12/24/2020 continuing into 12/25/2020 she cannot move the right shoulder through range of motion past only approximately 30° in flexion. She states that this is not limited due to pain although the right shoulder does hurt with range of motion. She states that she cannot make the right shoulder move any further through range of motion even with full attempt. She does state yesterday that she had some myalgias, chills, possible subjective fever. She denies any side injection erythema, edema, induration. She characterizes the pain as sharp and shooting as well as aching. She states pain severity is moderate to severe. She denies any relieving factors. She has attempted tramadol and Tylenol for relief. She states aggravating factors include any attempted range of motion of the right shoulder active or passive. She denies any additional focal neurologic deficit, fall or injury, neck pain or stiffness, vision changes. In the ER on 12/25/2020, The patient received ketorolac 15 mg IV and acetaminophen 650 mg PO

995504	2/2/2021	WA	31	F	1/8/2021	1/9/2021	Received #2 dose of Pfizer Covid19 Vaccine on 1/08/21 at 10 AM. Approximately 12 hours later she woke up with right eye pruritus with sensitivity, maculopapular erythematous rash and itching over left cheek to temple. She was rubbing at her eyes and did develop local swelling around the right eye. She treated herself with benadryl and advil. Her swelling and eye sensitivity decreased later that day but she developed a fixed itchy maculopapular rash on btl forearms (pictures in chart). She works in the ED as a technician and was seen during her shift 36 hours post shot. Diagnosed with a possible delayed reaction to the vaccine and discharged with prednisone, allegra, hydroxyzine. Symptoms have resolved except for residual hyperpigmentation over areas on forearms where the rash was and still feels itchy, though this increased after stopping antihistamines for her visit. She reports no episodes of lightheadedness/syncope, increased nasal congestion, difficulty breathing post vaccine. She has no history of anaphylaxis or allergic reaction to prior vaccines.
996251	2/2/2021	IL	20	F	2/2/2021	2/2/2021	Approximately 30 second after injection patient reported feeling nauseated and then passed out. Patient regained consciousness a minute later. Her vision and pulse rate was back to normal within 5 minutes. She was given juice and was able to walk to observation where she remained for at least 30 minutes.

995526	2/2/2021	VA	36	F	2/2/2021	2/2/2021	Vaccine administered by RN on 2/02/2021 at 11:50am. Location was at Nursing Home. Coordinating facility for vaccines is the Health District. Within five minutes after vaccine administration, the patient's co-worker informed the patient that she had some redness on her neck. Patient left dining hall where vaccines were being administered and upon return, RN with HD asked patient how she was feeling. The patient was noted to have a red neck and chest with some petechiae on neck and chest. Patient c/o headache and numb right arm, same arm used for vaccine. At 12pm, 25mg PO of Diphenhydramine was given by RN. The patient c/o nausea and started to vomit. HR was assessed by RN at a radial rate of 106 BPM. Patient stated her head was hurting worse and continued to vomit. RN, called EMS. Cold compress given to patient and patient was assisted to restroom by RN. Upon exiting the restroom, patient started vomiting again and stated her throat was itching and tongue felt swollen. She stated she was allergic to vanilla and her throat felt the same as when she reacts to vanilla. RN, attempted to visually inspect the patient's throat/tongue/mouth and noted that back of the mouth was edematous and unable to visually see the throat. 12:11 pm, 0.3 mg of epinephrine administed by EPIPEN into right lateral thigh. EMS arrived at 12:15pm. Patient assessed by EMS and agreed to transport to Hospital for evaluation. EMS and RN assisted patient to stretcher for transport. Nursing Supervisor, with Health District notified by phone by RN.

995532	2/2/2021	CT	49	F	1/28/2021	1/31/2021	I had the Pfizer COVID vaccine on 1/28/21, I had no side effects at all, left arm, site of injection was a tad sore, nothing out of the ordinary. Sunday morning my husband noticed I had a rash on my throat/neck and around my eyes. They were not itchy at all or bothering me. My inside of my throat was a little scratchy, but not closing at all. I put hydrocortisone cream on neck & throat Sunday night, Monday, rash, hives, scratchy throat were the same, Monday night after my shower, they were extremely itchy, I again put hydrocortisone cream on my neck and around eyes, it was still itchy and getting onto my eyelid, Monday my face was very blotchy and itchy, I called my doctor, who saw me right away, the doctor told me NOT to get the 2nd vaccine, he is concerned about an anaphylactic reaction and to take Benadryl. Doctor told me he would be researching if I could get another brand, ie. the Johnson & Johnson 2nd dose? Now, I am very nervous to get a 2nd dose and do not know if I should cancel my 2nd dose or not? I do not know who else to talk to about it?
995563	2/2/2021	TX	85	F	2/2/2021	2/2/2021	Seizure - onset approximately 1 hour after vaccination administration. No medical history of seizures. Duration estimated 3 min - myoclonic head jerking, eyes rolled back, cyanosis
995571	2/2/2021		47	F	2/2/2021	2/2/2021	1225- Patient reported nausea, visual spots, and fatigue after receiving second dose of vaccine to the Nurse. She also reported that she had the same symptoms after receiving the first Pfizer vaccine. Vitals were taking and patient was monitored. Patient later starting vomiting in clinic. EMS was called and patient left via ambulance. Methodist ED contacted prior to the patient arriving.
995855	2/2/2021	TX	44	F	1/5/2021	1/5/2021	right after the vaccine my whole arm got hot and traveled to the top half of body. I felt hot right away , during the day I felt my left eye a bit droppy and pain to the injection site by the end of that day I had chills, next day chills , nauseated, tired, slight cough and still felt my left eye droppy , next day slight sorethroat and by the next day I was good.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
995876	2/2/2021	FL	32	F	1/27/2021	1/27/2021	I could not lift my arm away from my body for about 12 hours and it progressively went away until it felt normal about 48 hours later. I also got a rash on the same arm where the vaccine was administered about 24 hours later that lasted 5 days. I had chills and a fever 12 hours after the injection lasting about 6 hours. I had a feeling of sinus congestion with coughing and sneezing starting 24 hours after the injection and lasting for about 4 days. Lastly, I had a rash on my upper face that started 36 hours after the vaccination. The skin felt very dry, was red, and eventually became scaly and flaked off from my eyelids and upper cheeks a few days later.
995402	2/2/2021	CO	54	F	1/17/2021	1/17/2021	Diagnosed with iritis on Jan 25. I had had irritated eyes since having covid (diagnosed on Nov 17, fairly ill) so I am not sure if had iritis before, but definitely became more symptomatic after getting vaccine, formally seen by OD on Jan 25 and diagnosed with iritis of both eyes, right greater than left. I also had symptoms post vaccine x 3 days of chills, headache, myalgias, nausea and diarrhea (same symptoms I had with covid). Treatment for iritis ocular steroids, treatment ongoing.
995862	2/2/2021	CA	39	F	1/26/2021	1/26/2021	Started with a rash to my neck and chest. A day or a rash started to develop on my forehead, eye lids and under one eye. Lymph node in my neck was also swollen. A week later my lips are slightly swollen, rash is better on my neck but is worse on my face.
995598	2/2/2021	WA	31	M	1/14/2021	1/14/2021	About one hour after injection developed left facial numbness while I was on my way home. Not full numbness, but felling as if coming out of a novocaine shot. Left side chin, lips, cheek extending up to ear/eye. No sign of swelling, droop, redness. Has lasted 2 weeks + and has improved over time but not fully resolved. Now is more an occasional numb feeling mostly in L cheek/lips/corner of L eye. I grind my teeth during stressful times and grind more on my left side so was thinking it could be related to that. Sought medical attention from my doctor who felt said most likely not Bell's palsy related.

995836	2/2/2021	NE	37	F	1/14/2021	1/14/2021	15mins after getting vaccine got a tickle in my throat. By 6pm I had a headache, tickle in my throat, intense fatigue, dizziness, chest pressure/sob, intense joint aches especially where I had fracture a bone in the past, deep muscle aches, nausea, right arm pain where injection went, also wasn't able to move my arm about 15degrees, By 9pm that evening my side effects increased 10fold. At that time it had taken some Benadryl and Tylenol to help with. That evening I don't remember going to be or how I got to bed. Then the next morning I woke with a terrible headache I, wasn't able to open my eyes, dizziness, nausea, SOB/chest pressure, intense joint pain, intense deep muscle aches, nausea, right arm couldn't move >15degrees, memory fogginess. Lasted all day and took tylenol, benadryl, and rescue inhaler for the SOB. Sunday AM I woke up feeling pretty good at 0800 Got started doing somethings around the house and it hit me again by 1200. SOB/Chest discomfort, headache, nausea, body aches, joint aches and lasted the remainder of the day. Then on that Monday I went and was tested x2 for covid and x1 for influenza/

995651	2/2/2021	FL	66	F	1/30/2021	2/1/2021	<p>From my diary about the events of yesterday and today: I will try to relate what happened to me yesterday. I received my second Covid vaccination a few days ago and perhaps the following is related, but I'm not sure. I think I felt fine yesterday morning, and decided to scrub my tub. I was mostly finished when I felt dizzy and went to lie down around 1pm. A friend texted me asking if I was free for a chat, but I wanted to rest a little and did so, texting her when I awoke. I did feel out of sorts when I awoke, and was aware that I had had some dreams, but texted her anyway. We agreed to have a call at 2pm. While on the call, I felt I was struggling with the conversation. I was trying to tell her of my experiences with a recent part-time job (which I quit) and couldn't remember names of people I worked with or certain events that I wished to convey. I still can't remember names of people with whom I worked, and it was just one week ago that I left. I suddenly felt really out of it and nauseous, and struggled to tell my friend I needed to get off the phone. I could not remember her name, to tell her this (and I've known her for 40 years)! The next few hours are a total fog. I know I was having dreams of a sort, but I was not asleep. There are maybe 2 hours that I can't account for. It is most troubling to me that I can't account for this time, but I know something was happening with my brain and while I was having these dreams or hallucinations, I was not asleep. I remember having to think really hard about what my son-in-law's name was ? note that I live with this person. I did not seek medical care, but feel like this information could be related to the Covid vaccine, and may be important to you. It was my night to cook, and I had a really hard time keeping up. I did manage to pull most of a meal together, but right before I was done, I needed to call my daughter to finish it. I was unable to eat anything myself, and only wanted a drink. I felt really nauseous and unsteady, although my thinking was a bit more clear by this time. I'm not sure when the numbness in my toes and fingers on one side of my body (right side) started, but as of this afternoon, both are still numb and weak. It is 1:00pm and I am still having trouble remembering some things, and that few hours of the afternoon from yesterday are completely lost to me. I have like a shadow hanging above one eye. I am seriously thinking I have had some sort of a neurological event. As of 3:00</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							today, my right hand and right foot are still numb, although my thinking seems to be clear.
995610	2/2/2021	TX	75	F	1/30/2021	2/1/2021	Angioedema type of reaction: Itching of both eyes. Itching, redness, and slight swelling of cheeks, elbows, knees, knuckles of both hands about 48 hours post vaccine. I have had this type of reaction previously - unknown trigger, not related to a vaccine. I took one benadryl dose, and called my PCP office. The nurse took the info, and advised me to take another benadryl if needed, and to call her back in 1 hr. I called her back reporting that the reaction had subsided. She gave the same advice and told me to make sure to call back if needed.
991377	2/1/2021	KY	52	F	1/28/2021	1/28/2021	Vision issues and bad headache (24 hrs.) My vision has not been the same since after receiving my second dose of the vaccine. Very hard to focus and everything seems shadowy or dim.
991698	2/1/2021	NY	40	F	1/19/2021	1/20/2021	Eye twitch, intermittent and random, ongoing daily
991688	2/1/2021	WA	46	M	1/12/2021	1/18/2021	Six days after the second vaccine, I had a sub-conjunctival hemorrhage involving almost the entirety of my right eye. There had been no trauma or other precipitating incident. My vision was fine, and there was no pain. It cleared up in about 2 weeks. I had never had this before. I have no bleeding disorders or eye problems. I wasn't convinced this was associated with the vaccine, but I'm now personally aware of THREE other people who had significant sub-conjunctival bleeds after the second Covid vaccine dose (all Pfizer). Two had some other symptoms after the injection, one did not. I was otherwise fine, and did not see a doctor (I work with ophthalmologists who said give it time, and if it didn't clear up I should get checked out)
991683	2/1/2021	OK	64	F	1/21/2021	1/21/2021	Approx 8 minutes after receiving the vaccine client started c/o feeling pressure behind her eyes. She has had this problem before and thinks it is because her blood pressure is elevated. Client was not feeling well enough to drive home so her husband came and got her. She said after she was home for a few minutes she felt better. She was able to pick her car up within 2 hours of the incident. She did call her PCP and let them know.

991999	2/1/2021	TX	37	F	1/13/2021	1/26/2021	13 days after receiving my first shot I started with a mild cough. I thought it was allergies associated with changing weather and I wasn't running fever so I continued to go to work. Two days later I still had no fever, but got dizzy and started feeling bad. I went and got tested that night and tested positive for the virus. My eyes have itch and burned, but I still have never run and fever and didn't loose my Sense of smell until 5 days after symptoms first started. My cough got worse and I have also had sneezing.

990428	2/1/2021		57	F	12/30/2020	1/1/2021	<p>Soreness in the arm; Conjunctivitis; Episcleritis; This is a spontaneous report from a contactable physician (dentist, dental surgeon/patient's husband). A 57-year-old female patient received the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EL1284), via an unspecified route of administration on 30Dec2020 at 57-years-old at a single dose for COVID-19 immunization. Medical history included blood pressure increased, and blood cholesterol increased; both from an unknown date and unknown if ongoing. Concomitant medications included atenolol (MANUFACTURER UNKNOWN) taken for blood pressure from an unspecified date to an unspecified date, "normal hormones" from an unspecified date to an unspecified date, "statin for cholesterol" from an unspecified date to an unspecified date. On 10Jan2021, the patient experienced conjunctivitis (non-serious). In Jan2021, the patient experienced episcleritis (non-serious). On an unspecified date, the patient experienced soreness in the arm (non-serious). The clinical course was reported as follows: The physician (patient's husband) stated that he and his wife received the Pfizer COVID-19 vaccine on 30Dec2020; and both had "a little bit of soreness in the arm, nothing spectacular." The patient developed a pink eye and was diagnosed with conjunctivitis 12 days (also reported as "approximately 10Jan or so") later after getting the vaccine (as reported). The doctor prescribed some topical cortical steroid eye drop. The eye was still swollen, and not totally resolved; "continually got worse." The patient consulted an ophthalmologist who gave the patient some prednisone ophthalmic (also reported as cortisone) and over the counter lubricant for the eyes. The patient was still symptomatic. The patient was diagnosed with episcleritis. The ophthalmologist classified the episcleritis as an autoimmune disease. Regarding the causality between the vaccine and the events, the patient's husband stated that his wife did not think it was related, and that the events could be totally idiopathic and there could be no correlation. The patient underwent lab tests and procedures which included COVID test: negative on an unspecified date. Therapeutic measures were taken as a result of conjunctivitis and episcleritis. The clinical outcome of the events was unknown.</p>

990497	2/1/2021	FL	71	F	1/9/2021	1/11/2021	nauseous; threw up all day; heart races a little bit in the middle of the night/her heart also went racing a few times in the night; sinus pain; dizziness/like she was not dizzy today like she was yesterday, but today she was just more like lightheaded; Low grade fever; feeling sick/doesn't feel good; head hurts really bad/terrible headache; This is a spontaneous report from a contactable consumer (patient). A 71-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; lot number EH9899, expiration date Mar2021) via an unspecified route of administration on 09Jan2021 at a 0.3mL via injection into the left arm for covid-19 immunization. The patient stated that she had Type 2 diabetes which diagnosed about 10 years ago and high blood pressure diagnosed about 20 years ago, so her providers office sent her a text saying the doctor wanted her to have the vaccine. She confirmed that she had no other vaccines on the same day as the COVID vaccine. The patient stated that she had high cholesterol about 5 years ago and her doctor initially put her on Lipitor, but she got to a point where she could not walk, so her doctor put her on something else, but she could not tolerate that either, so then she was switched to the Pitavastatin Calcium. The patient stated that she also had a very sensitive stomach, but she cannot think of the name of what she was diagnosed with because since she had her a couple of seizures started about two years ago this upcoming Aug, she can't think straight. The patient also had GERD about 5 years ago, macular degenerative disease a couple of months ago. All medical condition was still ongoing. Current concomitant medications included levetiracetam (KEPPRA, Tablet) 500mg, once daily, by mouth started from about two years ago, this upcoming Aug for seizures; metformin 1000mg, two tablets daily, by mouth started from about 10 years ago for Type 2 diabetes; allopurinol Tablet 300mg, once daily, by mouth started from probably 2 or 3 years ago for her kidney; metoprolol tartrate (LOPRESSOR, Tablet) 50mg, once daily, by mouth started from 2 years ago for high blood pressure; empagliflozin (Jardiance, Tablet) 25mg, once daily, by mouth has been on this product about 6 months for Type 2 diabetes; lisinopril Tablet 40mg, once daily, by mouth started from probably about 10 years ago for high blood pressure; diltiazem hydrochloride (CARDIZEM CD,

----------	-------	-------	---------	-----	----------	------------	--------------

24 hour Capsule) 180mg, once daily, by mouth started from a couple years ago; omeprazole magnesium (Prilosec, Capsule) 20mg, once daily, by mouth started from probably about 4 years ago for GERD; hydrochlorothiazide Tablet 25mg, once daily, by mouth started probably about 10 years ago for high blood pressure; Vitamin D 125mcg or 5000unit Tablet, once daily, by mouth as Vitamin supplementation started taking this about a year ago. The patient had a blood test where her Vitamin D was a little low. Vitamin C was got it over the counter; PreserVision OTC medication, with Vitamin A, E, C, zinc and copper Two capsules by mouth daily started from about two months ago for macular degenerative disease; pitavastatin calcium Tablet 2mg, once nightly, by mouth for High cholesterol; it was on it before, but started back on it a couple months ago. The patient reported she doesn't feel good and got headache on 11Jan2021, had dizziness and low grade fever on 15Jan2021, had nausea and threw up, sinus pain and heart races a little bit on 17Jan2021. She did not want to go through this again. The patient stated that she had the first shot of the Pfizer COVID Vaccine on 09Jan2021. She felt for a day and a half by Monday, 11Jan2021, she has been sick ever since, she did not feel good at all. She had a terrible headache, and for probably one or two days, she ran a low-grade fever. Her headache was still ongoing, but it had eased up because she was taking Tylenol. The patient stated that the dizziness she had, caused her to be nauseous and she threw up all day yesterday. She tried to eat something today and she was just having bad problems with feeling sick all the time. She asked if there are recommendations for getting the second shot after having symptoms like this. Today is the third day that she had been feeling the dizziness and it had improved a little, like she was not dizzy today like she was yesterday, but today she was just more like lightheaded. The patient reported that the nausea was ongoing, she felt like she was going to get like today like she did yesterday. She did not think she still has a low grade fever, she probably had the low grade fever on 15 and 16Jan2021. She just can't seem to shake not feeling good. At first that it was her sinuses because that was where her head was hurting, but then the sinus pain went away but she still had a headache. The patient stated that her heart also went racing a few times in the night.

990520	2/1/2021	FL	66	F	1/17/2021	1/17/2021	itching to eyes, mouth, and throat an hour after vaccination; itching to eyes, mouth, and throat an hour after vaccination; itching to eyes, mouth, and throat an hour after vaccination; arm soreness; dry throat; arm discomfort; This is a spontaneous report from a contactable consumer (patient). A 66-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) at left arm, via an unspecified route of administration on 17Jan2021 11:00 at single dose for covid-19 immunisation. Medical history included Cholesterol and Blood pressure, patient stated she took low dose medication for her blood cholesterol and blood pressure, but has had no new medications. She had a history of some allergies: a slight shrimp and scallops allergy, possible peanuts, penicillin, and a Neomycin product. She said they were not a big deal, and she had environmental allergies as well. She had an allergic reaction to the eye drop Neomycin, possibly, just the eye drop, she had a little breakout around her lips but she didn't know if it was the drug or not. The allergy to shrimp and scallops showed up in a blood test, her reaction to peanuts around her mouth but she had a negative scratch test and blood test for allergy to peanuts. The patient's concomitant medications were not reported. The patient stated she did get the flu vaccine, that was ok, she was fine, this was probably around Nov2020 or so, though she didn't know off hand when she got it, it was the regular flu vaccine and not an increased dose. The patient experienced arm discomfort on 17Jan2021, itching to eyes, mouth, and throat an hour after vaccination on 17Jan2021 12:00. The patient took the first shot yesterday (17Jan2021) and she had some discomfort to her arm, but it didn't bother her. She got the shot about 11:00 yesterday (17Jan2021) and about an hour after the shot she had some itching to her eyes, mouth, and throat that was not severe then was on and off through the day. She would like to know if this is common, she would like the information for the second dose, if she should expect more or less or same, she was concerned about the second dose. She did not have a severe reaction, she just wanted to make sure there weren't any adverse reaction for that make sure she known. She had not seen a doctor for her itching eyes, mouth, and throat. She didn't do any treatment for it, it was better today (18Jan2021), she just noticed it an hour

990792	2/1/2021	IL	71	M	1/20/2021	1/30/2021	Bell's palsy -L side of face began 1/30/2021. Gradual onset. Began with dysarthria and droop of corner of mouth, then upper brow of eye, then weakness in closing L eye. Went to Hospital ER. Diagnosis made after exam and tests
990917	2/1/2021	IN	63	F	1/30/2021	1/31/2021	The time of my COVID 2nd vaccine was around 12:58 pm on 01/30/21. I started noticing blurred visions and some tingling at the injection site about 30 minutes after vaccine. Around 9:00 pm I started feeling weak and muscle aches all over, so went to bed. Around 2:00 am on 1/31/21 I woke up in pain all over my body muscle ache, headache, and difficulty walking. Took temperature 99 and my average temp is 97.9. I took one extra strength Tylenol. On 01/31/21 I just felt bad all day felt like COVID symptoms but no breathing difficulties just bad headache all day, weakness, entire left side my body left arm, left side chest, left leg hurt worse than right side. I've just treated with extra strength Tylenol and rest. Last night temperature was still 99, but sleep through the night. Today, February 1 still weak, ache all over, mild headache, and some pain on my left side body. I have not sought emergency treatment as if the date/time of report. I'm a healthcare worker taking today and tomorrow off work to recover.

990523	2/1/2021	LA	80	M	1/17/2021	1/18/2021	he is shrinking; chills; tired; cant walk; it hit me like I had the virus; it hit me like I had the virus; My eyes are hurting; no matter which way I turned it was hurting, knees, everything was hurting really bad/aches and pain; dizzy/dizziness; weak; muscle pain; joint pain/back knees elbow joint pain; fever; headaches; This is a spontaneous report from a contactable consumer (patient). An 80-year-old male patient received first dose of bnt162b2 (Pfizer BioNtech Covid 19 vaccine, lot number EL1283) , via an unspecified route of administration on 17Jan2021 01:15 at single dose for covid-19 immunisation. Medical history included open heart surgery 11 years ago, covid-19 from Jul2020 to an unknown date. The patient's concomitant medications were not reported. The patient received bnt162b2 yesterday, with no problems. However today (18Jan2021), in 15 minutes after waking up at 11, he had the chills really bad, that went away, then he went to sleep again and woke up and he had all the symptoms on the paperwork, he had dizziness, headache, he's hardly ever had a headache ever. He had aches and pain. Caller states that he was just asking right now about another company, and their vaccine in started with an M, and her daughter is at a girls home, because she has a epileptic type thing, and this particular shot, that started with M, the nurse called over, and the problems that he is having he explained to the nurse is like when he had the virus previously about in Jul2020, when he had the virus he was in hospital for a week, because he had to get rid of the virus, and they got him out of that. Now he took this shot yesterday and the next day is when he got all these symptoms, he's tired, cant walk, muscle pain, had chills not any more, pain in the knees, everywhere really, he couldn't get any position to go back to sleep, his back knees elbow joint pain. Since he had these things, the nurse at the girls home, told his wife if having these problems he can take 300 mg of Zinc, 1000mg of Vitamin C, and 2000IU of Vitamin D, the same thing, that amount, he asks will it over come the symptoms. Another person felt good after getting those, it helped him he does state however that is what the person took when he actually had the Covid 19 Virus. Caller states that he received paperwork after the vaccine from the (State), it has a bunch of blocks asking if he has this or that symptom. His First dose was 17Jan2021 at 1:15, then on 07Feb2021 if this Second

							Dose. All the side effects started Today 18Jan2021. His doctor said he's in good health. He did have open heart surgery 11 years ago. The patient reported he is 5 feet 8 and a half inches, he is shrinking. He stated, "I was good until this morning, it hit me like I had the virus. The product they gave me at the (State) was the Pfizer-biontech vaccine. I had all the symptoms except vomiting/throwing up. I got all the other symptoms. no matter which way I turned it was hurting, knees, everything was hurting really bad. I was dizzy and weak so I don't want to walk around too much. I had muscle pain, joint pain, fever, headaches, chills, never went away. I hurt everywhere. I am really weak. My eyes are hurting. My daughter is in a girls home (paralysis problem). They had the vaccine from the another company and they have heard so many negative stuff so they decided they did not want to, when my wife told her I was having these problems. I had the virus 4 months, the nurse told me to take 300mg of zinc, 1000mg vitamin C and 2000mg vitamin D (the person took that when he had the disease). Should I take this stuff? Is there any information on that? what's in this? protein? my wife got the disease. They said she had enough antibodies. How long is the immunity? When does it start?" The outcome of the event chills was resolved, of other events was unknown.
992931	2/1/2021	WA	65	F	1/29/2021	1/29/2021	Rash on face and neck starting within 10 minutes of vaccine. Swelling in cheeks and left neck, and tightness starting in left neck. Itching in the eyes.. Benadryl 50 mg po taken and pepcid 40 mg po taken at home. To emergency room within 1 hour after the vaccine due to tightening and swelling in the neck. They gave me Solumedrol IM and po zyrtec and observed me for awhile. Tightening in the neck eased up and I went home. By bedtime I turned pastey white color, no rash. In the morning I broke out in another rash on my face and neck. Rash resolved by the second day.

992575	2/1/2021	FL	66	M	1/27/2021	1/27/2021	After the first dose I had no side effects but after the second dose I had various reactions: - about thirty minutes after the shot I developed a strange sensation on the left temporal area of my head extending to behind my eye. This went away after a few hours but when it started I thought of Bell's Palsy. - Later my arm got extremely sore at the site of the injection it still hurts and in a large area of the arm 5 days later - Painful area below the left armpit and in an area about 3 inches in diameter (area of the lymph node). Still have pain although less after 4 days.
992614	2/1/2021	CA	58	F	1/28/2021	1/29/2021	Chill, fatigue. Numbness on her face. Massive Cole sore on left side of her face. Head ache behind left eye.
992623	2/1/2021	LA	26	F	1/4/2021	1/5/2021	Following 1st COVID-19 vaccination she began having generalized fever, body aches, fatigue, and near syncope prompting her to go to the ED, 2 days after the vaccine. She also began having diffuse swelling of the LUE and L chest wall. Swelling down to elbow prior with erythema and mild rash, which I visualized in a photo. Unsure if blanched. Resolved over several days and was without symptoms when I saw her. Had IV in AC area for IVFs on impacted side but denied symptoms of infiltration.
992636	2/1/2021	TX	45	F	12/22/2020	1/5/2021	Patient started she had numbness to tongue area and HA to frontal lobe. Taste to food was different and the continues of HA and numbness sensation during the day/ evening. She was unable to close her R eyelid and R side drooping. The HA increased with time after two weeks the R side of the face different mouth and R side was swollen. She then seek medical treatment at the ER where she received prednisone and valacyclovir for one week treatment.

992761	2/1/2021	MD	66	F	1/19/2021	1/28/2021	Moderna COVID-19 Vaccine EUA For the first 8 days, I experienced no reaction to the vaccine. On day 9, I developed a rash on my right arm surrounding the vaccination site. I was also flushed and my eyes were red. And, I experienced diarrhea. I began taking Benadryl 25mg every 4 hours during the day (and took zolpidem only at night). In the subsequent 4 days, In addition to the rash, I experienced minor headaches and body aches (not unusual with my Fibromyalgia) so I added Tylenol 500 mg every 6 hours. The rash remained the same. Today is Day 5 and I awoke feeling better and the rash is the same size but not as vibrant. I used a cortisone cream on the rash today and only took Benadryl once when I began to feel lousy at the end of my work day.
992768	2/1/2021	AR	62	F	1/29/2021	1/29/2021	(Friday)Immediately after the injection-dizziness, vertigo, tunnel vision, blurred vision, pin point pupils, unable to talk, headache, facial and lip numbness, numbness traveled down the right side of my body (side of injection) trembles, weak legs, very weak all over. EMTs were called but I didn't go to the hospital. My son picked me up and took me home because I was unable to drive. On the way I experienced loss of vision and speech for about 5 minutes. When I got home, my legs were so shaky that I had to have help walking. I started getting severe chills that took 3 hours to get warm (2 heavy blankets, space heater, and heating pad). I was very fatigued and felt bad the rest of the day. (Saturday)The next day I had flu-like symptoms; headache, joint aches, chills, nausea, extreme fatigue. Sunday was better but still had to rest most of the day because when I would stay up for over 30 minutes, the symptoms would return. Monday-stomach cramps, headache, fatigue but went to work (30 minutes late due to stomach) and left 30 minutes early.
992828	2/1/2021	CA	48	F	1/25/2021	1/25/2021	1-25-21, at around 6 pm at work reported she had soreness and numbness to entire L arm and numbness at L side of jaw (upper and lower) and cannot chew with L side of jaw. Denied having any issues with R side, drooping of face, periorbital swelling, tongue/lip swelling, respiratory distressed, ALOC or altered vision, pain. She contacted PCP on 1-26-21 and informed her that side effects will subside gradually without further treatment.

992559	2/1/2021	WY	39	F	1/27/2021	1/27/2021	15 minutes after her vaccine she complained that she had blurred vision. She did report that she had a latex allergy so I removed the band aid even though the band aides are labeled latex-free. I checked her vitals and Her b/p was 114/85 pulse was 84 and respirations 16. Her pulse ox was 95% She was in no apparent distress. The blurred vision resolved in 5 minutes and her vitals remained stable for 30 minutes. I discharged her with no symptoms.
992924	2/1/2021	NY	65	F	1/26/2021	1/31/2021	Approx 40 hrs after injection, blurred vision, two hrs later, vision was restored to about 80%, one hr after that, blurred vision returned, restored two hours after onset to about 90%, then blurred vision returned for 2 more hours and. Restored to 100%. All total episode lasted 5 hours.
992673	2/1/2021	LA	43	F	1/11/2021	1/11/2021	A couple of hours after receiving the vaccine a co-worker said my eyes were very low and red. I started feeling extremely exhausted and even slept on my shift on my desk. My supervisor told me to go home for the day. I went home and slept through the day and night until next morning. I then started feeling myself again.
992937	2/1/2021	AZ	44	F	2/1/2021	2/1/2021	Numbness on left side of face, chin, behind ear, around eye, and inside of mouth.
992952	2/1/2021	KY	34	F	2/1/2021	2/1/2021	About 5 minutes after receiving the shot, I started having intense dizziness, and nausea, and my body felt very hot. My eyes teared up as well. This feeling subsided a little after 15 more minutes, so I went home. At home (and within 30 minutes of receiving the vaccine), the lymph nodes in my throat swelled considerably and I had great difficulty speaking. Having experienced anaphylaxis in the past, this was not anaphylaxis but something else entirely - it was like my vocal cords were paralyzed. I took ibuprofen to help with the swelling, but it did not seem to impact my throat or ability to speak. About 4 hours later my throat muscles seemed to loosen and I was able to speak fairly normally again.
992957	2/1/2021	CA	66	F	1/21/2021	1/27/2021	Droopy right eye, pain and pressure behind right eyeball, drooling out right side of mouth, slight head head , droopy right eyelid, thought I was having a stroke. After 2 visits to the E.R. , multiple test, diagnosed as having bell-palsy.

Planned follow up with Dr. (neurologist) this week and follow up with Dr. (neuro-ophthalmologist) next week
993038	2/1/2021	MI	66	F	1/27/2021	1/31/2021	January 31 I noticed that my face was tender when I touched it near my left temple. I didn't really think anything about it until it became more and more painful. The area involved increased from the left temple to in front of the left ear and above the left jaw. I also noted some stiffness of my upper neck and shoulders. I took Tylenol and Motrin and it relieved the discomfort some (from 3/10 to 2/10 on pain scale). It was mostly painful when palpated. I woke this morning with most of the discomfort gone (less than 1/10 on pain scale). Could just feel it a small amount when palpated the left temple and in front on left ear. At no time have I had any visual disturbance. The pain was constant and elicited most with palpation and movement of the jaw. No severe pain. Not sharp or burning. Mostly an ache and a bit of numb feeling. There is still a bit of lingering discomfort with palpation now (the evening of 2/1/21)

993108	2/1/2021	WA	39	F	1/29/2021	1/29/2021	Day 1: numbness, pins and needles to bilateral lower legs. The pain was severe. They felt frozen. Body aches ascended from feet up to shoulders and then head. This lasted for 6 hours. Severe pain. Tylenol and ibuprofen did nothing. I could not focus my eyes on an object, and my ears stayed plugged, I kept trying to pop them. My throat became raspy and irritated. (Symptoms started at 16 hrs) Day 2: started having fever symptoms at hr 22, cold sweats and malaise. Couldnt get out of bed.. charley horse cramps to legs, and lower back pain. Gatorade and water didnt seem to help. I became tachycardic. I was all alone and didn't have the energy to take my vitals, I wish I had, but I know my heart was bounding quickly. Im sure I was very dehydrated. My normal HR is 70-80s. Day 3: find my right axillary node is hard and swollen, my right arm still hurts too. General body pain and fatigue still, finally able to get out of bed. Day 4: (today)out of bed most of day but in pain still, fatigued. Lymphadenopathy to right axillary still. Called out from work. Im an RN, and have chosen not to go to the E.R for prolonged symptoms. If I am still symptomatic tomorrow I will. I have a dr. Appt in 2 days with a new primary care doctor.
994307	2/1/2021	AZ	53	U	1/27/2021		pt. has history of anaphylaxis with allergy shots, possible sulfa. Was asked to stay in observation / 30 minutes rather than standard 15. Was asked to tell us if she had tingling in mouth while in observation. At 425p pt reports tingling in mouth. Dr called & arrived at 428. Claritin lot 1/22 given BP - 130/90, pulse 90, sats 97%, 98% R= 16. Per Dr. - lungs clear no visual swelling in the mouth. EMS arrives - 430p. Dr. & EMS w/patient 440 - sats 98%, pulse, R = 16 445 - pt states she feels less anxious, tingling seems to be gone 450 - Dr - lungs clear, no visual swelling in mouth okay to discharge to husband is just outside facility 452 - pt agrees she can discharge aware to call 911 if any new swelling in mouth occurs

990127	2/1/2021	MD	32	F	1/29/2021	1/29/2021	Approximately 1 hour after injection I developed chest tightness, burning eyes, scratchy throat and hives. No anaphylaxis. If Benadryl was not taken regularly the hives would return for the first 48 hours.
992083	2/1/2021		56	F	12/31/2020	1/1/2021	Right after she received her dose, she just had a sore arm. 13 hours after vaccination, patient had a dry cough that woke her up from sleep. She then started to get a headache and took ibuprofen. She spike a temp of 99-102 degrees Fahrenheit. Blood pressure elevated to 165/100. One hour later it was 155/101. Normal baseline is 110-130/55. No visual changes occurred. After 8 hours, the blood pressure normalized. By 01/02/21, all symptoms had dissipated. I referred her to see her cardiologist for approval before second dose.
992871	2/1/2021	AZ	59	M	1/29/2021	1/29/2021	Pt started developing a droopy right upper eyelid on Friday night (01/29/21) and by the time he woke up on Saturday, his right upper eyelid was completely shut and he couldn't open at all unless he physically used his finger to open the lid. Pt also experienced double vision when opening the eye. Pt went to the Emergency Dept and was given an MRI and CT to r/o stroke and everything came out normal. He was diagnosed with a partial 3rd nerve palsy and was referred to Optometry where we saw him on Monday (today). Pt does indeed have a partial right 3rd nerve palsy which can happen after vaccinations.
992267	2/1/2021	GA	69	F	1/21/2021	1/21/2021	Recieved vaccine at Health department on 1/21/21 around 3:45 pm. Patient felt that injection was a little high on the arm. Patient states she had a bruise that night-grape sized with a tail, the tail went away. She continued to have a grape sized bruise until around 1/28 when she noticed a 1 in pink ring around the bruise this continued until it reached 2 in ring and then stopped. Patient has not done any treatments or been evaluated. She will continue to monitor her symptoms. Asked that she go to Health dept so that she could be visualized. Her PCP encouraged her to go to the emergency room if there was any progression of symptoms.

992263	2/1/2021	NC	54	F	12/22/2020	12/24/2020	I had my first covid vaccine 12/22/20. On 12/24/20 I noticed I could not see as well as normal with my RIGHT eye. I had a sore left arm and headache, which I attributed to the vaccine. By 12/27/20, I called the emergency number at my primary ophthalmologist as was seen. They thought I had a posterior vitreous detachment and asked me to see my primary eye doctor in a week. By 12/30/20 I could not see to work and called the eye doctor and they decided I should see my retinal specialist who deals with problems with my left eye. He could see nothing to explain my decreased acuity and told me to keep my follow up at the other office. I saw a Dr on 1/4/21, who takes care of my left eye cataract and glaucoma. He called in an associate. My vision had further declined and they thought I had ocular neuritis. I couldn't see the big E on the eye chart at all at my worst. I was scheduled for an MRI of the head, which showed ocular neuritis in my right eye. Dr assumed care and I started IV steroids on 1/13 for 3 days, followed by oral prednisone taper. I also was referred to a neurologist to rule out MS. I saw Dr. 1/28/21. After the steroids, my vision improved, but I still can't work or drive. Neurologist does not think I have MS and is ruling out NMO but doesn't think I have that either.

992307	2/1/2021	VA	44	F	1/30/2021	1/30/2021	Approximately three hours after injection the lymph node in the armpit closest became swollen and arm was sore. Administered Tylenol. At approximately midnight woke up with severe chills, fever (103) , Body pain, Severe eye pain and nausea. Developed a headache and sweating throughout the night. Continued to administer Tylenol at regular intervals. Sweating was profuse in that pajamas needed to be changed twice. At this point it has been more than 24 hours and though the symptoms have reduced in severity, eyes are still very sore and still experiencing chills and low-grade fever off and on. I would've gone into urgent care but there was a huge snowstorm. The reaction was quite concerning and very surprising. There was literally only a sore arm and mildly at that from the first injection .
992308	2/1/2021	WI	25	F	1/28/2021	1/28/2021	: 10 minutes after vaccination to left deltoid, patient approached medical assistant in observation area and reported left neck discomfort and difficulty breathing ?with mask on?; patient taken immediately to exam room for evaluation by nurse practitioner, including full set of vital signs and clinical eval (physical exam and subjective interview); performed continuous monitoring in exam room (including vital signs and physical exam) with 2nd nurse practitioner joining at times to assist; after several minutes, patient reported vision problems at which point patient was placed in supine position on exam table; after laying supine for several minutes, patient exhibited seizure like activity; at onset of seizure activity, notified COVID-19 RN to activate EMS via 911; Epinephrine via autoinjector was then administered to left vastus lateralis; continued clinical evaluation and vital signs monitoring until EMS arrived at scene to assume care; patient alert and accompanied by staff for transport to Hospital via EMS

992411	2/1/2021	TX	43	F	1/28/2021	1/29/2021	01/29/2021 930 noticed an itch on left thigh, like I wanted to hive - on various spots throughout the day. 01/30/2021 very tired (to be expected), noticed I had burning in what feels like my gall bladder and developed an ?odd? stomach ache later in the day. Thought it had to do with something I ate, but consumed nothing out of the ordinary. Went to bed early, felt like I wanted to fever but never did. decided to take a tsp of children?s Allegra because I still felt ? itchy? at times. 01/31/2021 woke up to what felt like pressure on my chest, like someone was squeezing me. Thought that was odd and thought it was perhaps the way I slept. Was still tired (4AM) went back to sleep. Woke up again feeling more rested and the same feeling. It was an awful feeling. Grabbed my pulse oximeter and my oxygen was about 96 laying down. Called an. ER, thought maybe I had Covid or something as I have never felt that way before. Receptionist told me she felt the same way after she got the shot. I ate, felt better but then developed a horrific headache akin to a migraine that was so sensitive to any movement I made. Felt like someone was shaking my head, it was so painful and I became disoriented. Like. I would get confused in my thoughts. Became very sensitive to light and movement. Looking at Facebook, I had to stop because I felt like I was going to seizure. Had to really rest. Ate lunch and took a multivitamin to see if that helped. Eventually I felt better but had to be careful, take it easy. 02/01/2021 woke up this morning still tired, like my body is fighting something. And I could feel the headache coming on and noticed I was getting confused in my thoughts. I decided to stay home from work. The morning was very bad as I felt as though I wanted to seizure. Could not get a hold of my doctor. My head still hurts, not as bad, but after I eat, I get confused and can?t hold two thoughts at once if that makes sense. Head seems very sensitive to eye movement like yesterday. It?s a gross feeling, even in absence of the pain.

989487	1/31/2021	CA	31	F	1/29/2021	1/30/2021	I received the vaccine on 1/29 at 5 pm and was feeling fine afterwards with only a slightly sore arm at the injection site. Then yesterday, 1/30 around 6 pm, I started to have a very fast heart rate, despite not exerting myself and only sitting down at the time. Between 6-6:45 pm, I had a heart rate between 125-140 bpm, according to my fit bit device that tracks my heart rate on my wrist. Anyways, after that I was going to the bathroom and started to feel nauseous, light headed, felt hot and chills like a fever, abdominal pain and vision issues (blackening in some spots and blurry on and off) so I went to lay down. I didn't vomit and the chills/hot fever feeling went away in 15 minutes. I also took my temperature and it was normal. My abdominal pain continued but the light headedness and nausea and vision issues subsided. I was unable to get up and do other stuff, so I just slept it off. I'm feeling better this morning. I had also drank about a half glass of wine (maybe 2 oz), so i'm not sure if that contributed to it, but i've never felt that way after drinking wine, especially that small of an amount. I had also drank this wine around 4 pm and that was 2.5 hours before I started feeling this way and did not drink anything on the day I received the injection.

989021	1/31/2021	KY	35	F	1/27/2021	1/28/2021	is a 35 y.o. female who presents ambulatory to the emergency department. She states last evening she began having chills, body aches, headache, difficulty taking a deep breath, nausea. Patient denies any tongue swelling or throat swelling but states when she was eating she felt nauseous. She did get her second maternal COVID-19 vaccine yesterday. States she took ibuprofen last evening but has not taken anything today. Patient does have a history of asthma. She does take two maintenance inhalers on a daily basis. She does take albuterol as needed. Has not had to use her albuterol inhaler. Patient denies any fever. She denies any vision changes, hearing changes, neck pain or stiffness. She denies any chest pain, abdominal pain, nausea, vomiting, diarrhea.
988883	1/31/2021	NY	52	F	1/15/2021	1/23/2021	Over the past 10 years I have occasionally experienced bouts of episcleritis which last approximately two days and responds well to ibuprofen. One week after receiving the vaccine I experienced the most severe flare up to date. My left eye was completely red, swollen and painful. Two days later my right eye also flared up. This episode has lasted 8 days and counting. There has been minimal relief using ibuprofen and I have had to add ice packs to help relieve the swelling and pain. As this condition is caused by inflammation I believe there may be a connection.
990026	1/31/2021	CA	70	M	1/31/2021	1/31/2021	slight headache, eyesight adversely affected: bright white objects extremely bright, as if my eyes were dilated. Lasted from time reported until 6PM.
989567	1/31/2021	TX	31	M	1/3/2021	1/4/2021	I woke up the next day with a severe headache, body aches, chills, severe malaise, sore throat and my face had swelled at around my eye sockets close to the bridge of my nose. All these symptoms last about 5-7 days.
989043	1/31/2021	NC	42	F	1/27/2021	1/27/2021	Within 30 minutes of the injection I had a lot of nausea and a weird taste in my mouth. This went on for a few hours. Then I had fever, body aches, bone and joint pain, headache, eye pain for about 36 hours. I continued to have a headache with eye pain following this for a day.
989977	1/31/2021	CA	53	F	1/29/2021	1/29/2021	Body ache, headache, eye ache, fever

989988	1/31/2021	MI	52	M	1/10/2021	1/11/2021	Diagnosed day after 2nd shot with ophthalmic artery thrombus causing vision loss/change in left eye. I did get shot series on 12/22/2020 #1 and 1/10/2021 and was diagnosed with Covid-19 on 12/13/2020. My internist MD did not feel the vaccine caused the thrombus /Stroke but I wanted to report it as it was associated with the vaccine administration (symptoms of vision loss within 24 hours of the vaccine #2 administration).
989590	1/31/2021	FL	85	M	1/7/2021	1/7/2021	The evening of the vaccine, Pt developed headache and puffiness of his eyes, as well as a decrease in vision. The following morning, his eyes were still very puffy. He was seen by his ophthalmologist 1-2 days later, who diagnosed him with corneal inflammation and keratitis. Steroid eye drops were prescribed to be instilled in both eyes qid. He went back for a follow-up on 1/28/2021 at 9:00 am. His eyes were worse, and he was prescribed a stronger steroid drop. His ophthalmologist advised him NOT to get the 2nd dose of the COVID vaccine, which was scheduled for that same day.
990032	1/31/2021	CA	65	F	1/31/2021	1/31/2021	I felt a sensation immediately after the injection. Ten minutes later I began to feel fuzzy but not that noticeable. The left muscle in my left side of my neck stiffened. As we left the area and headed down the street I was getting anaphalactic: numb jaw, swelling tongue, closed throat, eyes closing, inner cheeks numb - as if I was severely novacained from the dentist. I was able to breathe ok to get home hoping it would pass and drank water to keep things fluid. I was there for one hour. On advice, I went to the ER to get checked out.
990061	1/31/2021	NC	35	F	1/19/2021	1/21/2021	Started with mild headache. Turned into severe migraine with stroke like symptoms (numbness in hands and face, loss of vision in one eye, seeing waves, dizziness, difficulty speaking). Vomiting, neck pain. PRN medications did not help. Went to ED at Hospital for 4 hours. MD ordered troponin level, metabolic panel, CBC, COVID test, and head CT. ECG. Given multiple rounds of toradol, Ativan, Benadryl, Reglan, fioricet. Sent home with fioricet. Continue to have daily headaches and neck pain.

990025	1/31/2021		31	F	12/29/2020	12/29/2020	Asthma attacks, fatigue, brain fog, eyebrow hairs fell out, endometriosis pain unbearable, chills, nausea, headaches
989917	1/31/2021	WA	36	F	1/23/2021	1/26/2021	Urticaria/ hives on face, around eyes, neck, chest, trunk/around bra line, underarms. With systemic itching and redness. Symptoms presented between 830pm and 915pm. Unrelieved/no improvement with Benadryl PO. After consulting with nurse line from local hospital, per instructions I went to the emergency department and was diagnosed with urticaria/hives and treated with IV SoluMedrol and IV famotidine. I was discharged with a 5 day course of PO prednisone and to take over the counter Benadryl and PO famotidine until symptoms resolved. The hives resolved by 1/28, though additionally, I had moderate to severe side effects from the prednisone on 1/28 (2nd dose). I was unable to go to work 1/27 and had to leave work 2 hours into shift on 1/28 due to side effects from the prednisone.
989888	1/31/2021	FL	67	F	1/22/2021	1/22/2021	Shot administered 6:08pm. About 6:18pm I felt very tired and wanted to close my eyes. I told my husband 'I don't feel well'. Immediately my eyes rolled back and convulsions started. Then I passed out. EMTs were called over to car and started to administer oxygen. I woke up about 6:30pm cognizant of surroundings. BP was normal. No fever, no rash, no chills. I was just tired. Then 2 hours of vomiting started. Last vomit about 8:15pm in ambulance. EMT unable to administer IV. After waiting in ER waiting room for 45+ minutes, a bed was available (around 9pm). ER doctor gave me ondansetron ODT 4mg Once. Released at 10:12pm to go home. Next 3 days symptoms of lightheadedness and dull headache.
989809	1/31/2021	OR	48	F	1/10/2021	1/11/2021	Left eyelid twitch developed the morning after administration and continues at least 4 times per hour. Also sensation of heaviness behind both eyes and under eyes.

989629	1/31/2021	MI	34	F	1/27/2021	1/27/2021	Within 15 minutes chest became tight and became very dizzy. I took my meclizine for the dizziness sat my 30 mins and started to drive home. While driving home the left side of my face became numb and stayed that way for an hr still with chest tightness and dizziness went away. My gums started to hurt and right breast. I was very exhausted and very nauseous so went to bed. The feeling of tightness and numbness went away and woke up the next day still very exhausted unable to eat due to nausea. Still was dizzy and had a migraine, and had extreme muscle pain and multiple sores in my mouth. I slept the entire day again and until 2 on the following day. Dizziness has not gone away I still have it and a weird feeling in my neck/ center of my head. Have a low appetite and still have muscle soreness. I now have 2 cold sores and multiple sores in my mouth including my tongue. My right eye vision has decreased as well.

989606	1/31/2021	CA		F	1/12/2021	1/15/2021	Got my 1st dose of vaccine on 1/12/21. I experienced pain on my L arm the following day. And felt generalized body aches. I took ibuprofen and it's all gone the following day. But on the 3rd day I began to experience itchiness on one part of my body...which is my L arm. Then it began to spread all over my body. I took cetirizine in the morning for itchiness and benadryl at night so I can sleep better. The itchiness was controlled by anti histamine but small redness/ rashes kept spreading all over my body as days go by... the rashes and itchiness continues everyday until it becomes hives. Hydrocortisone cream or moisturizer had temporarily relief. Last night it spreads thru my neck, ears, face and my eyes that's why I called in and will go to urgent care or ER soon.

988252	1/30/2021	PA	29	F	1/20/2021	1/21/2021	<p>~~Pfizer-BioNTech COVID-19 Vaccine EUA" I received my 2nd dose of the Pfizer COVID-19 vaccine on Jan. 20th, 2021. On Jan. 21st, 2021, I woke up feeling feverish. I went to use the bathroom, and after washing my hands I walked towards the bathroom door and felt light-headed and dizzy. Suddenly, I passed out and hit my head and upper neck on the tile floor. My parents heard the sound of my fall and luckily rushed to the bathroom. They found me lying unconscious on the floor with my eyes rolled up for what felt like more than a minute. I regained consciousness on my own, and I drank water with a bit of sugar and salt mixed in. I felt too weak to get up and walk, and the back of my head and upper neck were in pain. I told my parents to call 911 as I wanted to make sure that there was no serious damage to my brain or neck area. I went to the local hospital in an ambulance. I was taken to the emergency room: Vitals were done and my temperature ranged from then was 99.5-101F and my heart rate was high- it stayed around 112 bpm for some time I was given 2 L of IV Saline Fluids EKG result: no clinical abnormalities CT head/neck/spine: negative 2 different types of COVID-19 tests: results were both negative Bloodwork: CBC/BMP/D-dimer: no clinical abnormalities Chest Xray: negative 2D-doppler ultrasound: negative Holter monitor: negative for irregular heart rhythm I was discharged the same day around 4:30pm</p>

988055	1/30/2021	WI	22	F	1/26/2021	1/27/2021	Received vaccine at 6:30pm on 1/26. Woke up at 7:30am on 1/27 feeling nauseous and had a headache. Rested for a few hours and went to work. At work (noon), suddenly became very lightheaded, cold, sweaty, experienced blackout vision around periphery and felt faint and nauseous. Threw up. Went home and had extreme chills and could not get warm. Nausea subsided around 6:00pm 1/27. Headache and neck soreness continues still today (1/30). Headache feels like pressure inside my head, pushing and causing dull pain at the base of my skull and top of neck.
988040	1/30/2021	MN	49	F	1/28/2021	1/28/2021	30 minutes after my 2nd shot my left lip, cheek to my left eye went numb, this lasted until the evening and had it minimally the next day as well. Today is 3rd day out and my outer corner of left lip has a little fuller and feels that way compared to other side, when you look at it there doesn't seem to be a physical change. This the original spot in which I felt it come on. I had this similar response with first dose but this didn't come on until 5-6 hours later. I have reported this adverse effects with this site as well.
988030	1/30/2021	WA	65	F	1/15/2021	1/16/2021	I felt anxious after the shot, but that night felt ok. Morning was another story. I woke up with pain in my muscles from the waist down and found it difficult to walk. My eyes started to hurt. I had blurred vision. Around 2:00 I went by the mirror and saw that my eyes were blood red. I laid down and rested. About 2 hours later I got up the most of the redness was gone but then I had a headache. The next morning a persistent cough and the sneezes started. The headache would return every time that I coughed or sneezed. It was very painful- as if someone hit me with a hammer. Even though the pain only lasted a few minutes, it hurt a lot. I sneezed and cough a lot. Finally, Sunday morning I was walking better; however, I felt I had the flu. Normally, I would have gone in and got ready for a sub, but I wasn't able to. I rested on the couch. Then took a 2 hour nap. Finally, I felt better around 6 pm except for the painful headache that returned every time I coughed or sneezed. It has been a week. I thought the worse would be over by now. I guess I will have to go in and talk to my doctor on Monday because the sneezes and coughs are still quite painful. When will it end?

987977	1/30/2021	FL	59	M	1/19/2021	1/22/2021	Approximately 60 seconds prior to emergency, patient felt a sense of panic (first time ever). Stated to me (wife) "I feel like I am having a panic attack" as we walked on to a parking garage elevator at 12:30 pm on 1.22.21. As I turned to push the button to go down, leaned against the wall of the elevator. His eyes fluttered and back, he was a little pale. When I turned around, again, he fainted and fell face down on the elevator floor. He never stopped breathing and had no convulsions. He was out for less than 30 seconds. When he came to, he got up by himself with minimal assist from me (911 was already on their way). He did not remember saying that he felt like he was having a panic attack; but he remember the fear/panic he felt just prior to. He was oriented x3. I had him smile, stick his tongue out and speak to make sure it was not a TIA or stroke and there were no symptoms of that. His bladder did release. He went by ambulance to the ER (we were on a mini vacation to celebrate his birthday). They did a CAT scan, checked his blood sugar twice, EKG twice, complete blood work panels and urinalysis. All tests were either normal or negative. They found nothing. His BP was normal for the first 30 minutes at the hospital, then increased. But has been normal ever since (he checks it daily). Absolutely no other symptoms since that episode. He met with our PCP on 1.29.21 as a follow-up and she directed us to complete this form. She has ordered a consult with a Neurologist and that is scheduled for 3.10.21. His second shot for the vaccine is due on 2.9.21.

987819	1/30/2021	WI	31	F	1/29/2021	1/29/2021	. She received the second covid pfizer vaccine 1/29/21. Within minutes post vaccine she had bilateral hand arm tingling. She stayed longer for observation and the provider did a brief exam which was normal. The paresthesias have persisted but now only in bilateral 4th to 5th digits. Severe, 8-10 HA began 7-8 hours later and has persisted in severity of 8/10 at worst and 6/10 this morning as she slept better through the night. It is located in the left orbit, left frontal area, throbbing, persistent, causing nausea and vomited 4 times since onset. Her vision is intermittently, "fuzzy" like she as if she does not have her glasses on only in the left eye. This comes and goes and seems to be present as the HA worsens. She has a hx of menstrual triggered headaches that resolve with meneses and just with OTC treatment. No photophobia. She has taken IBU 400mg q 8 hours, APAP 1g last night, melatonin 10 mg last night to sleep. Did not work her night shift last night due to the vision and HA she did not think she would be able to perform functions of her job. She also has flu Like symptoms of body aches, tired, no fever. Admits her anxiety is making the symptoms worse.

988287	1/30/2021	IL	23	F	1/29/2021	1/29/2021	I received my second dose of the Moderna COVID vaccine at approx. 10:40 AM on Friday, January 29 at clinic. By 12:00 PM, I noticed that I developed facial swelling, which was most significant around my eyes, and I felt lethargic. Between 12:00 PM and 2:00 PM, I developed hives on my neck, chest, stomach, and arms, which prompted me to take 1/2 of a dose of 25mg Benadryl. Nonetheless, the symptoms persisted and I began to experience dizziness and tightness in my throat around 4-5 PM, which was when I was advised by a nurse to go to the emergency room for treatment. I arrived at Hospital's Emergency Department around 6:00 PM and I was treated for "Possible Allergic Reaction Major." I received diphenhydramine (BENADRYL) injection 50 mg, famotidine (PF) (PEPCID) injection 20 mg, methylprednisolone sodium succinate (PF) (SOLU-MEDROL) injection 125 mg, sodium chloride 0.9 % iv bolus, and acetaminophen (TYLENOL) tablet 650 mg. I was discharged after 10:00 PM and sent home with a prescription for prednisone 20 mg and famotidine 20 mg. My facial swelling and hives have gone down but neither have completely resolved since being discharged. I am also experiencing full body aches and fatigue at this time (3 PM on Saturday, January 30).
987960	1/30/2021	AZ	37	F	1/28/2021	1/28/2021	Injection site started to be painful around 3 PM same day of injection, around 6 PM that same evening of January 28 I began to feel really cool.... went to bed around 730 and throughout the evening I woke up about every 1 to 2 hours sweating but feeling cold. My body hurt to touch. Left work early January 29 because I did not feel good. Afternoon of January 29 around 4 PM I noticed some redness approximately an inch and a half below the injection site. Looked like a lump under my skin and it was painful to the touch. I took Benadryl the evening of January 29 and the morning of January 30.,Not sure if the Benadryl is helping. I am keeping an eye on the redness and the lump, if it does not go away I will contact my provider. I do not feel the chills or feverish anymore and I was able to sleep through the night on January 29

988802	1/30/2021	AZ	61	F	1/30/2021	1/30/2021	in first half hour, heat/flush came up the left side of neck and face up to eye. inside of ears felt warm. extreme tinnitus. took Benadryl and slept. after 5 hours, symptoms came back. feels like lower jaw is pulling to right. took more benadryl.
988303	1/30/2021	TX	31	M	1/25/2021	1/26/2021	I received it at 10am and around 2am that night I started to have a bad headache and body aches. I would fall asleep for a bit but then at 4am I woke up with the worst headache of my life. It was so unbearable that I would clench my eyes shut. Bones and muscle pains all over. Violent hot/cold flashes. I would feel hot all over and after a minute or so of placing a cold pack on my head I began to shiver despite sweating. Around 5am I was looking at my phone wondering if I should go to the ER because I legitimately felt like I was in danger. The unbearable headache lasted a total of 14 hours from its onset. No OTC medications were taken. Around 6pm on day 2 from the dose the intensity of the headache began to subside VERY slowly. I woke up on day 3 completely fine as if nothing happened.

988655	1/30/2021	CA	49	F	1/27/2021	1/27/2021	My day began working in the Medical Surgical Unit, once I received the injection I was feeling fine. Five hours past and my eyes became itchy and swollen. Immediately after I started to have an itchy throat while my nose was congested. After conversing with my house supervisor she told me to call Employee Health Nurse. After that they directed me to the ER because my symptoms were worsening. At the ER they took my vitals and then the doctor came to assess me. She told me that I was having a severe allergic reaction to the vaccination. They started an IV gave me Benadryl, Epinephrine and Pepcid. After, the nurses monitored me for 4 hours until they decided I was well enough to go home. The doctor prescribed me with Epinephrine and Prednisone.

988372	1/30/2021	KY	64	F	1/16/2021	1/16/2021	COVID- 19 Vaccine. She was experiencing chest tightness, SOB, and dizziness. 50mg of Benadryl and 20mg of famotidine was administered around 1410. Patient was still experiencing chest tightness and was having difficulty breathing. 0.3mg of epinephrine was administered at 1420. EMS was called. Breathing improved. Pulse ox 100%, HR 68, BP 130/89. EMS arrived and assumed patient care. Pt seen in Emergency Room 1/16/2021 1513 CHIEF COMPLAINT: reaction to COVID vaccine HISTORY OF PRESENT ILLNESS: Patient is a 64y F with PMHx significant for Myopericarditis, Anxiety and HTN who presents to ER after developing tongue swelling, wheezing, tunneled vision and shortness of breath. Patient states that she was getting first shot of COVID19 Pfizer vaccine at 2:00 pm. After getting vaccine she waited 15 minutes like she was told and recalls room getting very hot at approximately 6 minutes after getting vaccine. She also states that her tongue felt swollen. She then noticed her vision started to turn dark and then she felt dizzy. She told pharmacist about symptoms and then she was given one pill of Benadryl. This did not help and actually made her symptoms worse. She recalls wheezing. She was given another pill of what she believes was Benadryl. She also recalls pharmacist measured her BP and her husband, who was present, reported that her blood pressure was in the 140s This did not improve so she was given 0.3mg IM epinephrine shot. This significantly improved her symptoms. However, she was sent to ER. She denies any hx of recent UTI or GI infection. She denies fevers, chills, nausea, diarrhea, chest pain, generalized itching, vomiting, abdominal pain, generalized swelling, headache or syncopal episode. She denies any past reactions to vaccines. She denies current SOB and feels like her symptoms resolved. Denies hx of COPD or asthma. Physical exam did not show any recurrent signs of wheezing or tongue edema. Her SaO2 was 100% on RA and BP was within baseline 140-160s. Given episode, we decided to obtain tryptase levels. We also observe patient to ensure she did not have any recurrence of symptoms. She remained hemodynamically stable and SaO2 remained in mid 90s to 100. She was given a rx for epinephrine pen should symptoms recur though this is highly unlikely as she remained stable throughout ER stay. She was also given

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							instructions to pick up OTC Benadryl and Pepcid. She does have antihistamines listed as an allergy but patient states that she gets tachycardic upon taking tabs, so this could just be a side effect. We will follow up with tryptase levels but even if tryptase levels return as normal, it does not mean she did not have an anaphylactic reaction to vaccine. Her clinical picture puts this diagnosis high in the differential. Teaching and instructions were given to patient and her husband. She was advised to return to ER if symptoms recur. IMPRESSION: Anaphylaxis Anxiety attack

988380	1/30/2021	LA	30	F	1/30/2021	1/30/2021	Roughly 15 minutes after the vaccine I began to blackout. I did not fully lose consciousness but my field of vision was taken over by spots and stars. My blood pressure was very low. After being monitored for 45 mins I felt well enough to go home.
988414	1/30/2021	TN	24	F	1/30/2021	1/30/2021	While waiting at the site, my body felt like it was spazzing out and I saw blurry colored static. It felt surreal. It happened again within a minute. This was longer. I had no control of my body, I was conscious the second time. I attempted to tell myself to "focus" and try and find something with my eyes. I couldn't; I was stuck in the state of my body shaking and unable to see anything. After the two times, I had the shakes.
988416	1/30/2021	GA	68	F	1/21/2021	1/22/2021	About 22 hours after the vaccination, I had chills. During the night I sweat so much my gown was soaking wet, and when I awoke, I had a foul odor on my body and gown, as if my body had expelled something foul during the night. The day after the injection, my arm felt sore and 2 days later I would have more described it as hurting and itching. 8 days after the injection, a red spot developed on my arm. 3 days before I had the 1st dose, I got a headache and still had the headache at the time of the vaccination. The pharmacy person questioned me about the headache, but decided to give me the vaccination. Personally, I think the headache is related to eye strain since I have had this type of headache before. I have an appointment next week to see the optometrist. I had no fever before the vaccination or after the vaccination.
988435	1/30/2021	IL	30	F	1/14/2021	1/14/2021	About 30 mins after receiving the vaccine I developed a strong headache while driving that affected my vision. Later that evening I got a stomach ache, the chills/hot flashes, arm soreness and the shakes. Most lasted until the following morning when I got up at 6:15am for work. The following morning I was only experiencing shakiness and arm soreness. About a week in a half later, I developed a rash at the injection site that looked like two large red blobs. The rash was slightly itchy and lasted only a couple of days.

988485	1/30/2021	MN	46	F	1/27/2021	1/27/2021	4 hours after the administration of her COVID-19 vaccine, she developed the onset of twitching of her left eyelid, some left-sided jaw pain, a cotton mouth sensation, and migratory left-sided facial paresthesias described as a tingling sensation that could involve the eyelid, nostril, scalp, cheek, or forehead. These sensory symptoms feels somewhat like a Christmas tree with lights going on and off in different spots but always restricted to the left side of her face. In addition she experience a mild headache but without associated scotoma, nausea, vomiting, or vertigo. Upon looking in the mirror she thought that perhaps there is some slight facial asymmetry on the left side. In addition she reports feeling that her neck is weak on the left side and that she has to support her head in order to keep it from flopping further to the left. The symptoms have been also associated with some pain in the left arm which has since improved as well as discomfort and achy sensation involving her left leg extending from the hip laterally down to the level of the knee. She was evaluated the next day by a neurologist. Her neurological examination demonstrates some subjective decrease in sensation involving the left V1 and V2 distribution but is otherwise normal. Difficult to know to what extent the prior Botox injections could be contributing to her worsening left-sided neck weakness. We are aware that the vaccine does induce a inflammatory cytokine response and it is conceivable that this is contributing to some of her symptoms. MRI was obtained to exclude any underlying CNS pathology that could be conceivably exacerbated in the setting of an inflammatory micro environment induced by the vaccine. There was no clear evidence of a new CNS lesion based upon the examination.
988491	1/30/2021	HI	53	M	1/28/2021	1/30/2021	Double vision experienced in right eye upon waking up this morning. Contacted health care provider. Recommended eye drops over the next few days and to call back if symptoms persist.

985644	1/29/2021			M	1/13/2021	1/15/2021	He woke up and his eye felt like it was hurting; He has a swollen eye and it is still like this today; This is a spontaneous report from a contactable consumer (patient). A 41-year-old male patient received the first dose of BNT162B2 (Pfizer-BIONTECH Covid-19 Vaccine), via an unspecified route of administration on 13Jan2021 as a single dose for COVID-19 immunisation. The patient's medical and concomitant medications were not reported. The patient stated that he received the first dose of the vaccine on Wednesday, the 13th of Jan2021 at 2:00. The symptoms began on Friday (15Jan2021) after he had taken a nap. He woke up and his eye felt like it was hurting. He has a swollen eye and it was still like this today. He stated there was a delay in the reaction and he has never experienced anything like this before. He was trying to determine if this was from something he ate or something else, but the only thing different was that he got the vaccine. He asked if this has been reported by other people. Outcome of the events was not recovered. The events were reported as non-serious. Information about the lot/batch number has been requested.
985556	1/29/2021		45	F	1/27/2021	1/27/2021	Patient was very nervous prior to injection. Patient received Moderna covid vaccine. Patient was instructed on waiting in the store for a 15 minute observation period. A few minutes later she said her vision was blurry, and then it had passed shortly thereafter and her vision was clear again. She also said she felt tingling in her hands and feet. The pharmacy technician called 911 and the medics arrived and she went to the hospital. The husband had stated he thought it was her anxiety.
985547	1/29/2021	OK	70	F	1/13/2021	1/18/2021	Rash below shot sight . Only noticed because of itching. Red rash that was warm to touch and dissipated in a bulls eye manner. Used Benadryl to stop itching so not to scratch. Lasted about 4-5 days but did not think much about it until I read where several people had the same symptoms, but only happened in primarily women 30-40 years of age. Thought you may be interested as I am 70.

985936	1/29/2021	PR	33	F	1/4/2021	1/4/2021	3 eye blood capillaries had exploded; itchy in the site of injection; swelling and warm; Felt local pain in the other arm; swelling and warm; A spontaneous report was received from a consumer who was also a patient who received Moderna's Covid-19 vaccine (mRNA-1273) and experienced 3 eye blood capillaries had exploded, pain the in other arm, and itchy, swelling and warm in the site of injection. The patient's medical history included hyperthyroidism. Products known to have been used by the patient, within two weeks prior to the event, included thiamazole, glucomannan and celecoxib. The patient received their first of two planned doses of mRNA-1273 (Lot number: 026L20A) on 04 Jan 2021 in the left arm intramuscularly in for prophylaxis of COVID-19 infection. A consumer who is the patient called to report she received the Moderna COVID-19 vaccine on 04 Jan 2021. She reported the injection site itched, had swelling and was warm. The patient also reported she felt local pain on the opposite arm that was vaccinated. On 05 Jan 2021, the patient stated her doctor told her that she had 2 or 3 eye blood capillaries that had exploded. The patient reported it was better, did not have any pain, and it was not itchy. Treatment for the event included paracetamol. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the events, pain the in other arm, and itchy, swelling and warm in the site of injection, was unknown. The outcome of the event, 3 eye blood capillaries had exploded, was recovering.; Reporter's Comments: This case concerns a 33-year-old, female, patient, who experienced a serious unexpected event of eye hemorrhage and non-serious unexpected events of injection site warmth, pain in extremity and non-serious expected event of injection site swelling and injection site pruritus. The event of injection site pruritus, injection site warmth, pain in extremity, and injection site swelling occurred 1 day (same day) after first dose of mRNA-1273, lot # 026L20A. The event of eye hemorrhage occurred 2 days after first dose of mRNA-1273, lot # 026L20A. Treatment included Panadol. The subject's concomitant medications included Tapazole, Propol, Celexa. Based on the current available information and temporal association between the use of the product and onset of the events a causal relationship cannot be excluded.

986107	1/29/2021	TN	63	F	1/14/2021	1/14/2021	8/10 chest pain radiating into left arm; 8/10 chest pain radiating into left arm; tightness in chest; tightness bilateral flank area; HA; body aches; diaphoresis; hot feeling; numbness tingling of head; numbness tingling of head/tingling in jaw and over the top of my head; pressure in the back of my neck; blurred vision; This is a spontaneous report from a contactable nurse. A 63-year-old female patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL1283), via an unspecified route of administration in right arm on 14Jan2021 10:00 at a single dose for covid-19 immunization. Vaccination was done in a hospital. Medical history included HTN, GERD, constipation, ocular migraine, osteoarthritis in sacroiliac joints, small fiber neuropathy, glucose intolerance, steatotic liver, CTS (Carpal tunnel syndrome). Concomitant medication included losartan (LOSARTAN), furosemide sodium (LASIX [FUROSEMIDE SODIUM]), and spironolactone (SPIRONOL). The patient previously received the first dose of bnt162b2 on 24Dec2020 10:00 AM for COVID-19 immunization. On 14Jan2021 11:00, the patient experienced tightness in chest tin which the patient took benadryl 25 mg with improvement, tightness bilateral flank area, HA, body aches, diaphoresis, hot feeling, numbness tingling of head, pressure in the back of my neck, and blurred vision. On 15Jan2021, the patient had an 8/10 chest pain radiating into left arm subsided after 10 mins, tingling in jaw and over the top of head, chest tightness and tightness in both flanks most of day 2. The outcome of the events was not recovered.; Sender's Comments: Based on the compatible time association, the possible contribution of suspect BNT162B2 administration to the event chest pain cannot be excluded. The status of medical history including HTN, GERD, constipation, migraine and osteoarthritis in sacroiliac joints would be helpful for further assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

985648	1/29/2021	NC	73	M	1/20/2021	1/20/2021	Patient reported that both eyes dilated after the 15 minute wait period and that one returned to normal in about 5 hours and the other returned to normal by the next day. He also stated that her has noticed "irregular heart beats" since his vaccination and has an upcoming appt. with his cardiologist.
986032	1/29/2021	FL	67	M	1/13/2021	1/14/2021	Full body rash with itching; Swelling in my upper and lower eyelids; Urticaria; Soreness at site; Headache; Fatigue; This is a spontaneous report from a contactable other HCP (patient). This 67-year-old male patient received the 2nd dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EL1284), via an unknown route, on 13Jan2021 (at 15:00) at single dose on the left arm, for COVID-19 immunization, administered at hospital. Historical vaccine included the 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EH9899) on 24Dec2020 (at 10:00) administered at single dose on the left arm. Relevant medical history included hypertension, benign prostatic hyperplasia, and allergy to NAIDs. Past drug history included allergy to acetylsalicylic acid (ASPIRIN). Relevant concomitant medications included losartan, simvastatin, eszopiclone (LUNESTA), dutasteride (AVODART) and tamsulosin. On 14Jan2021 (at 10:00), the patient had soreness at site, headache, and fatigue. On 15Jan2021, same symptoms but lower intensity. On 16Jan2021, she woke up with full body rash with itching, and swelling in her upper and lower eyelids. She took cetirizine hydrochloride (ZYRTEC) and the urticaria resolved within 90 minutes. Pre-vaccination and post-vaccination COVID tests were not performed. No therapeutic measures were taken as result of the events 'soreness at site', 'headache', 'fatigue' and 'swelling of eyelid'. All the events resolved in Jan2021.

986145	1/29/2021	OK	68	F	1/26/2021	1/27/2021	On the two hour ride home, my arm would ache then be fine. I was cranky, not myself, going to bed, I woke several times as I rolled over onto my right arm. When I awoke early, I was swollen from Head to Toes, my eyes were slits, my bracelets and rings were swollen into my skin, and my toes and ankles were large. AND I was grouchy about everything. As the day went on I was just mad about everything, I began to drink lots of water and tried to exercise to get the swelling down. About noon, my eyes and face began to ease, but my body didn't ease till about 2pm, as my rings and bracelets were movable then. I am still swollen and still angry and it is Friday.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
986129	1/29/2021	NY	49	F	1/15/2021	1/1/2021	Fullness under my armpit which is on the same side as the vaccine, which looks like swollen lymph nodes under my armpit/kind of benign; Generalized malaise low grade; Headache; Both eyes are very swollen; inflammatory prosthesis in my eye; This is a spontaneous report from a contactable Nurse (patient). A 49-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL3247) via an unspecified route of administration at arm on 15Jan2021 11:00 at single dose for covid-19 immunisation. Medical history was none. The patient's concomitant medications were not reported. Nurse stated that she just wanted to report what she thinks is adverse reaction to the Covid-19 vaccine from Pfizer not sure what to do about it at this point. She was vaccinated Friday 11 o'clock in the afternoon. Both days felt really fine. Last night (16Jan2021) got some fullness under her armpit which was on the same side as the vaccine, which looked like swollen lymph nodes under her armpit which you can see was kind of benign. But in addition to that some generalized malaise lowgrade and headache (Jan2021). Seems totally fine but her both eyes are very swollen (Jan2021). Nurse took some ibuprofen (ADVIL)-600 mg, she was taking Prednisone for inflammatory prosthesis in her eye as treatment (Jan2021). Outcome of the events was unknown. The nurse considered the occurrence of the events are because of COVID-19 Vaccine.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Swollen eyes and Eye inflammation cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

986112	1/29/2021	KY	53	F	1/14/2021	1/15/2021	lost eyesight, everything went black; sweating really bad; cold chills; feels kind of achy; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs) received from a contactable consumer. A 53-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: EL3249), intramuscular in left arm on 14Jan2021 12:00 at a single dose to prevent COVID-19. Medical history included shingles recently and was not given any medicine for that and breast cancer when she was 29 so she can't have shots on her right side. There were no concomitant medications. On 15Jan2021 05:00, she went to the bathroom and everything went black. When her eyesight did come back after a while, she was sweating badly and had the chills. As soon as her husband helped her get back to bed, she started sweating really bad. Her nightclothes were soaked, it wasn't like a normal sweat. She also got the cold chills. She got the cold chills right after she had the experience with her eyesight. She was just kind of achy. However, the sweating, chills, and achiness are all listed on the form she has. She isn't really worried about that. The patient was more concerned about the fact she couldn't see anything. Caller wanted to know if losing her eyesight is a side effect of the vaccine. She confirmed her eyesight came back. The outcome of the event losing her eyesight was recovered while the outcome of the remaining events was unknown. No follow-up attempts are possible. No further information is expected.

986108	1/29/2021	CA	38	F	1/14/2021	1/14/2021	nasty headache; felt hot; Shivers; achy; Nauseous; eyesight/ felt like she was straining; sensitivity to light; eyeballs felt sore; cold sweats; when she talked, she felt like she had to close her eyes because of pressure; arm was hurting really bad; received the 2nd vaccine yesterday/ date of the first vaccine was 28Dec2020; This is a spontaneous report from a contactable nurse (patient). A 38-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EL1284, expiry date: 30Apr2021), intramuscularly on the left arm, deltoid on 14Jan2021 15:30 to 14Jan2021 15:45 at a single dose for COVID-19 immunization. Medical history included ongoing pernicious anaemia, a B12 deficiency diagnosed 2-3 years ago (she gave herself B12 shots and she cannot convert B12 through her food), and myomectomy (15 cm uterine fibroid, removed this past summer). Concomitant medication included ongoing cyanocobalamin (B12) for pernicious anemia. The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EL1284, expiry date: 30Apr2021), intramuscularly on the left arm, deltoid on 28Dec2020 at a single dose for COVID-19 immunization; and a flu shot (the MA gave it in the back of her arm, it was pretty significant). The patient was a nurse and informed that she received the second COVID vaccine the day before report (14Jan2021). She woke up on the day of report on 15Jan2021 03:00 with a nasty headache, she felt hot, had the creepy crawly shivers, was achy and when she talked, she felt like she had to close her eyes because of pressure, and she was nauseous. She figured this was probably normal but she couldn't get a hold of her doctor and the hospital she worked at did not know what to tell her. She was wondering if she can take Tylenol or ibuprofen and has even thought about drinking caffeine, that it might help her headache. She didn't have a prescribing doctor as she got it at work. The first round of the vaccine she only had a super mild sore arm and a slight headache. She received the second vaccine at 3:30pm and then went to bed when she got home. She woke herself up at 3 am because her arm was hurting really bad. She started feeling like she couldn't keep her legs still. She felt hot, achy, and was shivering. She hasn't taken her temperature. When she woke up at 3 am she got on her phone, and her eyesight felt like she

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

couldn't quite focus. It wasn't bad, but she felt like she was straining. Then her head started hurting at 5-7 am. She was very sensitive to light. She woke up and couldn't go back to sleep. She had cold sweats, and was shivering. Every time she stood up, she was chattering. She felt achy almost like growing pains. She woke up with the arm pain, and then 10-15 minutes later, she started feeling that creepy crawly feeling. She got up and the cool fan hit her, and she realized how bad she was shivering. The shivering intensified at times but hasn't gotten worse. She had just called employee health and realized that when her eyes were open when she was talking was when she felt nauseated. She has noticed the nausea in the past half hour. She did not know if it was related to the headache or what. She had to cover her eyes, her eyeballs felt sore. When she talked with her eyes open, she felt a little queasy. She was just straining to see. Her vision was not blurry but she can tell she was straining. She did not know if it was because of the headache and nausea. When she got out of bed, the cold fan did not feel cold but it made her shiver. She was a nurse was trying to be socially responsible as she did not want to get COVID. She was a little suspicious because of the headache after the first one. She hasn't been around anyone in a couple of weeks and had been working from home. She has not been exposed to people. She kept feeling like she needed to stretch because she was sore. The patient was tested for COVID pre-surgery (myomectomy) and was negative. She was also tested for COVID antibodies and she did not have any. She was vaccinated at a hospital facility. Patient received no other vaccines on that day. The adverse events did not require any visit to the emergency room or physician office. Patient did not receive prior vaccines in the previous 4 weeks. Outcome of the events cold sweat and "tested for COVID antibodies and she did not have any" was unknown, nasty headache was reported as worsened (not recovered), and the remaining events was not recovered. The reporter considered the events serious due to medically significant events and related to the suspect drug.; Sender's Comments: Based on the information currently available, a possible contributory role of BNT162B2 vaccine in the development of the events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated

The patient's medical history included allergy to soy. No concomitant medications were reported. On 13 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot number: 041L20A) intramuscularly for prophylaxis of COVID-19 infection. On 13 Jan 2021, the patient experienced anaphylaxis-like symptoms that included, anaphylaxis, angioedema, shortness of breath, itching, swelling of eyes, and sleepiness. The patient was treated with epinephrine injections and taken to the emergency department. Action taken with mRNA-1273 in response to the event was not reported. The outcome of the event, anaphylaxis-like symptoms, was unknown.; Reporter's Comments: This case concerns a 23-year-old patient who experienced a serious, unexpected event of Anaphylactoid reaction. The event occurred same day (exact time not provided) after the first dose of mRNA-1273 (Lot number: 041L20A) administration. The treatment included EpiPen injection. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

984454	1/29/2021	PA	35	M	1/14/2021	1/15/2021	Facial tingling; facial tingling and numbness/cheek and eye feel swollen or numb; eye feel swollen or numb; eye feel swollen or numb; cheek and eye feel swollen; This is a spontaneous report from a contactable consumer (patient) via Medical information team. A 35-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EJ1685), via an unspecified route of administration in left arm on 14Jan2021 09:00 at single dose for COVID-19 immunization. Medical history was reported as none. There were no concomitant medications. The patient received the first dose of the COVID-19 vaccine yesterday morning at 9:00AM. The patient was experiencing facial tingling and numbness on unspecified date. He would like to know if this is a common side effect. He wanted to ask if numbness and tingling in the face a common side effect? The patient does not know if slept on his face or what but his left cheek and eye feel swollen or numb and stated that it was hard to describe. The patient noticed this this morning 15Jan2021. The patient stated, "it sort of feels like when you go to the dentist". The outcome of the event cheek swollen and eye feel swollen or numb was not recovered. The outcome of the remaining events was unknown.
984746	1/29/2021	TX	39	F	1/26/2021	1/27/2021	10 hrs after I received 1st dose of Pfizer I started feeling my heart beating rapidly and hard. I was short of breath and had nausea and a headache. This lasted for 1.5 hrs. then I laid down. As I was falling asleep I couldn't shake a scary "vision: I was having of myself like my eyes turning bright blue and electricity going through my body and my body ascending into the air. I had nightmares all night. I have never had hallucinations or whatever that was. And nightmares are rare for me. I woke up fine on day 2, just a stiff sore arm. Day 3 I was fine. Day 4 I am developing an itchy, bumpy, rash on my right arm at site of injection and around it. I reported this online on my health chart and will go in if I keep getting strange reactions.

984644	1/29/2021	MI	41	M	1/13/2021	1/13/2021	his eye felt irritated; swollen eye; red eye; Sore arm; This is a spontaneous report from a contactable consumer (patient). A 41-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3248, expiration date: Apr2021), via an unspecified route of administration in arm on 13Jan2021 02:00 at single dose for COVID-19 immunisation. Medical history included blood pressure (as reported). Concomitant medication included hydrochlorothiazide and lisinopril, both for blood pressure. The patient just took the vaccine on Wednesday (13Jan2021) and had a reaction, not sure if it was from the vaccine or not and he was just calling that in to report that as it can be related. The patient got vaccinated on Wednesday at 2 O' clock and no major issues, just sore arm. However, Friday (15Jan2021) afternoon he had woke from a nap and his eye felt irritated. He was still experiencing a swollen eye. So, he was calling about the swollen eye, red eye. He never had something like this before, didn't take anything that might cause it, the only thing unusual was because he got the vaccine. Treatment included using a cold compress only, not ingesting anything. The outcome of events sore arm, eye felt irritated and red eye was unknown, swollen eye was not recovered.

984527	1/29/2021			F			eyelids are a little swollen; This is spontaneous report from a contactable consumer. An 83-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, "Pfizer vaccine" as reported, lot number: unknown), via an unspecified route of administration on an unspecified date (06:30AM) at single dose for Covid-19 immunization. The patient's medical history included allergy to antibiotics (reported as "she is allergic to other things, but they are antibiotics"). Concomitant medications were not reported. The patient reported that she had the vaccine at 6:30AM (unspecified date) which she thought was Moderna (pending clarification). She clarified that she was supposed to get Pfizer's but that she thought that she was allergic to some of things in it (pending clarification). She further stated that her eyelids are a little swollen on an unspecified date. She did not know if she should take Benadryl or what. She reported that she was having slight reaction to the shot. She stated that she is allergic to other things, but they are antibiotics. The outcome of event was unknown. Information on lot/batch number has been requested.
985158	1/29/2021	FL	69	F	1/8/2021	1/8/2021	On Jan. 8th I had significant shaking in my hands, arms and shoulders, lower legs about 20 mins after injection and lasted about an hr after that. Then is eased. then it began again about 12:30 pm and lasted until 5:30 PM roughly. Jan 9th i felt okay. On Jan 10, 11th, 12th it returned. Then after the 12th it eased, and there was spiritic shaking but not has intense and those three days. Then 16 days after i had the injection on jan 24th i woke up in the morning i developed sensitivity the left temple of my head close to my eye on the left side of my face. Kind of feels like slight bruising and numbing. And my left eye lid feels heavy. and my vision feels slightly affected. That has continued through today Jan 29 and has been on going since the 24th.

984486	1/29/2021	CA	47	F	1/11/2021	1/1/2021	<p>Blurry vision; darkening in the eyes; I felt like something in my eye like heaviness; Blurry vision; darkening in the eyes; I felt like something in my eye like heaviness; Blurry vision; darkening in the eyes; I felt like something in my eye like heaviness; has pain in her rib cage close to the arm pit occurring mostly at night; hot at night; The initial was missing the following minimum criteria: no adverse effect. Upon receipt of follow-up information on 13Jan2021 this case now contains all required information to be considered valid. This is a spontaneous report from a contactable nurse (patient). This 47-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration in the left upper arm on 11Jan2021 at 11:00 at single dose for COVID-19 immunisation. Relevant medical history included knee pain. There were no concomitant medications. On 11Jan2021, the patient experienced "blurry vision; darkening in the eyes; I felt like something in my eye like heaviness" and in Jan2021 she experienced pain in her rib cage close to the arm pit occurring mostly at night and hot at night. The patient stated "I wanted to tell you that after the shot I was for 15 minutes sitting on a chair and I didn't feel anything and then I left and went for a walk and when I was walking by the gift shop at hospital, I noticed I just got blurry vision like when I looked at the stock, it kind of looked darkening in the eyes and blurry". She stated also "You know exact time I wouldn't tell but for the day like it happened first time near the store and later in the day when I was working, I felt like something in my eye you know like heaviness I don't know if that's blurriness but then runs away so like later yesterday I am fine and today I am okay". The patient also specified that blurry vision started 20 minutes after the vaccine and lasted 10-20 seconds and later during the day when she was reading. The patient also reported she was hot at night and has pain in her rib cage close to the arm pit occurring mostly at night. The patient did not receive corrective treatments; she just blinked and then she went and sit down, it never came back again. At the time of the report, the outcome of the events was unknown. The information on the lot/batch number has been requested.</p>

984450	1/29/2021	OK	69	F	1/14/2021	1/14/2021	<p>temperature of 105.5 and stated it would fluctuate between 104-105; blurred vision; balance was off; first it was up around 163/71 and then over time it was really low 118/58; HR was high; body was jerking; arm that she got the injection in was dropping; dehydrated; urine is darker; real thirsty; extremely weak; tired and exhausted; feeling horrible; couldn't stay awake, fell asleep; This is a spontaneous report from a contactable consumer (patient). A 69-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EK9231 and expiry date: unknown), via an unspecified route of administration on the left arm, on 14Jan2021 13:30 at a single dose for COVID-19 immunization. Medical history included left hip replaced on 16Nov2020 and had her right hip replaced on 29Dec2020. There were no concomitant medications. Patient reported that she got the shot at 1:30 pm and on the way home she started getting tired and exhausted on 14Jan2021. She got home and went right to bed. She felt like she couldn't stay awake, fell asleep and woke up about 6 pm then with a temperature of 105.5 and stated it would fluctuate between 104-105. She was just feeling horrible. At 7:30 pm, patient had a temperature of 103.5 and at 7:45 pm, her temperature was 104. On 14Jan2021, patient stated that she couldn't see straight, had blurred vision, having trouble walking, her balance was off and falling into walls. Her body was jerking and the arm that she got the injection in was dropping. Patient called her cardiology office, and was advised to take Tylenol 3-4 times per day and alternate it with Motrin. She was also taking coated 325 mg aspirin. She can hold her head up and was not jerking as much as she was. She was doing noticeably better. Patient had put ice bags on her groin, stomach and throat to try to cool down through the night. This brought temperature down to 103. She woke up at 12 am she was 102. Her temperature at the time of report was around 101-102. She took her blood pressure it was going crazy, first it was up around 163/71 and then over time it was really low 118/58 and heart rate was 130 for a while and went to 103. The back of her neck still felt so weak and she still feels extremely weak and exhausted. She went on to report that her HR was high and B/P was up but since then it has come down. The night of 14Jan2021, her b/p was low. On 14Jan2021, patient was also real thirsty and</p>

985401	1/29/2021	VA	50	F	1/12/2021	1/14/2021	Patient came to urgent care clinic 16 days after vaccination. Patient stated she received the Moderna vaccine on 1/12/2021 and began to develop a rash on her arms on 1/14/2021. Patient stated that she has been to see her primary care provider after onset of rash. Patient was prescribed a steroid injection and a Medrol dose pack. Patient stated that after completing these, the rash persisted and started to get worse. On presentation to urgent care, patient had rash on both arms, across her chest, on the left side of her neck going up to her ear, on her left eye lid and starting on her mouth. Patient's right hand was extremely red and excoriated. Patient gave a history of sebhhoric dermatitis.
985366	1/29/2021	MI	23	F	1/28/2021	1/28/2021	Within about 20 minutes post injection, patient stated she felt "itchy". I gave her diphenhydramine and she swallowed it. At about 30 minutes post injection, she stated she had small bumps on her bilateral arms. They were hard for me to discern but she also claimed the bumps were painful. I asked about any labored breathing or chest tightening and she denied both. After about ~45-50, she still stated the same itchiness and pain. Visually there was no change in my opinion. Patient then conferred with supervisors at her employment about her next steps. Her PCP was closed and she was deciding if she wanted to go to urgent care. That's the last interaction I had.
984761	1/29/2021	CA	49	F	1/22/2021	1/22/2021	Day 1: mild headache, dizziness and loopy, tired. Day2: soreness at the injection site and my entire right arm. I was only able to lift my arm up to my shoulder. Very fatigue, body aches, dizziness and drunken feeling. Day 3: less arm soreness. Very fatigued and dizzy. Body aches, joint and muscle pain. Pain in my body. Day4: muscle and joint pain, still very fatigued and my vision began to become blurry. Day 5: fatigue, joint pain, headache and blurred vision has worsened. Day 6: fatigue joint pain, sever headache, dizzy, vision is still bad. I contacted the ophthalmologist and Optometry to schedule an appointment.
985256	1/29/2021	MI	38	F	1/28/2021	1/29/2021	Following morning woke up very dizzy, couldn't lift my head up and get out of bed, slight blurry vision

987078	1/29/2021			F	1/20/2021	1/21/2021	<p>~~I received my second COVID vaccine on 1/20/2021 at 1100. (Pfizer) At 2100 I had a slight headache and body aches and went to bed. I slept poorly and felt as though my heart was racing overnight. When I awoke at 0700 on 1/21/2021, I felt very lightheaded with sitting upright at the side of my bed and ~~"blacked out~~"/lost my vision, but was still conscious. I proceeded to lie back down on my bed. I began to feel nauseous and again attempted to sit up to go to the bathroom. I again blacked out. I lowered myself to my bedroom floor and laid there to rest for several minutes and then crawled to my bathroom. I began retching and had emesis of frothy sputum. I then felt the urgent need to have a BM and sat on my toilet, but was again lightheaded. I bent forwards to not pass out and completed the task and then laid down on my bathroom floor to recover. I was gradually able to crawl down the stairs and located my cell phone and contacted a friend. I pulled myself up to my couch and sat for some time. I checked my BP and it was WNLs, but low for me, as I generally take 2 antihypertensives in the AM. I did not take them at all on the 21st. I gradually was able to walk to the kitchen and drank several glasses of water and tea. In addition to these symptoms, I had severe pain up and down my spine, in my knees, shins and buttocks. I applied Thermacare heating pads to my occiput and sacrum. I had no appetite and was very lethargic, napping for nearly 6 hours, on and off. I took Tylenol later in the day when I was able to eat a banana and yogurt. By evening, I had a headaches and body aches, but no more dizziness. When I awoke 1/22/2021, I was not dizzy, but my head felt ~~"huge~~" and ~~"off~~". My body continued to ache severely and I was unable to come to work. Tylenol helped diminish the pain slightly. I was again very fatigued. I did not leave my house, feeling unsafe to drive. By 1400 I felt better and was able to eat dinner that evening. I finally felt safe to take a shower Thursday PM 1/23 I awoke at 0615 to work. I was able to work until 1700, feeling fatigue, but no other symptoms. I did take Naproxen prior to coming to work for low back pain~~</p>

987071	1/29/2021	HI	35	F	1/28/2021	1/28/2021	830am vaccinated, 12pm mild-mod headache and fatigue (sore arm at inj site), persisted, 10pm worse headache, fatigue, mild body aches started at shoulders and upper back and neck, able to fall asleep by 11pm, woke up at 1am in severe pain, migraine, head pressure, joint pain of every joint in my body, hands were swollen, felt like my joints were pulsating, very painful to bend or move any of my joints, muscle aches so bad any tiny movement hurt, even lying still hurt my back because of the pressure onto my back, even my spine felt tender, stiff neck I could barely look down or up but i could turn head left and right, stomach ache and nausea, my arm that was given vaccine was severely in pain and tender to touch and swollen at area of inj. There was light headed sensation w/ movement and position, pressure in my head felt like my head was going to explode and my eyes were burning. Because so severe, I took 1000mg tylenol, lathered by entire body in eucalyptus oil and peppermint on my hands, I was able to fall asleep at 3am but it was restless sleep I kept waking up because any movement I made in bed I'd have severe pain. 6am I felt moderately better all symptoms 50% improved, applied eucalyptus oil on again, started work at 730am I could barely function at work I have brain fog, just thinking focusing eyes concentrating makes migraine worse, +photopphobia, phonophobia, just typing is very hard to do because it hurts my joints, the vertigo worsened and the slightest looking down to the keyboard while typing causes lightheaded sensation. No improvement and it's now almost 1pm. I didn't take any pain medication or apply any essential oils.

He was unresponsive so his wife called 911 and an ambulance came and transported him to the Hospital. Concern at the time was either a seizure or stroke.
987227	1/29/2021	TX	45	F	1/29/2021	1/29/2021	Rashes face like chemical peel and red on fire, eyes itchy, red line waistline and bra line, neck and chest are red. Pt. had Covid in Oct. 2020, blood drawn showed no anti-bodies 3 weeks prior the vaccine.
987331	1/29/2021	NJ	41	F	1/29/2021	1/29/2021	~~Pfizer-BioTech COVID-19 Vaccine EUA" Received 1st dose of vaccine in left arm at 10:28 a.m. Drove home and at 4:00 p.m. face, forehead, and neck turned bright red, facial tightness, feeling like face was on fire. Heart rate recorded between 112bpm and 115 bpm and began having shortness of breath. Then began feeling nauseous, eyes were itchy and had a headache. Took 10 ml Benedryl @ 4:40 p.m. and drank some water. 7:00 p.m. still have slight facial and neck redness and headache.
987312	1/29/2021	AZ	43	F	1/29/2021	1/29/2021	After about 5 mins after the shot, I started feeling "foggy" with my vision and mental clarity. After about 20 minutes, I grabbed my water bottle and both arms felt weak when I lifted them and they felt like they were floating. I had a sudden urge to cry when this happened that lasted for 30 seconds. I was not anxious or nervous to take the vaccine but my body may have overreacted to the sensation of my arms but it didn't feel like a panic attack that I had a few in my earlier 20s after the birth of my child and undiagnosed thyroid disorder.

987305	1/29/2021	VA	60	F	1/14/2021	1/14/2021	I have been having left arm pain every since having the vaccine. I thought it would go away but the discomfort is now when I have Range of Motion upward and the discomfort is in my shoulder, arm area and a little below the injection site. I still am having that discomfort and in addition to that, that past 7 days I have been having neck and jaw pain like in the node areas front and back of my neck. As well as my lower lip has has two episodes of swelling but it goes down and then it feels ok. I generally overall just don't feel well. Eye and head pain as well. I thought it was best that this be reported cause I just don't know what is going on. I have made an appointment with my doctor which is on Feb 5.
987284	1/29/2021		79	M	1/29/2021	1/29/2021	Reports redness on the left cheek few minutes after the vaccine. Denies chest pain, SOB, itching, blurred vision. BP: 121/75 HR: 81 SpO2: 100% T: 97.3 seen and cleared by EMS
987272	1/29/2021	CA	29	F	1/29/2021	1/29/2021	About 11 minutes after her second dose of Moderna vaccine, patient reported seeing floaters and having tunneled vision. She felt light headed and flushed. Blood pressure was checked and BP was 77/43, P70s, O2 sat 98%. Patient was put in supine position and rapid response was called. Given no respiratory compromise, no angioedema, and no hives, epinephrine was not administered. Felt to be vasovagal event. BP recovered up to 120s/80s. Patient was observed in clinic for 2 hours and had 3 more episodes of lightheadedness but BP remained >90s/50s. She was given juice, crackers as she had not eaten for 4 hours prior to vaccination. She was sent home with family member for observation.

987259	1/29/2021	MN	32	F	1/29/2021	1/29/2021	Client received vaccine at 12:00pm after passing risk screening and completing consents at a vaccination clinic event at a local fire station. At 12:09pm, while client was sitting in the waiting area after vaccination as part of the recommended protocol to monitor for adverse events post-vaccination, she began feeling unwell. She started to walk toward the vaccination stations and was stumbling. Staff escorted her to a preassembled cot and had her lie down. The patient reported feeling "tingling" in her face, throat and lips and felt like her lips and tongue were swollen. There was no swelling visually apparent. Staff called 911, and assessed patient, collected some vital signs (BP 140/90, pulse 83, O2 sats 100,%) and prepared epinephrine auto injector pen. First responders who were in the fire station building arrived promptly. The patient continued to feel swelling in her throat, but no difficulty breathing. She appeared pale and weak but did not exhibit other signs of anaphylaxis. The healthcare team administered epinephrine in left deltoid. EMS arrived, and team gave report. Care was transferred to EMS. EMS transported patient to local hospital. Patient walked to ambulance without difficulty.
987537	1/29/2021	CA	51	F	1/14/2021	1/15/2021	20 hrs after vaccination; mild fatigue, mild headache, mild chills, upper arm pain and weakness (unable to lift arm above head) 2-5 days after vaccination; moderate upper arm pain, MODERATE GRADE 3 FATIGUE, MILD TIGHTNESS IN CHEST, mild chills, mild aching- symptoms felt identical to seasonal allergy flare except no cough, itchy eyes, or nasal congestion 6-10 days after vaccination, all side effects resolve except mild upper arm pain 11-14 days after vaccination, tenderness in upper arm (unsure if related to vaccination)
987447	1/29/2021	TX	68	F	1/8/2021	1/17/2021	I can?t be certain of the exact date but for at least 2 weeks I?ve had recurring symptoms of Bell?s Palsey which I had January 19, 2019. I feel weakness in the right side of my face and my right eye is oozing. I notice my speech is a bit slurred because of lack of full control of my mouth. Nothing is drooping just the nerves. I had not thought about it may being an adverse affect until today.

986286	1/29/2021	OH	50	F	1/25/2021	1/25/2021	At 6pm on 1/25/21, 10 hours after dose 2 of the Covid vaccine she began to shake, have chills . She did not take her temperature but felt she had a fever. She went to sleep and woke at 4am and had wet the bed. The next day, 1/26/21 she had a headache, tremors and chills. She stayed home from work. On 1/27/21 she went to work, felt better except for a headache. On 1/28/21 she went to work but felt "weird". At 12:30 that day her head was pounding, glassy eyed, felt chest pressure and was "foggy". She went to eat lunch but on the way back to the elevator her legs buckled and she could not walk. She was escorted by wheelchair to her desk . Her Manager stated she did not look well and 911 was called. She was taken to an adult ED. She was thoroughly evaluated ( Head CT, blood work, EKG ) give IV fluids. She was found to have a UTI and was placed on Keflex. Given RX for nausea and vomiting. She was discharged home to follow up with PCP. 1/29/21, she is feeling better except for some fatigue.
986531	1/29/2021	IN	26	F	1/25/2021	1/26/2021	Fatigue for 2 and half days. Increased blurred vision while driving and watching television. Tender at injection site.
986514	1/29/2021	CA	77	M	1/29/2021	1/29/2021	Pt receive his 1st dose of COVID-19 vaccine today at approximately 0915. At 0930, pt reported feeling "a rapid heart rate, like I have my A-fib again." Pt was non-ill appearing upon complaint, spoke clearly and was a good historian. Denied shortness of breath. Denied N/V Denied dizziness Denied Blurry vision Denied Chest discomfort or chest pain --"I just have the palpitation feeling, but not any pain." Pt reports a history of A-fib and needing Cardioversion in his past ("about 6 years ago I think." Pt offered to be seen in ED and states, "yes, I think that would be a good idea. This is what I felt like in the past when I had A-fib. I feel it right above my heart." Pt was moved via wheelchair safely to observation; vitals taken (see flow sheet). Charge RN called to give report; Charge RN arrived quickly to transport patient to ED.
986499	1/29/2021	GA	37	F	1/9/2021	1/9/2021	At 4:26pm patient reported that she has itchy eyes and nose and also a runny nose. Vital signs taken. Patient given Diphenhydramine by mouth at 4:33pm. Patient was discharged to go home.

986263	1/29/2021	CA	59	F	12/23/2020	12/23/2020	This is a spontaneous report from a contactable nurse, reporting for herself. A 59-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), first dose on 23Dec2020 11:45 (lot number: EL0140) and second dose on 10Jan2021 10:15 (lot number and expiry date were not reported), both intramuscularly in the left arm at a single dose for COVID-19 immunization. Vaccination was done in a hospital. Medical history included occasional gastroesophageal reflux disease (GERD), osteoarthritis, penicillin allergy and sulfa allergy, all from an unknown date and unknown if ongoing; and shingles from Mar2018 to an unknown date. Concomitant medication included paracetamol (TYLENOL), famotidine (PEPCID), melatonin and colecalciferol (VITAMIN D). The patient previously took vicodin and experienced allergies. It was reported that after both injections, the patient had a headache in the same area where shingles had started in Mar2018 throbbing above left eye radiating to top of head on 23Dec2020 14:30. No treatment was given. There was no other vaccine in four weeks. There was no Covid prior vaccination. No Covid tested post vaccination. The patient was not pregnant. The patient recovered with lasting effects. Information on the batch/lot number has been requested.
986282	1/29/2021	NV	42	M	1/9/2021	1/9/2021	This is a spontaneous report from a contactable consumer (patient). A 42-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL3248, expiration date 30Apr2021), via an unspecified route of administration on 09Jan2021 at single dose for COVID-19 immunization. Medical history included asthma. Concomitant medication included salbutamol (ALBUTEROL) for asthma. The patient experienced left side of his face went numb, his eye became swollen on 09Jan2021 with outcome of recovered. Caller stated this lasted 8 hours and then went away. Caller stated he used an ice pack during the reaction. The outcome of the events was recovered on 09Jan2021.

982023	1/28/2021	TX	63	M	12/31/2020	1/5/2021	Third cranial nerve palsy; A spontaneous report was received from a 63-year-old male pharmacist who received Moderna's COVID-19 Vaccine (mRNA-1273) and developed third cranial nerve palsy. The patient's medical history was not provided. No relevant concomitant medications were reported. On 31 Dec 2020, approximately 5 days prior to the onset of the event, the patient received their first of two planned doses of mRNA-1273 (Lot 037K20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 05 Jan 2021, the patient began to have blurred vision which progressed into double vision. He then experienced a headache that felt similar to when you have the wrong prescription glasses or cross-eyed. On 06 Jan 2021, he was seen by his ophthalmologist who ordered a CT scan which was negative. His eyelids were drooping and he wore an eye patch on the right eye because his right eye is completely shut. The patient reports that the muscle that keeps the pupil in focus in the middle is paralyzed, so his pupil is turned to the right and down, which is what was causing the double vision. The treatment of the event include eye patch. Action taken with mRNA-1273 in response to the event was not reported. The outcome of the event, third cranial nerve palsy, was considered unknown.; Reporter's Comments: This case concerns a 63 year old male patient, who experienced a serious unexpected event of third nerve paralysis. The events of third nerve paralysis occurred 6 days after first dose of mRNA-1273, lot # 037K20A. Diagnostics included a CT scan, which revealed no abnormality. Treatment for the event include eye patch and no other details were provided. Based on the current available information and temporal association between the use of the product and onset of the events a causal relationship cannot be excluded.

982003	1/28/2021	OR	63	F	1/25/2021	1/26/2021	Received the immunization @8:00 PM on 1/25/2021. On 1/26/2021, woke @07:00 feeling chilly, dizzy and headache behind my eyes. My energy level was very low too. Took my temperature @ 09:00 and it was 101.1. I took Aspiring @325 mg every 4-6 hours plus used cold wet cloths to calm my fever down. I was not able to walk or drive a car with confidence. Also, I had painful sensation with lights on. No appetite--Did not eat anything until 1/27/2021 in the afternoon. On 1/27/2021, my hunger came back and fever down to normal. I was able to drink juices and eat some soup. Today, I had some breakfast of Tofu and scrambled eggs. But still feel a bit "floaty.~~
981972	1/28/2021	OH	38	M	1/25/2021	1/26/2021	Pt was vaccinated at 10 am on 1/25/21 He stated that at 3:00 am on 1/26/21 he began having severe chills trouble moving and extreme thirst. He started to experience tachycardia and was diaphoretic. He stated that at 8 am 1/26 he had tingling in his lips and they began to swell. He stated taking 50 mg of diphenhydramine orally at this time. He had swelling and tingling of his face, eyes and tongue shortly after the oral diphenhydramine. He called an ambulance and was taken to the ER. At the ER he was given IV diphenhydramine and kept 2 hours for observation. He was also given oral steroids. He was sent home 1/26 with prescription oral steroids. He stated he has continues to experience tachycardia with average HR at 110. He also continues to experience night sweats but stated this symptom is improving.
981767	1/28/2021	MI	61	F	1/5/2021	1/5/2021	She experienced a noxious smell (ammonia) in the right nostril on the evening of her 1st COVID vaccine on 1/5/2020. It was so strong she could hardly breathe. Associated symptoms included nausea and watering of the right eye.

981916	1/28/2021	CA	27	F	1/28/2021	1/28/2021	Patient reports ~10 minutes post vaccine becoming sweaty, experiencing blurry vision, and muffled hearing. Writers assessment at 12 minutes , no longer diaphoretic, reports clear vision, slight headache, still slightly muffled hearing. Report no past medical history or allergies, and states last meal was ~20 hours ago. Assessment at 20 minutes - patient reports ?weak neck?, continued headache, vision/hearing returned to normal. Provided with education to seek care of physician if conditions continue or worsen, left site with boyfriend.
981821	1/28/2021	NE	23	F	1/27/2021	1/27/2021	The evening after I got the first dose I experienced painful muscle aches starting in my legs and progressing to the rest of my body, around 7pm. My left shoulder was a little achy, but no different than any other shot. About 30 minutes later I felt chills and felt really cold. I went to bed and tried to sleep. I woke up several times in pain. I did not take any pain meds. At 1am I went to the bathroom and felt nauseous and lightheaded. My vision got blurry and it felt like I was going to pass out, so I grabbed the towel rack and closed my eyes. I must have blacked out for a second and lowered myself down to the floor. I came to, and I was sitting on the ground, sweating a lot. I stayed on the floor for at least 10 minutes cooling down. (I had dressed warmly and turned on my heater after the chills started). I heard ringing in my ears while I was sitting on the floor. It went away after 5 minutes. I got up and went back to bed. I woke up at 9am and felt a lot better. Some minimal soreness. No more chills.
982467	1/28/2021	OH	60	F	1/9/2021	1/16/2021	Received vaccine on 1/9/21. On 1/16/21 started with drooping to eyelid. On 1/21/21 experienced vertigo. She was evaluated by her primary care doctor for those symptoms and was diagnosed with Bells Palsy at that time, and with vertigo. Her PMD recommended she not go forth with the 2nd dose of the vaccine.

981719	1/28/2021	NJ	39	F	1/27/2021	1/27/2021	After the first COVID19 shot I got very red and very hot. I had a blinding headache for days. I received the shot on a Wednesday afternoon and by Saturday I felt like I could claw my eye out, that I had something in it. I went to the eye doctor Monday morning and was diagnosed with a corneal ulcer. After the second COVID19 shot I was watched for 30 minutes based on my first reaction. I again turned very red and very hot. I had hives on my arms, neck, and behind my ears. I felt lightheaded and dizzy. I received 25 mg Benadryl by mouth and was observed for another 45 minutes. At that time I walked outside and felt worse. My throat became very itchy and I kept coughing. I went back in to tell provider and received an epi pen injection into my right leg, they took my vitals, and sent me to the hospital by ambulance.
981686	1/28/2021	NJ	19	F	1/27/2021	1/27/2021	Symptoms- Diaphoretic, blurred vision, shaky. Pt was brought to the medical booth and placed in a trendelenburg position. Symptoms resolved and pt was able to drink, stand up and walk. Released at 1:13pm.

982550	1/28/2021	CA	26	M	1/11/2021	1/12/2021	After receiving the first dose of the COVID vaccine I was experiencing headaches, dizziness, lightheadedness, palpitations, and nausea. The first dose was on 12/21/20. These symptoms resolved around 12/26/20. I received the second dose of the COVID vaccine on 01/11/21. I began experiencing symptoms on 01/12/21. The symptoms I was experiencing were lightheadedness, dizziness, and brain fog/confusion. These symptoms got significantly worse from 01/13/21 - 01/24/21 and I began developing profound confusion/brain fog, diplopia, blurry vision, headaches, feeling like I'm swaying on a boat, and the "feeling of being drunk". As of 01/25/21, the symptoms have seemed to get better and I am starting to feel more like myself. The drunk feeling and mild blurry vision are still present as of today 01/28/21.
982548	1/28/2021	OR	34	F	1/14/2021	1/23/2021	Pt was vaccinated with Moderna Covid-19 on 14JAN21 developed a sore L arm that was initially resolved within 1-2 days. Beginning on 23JAN21 pt developed an itchy, patchy, and achy rash around injection site on L deltoid. Pt was then seen at the clinic on 25JAN21 where she was prescribed Cephalexin 500 mg #28 taken QIG and Benadryl 25mg T1-2 Q6H. Sx did not resolve by 26JAN21 and was seen in clinic for a follow up, the rash visually looked better with decreased redness and swelling, although the patient began experiencing H/A after beginning the Cephalexin. Pt instructed to continue with current medications and to F/U on 28JAN21. Pt was seen for F/U where rash had increased in size, itchiness and burning sensation. Pt was Diagnosed as having Erythema Multiforme of the L Deltoid and began taking a new Rx of Prednisone 40 mg for Sx. Pt informed to F/U if Sx worsen or are unresolved by 29JAN21.
982445	1/28/2021	RI	24	F	1/28/2021	1/28/2021	Near syncope. sweating. Blurred and blacked out vision. Drop in BP. Nausea. Slight chest pain when resolving.
982501	1/28/2021	OR	59	F	1/25/2021	1/25/2021	Patient initially with fever and chills rigors on evening of and day after the vaccine. On date of emergency room visit 01/28/2021 patient had awoken with right lower quadrant pain, rash on her back and palmar aspects of her forearms, swelling around her eyes. Abdominal pain was crampy she had no diarrhea constipation.

982416	1/28/2021	MI	23	F	1/25/2021	1/25/2021	1/25- received vaccine at 11:45 am. Started round-the-clock extra strength Tylenol at 12:00pm. At 10:30pm began to feel chills and body aches. 11:00pm got very hot and sweaty, hands began to tingle, vision became fuzzy around the edges, felt like I was going to pass out. Experienced tachycardia, tachypnea, and headache. 12:20am- vomited. Restless sleep through the night, chills, fever (100.6-99.6 on Tylenol), body aches, joint pain, stomach ache, woke at 5:00am. 1/26- spent all day vomiting. At least once every hour. Continued tachycardia, tachypnea, stomach ache, fever, headache, body aches, and joint pain. At 7:00pm took Zofran and I stopped vomiting. Still nauseous. Could not eat all day. 1/27- woke up with headache and slight body aches but otherwise felt okay during the day. Was hungry and able to eat. Starting at 10:00pm my stomach began to hurt again. Experienced bloating, sharp stabbing pain and nausea. Felt like I needed to vomit or pass a bowel movement but could not do either. Took Zofran at 11:00pm, did not help in relieving my GI symptoms. Still on round-the-clock extra strength Tylenol. Could not eat all night. 1/28- woke up still with headache, and mild-moderate stomach pain. Able to eat a couple bites of food.
982386	1/28/2021	MI	74	M	1/21/2021	1/21/2021	Flushed, reddened cheeks, itchy, tingling eyes, slight swelling, tingling lips, slight swelling 20 minutes after injection Untreated symptoms significantly reduced after 3-4 hours except itchy, watery eyes Itchy, watery eyes is ongoing a week after the injection, now being treated with Lotemax steroid eye drops
982384	1/28/2021	NJ	26	F	1/28/2021	1/28/2021	Immediately after vaccine administration, Patient reported feeling warm and requested for a chair to elevate her legs. Patient was provided with a chair and elevated her legs with assistance. While elevating legs, patient began leaning to the side and sliding down in the chair. RN held patient to prevent a fall and called for help. We tried communicating with patient but she only produced humming sounds. Approximately 10 seconds later patient verbalized her name upon questioning. Patient reported later that she "blacked out" while her eyes were open. Patient verbalized that she has a history of sweating and vaso-vagal response to blood draws and vaccine administrations.
