1165811	4/4/2021	SC	74	M	3/8/2021	3/8/2021	This is a spontaneous report from a contactable consumer, the patient. A 74-years-old male patient received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration, administered in right arm on 08Mar2021 at 14:15 (Batch/Lot Number: EN6204) (at the age of 74-years-old) as a single dose for COVID-19 immunization; donepezil hcl (DONEPEZIL HCL), 10mg tablet, via an unspecified route of administration from an unspecified date (Batch/Lot number was not reported) to an unspecified date, at 10 mg, 1x/day for an unspecified indication; clonazepam (CLONAZEPAM), 2mg tablet, via an unspecified route of administration from an unspecified date (Batch/Lot number was not reported) to an unspecified date, at 2 mg for an unspecified indication; pioglitazone (PIOGLITAZONE), 45mg tablet, via an unspecified route of administration from an unspecified date (Batch/Lot number was not reported) to an unspecified date, at 45 mg for an unspecified indication; lisinopril (LISINOPRIL), 10mg tablet, via an unspecified route of administration from an unspecified date (Batch/Lot number was not reported) to an unspecified date, at 10 mg for an unspecified indication; vitamin d3 (VITAMIN D3), via an unspecified route of administration from an unspecified date (Batch/Lot number was not reported) to an unspecified date, at 2000 iU for an unspecified indication; multivitamin, via an unspecified route of administration from an unspecified date (Batch/Lot number was not reported) to an unspecified date, at an unspecified dose for an unspecified indication. Medical history included Parkinson's, diabetes type 2, hypertension and rapid eye movement (REM) sleep disorder, all from an unknown date and unknown if ongoing. The patient had no known allergies. Concomitant medications included carbidopa, levodopa (CARBIDOPA LEVODOPA), at 25-100 mg, taken for an unspecified indication, start and stop date were not reported; lovastatin (LOVASTATIN), 20mg tablet, at 20mg taken for an unspecified indication, start and stop date were not reported. The patient did not receive any other vaccines within four weeks prior to BNT162b2. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient experienced rashes on different parts of the body, whole

1163599	4/3/2021	IL	81	F	3/10/2021	4/2/2021	4/2/2021 - pain in right arm starting at injection site. Over next 18 hours pain ran along arm to shoulder to upper back. Pain starts as sharp, then burning. Patient had difficulty sleeping. Started on ibuprofen (1000mg) at 8am on 4/3/2021 and heating pad. Pain dulled a bit. Additional info: on 3/27/2021 Patient woke up with a droopy eyelid that was diagnosed as Horner's Syndrome on 3/31/2021. Sent to ER at Hospital for MRI/MRA/CT, scans showed nothing conclusive - no evidence of stroke, aneurysm, clot, cancer, or anything pressing on optical nerve. Have followup with Dr at Hospital Neurology. Blood work ordered to check for evidence of other conditions that could deteriorate the myelin sheath.
1163612	4/3/2021		23	M	4/1/2021	4/2/2021	A small growth appeared on the inside of my right eyelid. It felt like a piece of sand was stuck in there. This happened the day after my first vaccination and the day after the second dose. By one day after the occurrence (for both) the growth was gone and I felt normal. The growth did not hurt, but it was very noticeable.
1163618	4/3/2021	SC	49	F	4/1/2021	4/1/2021	Overall body pain, extreme weakness, extremely lethargic, excessive sleeping, nausea, vomiting, fever, eye socket pain,
1163626	4/3/2021	TX	44	F	4/1/2021	4/2/2021	On 4/2/21, arm pain, body aches, bad headache, chills, fatigue, redness at injection site. At about 7:30 pm, I started feeling bruising under my right eye. At about 9:30 pm, I had a small bump under my left eye. On 4/3/21, I woke up with facial swelling. I was swollen underneath my eyes, cheeks were swollen, and lip was swollen. Headache, slight back ache, redness at injection site and sore injection area continue. Took 2 Benadryl at 9:00 am to reduce swelling.
1163499	4/3/2021	NY	73	F	3/31/2021	4/1/2021	On 04/01/2021, at 3:00 pm, experienced severe stomach pains; joint pains; muscle aches; headache; back pains; tingling of tongue and mouth; swollen eyes and face; chills.
1163680	4/3/2021	IL	57	M	4/2/2021	4/2/2021	Facial numbness and tingling in addition to lip and tongue swelling. Left eyelid became droopy. Swelling did not obstruct airway.

1163686	4/3/2021	IN	35	M	4/1/2021	4/1/2021	Terrible body aches starting at 8pm on April 1st. Then had the chills. Was able to take ibuprofen and slept for a bit. Next morning April 2, got a migraine where it hurt to open my eyes. Had that for about 2 hours then got better. Also, I had trouble eating. I would take a small bite of crackers and feel like I was going to throw up. Took me a long time to eat a package of crackers and to drink 1 whole bottle of gatorade. I took more ibuprofen through the day and that helped. Around 5pm that night I was able to eat a little more and drink some with out feeling sick to my body. Around 9pm that night headache came back and I went to bed for the night. Today April 3 I feel a lot better. Body still aches a bit and feels like I've been sick for 2 days so will probably take today and tomorrow to fully recoup. No headache today. Just small aches and tired.
1163703	4/3/2021	CA	48	F	3/30/2021	3/30/2021	Flushing, LE weakness, heavy eyes, nausea. Water given.
1163717	4/3/2021	IN	20	F	4/1/2021	4/2/2021	Patient experienced swelling of the face, eyes, and lips, and a burning sensation in her throat and chest. We called 9-1-1 to check vitals and they recommended going to her doctor or the hospital in case of additional swelling. We called the doctor and they told us to try Benadryl. This worked a little bit, but she is still in a lot of discomfort today (Saturday after Thursday shot).

1163814	4/3/2021	IN	40	M	4/1/2021	4/1/2021	Time-line: - Started with achiness in both legs - Chills onset about 30 minutes after achiness - Chills briefly (1-2 minutes) were so severe I was shaking (convulsion like), only time this happened - Chills persisted for over 2 hours, covered up and took a nap - Upon waking, entire body had a hot/searing sensation (under skin), but no elevation in temperature - Eyes were extremely dry - Body aches continued into the next morning, hot/searing sensation had stopped - Was fairly fatigued the entire next day, dry eye issue persisted - After more rest than normal, I seem to be back to normal, no body aches, fatigue, or dry eye issues.
1163132	4/3/2021	OR	57	F	2/1/2021	2/4/2021	I woke up at approx. 2:30 am the next morning with my mouth (tongue and lips), eyes, and inside of nose on fire, as if dipped in hot sauce. Anywhere I touched burned. It felt like it was coming out of my pores, and I jumped into the shower to rinse off, spreading "it" everywhere. The redness and blisters would migrate every hour or so. One minute it was my tongue, then it would show up on my chest. I called the advice nurse who instructed me to take a Benedryl. My tongue and throat were tingling. The Benedryl helped, and I was able to go back to bed but woke up four hours later worse than before. I called again and my PCP was alerted. via email. She prescribed a run of Prednisone and that stopped it, however after the run was over, it started again. A second run of Prednisone was taken. Upon completion, my throat started to tingle again, then stopped. I have pictures of the hives, swelling, and blisters on my tongue, lips, eye, and chest, I cannot take the second dose, per PCP.
1163893	4/3/2021	AZ	46	F	4/3/2021	4/3/2021	About between 30-60 minutes after the vaccination, I began feeling mild pressure in my left eye, and it felt as if my eyes weren't properly matching up? in my glasses, like the prescription in one eye wasn't correct. It wasn't bad enough for me to stop driving home, but it was definitely noticeable and odd. I will keep an eye on it and phone my physician if it worsens.

1164929	4/3/2021	MD	20	F	3/15/2021	3/15/2021	It started with my teeth chattering and chills, but no fever yet. All of the muscles in my body had a severe tremor, and I had trouble with simple tasks like filling my nasal rinse bottle, because the tremor was so bad. My jaw was smacking the entire time, so hard that the headboard smacked against the blinds. Then I checked my temperature and it had gone from 97.5 to about 99.5. The symptoms got worse, and added in excessive thirst, pain at the base of my head where it meets my neck, pressure under and behind the eyes, severe lower back pain, muscle pain escalating on the right side of my body only, nausea, pain across the top of my forehead, and a weird heat sensation under my fingernails? Maybe an hour or so passed, and my fever rose to above 101, and I tried to go back to sleep. By this point the tremors were over, but slight chills and every other symptoms remained. I took my temp later and it was 102.7, and I again had all symptoms except the initial tremors. I also had tachycardia (super rapid heartbeat) and got dizzy for a second and have a little trouble focusing my vision when I sat up in bed.

1162446	4/3/2021		56	F			chest tightness/ chest tightness worsening slightly; lightheaded; vaccine-related anxiety; chest pain; shortness of breath; nausea; vomiting; diarrhea; This is a spontaneous report from a non-contactable health care practitioner (other HCP). A 56-year-old female patient received the first dose of BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE solution for injection; Batch/Lot Number: EN6205; Expiry date was not reported) via an unspecified route of administration on an unspecified date (at the age of 56-years-old) at a single dose for covid-19 immunization. Medical history included chronic pain from an unknown date and ongoing. Concomitant medications included glipizide and lisinopril 10mg (taken at night) which were taken for an unspecified indication; and morphine taken two times a day for chronic pain. The start and stop dates of these medications were not reported. The patient previously took pioglitazone hydrochloride (ACTOS) and was taken off in the last couple of weeks and switched over to Glipizide. On an unspecified date during the patient's 15-minute waiting period after the vaccination, the patient began to experience chest tightness. The patient was transported to emergency department (ED). The patient also experienced lightheadedness and chest tightness worsening slightly while she was being monitored after the treatment was given. The events were reported as non-serious. Differential Diagnosis: Vaccine- Related Anxiety (include misc mental health, unspecified) and Red flag symptoms (CP (Chest pain), SOB (Shortness of breath), NVD (Nausea, vomiting, diarrhea), and unspecified Visual/Neuro concerns. Treatment included antihistamine, Cetirizine (Zyrtec), and water for the event chest tightness. The outcome of event chest tightness was not recovered (reported as worsening); while other events was unknown. No follow-up attempts are possible. No further information is expected.

1162487	4/3/2021	FL	42	F	3/15/2021	3/1/2021	like blurry vision and then she lost her senses/loss of consciousness (fainting)/passed out; like blurry vision and then she lost her senses/loss of consciousness (fainting); tachycardia; mental confusion; loss of sphincter control (urinary incontinence)/pissed on herself; diarrhea; This is a spontaneous report from a contactable consumer (patient). A 42-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration administered on arm left on 15Mar2021 13:15 (Batch/Lot number was not reported) as SINGLE DOSE for COVID-19 immunization at the pharmacy. Medical history was not reported. There were no concomitant medications. The patient was not pregnant (including at the time of vaccination). On 16Mar2021 13:15, she came around to feeling really something bad in her body. She described this as she had loss of consciousness (fainting) which started to feel like blurry vision and then she lost her senses. She then passed out for 5-8 minutes and she had loss of sphincter control (urinary incontinence) as she pissed on herself. She also had tachycardia and mental confusion by that time. They called an ambulance and she was brought to the emergency or urgency department/room. The events [loss of consciousness (fainting), loss of sphincter control (urinary incontinence), tachycardia and mental confusion] were considered as serious (medically significant). She also had several diarrhea (noted in 2021) episodes during one week. She had no COVID prior vaccination and not tested post vaccination. She would like to know if the reaction that she had with first dose vaccination was normal as she was afraid of the second one. The patient did not receive any treatment for the events of loss of consciousness (fainting), loss of sphincter control (urinary incontinence), tachycardia and mental confusion. Outcome of the event of diarrhea was unknown while recovering for the remaining events. Information on the lot/ batch number has been requested.

1163024	4/3/2021	WA	25	F	3/31/2021	3/31/2021	?Janssen COVID-19 Vaccine? Approximately 5 hours after receiving the vaccine I started feeling extremely tired and cold despite the climate being warmer than usual. I went to sleep and woke up shivering, i was cold but my body was burning to the touch. My body ached and I had a headache and nausea. My eyes hurt whenever I moved them. These symptoms persisted until 9:18, I took 2 tylenol pills and started feeling better. Today is my third day, my eye pain has not gone and I still feel tired but what is bothering the most is the eye pain whenever I look anywhere or move my head.
1163036	4/3/2021	CT	66	F	2/17/2021	2/19/2021	I had minor headaches 5 out of 8 days. At first I thought it was just a headache but after repeat headaches , which would be unusual for me, I realized it was probably the shot. Not major pounding headaches, more like eye strain annoying type headaches. Aspirin didn't provide much relief. Motrin was better.

1162369	4/3/2021	CA	66	F	1/29/2021	1/29/2021	There's a tiny bit of irritation in the outside corner of my left eye; eyelid is swollen; This is a spontaneous report from a contactable consumer (patient). A 66-year-old non-pregnant female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose via an unspecified route of administration, administered in the left arm on 29Jan2021 10:00 (lot number: EL9261) as single dose (at the age of 66-years-old) for covid-19 immunization, administered in public health department. Medical history included seasonal allergies. Concomitant medications included varicella zoster vaccine rge (cho) (SHINGRIX, GlaxoSmithKline) on 08Jan2021, lot number: GM2Y4, second dose in the left arm taken for immunization; rhodiola rosea (RHODIOLA) taken for an unspecified indication, start and stop date were not reported; loratadine (LORATADINE) taken for an unspecified indication, start and stop date were not reported; montelukast (MONTELUKAST) taken for an unspecified indication, start and stop date were not reported; fluticasone (FLUTICASONE) taken for an unspecified indication, start and stop date were not reported. The patient previously took lanolin and experienced rash. The patient was not diagnosed with COVID-19 prior to vaccination. On 29Jan2021 at 22:00, the patient experienced a "tiny bit of irritation in the outside corner of my left eye and the eyelid was swollen". The patient has seasonal allergies, so this could be related to that. Although, the patient has never had swollen eyelid issue before. The patient has not been tested for COVID-19 since the vaccination. The events were considered non-serious by the reporter. The event did not result in death, not life-threatening, did not require hospitalization, was not disabling and did not contribute to a congenital anomaly/birth defect. No treatment was received for the events. The patient has not recovered from the events. Follow-up attempts are completed. No further information is expected.

1164947	4/3/2021	CA	73	M	3/9/2021	4/1/2021	<p>Patient woke up around 3:30am feeling extremely nauseous, shaking, drenched in sweat but with a normal temperature (97.6, which is normal for him), and feeling overall terrible. Food had tasted weird to him the day before, but he still ate. At 3:30am, he felt like he was having a major allergy attack - lots of phlegm, runny nose and eyes. He spit up a lot of thick phlegm (which can be normal for him, due to IBM). After 15 mins, the sweat and shaking died down, and he felt better enough to think about going to sleep. But 5 minutes later, the nausea returned, and he threw up about 25 mL of black "coffee grounds-like" fluid. (The smell was HORRIBLE). After getting through with that (about 15 minutes), he wretched up more thick mucus with a few flecks of black cells in it. After awhile, he felt okay enough to go back to sleep. Around 6am, he had another major allergy-like attack, but did not vomit. Around 8am, after being awake for awhile, he vomited again with more black liquid, about 50mL this time. He felt weak and horrible and was shaking. At the recommendation of the advice nurse, he was taken to the ER by ambulance. Upon arriving, he waited around an hour for an ER bed. They put him on an IV, did a physical inspection and did blood work. His sodium was a bit low, but in normal range. Potassium levels were fine. He was mentally clear the whole time, but physically very weak. He was kept overnight after a hemochrit test in the afternoon showed low levels of hemoglobin. He was stabilized in the morning, but was barely able to eat anything the whole time. He was meant to get an endoscopy, but they decided to allow him to eat and sent him home after noon bc they hadn't yet been able to schedule him for it and he was in pain and massively hungry. When he got home, he still barely ate, and still isn't eating almost anything a day later. His stool was incredibly black and thick and SMELLY immediately upon arriving home (he had not defecated for 48 hours at that point), and he has not been able to defecate since, which is extremely abnormal (he usually goes each day in the morning upon waking). They believe that he may have bleeding in his stomach or upper GI or esophagus, but we are waiting for an endoscopy later this week. He is still very weak and frail and fatigued.</p>

1164603	4/3/2021	CA	20	F	4/3/2021	4/3/2021	20 y/o female, s/p 1st vaccine. C/o blurred vision, pale, diaphoretic. Code green called by clinic staff, med consult, and medic with patient, laid down onto cot. Cold water bottle applied to neck, ice to head by staff. Speech clear, he of allergies to MMR per mother. Symptoms resolving, pt signed out AMA with medic. Cleared by med consult Dr to go home. Requested pt to remain on site for additional 15 minutes. Head of cot raised, eating Cliff Bar and drinking Gatorade. C/o feeling tired. Escorted to car via wheelchair with mother. Denies any symptoms.
1164613	4/3/2021	WA	65	F	3/13/2021	3/13/2021	On Sat. 3-13-2021 at 11:53am, Janssen covid shot was administered in left arm. Approximately 3 hours later, at about 3:10pm, I started seeing bright flashing arcs of light in my upper left vision. I wondered if these were precursors of a migraine coming, but mine normally are crackles of primary colors in the center of my vision. I remembered the vitreous detachment in my right eye 5 years ago. This seemed similar, but not very similar. Around 6pm I noticed a largish donut in my left eye vision, which I've never seen before. About 7:30pm I called the consulting nurse, who told me to go to Urgent Care. Got there about 8pm. The MD thought it was a vitreous detachment, but wanted to get an OD on the phone. Additional floaters appeared in my left eye vision while I waited. OD via phone thought it was a vitreous detachment and set up an appointment to see me on Mon. 3-15-2021. Flashing arcs/donut/floaters continued through the next day. Last flashing arcs were about noon on Mon. 3-15-2021. In total the flashing arcs lasted about 45 hours. 5 years ago, in the right eye, flashing lights lasted only 5-10 minutes. On Mon. 3-15-2021 had eye exam. OD said posterior vitreous detachment (PVD). Wanted second opinion about my retina. Second OD performed exam, agreed on PVD and that my retina looked okay. On Fri. 4-2-2021 had follow-up exam with same OD. Retina looked good. Floaters are diminishing. What terrible timing if this was a coincidence. It made everything post-covid-shot very confusing.

1165024	4/3/2021	CA	28	F	4/3/2021	4/3/2021	Waited for the 15 minute observation period and felt fine, but while driving home (approximately 20 minutes after injection) I caught a glimpse of my face in the rearview mirror and noticed that it was swollen, specifically in the cheeks and under eye regions. When I got home 5 minutes later, it was more swollen and my throat was feeling tight, though not obstructing my breathing. I monitored the reaction and did not take any medications. About 30 minutes after the reaction began (50 minutes after injection), the facial swelling began to diminish and both the facial swelling and throat swelling went away within about an hour from the onset of the reaction, I was very tired and had a headache the rest of the day, which I understood to be more typical symptoms.
1164964	4/3/2021	MA	75	F	3/13/2021	3/14/2021	Rash started on legs, then moved up my back, up neck and right side of face to my eye. Then it moved down my legs and last places affected were lower legs, ankles and feet. Worst rash I have ever had. Very itchy, mass of red on my middle back and neck and ears. I tried Benadryl and Cortizone cream. Had no effect. Had tele-appointment with PA at my PCP's office and was prescribed Hydroxyzine and a steroid topical cream. Hydroxyzine knocked me out, but neither that nor the cream stopped the itch. Finally resorted to Domeboro solution as I remembered I had tablets. Created a solution and put on with washcloth. Only thing that stopped the itch. Rash stopped itching on March 23rd. Happened to have appointment for annual skin scan with dermatologist on 3/25. She saw remnants of rash and said inflammatory response was so great that my blood pooled at the surface of my legs and ankles. She said she had been seeing patients who had hypersensitivity responses after 2nd shot of a Covid vaccine. Not sure if was Moderna, Pfizer or both.

1165001	4/3/2021	IN	47	F	4/1/2021	4/1/2021	Within the first hour, developed headache and neck ache (back of neck where neck meets head) and arm ache all on right side of body, same side as injection. Also developed a slightly chemical taste in my mouth, which lasted 36 hours. Within 5 hours, headache, neck ache, arm ache significantly painful; applied gel ice packs to head and right arm; went to bed early. Awoke at midnight with entire right arm, down to hand, feeling like it was in a steel-toothed trap; pain was excruciating, and while I was able to rotate arm and flex hand, pain level was very high. At same time, neck ache was very high, felt like a boulder was sitting on it. At same time, had blistering migraine with runny nose and eye. Called family doctor's office at 8am next day to ask whether I could take migraine medication (elatriptan or sumatriptan) after vaccine; office closed but nurse in call center told me to go to ER; I suggested the side effects were very painful but listed as possible, and didn't know that they warranted ER, and just wanted to know whether I could take triptan for agonizing migraine; nurse didn't really know how to respond. I went back to bed with ice. A few hours later, a family member called their doctor's office and was told yes, I could safely take triptan. Took sumatriptan at 1pm and it cut the migraine way back, to a manageable level. Over the course of the first 24 hours after vaccine, also felt lightheaded, woozy, nauseous, hot, cold sweats, digestive upset and loose stool, diminished appetite. Checked temperature a few times, but it was normal. At 5pm of second day, took 2 Tylenol, which helped pain. Waited 24 hours before taking 2 more Tylenol. By end of second full day after vaccine, feeling better, but like I had a bad head cold with mild headache.
1165013	4/3/2021	NM	70	F	3/18/2021	4/1/2021	Received Janssen vaccine 3/18/21 - on 4/1/21 (14 days later) woke up with numbness to left side of face (can't close L eye, can't raise L eyebrow, left mouth crooked with smiling, watery left eye), and possibly droopy R eye. No diplopia, no weakness limbs (gait ok), no pain - went urgent care - transported to ER due to concerns of TIA/CVA

1165101	4/3/2021	WY	29	F	2/23/2021	2/27/2021	<p>Patient is a 29 year old female patient who went to County Health ER on 3-1-2021 at 02:52AM with possible complex migraine, vision blurring, and transient aphasia. CT was (-), she needs an MRI and referral to neurology. 1) paresthesia of skin, 2) other migraine not intractable, without status migrainosus, 3) (receptive) aphasia Saturday night(2-27-21) laying in bed looking at her phone and all of a sudden experienced a headache, vision went blurry, thought her eyes were tired and she tried to go to sleep. Headache was in the front of her head. Went to sleep then woke up at midnight, 2 hours later, breathing was off, head was hurting and felt anxious, felt like she needed to pace. Her husband was asking her what she was doing but she could not understand what he was asking. Couldn't figure out what to tell him or how to tell him, she could only say "what?" She then lay down, shaking, hand and tongue went numb. Went to ER, by that point the numbness was gone and she could understand what they were saying. The ER doctor Gave her Cogentin that helped to calm her down. Her head was not hurting all of the time. Gets headaches but not usually migraines. Patient has not had COVID that she knows of, son was negative for COVID in November 2020, but he had COVID-like symptoms. No recent sickness, travelled the first week of February 2020. Denies any weight loss, night sweats, no falls, no rashes, no tripping over her feet, no urinary retention. Yesterday felt light headed and dizzy, felt that she had to focus her eyes a little longer. PE abnormalities on office exam 3-2-2020: Right side smile is more droopy than left. Right side, pt is unable to puff cheeks due to right facial muscles with decreased strength/tone. Right foot has decreased vibratory sense compared to left foot. Left foot slightly decreased vibratory sense, but very slight, right is much worse. Monofilament testing is good/normal in the hands and feet bilaterally. Point to point discrimination testing: 2 mm left hand 3 mm right hand Right foot 11 mm on bottom, 10 mm on top (abnormal) Left foot 12 mm on bottom, 11 mm on top(abnormal) strength 5/5 and reflexes normal 2+ in bilateral UEs and LEs. Mental status is normal. MRI and MRA of brain is advised. EEG study with Dr., neurology, referral made. Check tick borne illness panel, vitamin B, folate, thiamine. (ER labs were unrevealing.)</p>

1165138	4/3/2021	CA	30	F	4/3/2021	4/3/2021	Patient 30 y/o Female, received her first dose of Pfizer COVID-19 vaccination (Lot #ER8729, exp. 07/31/21) on 4/3/21 around 11:10am. While in the post-vaccination observation area, notified EMTs around 11:15am that she felt lightheaded, sweaty, nauseous, dizzy, had ringing in her ears, fainting, and was experiencing "tunnel-vision." EMT and responded to . had a BP of 108/60 at 11:15am. Co-lead , RN attended to after being notified. Upon assessment, is arousable, alert and oriented x 4, verbally responsive but sluggish to respond. No signs or symptoms of respiratory distress. Medical history of asthma, phobia of needles, not currently taking any meds. 911 was called. 911 instructed RN to not give any food or drink to . stated she was feeling a "little better" around 11:22am; appeared sweaty and reported mild dizziness and lightheadedness. At 11:25am, had a HR of 68 and a RR of 18 and O2 SAT OF 97%. At 11:28am reported mild lightheadedness; her symptoms of sweatiness and dizziness had resolved. At 11:30am the AMR Paramedics arrived, as well as the Fire Dept. refused to be taken by ambulance to the ER. Paramedics monitored at the site for the next 30 mins. in the post-vaccination observation area. Provided education to to notify next time during vaccination that she has a history of fainting from vaccinating. left the site on her own will; accompanied by her spouse, unassisted, no complaint of nausea, fatigue, and ambulates with steady gait. VAERS report submitted. Confirmation #
1163954	4/3/2021	PA	65	F	3/1/2021	3/20/2021	Onset from administration of Pfizer-BioNTech COVID 19 Vaccine EUA. Body aches, eye soreness, fatigue, headache, dry cough off and on. Onset was the first night that I received the vaccine, continued on and off the first week for a few days and then occurred and stayed continually most of the second week.

1164212	4/3/2021	IN	50	M	4/1/2021	4/1/2021	April 1, same day as shot, around 10pm my nose experienced intense pain to the point of drawing tears along with blurry vision. Pain would be rated a 9 on a 10 scale. This was not caused by any impact to my nose. I was sitting in my chair and watching TV. This lasted 5 minutes and then "went away". April 3, two days after shot, left index finger and left middle finger are shaking (still shaking and has been for last 6 hours). This was noticed upon waking up and is still occurring. I am fatigued.
1163991	4/3/2021	TX	40	F	4/1/2021	4/2/2021	Had left eye pain and skin sensitivity 20 minutes after the vaccine. Around hour 12, started with body aches and intense headache. Between hour 12 - 36, I had fevers up to 101.1, body aches, nausea, and headaches. All resolved by hour 36.

1164187	4/3/2021	IN	59	F	4/3/2021	4/3/2021	A patient received her first dose of the Moderna-Covid 19 vaccination. Several minutes later, I checked on her. She mentioned her eyes were doing something funny. She reported feeling dizzy and seeing black dots. I took her blood pressure, and it was 98/71. The patient reported having a blood pressure that normally runs high. I gave her some water and an ice pack. A Code white was called. I waited 5 minutes and attempted to check her BP on the alternate arm, but the machine would not read. This happened 3 more times even with alternating arms. The patient continued to report feeling faint and began to be lethargic and only mildly responsive. EMS was called and came on the scene several minutes later. The patient did not exhibit issues breathing at any time. The patient left with EMS.
1164213	4/3/2021	MI	21	F	4/3/2021	4/3/2021	Patient stated she was dizzy, blurred vision, ears were clouded after about 10 minutes after the Covid-19 Janssen vaccine.
1164256	4/3/2021	IA	72	F	3/9/2021	3/9/2021	I fell asleep for a full 24 hours after vaccine. I was too tired to stay up past 8:30 pm and woke up the next evening at 8:00pm. I lost a whole day! I continued to be unable to stay awake longer than 12 hours a day; always sleepy. Several days after vaccination itchy, red, swollen eyelids began and continue. They do not look infected as in conjunctivitis, just red, swollen and itchy with no discharge. I do not know if the itchy eyes are from the COVID vaccine, but assumed the extreme sleepiness was from the injection.
1164298	4/3/2021	TN	52	F	3/31/2021	4/1/2021	Rigors at hour 16, lasting approx. 2 hours; hives on day 2, currently ongoing (day 3). NO FEVER. Headaches, nausea and fatigue throughout. Blurred vision day starting day 2 and ongoing.

1164484	4/3/2021	WY	68	F	2/26/2021	2/28/2021	<p>Tested positive for COVID-19 January 11th 2021. Feb 26th 2021 went in to get the first COVID vaccine around 1130 with Public Health. COVID vaccine manufacturer was Moderna. Given in the left deltoid, IM. Patient did stay an extra 30 minutes post vaccine b/c she has lots of allergies. About an hour After the vaccine she experienced pain in her left arm and up into her neck on the left side. Symptoms are very simular to something that she ingested and had an allergic reaction to in the past. Felt okay the first day, second day (2-27-2021) she had chills, fatigue, aches and pains. Started to feel like she was improving on Monday around the 28th of February 2021. Fever was down. Still felt fatigued. Nose felt like it was runnng, itching. Experienced dry eyes, started using the eye drops more frequently. Ear canals were itching. She noticed a tickle in her throat later. Not conscious of everything all the same time, she just didn't feel well overall. Vagina and anus were itching. Started to use the estradiol compound daily hoping that might help. Itchy all over and then realized that the reaction was sort of the same reaction she had in the past with the statin medication. Few days after that had abdominal bloating and cramping, also loose stool and finally diarrhea. Around that same time she reports that she was very dizzy and saw stars, had to sit down, did not actually faint. Denies any fainting episodes, but felt faint. Resolved after 5-10 minutes of sitting down, did not feel clear headed after that for several days. Did do her daily walk, starting on 2-28-2021, felt like she had less stamina. Feels more tired in general still now. Does regret getting the COVID vaccine now. Took some benadryl at the time of the reaction and at hs PRN, benadryl makes her feel drowsy. Takes zyrtec, flonase daily and singulair. Pt's husband is a physician, and he prescribed a Medrol dose-pak, which did not seem to help. At the time was taking all of her prescribed medications amlodipine, benazepril. Has taken pepcid for heart burn in the past, was not taking it as the time. Taking prn omeprazole. Denies experiencing any wheezing. Experienced Generalized swelling of eyelids, face, hands, feet. Tongue is kind of swollen today, and she feels like it has been swollen on and off since the vaccine. Prior to the vaccine she felt pretty good overall. Went out for a few days and went skiing with her family. Has a place out of town that she deep cleaned, felt like</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							maybe she over did it, but she recovered after she rested briefly. Was due for the second vaccine last week. She held off until she could discuss with her doctor, and they discussed that she should not have any further doses. Physically she felt that she should not receive the 2nd vaccine. Continued symptoms include itchy throat (tickle), vaginal and anal itching all day every day. Itching has become a little more like soreness of the tissues. No bruising. Patient has not had the shingles vaccine (Shingrix), thinks she should not get it now. She has pretty much avoided getting vaccines throughout her life b/c she has had poor reactions to flu shots in the past as well. One year, we tried a "half-dose" regimen of the flu shot, giving 0.5ml IM , waiting one month and repeating 0.5ml IM. She did tolerate this well with no reported adverse outcome and did not get influenza that year though it was very active in the community. Since the Moderna vaccine, pt describes Abd distention, bloating of small intestine, "I look 6 months pregnant." pt states her stomach has been like this since the COVID vaccine reaction.

1164359	4/3/2021	CA	19	F	4/3/2021	4/3/2021	At 0830, RRT was called for a 19 y/o F with c/o dizziness, lightheadedness, pain in neck area, and difficulty with vision. At initial meeting, client was pale and stated she had difficulty breathing and had blurry vision, per client, like in "hyperspace?". Head-to-toe assessment completed. Client was diaphoretic and cool and clammy. Pulse was thready. AA0x4 and tachypneic but has clear breath sounds. PERRLA. Vitals: BP: 100/60, HR: 55, O2: 95% on RA. Mother and father present during this time. No PMH, NKA. Did not take any medications today, only ate a small breakfast. Not pregnant. Client states she had a similar reaction like this with the HPV vaccine 1 year ago. During monitoring/observation time, client's status improved. Client insisted for EMT/ambulance assistance. 911 called. EMT arrived at 0845. During EMT evaluation, client vomited about 70 ml of clearish/yellow emesis. After paramedic explained options of going home or transportation to the hospital, client opted to be transported to the hospital. Client left facility with paramedics (AMR 332), accompanied by mother and father. Patient transported to Hospital via ambulance.
1164365	4/3/2021	VA	31	F	4/3/2021	4/3/2021	Spots in vision and double visions for about 40-45 minutes afterwards. About 1-1.5 hours afterwards tingling and numbness in both hands and mouth started and lasted for about 30 minutes.

1164379	4/3/2021	VA	44	F	3/23/2021	4/1/2021	Started with normal sore arm and headaches transitioned to diarrhea and fever. Tinnitus set in on Thursday morning and has continued since then. Friday night I experienced a loud pop on the left side of my head - pressure released on the left ear slightly followed by numbness and tingling in face along with blurred vision, dizziness and weakness in left leg. Blurred Vision lasted maybe 1-2 minutes, numbness and weakness/dizziness resolved on ride to ER so maybe 10 minutes as we live near the hospital. ER evaluated me for potential stroke. Cat scan and labs done. Nothing odd was noted. Doc decided it was paresthesia of left leg and nonintractable episodic headache event. Blood pressure was elevated which is unusual for me along with a high White blood cell count- Doc said this is normal with just having received a vaccine recently. No concerns with platelets or enzymes and electrolytes. Doc does think it could be vaccine related as that is the only thing new this week. Due to earlier in the week side effects, my PCM did COVID test me just incase since the side effects were hanging around longer than the normal window of time and nasal swab PCR came back negative.
1164400	4/3/2021	DE	65	F	2/26/2021	2/26/2021	About 20-25 minutes after receiving the shot, my left cheek began to tingle. In the days that followed, the left side of my face, especially my cheek felt like I had razor burn. My left eye became dry, but that went away, as did scalp itching. I began to produce more saliva on the left side of mouth. My face felt heavy, my upper jaw at times aching, but mostly my lower jaw. The inside of my left ear hurt occasionally along with upper jaw pain. My left lymph node became swollen, as did the left side of my face. My doctor on Zoom said these were symptoms of Bell's Palsy, though I did not have the characteristic drooping eye or mouth of Bell's Palsy. My symptoms have abated, but persist five weeks after administration of the shot.

1159834	4/2/2021	VA	61	F	3/15/2021	3/16/2021	pt states her arm felt like it was on fire as the vaccine was being administered. She became very dizzy and had a headache. On 3/16/21 her arm was sore at the injection site. Her throat hurt and when she swallowed she would have a sharp pain right between her eyes. Her left arm became very painful and every time she tried to move it would cause pain in her chest. She had diarrhea, sweating and had 101 fever. On 3/17/21 she had to have someone help her out of bed on this day. She felt like she was going to pass out. She had this feeling on at least 3 occasions. Pt had pain when opening her eyes, trouble breathing and having heart palpitations. She called her cardiologist with her symptoms and was told it was related to taking the vax. She had a televisit w/ PCP and she was sent to have a Covid test which was negative. She was told to drink plenty of fluids and rest. By 3/20/221 pt started feeling better at this time.

1159716	4/2/2021	IN	41	F	4/1/2021	4/2/2021	None the day of vaccine, awoke the next day (4/2/21) at 05:45 AM with right eyelid swollen and left side of mouth swollen, and felt lethargic all morning though took Benadryl. Denies any previous problem with swelling and denies any difficulty breathing, swallowing or rashes.
1159624	4/2/2021	FL	64	F	3/31/2021	3/31/2021	Moderna COVID-19 Vaccine EUA. I experienced a fever of 101 degrees over 36 hour period, chills, nausea, body aches, and severe headache that affected vision.
1159698	4/2/2021	DE	22	M	4/1/2021	4/1/2021	Around 11:30pm I started to get chills and my teeth started to chatter. At the same time my body was shaking slightly. I was laying on the couch during the start of it for the above events, this lasted for about 20+ minutes. Then I tried to get up to go to bed. I was shaking very badly at this point, teeth chattering a lot and I was very cold. I tried to use the bathroom and I couldn't even stand still to use the bathroom. My chest was also tightening and it was hard to breathe. I went to bed to lay down and I was practically hyperventilating for about 15 minutes at a time and I would stop for a minute then it would start up again. I tried to go to sleep but I couldn't because I couldn't breathe and my chest was closing in, it felt like. I called my parents in and they sat with me and gave me ibuprofen and benedryl. I started to feel better after about an hour. During that time, though, my body was extremely hot (but no fever) but I was still cold and had the chills. My head also was hurting like a headache and my eyes were really hot too. It was hard to get air and if I sat up I would get dizzy.
1159650	4/2/2021	KY	28	F	3/18/2021	3/20/2021	Flu like symptoms 4 days. Those disappeared. On day 2 after injection my elect eye became itchy, very painful, and red. It never got better. Then on day 12 I lost vision in that eye. Still painful. I continue to have half tunnel vision and pain.

1159649	4/2/2021	AR	23	M	3/30/2021	4/1/2021	The patient experienced body aches and headache within the first 24-48 hours of receiving the vaccine. On 4/1/2021, the patient had swelling around his eyes at around noon. He stated that he feels that the swelling worsened that night but this morning (4/2/21) the swelling has improved. He came to the clinic this morning to check in regarding his symptoms. I called in PA to assess the patient. She assessed the patient and he stated that he had some SOB yesterday but denied any SOB today. The patient's O2 sat was 99% and HR was 98 bpm. She recommended that the patient take Claritin BID and return for follow up on 4/5/21 to see her in clinic. She advised him to go to the ER if he experiences any SOB, increased swelling, or difficulty breathing and he verbalized understanding. The patient has a hx of HTN and takes Lisinopril 10 mg daily. He did take his medication this morning. The patient denied taking any new medications. He also denied any previous vaccine, drug or food allergies.
1159630	4/2/2021	SC	17	M	3/27/2021	3/27/2021	During monitoring, patient c/o nausea, dizziness and became pale. Vitals: systolic BP 52; pulse ox 88%. Patient lost vision and pupils slow to react. Called EMS and gave 2L supplemental O2 via rebreather. Patient moved to hospital bed and had legs elevated. Upon recheck blood pressure improved and patient responsive to questions (suspected vasovagal response). After EMS arrived, patient's family declined to send patient to hospital via EMS, and ultimately left the clinic with his family.
1159886	4/2/2021	IL	37	M	4/2/2021	4/2/2021	Vaccine was administered at 10:25am. Patient walked over to the waiting area and as he was walking he passed out and fell to the ground. Vitals were taken at about 10:28am: B/P 132/74 HR 70 RR 18, glucose 120. Patient was able to state his name and where he was located, but kept his eyes closed and kept stated he felt "confused and dizzy" and was apologetic. EMS was called at 10:30AM and when EMS was here pt was noted to have another syncopal episode. Patient was transported to Hospital via ambulance.
1160215	4/2/2021	FL	58	M	3/26/2021	3/28/2021	Red l eyes. An herpes close to mouth and head ache

1159603	4/2/2021	DE	60	F	3/23/2021	3/24/2021	Morning after the vaccine, I woke up with Itchy eyes, runny nose and sneezing. Tried over the counter products (Eye drops: Systane, Allergy Pills: Zyrtec and Xyzal) for two days (3/24/21& 3/25/21) with no relief. Had a teleconference 3/26/21 with Physicians Assistant. Medicine prescribed: Montelukast - 10mg and Azelastine - eye drops) After 5 days on the medication (3/31/21) - called the Doctor to report that Montelukast was not effectively keeping me from having a runny nose and sneezing. Prescribed addition RX of Mometasone Furate Nasal Spray - 50mg. As of 4/2/21, all symptoms have subsided enough for me to resume all activities without discomfort.
1159440	4/2/2021		29	F	3/31/2021	3/31/2021	1516: 10 minutes after vaccine administration pt reported blurred vision, dizziness, anxiety. Had eaten lunch several hours previously. No difficulty breathing, swelling, itching, rash, nausea, or any other symptoms. No history allergies drug/food/environmental. Has not previously had similar feeling.
1159465	4/2/2021	TN	30	F	3/26/2021	3/30/2021	Rapid back and forth eye movements causing vertigo like symptoms. Feeling unbalanced and dizzy at times. I feel better when I lay down. I am not sure if it is caused by the vaccine, but it is the only change in my life currently.
1159708	4/2/2021	AZ	65	M	3/31/2021	4/1/2021	Sore injection site, 102° fever, eyes hurting, sensitive to light, elbow, knee & ankle joint pain. Lasted about 10 hrs, 10 AM to 8 PM. Took 2 tylenol at 730 PM.
1160243	4/2/2021	NY	66	F	3/23/2021	3/23/2021	about 2 hours later I started having allergic reactions similar to ones I have had in the past with food allergies. My bottom lip started swelling, my tounge swelled, I took Benedryl which reduced the swelling but I was very tired, lightheaded, blurry vision, Brain fog could not perform normal duties, rested most of the rest of the day. The next day I still was not comfortable driving as I was still feeling lightheaded. I have Vasovagal syncope where my blood pressure drops, even 7 days later I still felt lightheaded and in the mornings my calfs burn. 7 days later blood pressure was low 94/61 and 97/59. Its now 10 days later and I still do not feel 100%. my Cardiologist recommended extra salt intake and not to take 2

1159414	4/2/2021	KY	34	F	4/1/2021	4/1/2021	Pt rec'd Covid 19 vaccine. Reported to RN about 10 min post vaccine that she felt like she was "going to have a seizure". Pt has aunt accompanying patient and pt was A&Ox3. Pt reports hx of "pseudoseizures x 5 years". RN then noted pt eyes roll back in head. Pt unconscious and assisted to floor and turned on Left Side. Head protected by staff member. AED placed on patient. Seizure approx lasted about 1 min. Pt awoke and alert and arouseable to staff. Pt then began with another seizure lasting approx the same amount of time. Pt awoke non post ictal. She was alert & oriented. Refusing 911 call or go to ED as she reports "I've been checked out many times before, I do this". Bp 140/80's, HR stable and palpable. Pt then underwent 2 more seizures lasting approx same amt of time. 911 called at beginning of 2nd seizure. Upon arrival of EMS pt was still unarouseable and taken by EMS to ED. RN, BSN, CCM Nurse Navigator NMG
1160308	4/2/2021	AZ	77	F	3/11/2021	3/15/2021	As I was driving at 70 mph along the highway 4 days after I had my second dose of the COVID-19 vaccine, suddenly I went blind in my right eye. I was blind in that eye for about 10 minutes. We drove right away to my eye doctor, who sent me to the ER. The hospital is Stroke Certified. They admitted me and did a stroke workup. I was in the hospital for 1 day (24 hours) which included overnight. The treating HCP concluded that I had experienced an ocular stroke. Since it was exactly 4 days after my second dose of the Moderna COVID-19 vaccine, it most likely was caused by that vaccine.

1160307	4/2/2021	CA	66	F	3/11/2021	3/11/2021	8 hours after injection developed a fever and went to bed. Slept on an off for 30 hours with fever up to 104F. When I got out of bed, the effort to walk 10 steps to the bathroom caused vomiting due to exertion. Head ache was severe. Saw blinding white light at corners of my vision when I closed my eyes. Had vision problems and eye swelling. Could not get to Tylenol in upper bathroom (too many steps) for 30 hours. Drank 8 bottles of water during this time. Spent next 30 hours on couch taking Tylenol for 48 hours as often as possible, with the fever under control, maxing out at 100F. . Fever ended by day 4. Bone marrow pain at hips, ankles and back. By day 5 I could do light activity for up to 10 minutes and I was able to eat something other than water. All energy went to immunological response, could not even drink chicken broth for 5+ days. Arm had a lemon sized bulge at injection site and heat locally. Back on my feet by day 7.
1160294	4/2/2021	ID	86	M	3/5/2021	3/6/2021	S/S began Saturday, 3/6/21. Patient was unable to walk or stand. He had to crawl. He also lost his vision, and was only able to see frame of television. He couldn't see anything else in the room. Approximately, 2200 or 2300, his vision returned. He also was able to get up out of chair. He did not seek medical care or report to a health professional until the following Monday, 3/8/21. He saw a urologist (didn't remember name) who instructed him not to get the second dose. He is now reporting the episode to the Pharmacy today.
1160292	4/2/2021	TX	42	F	1/23/2021	1/23/2021	Waited 30 minutes & had not reaction. Then after 45 minutes past I had to pull over to side of road due to sudden onset blurred vision for 10-15 minutes. Regular muscle soreness at injection site & some fatigue for 2 days.
1160183	4/2/2021	CA	59	M	3/31/2021	4/1/2021	I had the vaccine on my left arm. I was advise of being thirsty symptom the next day as a side effect. I got up as usual. I did my daily physical exercise routine as usual ( lift weight 80 lbs), Went to clean my face and look the mirror, and I notice I have my LEFT EYE bloody AND RED. Second day is more. I am using eye drops to remove this problem. Never had this situation happened before and I have never had any shot for 55 years.

1160173	4/2/2021	TX	57	F	3/30/2021	3/30/2021	ASSESSMENT: 57 y.o. female with PMHx of HTN who presented today to the Vaccine site for her second COVID vaccine. She c/o only a sore arm for 1-2 days after her first vaccine but otherwise tolerated it well. NKDA. She states that about 5-10 min after the vaccine she developed rhinorrhea so she went to the bathroom and blew her nose and it improved some but did not resolve. She did not inform us of this until her 15 min timer went off so I completed an evaluation. I am the physician assistant on site at the vaccine clinic who monitors the patients and is there for emergencies. If a patient feels they are having a reaction I complete an exam on the patient. She states the rhinorrhea was still there but was better than it was. Associated with a sensation of "oil in my throat, like eating some butter" but denies throat itching or tightness. Associated with intermittent dry cough and throat clearing. Denies difficulty breathing, wheezing, tongue/lip swelling, mucosal or skin itching, hives, palpitations, lightheadedness, dizziness, SOB, headache, nausea, vomiting, diarrhea, abdominal pain. She has experienced similar rhinorrhea and dry cough in the past with certain medical masks like the one we provided her today. She also experiences this with her seasonal allergies. Her allergies have not been flaring up the last 2 weeks or so but they were before that. She states she has dry mouth and has to drink a lot of water or she will develop a dry cough and throat clearing like she has today. Reports she has never had an allergy to any vaccine or injectable medication in the past. ROS: Constitutional: Negative for chills, fatigue, fever, diaphoresis and weakness. REFLEXES Gait: normal PSYCHIATRIC  
 ORIENTATION: She is alert and oriented to person,  
 place and time. MOOD/AFFECT: Normal mood and  
 affect. INSIGHT/JUDGEMENT: Normal  
 insight/judgement. The patient has good insight with  
 good judgment. ASSESSMENT/PLAN:  
 Rhinorrhea - Airway remained clear, breathing was  
 normal, circulation was good and mentation was good. -  
 She was monitored for 60 min after the rhinorrhea began,  
 vitals remained stable and WNL (despite slightly elevated  
 BP). She drank 1.5 bottles of water which improved her  
 dry cough. She stated she was feeling back to normal  
 before she left the clinic. - Warned her that she likely  
 was having a mild allergic reaction to the vaccine and  
 warned that it is possible for allergic reactions to worsen.  
 Reviewed signs and symptoms of anaphylaxis in detail  
 and gave strict ER warnings if any develop, especially  
 difficulty breathing, throat/facial swelling or any  
 worsening symptoms occur. Warned her while driving to  
 work (15 min drive) she keep an eye on her symptoms  
 and pull over and call 911 if any signs or symptoms of  
 anaphylaxis develop. - Advised she take a non-sedating  
 antihistamine like Claritin on her way to work. I advised  
 she let her colleagues at work now to keep a close eye  
 on her at work. - She expressed understanding and  
 stated she was feeling well and wanted to go to work - All  
 questions were answered. I informed her PCP and sent  
 them my note. I called 4 hours after the vaccine to follow  
 up but had to leave a voicemail,. I spoke with her the  
 following day on 3/31/21 and she stated she felt great  
 besides localized soreness at the injection site.  
 Otherwise she felt well. The rhinorrhea, cough and throat  
 clearing had completely resolved after taking 1 claritin.  
 Denied shortness of breath, difficulty breathing,  
 wheezing, fever, chills, n/v/d, chest pain, hives, itching,  
 palpitations, dizziness, syncope, near syncope or  
 headache. She did not require any further treatment and  
 did not need to have a visit with her PCP and did not  
 need to go to the ER or hospital.

1158700	4/2/2021	WI	64	F	3/18/2021	3/18/2021	<p>She said that she has a pretty swollen black eye that is really red too; She said that she has a pretty swollen black eye that is really red too; She said that she has a pretty swollen black eye that is really red too; Blacked out; severe stomach cramps; Nausea; Diarrhea; Vomiting; This is a spontaneous report from a contactable consumer (patient). A 64-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in left arm on 18Mar2021 at 09:55 (Lot Number: ER2613, unknown expiration) as a single dose for COVID-19 vaccination. Medical history and concomitant medications reported as none. The patient received the first shot of COVID-19 vaccine in the morning of 18Mar2021, and after supper, she experienced severe stomach cramps, nausea, diarrhea, vomiting, and stated that she blacked out. She mentioned that she is just taking it slow and eating broth. She confirmed that blacking out has only happened to her 2 other times in her life. She said that it usually happens with the cramping and the vomiting in this same kind of situation. She plans to follow up with the physician. She said that she has a pretty swollen black eye that is really red too (unspecified date). She is putting ice on it. It did not seem like she ate anything that would cause this reaction. She has no other reason to think her reaction could have been caused by anything else. She called the pharmacist and they told her to report it to Pfizer. No additional vaccines administered on the same date of COVID-19 vaccine. No prior vaccinations within 4 weeks. The patient recovered from events blacked out, severe stomach cramps, diarrhea, and vomiting on 18Mar2021; recovering from nausea; while unknown outcome for the remaining events. No follow-up attempts are possible. No further information is expected.</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1158692	4/2/2021	TN	79	F	2/28/2021	3/12/2021	prothrombin time was 16.2 seconds (standard: 11.9-14.5 seconds); Pfizer vaccine caused the bleeding around the eye/bleeding under her eye; Black eye/left eye was black. It is a purple eggplant in color.; This is a spontaneous report received from a contactable consumer (patient). A 79-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6200, expiry date: 30Jun2021), via an unspecified route of administration in the right arm, on 28Feb2021 10:20, as single dose, for Covid protection, at the hospital. Medical history included atrial fibrillation and ablation. Concomitant medication included apixaban (ELIQUIS) taken for atrial fibrillation and to prevent stroke from 2019. The patient did not have prior vaccinations within 4 weeks. It was reported that the patient received the first dose of COVID-19 vaccine on 28Feb2021 and was scheduled to get the second dose on 21Mar2021 (Sunday). On 12Mar2021, her left eye was black, it was a purple eggplant in color. She wondered if she needed to tell the doctor and remembered her mother had blood vessel that burst. The patient clarified that it was to the side of her eye and not in her eye. It was bleeding under her eye. The nurse wanted the patient to stay so she could do some research. The nurse told her that the Pfizer vaccine caused the bleeding around the eye. The patient didn't want to have the second dose of the vaccine. She was told that she needed to report it. The nurse also told her that she needed to have her blood levels checked and that she does not need to take the second dose until she gets her blood levels checked. She went to her doctor's office but her primary care doctor and the other doctor were on vacation. She was seen by the nurse practitioner. The nurse practitioner told her that she had to take the second shot and she might have to come off the blood thinner. She underwent blood work on an unspecified date with unknown results. She was told that the nurse practitioner has to study up on this and might have to come off of the blood thinner in order to get the second dose. She has been on blood thinner since 2019 after having an ablation. She has done wonderful. She is on this to prevent a stroke. She is on Eliquis. She is thankful for it. She has gone in and out of atrial fibrillation while taking Eliquis. The patient didn't want to take a chance on the second dose of the vaccine in case of hemorrhaging and was scared to take the

Anxiety (Diagnosed probably when she started menopause in early 50s), ongoing Sinus headache (Worst sinuses; Takes Excedrin because Tylenol does not have an effect on her), ongoing smoker (Pack a day, but smoking about only about half of it each time. started when she was a teenager. She was without a cigarette for 3 days in the hospital, but when she came home she had to start again), menopause (in early 50s), shoulder-torn rotator cuff-operated in 2018. Family history included cardiac and heart disease, Parkinson's and Frontal lobe dementia (husband). Concomitant medication included colecalciferol (VITAMIN D3) 1000 IU, once a day, by mouth (Taken these for as long as she can remember, they kept advising it, husband takes it for Parkinson's so she just throws one in for her), calcium ascorbate (VITAMIN C) 1000 IU, once a day, by mouth (Started at least 2 years ago, doesn't drink enough orange juice, doesn't do fruits, doesn't get enough Vitamin C), linum usitatissimum seed oil (FLAXSEED OIL) 1000 IU, once a day, by mouth (Started at least 2 years ago, family history of cardiac and heart disease, takes as preventative) for cardiac and heart disease, takes as preventative, fish oil 1000 IU, once a day, by mouth (Started at least 2 years ago, family history of cardiac and heart disease, takes as preventative) for family history of cardiac and heart disease, takes as preventative, hydrochlorothiazide, lisinopril 20/12.5 mg, once a day, by mouth (She has been taking this medication for years, under control with this medication) for High Blood Pressure, lansoprazole from 2020 30 mg, once a day, by mouth (Started years ago) for Stomach pill for acid reflux, duloxetine hydrochloride 60 mg, once at bedtime, by mouth (Started forever ago) for just being achy and anxiety, lorazepam .05 mg, 1 tablet 3 times a day, takes one tablet a day at bedtime, by mouth for Anxiety (Started this a while back-with the heart disease and everything else, gave this to help with menopause symptoms too), meloxicam 15 mg, at bedtime as needed from 2017 for back issues- really sore at times, takes if really stressed or she overdoes it. Patient previously took Tylenol for sinus headache and does not have an effect on her. After the first dose of the vaccine the patient reported that she was extremely tired on 11Mar2021. She was completely nauseated most of the day on the second day. On Saturday, she was extremely nauseated (12Mar2021) with vomiting and

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

major diarrhea on 13Mar2021. By 4 PM that afternoon (12Mar2021), she could not function because she was so cold; she felt like she was in a really bad dream and couldn't wake up. She called on 13Mar2021, her blood pressure was so low-they got 58 for the top number, they were unable to pull up bottom number at that point. patient reported that when the ambulance arrived, they described her face as extremely pale on 13Mar2021; her major complaint was that she was so cold- she has never been that cold in her life. When she got to the ER- they had to use the old blood pressure cuff to get her blood pressure because it wasn't coming up on the machine- the kind where you pump it up and watch the needle, they said it was 58/38. patient states that they asked her about the rash that was all over her body in 2021; caller reports that she did not have a rash when she called at 4 PM. patient describes the rash as an extremely red sunburn rash- like you got really bad sunburn, most of it was on her torso, she also had it on legs on 13Mar2021. patient mentioned she remembers them taking off sock and her toes were purple on 13Mar2021. She also had a red on her eyelids- she described as itchy and swollen on 13Mar2021. patient mentions that unbelievably as sick as she was in 2021, she could understand everything that they were telling her. Treatment was given as they prescribed her Prednisone and Benadryl; she was also hooked up to an IV, and they were trying to warm up her body because body temperature was low in 2021. Discharge paper reads as anaphylaxis due to vaccination on 13Mar2021. patient states that she came home from hospital on Monday, 15Mar2021. patient reports she started a diet. 2nd day (12Mar2021)- From the time she got up, she was too cold to do anything; she couldn't walk and she was feeling like she was getting the flu. Saturday (13Mar2021)- She woke up and had the worst Charlie horse between ankle and calf- took forever to walk Charlie horse off. Really sharp Charlie horse. Even had less energy today. Really nauseated. patient reports that yesterday and today, she is just tired. She doesn't know if it's just her body catching up on sleep or she's just tired; she will find out today when she goes to doctor. Caller mentions that she is normally more active than she feels right now. patient reports her eyes have been itchy and she has a rash on her eyelids. patient doesn't know if it's from the shot; patient mentions that she decided on

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

01Mar2021 she would start a diet, get healthy, and see a nutritionist. patient reports that initially she didn't think her symptoms were from the vaccine and thought it was that she wasn't eating enough food on Friday. She got in touch with the dietitian. patient reiterated she did not attribute this to shot right away. patient reports that she was wondering if she had asymptomatic covid, and it would have been within a 3-month period that she reacted to the shot. She was not sick if she did have asymptomatic covid. There still trying to figure out why her body had this reaction. patient states that every now and then she was still cold, but she doesn't know if its her imagination and plus it is cold outside where she is. She is still on the cuff on that one. patient describes the nausea she first felt as almost felt like morning sickness on 12Mar2021-that's why she attributed it to her diet. patient mentions that the day she started feeling better, late Sunday afternoon, she wanted salty foods. Anything salty, chips, she just really wanted salty stuff. She was not normally a salt person, but the saltier it was, the better it was. patient reports that when she was vomiting with diarrhea and laying down, she would be throwing up in a towel because she couldn't make it to the bathroom when she was laying, it would just gush. patient describes it felt like her body was going to be locked into the position it was in, she doesn't know how to describe it. patient states that she had vomit on her clothes when she called. patient reports the nausea stopped late Monday and the queasy feeling went away. patient reports she stopped vomiting when they gave her Zofran- they had to give her a couple because she didn't stop throwing up right away. patient reports she was extremely dehydrated and her kidneys were showing some damage; her creatinine level was really off on 13Mar2021. The diarrhea was gone, but now she has a mixture of soft stools and semi formed. It is trying to improve but hasn't yet. patient states that because of her creatinine level, they did want her to drink and she might have soft stools because she was drinking so much. patient reports she knows when her husband put the shirt on her she did not have the rash, but when the ambulance arrived, they said she had the rash. Upon discharge, they told her not to receive any further covid vaccines- she cannot get her second one which was scheduled for 01Apr2021. She started experiencing the

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

really cold feeling on 12Mar2021 after receiving the vaccine. She went to bed at 7, that's not like her, she was usually up all hours of the night. symptoms she was experiencing were beyond typical. patient reports she also felt dizzy and weak on 13Mar2021. She thought she was going to die because of the purple toes in 2021- she knew that was a sign of her body shutting down and she got the most scared. patient mentions she is experiencing a residual side effect from the covid and influenza tests-both were negative on 13Mar2021, but it seems like her nose won't stop running ever since she got it, sore from blowing- looks like Rudolph in 2021. patient reports she feels human today, but she is still sleepy in 2021. She thinks she would feel a whole lot better if her nose stopped running. The tiredness might be from nose blowing and stuff. patient remembers the nurse was thrilled that her toes weren't purple anymore. It started going away when her blood pressure and everything came back up. patient states that she was so scared that she was dying so she remembers everything that happened. patient remembers she was in the ER still when her blood pressure improved. Treatment for her face was so red like the rough sunburn feeling and putting moisturizer on the dried cheeks. patient reports that she doesn't see any patches of red on her. Part of her has a fear that the stuff is not totally out of her system and it will happen again. patient mentions she has heard comments that this was not a typical reaction from the first one and wants to know if it is typical to be that sick from the first dose. patient reports that now her eyes just feel like she's allergic to something. She doesn't know if the redness is from crying now- it was improving, but was still there. Husband has Parkinson's and Frontal lobe dementia and she is his caregiver, she cannot afford to get Covid, she wants to get back to normal. patient reports that she did not take any of her prescriptions the day of the vaccine, she did not want to get a reaction. patient reports she had her shoulder- torn rotator cuff- operated on in 2018. If nose is really stuffed up or allergies, or Fluticasone nasal spray- she can take it 2 times a day, 2 squirts in each nostril, take it as needed. patient reports that she has the worst sinuses- when it gets too bad, she'll go to the doctor and she'll prescribe Flonase, take Metamucil or whatever she thinks will help with sinuses. she still wants to get the second vaccine.

1158366	4/2/2021	CA	38	F	4/1/2021	4/1/2021	<p>On Thursday, 4/1/2021, client received her first dose of Pfizer COVID vaccine (LOT # EW0150, EXP 7/2021) at approximately 10:07 am by vaccinator RN. RN instructed client to self-monitored at the observation area. EMT found this 38 years old female in an observation chair sitting upright and requesting assistance. Due to the client needing translator, site manager present provided translation. lead RN came to assist EMT as needed. EMT reported client had a chief complaint of lightheadedness. Client stated that she felt like her head was "big" but that she did not feel like fainting. Client stated she had a history of high blood pressure and diabetes type 2 but did not take diabetes medication. Instead, she stated that she managed it strictly with her diet. Client had no known allergies. Assessment revealed no redness, hives, swelling, shortness of breath, chest pain or other signs of anaphylaxis throughout her body. Client denied having a headache but stated that she felt "hot" and that the heat was rising to her head. Client denied having a meal before her vaccination. Initial vitals were as follows: Alert and oriented x 4, Eyes were PERL (Pupils Equal and Reactive to Light) at 4 mm, pulse - 74, regular and strong at radial, O2 - 99%, blood pressure 160/98, Temperature 97 F, Respirations 20 and regular. Skins were warm and mildly sweaty. Client consented to staying present for an extra 30 minutes after incident onset. Staff present verified that client had no food allergies and was provided food to eat while under observation. Client's vitals were monitored at 5 minutes intervals after the onset of the incident as follow: 10:18 am: 160/98 (Blood Pressure), 74 (Heart Rate), 99% (Oxygen), 20 (Respiration), 97 F (Temperature); 10:23 am: 162/98, 68, 99%, 18; 1028 : 162/98, 68, 99%, 18; 1033 : 162/98, 72, 99%, 18; 10:38 am: 162/98, 72, 99%, 18, 98 F; 10:48 am: 162/98, 72, 99%, 18. Client reported at the end of her observation that she no longer felt hot and her head sensation was gone. Client's temperature improved from 97 degrees Fahrenheit to 98 degrees Fahrenheit and she ceased sweating at the end of her observation period. Client's husband was present and both were provided a Pfizer vaccine fact sheet and instructed to seek out medical advice or emergency care if a severe allergic reaction occurs later in the evening. Client left with husband in no apparent distress at 10:48 am with husband stating he would drive them home.</p>

Approximately 33 hours after vaccination i developed another rash just to the right of the corner of my mouth. The rash is itchy and is slowly getting worse.

1158701	4/2/2021	WV	51	M	3/9/2021	3/12/2021	Myasthenia gravis; double vision, cannot focus; left eye droop/right eye droop; Bell's Palsy came back with left eye droop/right eye droop; Bell's Palsy came back with left eye droop/right eye droop; This is a spontaneous report from a contactable consumer (patient). A 51-year-old male patient received the first dose of bnt162b2 (BNT162B2 reported as PFIZER COVID-19 VACCINE), via an unspecified route of administration in the left arm on 09Mar2021 08:48 am (lot number: EN6199) as a single dose for covid-19 immunisation. Medical history included facial paralysis from 20Jan2021 to an unknown date diagnosed initially as bell's palsy but now is diagnosed as myasthenia gravis and gastric reflux. Concomitant medication included unspecified gastric reflux medication and unspecified vitamins. The patient did not receive other vaccines within 4 weeks prior and did not receive other vaccine on the same day. The patient previously he was put on prednisone 60 mg tablets by mouth times 7 days, then 10 mg tablets for an additional 7 days. The patient mentioned he received the vaccine in a vaccination center. The patient reported that prior to his first shot towards the end of Jan2021, his doctor thought he had Bell's Palsy. On 20Jan2021, he stated that he was put on a high dose of steroids to clear it up. He stated that on 09Mar2021, he had his first Covid vaccine with no issues. On 12Mar2021 between 5-6 pm, he mentioned that it came back (the Bell's Palsy) with a vengeance, near his eye and with eye droop. He specifies left eye droop. He added that the Monday after (15Mar2021) over the weekend, it got worse. He mentioned that he talked with his neurologist who told him to speak with his ophthalmologist who the patient spoke to on Tuesday. The patient mentioned that both doctors came up with the diagnosis of Myasthenia Gravis. He inquired since one of his doctor's is concerned about him taking the second vaccine and the other doctor was ok with it. He mentioned that one doctor had a feeling of some bias, and the other doctor. He did some research in an association with people diagnosed with it. One of his doctors said that he is immunocompromised, so he looked at autoimmune information, and the information says it is ok. He reached out to the local medical center that is doing the vaccination and they are unwilling to talk with him over the phone. He has read on the association site and they

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

seem to recommend to take it. He did not want to rebel against his doctor, so he wants to be sure. He inquired if it was safe for him to take his second dose and wanted to get good factual information that can give him a good starting point that is related. He mentioned that his second dose schedule was on 30Mar2021. He also stated that initial onset of Bell's Palsy with left eye droop, he was on a high dose steroid regimen and that seem to help which he finished up early Feb2021. It was mentioned that the event initial onset was not after the vaccine. The Ophthalmologist checked him on Tuesday and his left eye which he could barely open, and his doctor also noticed right eye droop. He stated without medication, it is worsening but with his medication, it is definitely helping to transmit between nerves. He stated before the medication this time of day he could not lift his left eye longer throughout the day, the more difficult it is for the muscles as they become weaker. There was noticeably drooping of the right eye. The ophthalmologist exam on his right eye was drooping which was ongoing. It is still there, his wife and he were comparing their eyes and how much he could open it, and it surprised them how little he could open it. It was different and strange. The time reported for the drooping of the right eye was 2:30 pm and persisting but the left eye was worse. He hasn't noticed a difference about the same, medication has been helping. It was also mentioned that myasthenia gravis reported that it started on the 16Mar2021 2:30 pm (talked to the Neurologist to compare notes, so maybe 3:30 - 4:00) when they made the initial diagnosis and started testing the next day. He is waiting for blood work to come back, but all the tests have pointed in that direction. Myasthenia gravis was ongoing, but the condition has worsened and the medications at a therapeutic level, it keeps it at bay. He further added that his eye became so hard to see, so he pyridostigmine bromide on 17Mar2021 since he couldn't open or focus, he thought he would give it a try. It works when he can't focus and if he doesn't take, it he will go back to where he was before. He will not be able to open his eye and the double vision will come back. The events required physician's office visit but did not require emergency room visit. He mentioned that there were 3 test and one more scheduled. The first one was a common test; the first initial test diagnose Myasthenia gravis. The second

1158265	4/2/2021	NV	44	F	3/16/2021	3/21/2021	test was the ice test since they went on the assumption in their initial thinking it was Bell's Palsy and in his, doctor's, opinion it didn't look right. The test sounds goofy and it is one of the tests, they did to predict how it was going to go. He reported that they placed an ice cube in a cloth on the eye and let cool for 2-3 minutes. The eye lid is raised more than it was before the test and it went back down. This test was done on 16Mar2021. He reported that the did a chest x-ray on 17Mar2021 and looked for enlarge thalamus, he states it was normal. He has a CT scheduled next Wednesday (24Mar2021) to check his thalamus and lungs. The patient underwent lab tests and procedures which included blood test with unknown results on 17Mar2021, he reported that he is waiting for the results to look for antibodies for Myasthenia gravis; chest x-ray was normal on 17Mar2021, he reported that they did a chest x-ray and looked for enlarge thalamus, he states it was normal; endoscopy with results of no finding on Mar2021, his GI doctor wanted to do an upper and lower endoscopy, so 2 weeks prior to the vaccine he had an upper and lower endoscopy with no finding; and ice test with results of bell's palsy on 16Mar2021 and in his doctor's opinion, it didn't look right. The outcome of the events was not recovered.
							Dizziness, blurred vision, dropping things for 6 days. Could not see up close and then away. motion sickness

1158793	4/2/2021	MO	67	F	3/3/2021	3/19/2021	Bell's Palsy; This is a spontaneous report from a contactable consumer (patient). A 67-year-old female patient received bnt162b2 (BNT162B2), dose 1 intramuscular, administered in Arm Left on 03Mar2021 15:00 (at the age of 67years) as single dose for Covid-19 immunization. Medical history included hypertension, type 2 diabetes mellitus, kidney disease, and known allergies to Penicillin and Sulfa drugs. Concomitant medications included amlodipine besylate (AMLODIPINE BESYLATE) and dulaglutide (TRULICITY); both taken for an unspecified indication, start and stop date were not reported. The patient is not pregnant at the time of vaccination. The patient was not diagnosed with COVID-19 prior to vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 19Mar2021 (13:00 Friday), the patient experience left side of face became numb and droopy with droopy eye lid and numb lips. The patient sought medical care; stroke was ruled out. The diagnosis was Bell's Palsy. Valacyclovir hcl 1-gram tab was prescribed. The adverse event resulted in Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. The patient has not been tested for COVID-19 since the vaccination. The outcome of event was recovering. The event was considered serious (seriousness criteria: important medical event). Information about lot and batch number was requested.

1158288	4/2/2021	HI	67	F	3/25/2021	3/25/2021	Heart rate increased within 5 minutes of having the shot, went from 72 to 114. My heart rate stayed at 109 or more until 10 PM the next night when its slowly went down to a normal heart rate. At 3 am (12 hours after the shot) i had a blinding debilitating headache that lasted until 9pm the next night. It also affected my vision. The headache was so bad i could not concentrate on the simplest task. I was unsure of what i could take for the headache. So, I did not take anything. When i woke up i was very tired and this lasted until the following day. 6am i had a fever of 102.3 this went down to 100.4 at 9:15 pm that night. I also had chills for several hours. 9:20 AM the nausea started followed by vomiting and dizziness. This only lasted for a few hours. I experienced very vivid dreams the night of the shot. I only drank some coconut water all day and could not eat any food. The next day Saturday March 27 i felt better but the fatigue did not go away until late in the evening. Sleeping seemed to help but i could only sleep for 2- 3 hours at the most.
1158286	4/2/2021	WI	61	F	3/30/2021	3/30/2021	dizziness, blurred vision, ear ringing, ear pressure, fatigue/malaise, mild headache, sluggishness, brain fog, difficulty speaking, joint pain, symptoms from 8 hours after vaccination until 48 hours after vaccination
1158279	4/2/2021	IL	26	F	3/25/2021	3/26/2021	Morning after shot had a pretty bad headache, ate breakfast and almost immediately had to lay down. Could barely keep my eyes open I was so tired. Slept all day, headache did not subside, tried to shower but was too tired to stand for even a few minutes and started to feel nauseous. I felt like I was on a high dose of Vicodin. Was hard to even keep my eyes open long enough to eat. Wasn?t until about 8 pm that I was able to sit up, alert, for an extended period of time. Arm was sore throughout all this but not as bad as the first shot (also it is not my dominant arm). My headache continued for about her 3-4 days.
1158269	4/2/2021	WI	55	M	3/22/2021	3/26/2021	4 days after vaccination, suffered diplopia that resolved, recurred again 7 days after vaccination, lasted 20 minutes and then recurred 8 days after vaccination with associated headache. Patient to emergency department and noted to have orbitopathy with asymmetric swelling of rectus muscles of left eye.

1162853	4/2/2021	AZ	63	F	3/24/2021	3/24/2021	Severe itching on vaccinated are, chest , stomach and back. Rashes and hives, Burning skin, Sneezing, over active sinuses, Nausea, swelling in neck glands and ear glands, facial swelling at mouth and eyes, tightness in chest and difficulty breathing. The symptoms got worse each day and I went to Urgent Care on the 6 th day when the swelling started. I was given a Steroid shot and a prescription for Predizone for 10 days. The shot helped within a hour or two but the symptoms are still there but not as severe. All these symptoms have happened to me before when I have accidentally injected Gluten or Wheat. Is there Wheat in the fillers? I am very nervous about having the 2nd shot !!!!!
1160353	4/2/2021	TX	43	F	2/26/2021	2/26/2021	Sore arm at injection site, extreme fatigue, sudden onset uncontrollable menstrual bleeding & blood clots, felt faint & had some blurred vision. Heavy bleeding & heavy clotting continued until next morning (I have not had any issues with my cycle since my surgery last year so this was not normal). Woke up with fever of 100.7 Saturday morning at 4:57am; fever did not go away until Saturday 8:45pm. Had flu-like symptoms, fatigue, fever, chills, intense all over muscle soreness. Felt better & symptoms were gone by Tuesday 03/02/2021. Menstrual cycles went back to normal following month after 2nd vaccine.
1158357	4/2/2021	CA	54	F	3/30/2021	3/31/2021	swelling of eyelids, burning sensation of face (feeling like sunburn), flushed skin on face, and swelling, warmth, and redness below the injection site-about 2.5 inches in diameter

1159196	4/2/2021	NC	66	F	2/19/2021	2/19/2021	Starting at 10 pm day of vaccine #2: sleepy, muscle soreness, By 2am I had a fever 102 degrees which lasted until 3pm the next day. Then tapered to 101 by the next night and continued until 48 hours after the vaccine. At 3am I was UNABLE to MOVE MY RIGHT KEG IR ARM OFF THE BED ( same side I had polio when I was infant). I was unable to walk to bathroom and husband had to help me. All I could do was shuffle my feet forward once he got me standing. By 4am I COUKD NOT RAISE MY ARMS OR LEGS OFF THE BED, EVEN AN INCH HIGH. and had a VERY hard time breathing. The only relief I had to help me breathe was lying on my stomach. I was seeing streaks of light across my vision for the next few hours. By 11 am I still had a fever 102 but I was able to start breathing easier and I could start moving my arms . It wasn?t until 48 hours after the vaccine that I could move my arms and legs without assistance. I had a slight fever of 100 all day Sunday and slight muscle soreness.
1159155	4/2/2021	CT	44	F	3/31/2021	4/1/2021	While sleeping the night of my 2nd injection, I had a headache develop and chills. My rapid beating heart woke me up at 5:00 AM the next morning. I had a Fit Bit watch on and my heart rate was 108. This was my heart rate just laying in bed and not getting up at all. My normal resting heart rate is 65. My heart rate ranged from 89 to 108 all morning laying in bed. I had a severe headache, muscle pain, and was nauseous. My rapid heart rate lasted most of the day. My head hurt so bad I could barely open my eyes. I had hot flashes and chills. I took 2 Advil around 10:00 AM on an empty stomach because I was so nauseous I couldn't eat anything. I finally was feeling well enough to get out of bed at 12:30 PM and took a shower. I had 2 pieces of toast and that was all I ate all day. I was up and about for 3 hours and then back on the couch at 4:00 PM. From there I developed chills again and had on 5 blankets trying to stay warm. At 9:00 PM, things reversed and I got hot flashes. I had hot flashes/sweats through the night where I had to change my nightgown. I still had a slight headache and hot flashes the next morning. That is where I am at right now. This is day 2 after my vaccination.

1158731	4/2/2021	CA	43	M	4/1/2021	4/1/2021	Upon presentation to Tent 4, participant identified himself as being, "a big baby when it comes to needles". Received vaccine to LUE and was waiting in Obs area with son (who reported only being seated for approx 5 mins.). A loud noise was heard and participant was observed laying out prone on the floor. Clinicians assisted him to roll over where his eyes were red, wide-open gaze, and diaphoretic but was not responding to commands. After turning him to his Rgt side he began to sit up and became slightly combative and was able to be calmed down. Moved to Tent 6 to cot via wheelchair where is RUE BP was 180/100 at 11:09, and Lft radial pulse taken by MD was "60 and weak", Resp 16 and unlabored so no oxygen in use but nearby. Upon further assessment, participant repeatedly stated that, "he just did not feel well" and when probed, c/o frontal headache, nauseated (but did not vomit), and weak. Offered water to sip and by now lip no longer bleeding. When asked, "what did you feel prior to falling out of your seat?", he stated, "I just remember that you all were around me asking me questions...hence could not recall moments leading up to being found on the floor and no type of aura was identified as well. Reported a h/o HTN but did not take his medication today...other history is unremarkable. Ambulance arrival approx 11:13, VS taken, assessed and transported to nearest facility. Family returned and later reported that he sustained only a large "goose-egg" on the forehead and fat lip but otherwise was treated and released.
1159104	4/2/2021	FL	56	F	3/27/2021	3/27/2021	nausea, headache, fever & fatigue beginning on 3/27/2021, mostly resolved as of today. Caller woke up today with facial swelling under left eye and cheek. No swelling of tongue or mouth, no swelling in neck or of any lymph nodes. Denies chest pain, shortness of breath or difficulty breathing. Took ibuprofen & claritin this morning before work, unsure if medications are helping. Advised to contact PCP or urgent care if she feels that facial swelling is getting worse.

1158957	4/2/2021	PA	51	F	3/19/2021	3/20/2021	I had the first shot on March 1st. My arm was a little swollen and sore for two days, and I was extremely tired, but other than that no adverse reaction. I received my second shot on March 19th, my arm again swollen and sore, and I could barely keep my eyes open the rest of the day. On 3/20/21, I woke at 8:30, feeling like I had hardly slept at all even though I had slept for 9 hours. I woke up wheezing, which led to me coughing and chills but no fever. The exhaustion I had felt after the first shot, was nothing compared to this. I thought it would go away, but it didn't. I also noticed a lot for fluid retention in my lower legs and stomach area. When I got on the scale, in the 20 days from the 1st shot til the day after the second shot I had gained 20 pounds of fluid. I was stunned. I could barely do a simple task, then I would have to sit down to rest for a minute, and would immediately fall asleep for 2 to 3 hours. I went to my doctor's on 3/22/21. They did a covid test, it was negative. The doctor said I was definitely wheezing and gave me the only sample inhaler that they had in stock Anorro to try to open up my airways. After a week, I was still having the issues, went back to doctor on 3/29/21 This time they perscribed 12 days of taper steroids. I am on day 4. I also received a referral to see a pulmonary specialist. I am still dealing with the exhaustion, wheezing and cough.
1158855	4/2/2021	IN	68	F	3/31/2021	3/31/2021	12 hours after injection I developed several muscle aches. Extreme shivers and chilling. Fever. Headache unmanageable. Teeth, neck, jaws, eyes, shoulders all throbbed with extreme pain. Frontal lobe irritation! Loss of appetite. Sought Drs. Care after 12 hours. Meds for pain given. In bed and immobilized. Meds did help headache pain.. Injection of toradol then APAP/butalbital/cafeine every 4 hours. Head pain was a 10 of 10! Down to 5/10 with meds. I'm at the 48 hour mark with no let up in sight.

1158818	4/2/2021	MD	47	F	4/1/2021	4/1/2021	Patient received the covid-19 vaccine, about 5 minutes after the patient starting having blurred vision, at this point the pharmacy staff was alerted and the emergency kit was taken to the patient. The patient then started flushing and began swelling. Patient's vitals were normal but she continued to swell showing significant signs of allergic reaction. Patient was transported by ambulance to Hospital ER
1159390	4/2/2021	OH	20	F	3/31/2021	3/31/2021	At 4:00pm I got lightheaded, dizzy, and achy. The lightheadedness was such that my heart was pounding, vision was lost for a second (similar to the effect when you stand up too fast), and the sound went out for a second. Around 7:00 I got chills, a 101 degree F fever, and headache. The chills, fever, and headache lasted throughout the night, but they were gone in the morning. The entire day after getting the vaccine, 4/1/2021, I had a metallic taste in my mouth. By the morning of 4/2/2021 the metallic taste was gone.
1159149	4/2/2021	OH	28	F	3/5/2021	3/6/2021	I received the second dose of the Pfizer vaccine on Friday, March 5th at around 10:00AM. On Saturday March 6th around 9:00PM, I started experiencing a tingling sensation in my eyelid that spread to the left side of my head, arm, fingers, and toes. The tingling sensation spread to the right side of my body by the following Friday, one week after the shot. I had high blood pressure, rapid heart rate, head and ear pressure. It is now April 2nd, four week after the second Pfizer dose, and the tingling sensation continues to come and go. I have had a left side headache off and on most days since the second dose.

1162062	4/2/2021	MN	32	F	3/13/2021	3/13/2021	left eye and left side of mouth was not working/Bell's palsy.; left ear was hurting all day; drainage in patient left ear; neck down to elbow was sore; neck down to elbow was sore/soreness on arm; neck down to elbow was sore; This is a spontaneous report from a contactable consumer. This 32-year-old female consumer (non-pregnant) reported for herself that she received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in arm left on 13Mar2021 10:00 (Batch/Lot Number: EN6208) as single dose for covid-19 immunisation. Medical history was none. Concomitant medications included metformin and prenatal vitamin. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. About 30 mins after the shot patient neck down to elbow was sore. On 14Mar2021 the soreness on arm went away but patient neck was still sore. 14Mar2021 night there was drainage in patient left ear. On 15Mar2021 patient left ear was hurting all day. 16Mar2021 morning (07: 45 am) patient woke up with no more pain in left ear, but left eye and left side of mouth was not working. Patient went to ER and they said patient have Bell's palsy. Patient had no control of the left side of face by 18Mar2021. The patient was not diagnosed with COVID-19 prior to vaccination. Since the vaccination, patient had not been tested for COVID-19. Event Bell's palsy resulted in emergency room/department or urgent care, disability or permanent damage, and patient received unspecified medications as treatment for the event. Outcome of events pain in arm/elbow was recovered on 14Mar2021, outcome of event left ear was hurting was recovered on 16Mar2021, outcome of events Bell's palsy and neck pain was not recovered, and outcome of event drainage in patient left ear was unknown.

1162058	4/2/2021	NY	51	M	1/29/2021	1/30/2021	has a constant severe headache; tinnitus in right ear/Tinnitus continues to persist/Right Ear ringing; stomach pain; high BP; sore arm; tingling in in throat and right side of face.; irritated right eye; Right Ear ringing worsened culminated in 8 days of insomnia from severe ringing; mesenteric inflammation; This is a spontaneous report from a contactable nurse (patient) and a consumer. A 51-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration, administered in arm left on 29Jan2021 (Batch/Lot Number: EL3247) at single dose for COVID-19 immunization. Medical history included sciatica (resolved), and the patient took the first dose of BNT162B2 (lot/batch number: EL0142) at 15:00 on 29Dec2020 administered in arm right for COVID-19 immunization and developed paresthesias in right arm, into axilla, nex and right side of face and burning irritation of right eye, both on 24Jan2021. The patient's concomitant medications were not reported. Clinical course: 3 days after vaccination, patient developed sore arm, tingling in in throat and right side of face, irritated right eye. 6 days after vaccination, patient woke up with tinnitus in right ear, stomach pain and high BP. On 30Jan2021 (as reported), patient went to Emergency Room. CT scan showed mesenteric inflammation. Right Ear ringing worsened which culminated in 8 days of insomnia from severe ringing. Tinnitus continues to persist. He also had a constant severe headache. All events were reported as serious and seriousness criteria were disability. No allergies to medications, food, or other products. The adverse event result in Doctor or other healthcare professional office/clinic visit. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The outcome of events was not recovered.; Sender's Comments: Based on the information provided, known drug safety profile and plausible temporal association, the causality between BNT162B2 and the events cannot be completely excluded. The impact of this report on the benefit-risk profile of the Pfizer product and on the conduct of the study is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. A 55-year-old adult female received the first dose of BNT162b2 (solution for injection; Lot EN6202 and expiry information not provided) via unspecified route in the left arm on 03Mar2021 between 17:10 and 17:30 (at 55-years-old) for COVID-19 immunisation. Relevant medical history included Frozen shoulder (2020-2020), and severe migraines (especially in the past ten years). The patient further stated that she has always had migraines. She said sometimes when her migraines escalate, her blood pressure goes up, and her left side tingles. She said several times in the past, she thought her migraine symptoms may have been a stroke. She said she her doctor is checking her for any kind of things like rheumatoid arthritis, mast cells, constant (chronic) fatigue, and fibromyalgia. She said right before the COVID-19 Virus pandemic she had passed out unexpectedly. She said she doesn't know what caused her to pass out. She said she needs another neurological test done. She said she had a neurological test that maybe showed that veins were dying in her brain, but she wasn't sure. She said her doctor had been doing heart tests too, but because of the pandemic, it was taking longer to have the tests done. The patient also mentioned that her last blood work was probably in/around Nov2020. There were no concomitant medications or past drug history reported. The patient denied receiving any other vaccination within the four weeks prior to the vaccination. The patient also denied receiving any other vaccination on the same date as the vaccination. The patient reported that on 04Mar2021, approximately seventeen hours after she received the COVID-19 vaccine, she had what she thought was a kind of severe reaction. She said she had an inside numbness and tingling all over her body. She said the left side of her body, especially, had a very strong numbness and tingling, like a stroke. She said the numbness was in her left hand, and outside left shoulder. She said the left half</p>

of her face was numb. She said at the time she felt weird. She said she was speaking to her friend on a video call and did not want her friend to think she was a cry baby. She said then her friend told her there was something happening with her face. She said the right side of her face had dropped. She said her right eye and the right side of her mouth were drooping. She said she told her friend she thought she had an allergic reaction to the COVID-19 Vaccine. She said it took about three hours for her symptoms to pass. She said afterward she was so tired, had pain, and a headache. She said it was strange for her to have a headache because she was used to migraines. She said she still had a headache today (08Mar2021). She said she had a heaviness with her headache. She said if she had a migraine, she would not be able to do anything, but with the headache she had, she was able to go about her everyday things. She said her stomach was bothering her too, but she was not worried about how her stomach felt. The events did not require any visits to a physician's office nor the emergency room. Treatment for the events included drinking a lot of water and moving around. The outcome of the events, inside numbness and tingling all over her body, very strong numbness and tingling, like a stroke, numbness was in her left hand, and outside left shoulder, half of her face was numb, right side of her face had dropped, and tongue looked swollen, and allergic reaction to the COVID-19 Vaccine was recovered on 04Mar2021 after about three hours duration. The outcome of the events so tired, and pain was recovered on an unspecified date in Mar2021. The outcome of the events, headache, and heaviness with her headache was not recovered.

1162045	4/2/2021			F	1/28/2021	2/1/2021	unconscious; unable to talk; unable to move her body; Optical injury; This is a spontaneous report from a contactable consumer. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration on 28Jan2021 (Batch/Lot number was not reported) as single dose for Covid-19 immunization. The patient received the first dose of BNT162B2 on an unspecified date for Covid-19 immunization and experienced changes in her speech and cognition and legs, after the first shot. Medical history included multiple sclerosis for about 26 years, Covid-19 from Nov2020, and diabetic. It was unknown if the patient was pregnant at the time of vaccination. The patient's concomitant medications were not reported. It was reported that the patient has been recently in a nursing home. She had Covid end of Nov2020. Once the patient recovered, the reporter (patient's daughter) was urged to get the patient vaccinated for Covid. She stated that she reluctantly agreed and wish she had not agreed. They noticed changes in the patient's speech and cognition and legs, after the first shot, but did not put two and two together, until after the second shot. In under 24 hours of receiving the second shot on 28Feb2021 at approximately 3pm, the patient could barely hold her head up and she could only move her lips, making a mumbling sound at best. She suffered optical injury, and as the hours passed unable to talk, unconscious, unable to move her body, etc. She had to receive a tracheostomy and food peg and is in a long-term acute hospital. She has since become more alert (awake versus sleeping and not responding), tracks people with her eyes, fairly consistently. As of 27Feb2021, she is tracking better but not following commands and the biggest thing is she can turn her head a little, left to right. Today, the reporter saw the patient swallow, twice (she still has a tracheostomy). They told her that the patent can only come out if she can follow commands, this do some therapy with the respiratory therapist. It was further reported that the patient received the Pfizer gene therapy shot. The patient is currently at an acute care facility. The outcome of events was unknown. Information on the lot/batch number has been requested.

1162044	4/2/2021	MA	88	F	2/8/2021	2/23/2021	<p>She needs to get her magnifying glass, she states she's going blind/macular degeneration; She needs to get her magnifying glass, she states she's going blind/macular degeneration; temperature 99.2; vomiting; very tired; arm was sore, couldn't lay on it; This is a spontaneous report from a contactable consumer (patient). An 88-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number: EM9809) intramuscularly, administered in left arm on 23Feb2021 at 10:30 (at age of 88 years old) at a single dose for COVID-19 immunization; gabapentin, via an unspecified route of administration from 08Feb2021 to 15Feb2021 at 100 mg, daily, then via an unspecified route of administration from 15Feb2021 (Batch/Lot number was not reported; Expiration Date: 08Feb2022) to an unspecified date, at 200 mg, daily for feet burn. Medical history included hiatus hernia surgery from Nov2019, surgery from an unknown date, vomited after surgery for three nights/days, gastroesophageal reflux disease (GERD), cancer, feet burning, feet red, asthma and thyroid. Concomitant medication included paracetamol (TYLENOL EXTRA STRENGTH), fluticasone propionate, salmeterol xinafoate (ADVAIR) taken for asthma, montelukast sodium (SINGULAIR), fluid pill, vitamin D, vitamin C, potassium, acid reflux pill before nighttime before supper, thyroid pill, singulair pill. The patient previously took Codeine and percocet [oxycodone hydrochloride;oxycodone terephthalate;paracetamol] and experienced allergies. Two years before in Nov2019 she had hiatus hernia surgery. Her stomach went into her chest. She was in rehab. She had to have the surgery done twice. She went from one hospital and then she went to another and it was taken care of there. When she went to rehab after her surgery, all she did was vomit day in and day out. Her current vomiting reminds her of this experience. They finally did take care of it. She came out of the hospital and was vomiting. She clarifies she had problems with vomiting for the last 6 months before this current experience. She doesn't know what she's eating. They say it's acid and she has Gerd. She does try to get her exercises in. When she was in the hospital, they found she had cancer, which they are just watching for now. When querying what kind of cancer she has, the caller explains she didn't have them do a biopsy. She</p>

VAERS\_ID RECVDDATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

didn't want to go that far into it. She didn't want any extensive treatment. At first, they were keeping check of the cancer every 3 months. Now, she is going ever year. She last went in November. The patient experienced macular degeneration on an unspecified date, vomiting on 23Feb2021 at 17:30, temperature 99.2 on 25Feb2021 at 10:00, very tired on 23Feb2021, arm was sore couldn't lay on it on 23Feb2021. Patient had the first Covid vaccine Tuesday morning, clarified to 23Feb2021 at 10:30AM and around 5:30PM that night she started vomiting. She vomited all night long and all day Wednesday and Wednesday night, and this morning. So far, it had stopped. She was trying to hold water down, but she couldn't keep water down, the water would come up. She clarifies further she tried to take a sip but it kept coming up. She called her doctor who was a practitioner and she told her to drink ginger ale and maybe crackers. She told the doctor that her daughter sent her electrolytes and she was told that was fine to take. She tried toast this morning and she couldn't hold it down. She's been eating very slow, taking little bites at time and she had been holding it down. She did have temperature of 99.2 on 25Feb2021, but half hour or so before it was down to 96 now. She couldn't take medicine that she normally takes because she'll throw it up anyway. She tried to take a few of her pills but it didn't stay down, she threw them up. Around 9am, she took her thyroid and that stayed down. So far, that's doing good. She takes Advair for asthma and she took that, that's okay. She took her singulair pill. So far, the three of these medications have stayed down, and she took 2 Tylenol. Patient took Tylenol twice. She knows it was Extra strength, took 2 pills Tuesday night but it didn't stay down. She Took 4 Tylenol today, 2 pills this morning and 2 right before her CNA left at around 3pm. Caller mentions she can't see the dosage on her Tylenol bottle. She doesn't see the dose. She mentions she will get her magnifying glass to check it out. She's afraid because she had surgery a couple years before and she vomited after surgery for three nights/days, or whatever. Today (25Feb2021), when she spoke to her doctor she was advised to call Pfizer to let them know how the vaccine is affecting her. Right now, she feels pretty good, but she was very, very tired. She's going to lay down when she gets off the phone. She had a CNA with her today and

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

she also spoke to the nurse practitioner. The last time she vomited was around 10am. When the CNA came in, she told the caller to call the doctor but she told the CNA she'd be fine. However, the CNA urged the caller to call her doctor and let them know what was going on. Her second dose was scheduled for 16Mar2021. Her doctor told her don't drink the water, drink the ginger ale and don't drink it too fast, and try crackers and toast. The patient took her temperature last night (24Feb2021) but couldn't read it that great, she thought it was 98. When the CNA came this morning (25Feb2021), she took it around 10:00AM and it was 99.2. She told the CNA to take another temperature because she didn't think she had a fever. When the CNA left, she had to leave at 3:00PM, her temperature was normal, it was 96. She thinks maybe her temperature went to 99.2 because she was drinking her tea. However, she wasn't drinking it right away, because she threw up on it. She stopped drinking an hour before her temperature was taken. She clarifies wasn't drinking the tea when the CNA came. She also mentions she broke up her the toast into little tiny pieces and felt like she was eating like a bird, but it didn't stay down so she stopped. The CNA came around 9am, maybe 8am, and clarifies it was maybe around 1030AM when she took the temperature. When the CNA left her temperature was at 96. The patient was very tired the same day she received the vaccine. She remembers went to bed with clothes on. Last night, she wanted to go to bed again with her clothes on but she couldn't stand it and she changed into her pajamas. Then, she went to the bathroom and vomited, she has a bucket by the side of her bed. It wasn't the dry heaves, stuff was coming up. She was still very tired currently. She makes the comment "I forget things and then I remember afterwards". She had to get under the light to see the Covid card, it's small, it is handwritten. Caller mentions she sees the month on it. Caller reports her arm bothered her for quite a while. Last night, she went to sleep on her left side and her arm was feeling better which gave her some hope. Her arm started hurting her the day she got the vaccine, but her arm wasn't red or anything. Her arm was feeling better this morning. She thinks if she can sleep on it and didn't hurt, it's getting better. The last pills she took were Gabapentin she has been on for about 2 weeks. She explains her feet burn during the night and

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

the doctor recommended the Gabapentin for now. However, she has had too much time trying to stop the vomiting that that took over her feet burning, so her feet didn't bother her as much. She was initially prescribed 1 pill at night before going to bed at 10pm, then when the 1 pill didn't work for a week, the doctor increased it to 2 pills at bed time at 10pm because it takes an hour to work. She stated that she was going to take the Gabapentin on Tuesday night, which was a mistake because she threw it right up and it tasted awful. Caller makes the comment she has not given the doctor the report of how that reacted yet. When probed for an NDC, Lot number or expiry date for the Gabapentin, the caller explains she can't see writing, it's in small print. She does see the Discard After: 08Feb2022. She needs to get her magnifying glass, she states she's going blind. She's been told she had macular degeneration. She doesn't think the Gabapentin is agreeing with her. She reads that it "May cause drowsiness, operating vehicle which she doesn't drive, may cause dizziness, may cause vision. Call if you experience mood changes, sadness, depression.." She started out taking one pill of the Gabapentin every night from Monday to Monday. The second Monday, 15 Feb2021, she started taking 2 pills at night for a total of 200mg. She took it this past Monday night until she had the vaccine and then she took it again, and now she was not taking it anymore. Her burning feet wake her up during the night, it starts at her ankles and goes halfway up her leg. She had to put her feet on a cold floor. Normally, she feels good and she usually doesn't get pain so whatever little bit of pain she has, that's the pain she gets. Her feet were burning like that for month before she called the doctor. she didn't know. Her feet were red before they started to burn, this is the latest thing. During the day, she is fine, only a nighttime her feet burn. The patient underwent lab tests and procedures which included body temperature: 98 on 24Feb2021; 99.2 on 25Feb2021; 96 on 25Feb2021. Therapeutic measures were taken as a result of vomiting. She was going in for a test, clarified as an MRI on the 3rd of March for her eyesight. The action taken in response to the event for gabapentin was permanently withdrawn on an unspecified date. The outcome of the event "Pain in arm" was recovering, the outcome of the event fatigue was not recovered, the outcome of the events

1161162	4/2/2021	WA	82	M	2/5/2021	3/1/2021	82 year old male with history of hypertension, hyperlipidemia, mild dementia presented with progressive worsening weakness over the past 2-3 weeks. Patient reported that he has noticed whole body weakness that has progressively worsened over the past few days. Reported that he has noticed feeling weak, fatigue and requiring more energy to do his daily activities over the past few weeks. He went to his PCP's office yesterday and had laboratory tests for further evaluation. Initially his PCP thought he might have PMR since he had bilateral UE soreness. However, the labs returned reassuring and does not seem to suggest the diagnosis of PMR. Since yesterday, he has noticed worsening of his weakness. Reported that last week, he was still able to play golf. Today, he was unable to get out of his car or get up from a sitting position without help. Associated with unsteady and poor gait. And reported that he has numbness in both hands and feels like his grip is weak. Denied fever, chills, nausea, vomiting, diarrhea, constipation, chest pain, shortness of breath, headache, vision changes, no urinary/fecal retention or urinary/fecal incontinence. Primary Discharge Diagnoses 1. 1161974	4/2/2021	FL	65	M	1/4/2021	1/21/2021	<p>Left eye was not closing; Left face drooping; Extreme pain behind his left ear; Can't blink; A spontaneous report was received from a consumer concerning a 65-years-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced events left side of his face was drooping/facial paralysis, extreme pain behind his left ear/ear pain, can't blink/corneal reflex decreased, and his left eye was not closing/eye movement disorder. The patient's medical history included COPD, congestive heart disease and chronic problems with his back. No relevant concomitant medications were reported. On 4 Jan 2021, 17 days prior to the onset of the events the patient received their first of two planned doses of mRNA-1273 (lot batch: 026L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 21 Jan 2021 the patient had an unexpected reaction. He got up that morning and felt fine, but as the day went on, he noticed that when he spoke, the left side of his mouth was not moving, then he noticed his left eye was not closing and that side of his face was drooping. He was not in any pain at that point. He made an appointment to see his general doctor the next day, 22 Jan 2021, after the exam he was diagnosed him with Bell's Palsy (BP) and referred him to a neurologist and ophthalmologist. The earliest he could see the ophthalmologist back was next week and he could not get the neuro to call him back. His doctor prescribed him prednisone which he completed after 7 days but said the BP symptoms have not improved. Then on Saturday, 30 Jan 2021, he started feeling extreme pain behind his left ear. Everyday the pain got worse. His pain medications were not helping the pain behind his left ear. He could not see out of his left eye and he could not blink. The event left side of his face was drooping was considered as medically significant. Action taken with mRNA-1273 in response to the events left side of his face was drooping, extreme pain behind his left ear, can't blink, and his left eye was not closing was not provided. The events left side of his face was drooping, extreme pain behind his left ear, can't blink, and his left eye was not closing was not reported.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Further information has been requested.</p>

1161921	4/2/2021	TN		F	3/1/2018		<p>her heart went back into afib one; feeling tired; numbness in her hands and fingers; tingling in her hands and fingers; lower back pain on the right side/lower back starts to hurt sometimes; weakness in legs/legs are weak; shortness of breath; feeling off; black eye; This is an initial solicited report from a non-Pfizer sponsored program, from a contactable consumer, based on information received by Pfizer. This 79-year-old female patient was involved in a patient support program. The patient received apixaban. The report describes a case of fatigue (feeling tired), hypoaesthesia (numbness in her hands and fingers), paraesthesia (tingling in her hands and fingers), back pain (lower back pain on the right side/lower back starts to hurt sometimes) and muscular weakness (weakness in legs/legs are weak). The occurrence of additional non-serious events is detailed below. The patient's past medical history included High frequency ablation and Hospitalisation. In March 2018, the patient started apixaban (Oral), (unspecified dose, twice a day). On an unknown date, the patient experienced fatigue (feeling tired), hypoaesthesia (numbness in her hands and fingers), paraesthesia (tingling in her hands and fingers), back pain (lower back pain on the right side/lower back starts to hurt sometimes), muscular weakness (weakness in legs/legs are weak), dyspnoea (shortness of breath) and feeling abnormal (feeling off). The action taken with apixaban (Oral) was unknown. At the time of the report, fatigue, hypoaesthesia, paraesthesia, back pain, muscular weakness, dyspnoea and feeling abnormal outcome was unknown. For apixaban (Oral), the reporter did not provide any causality assessments. Patient received apixaban for the indication of Atrial fibrillation. The consumer reported that in Mar-2018 during a trip with her daughter, she began feeling tired and her legs hurt. When she returned home, she was hospitalized and diagnosed with Atrial Fibrillation. Follow-up (18Mar2021): This is a follow-up solicited report from a non-Pfizer sponsored program, from a contactable consumer, based on information received by Pfizer license party for apixaban. This 79-year-old female patient was involved in a patient support program. The patient received APIXABAN. The report describes a case of ATRIAL FIBRILLATION (her heart went back into afib one). The occurrence of additional non-serious events is</p>

----------	-------	-------	---------	-----	----------	------------	--------------

detailed below Co-suspect products included Covid-19 Vaccine. The patient's past medical history included High frequency ablation and Hospitalization. Concurrent medical conditions included AFib. In March 2018, the patient started APIXABAN (Oral), (unspecified dose, twice a day). On an unknown date, the patient experienced ATRIAL FIBRILLATION (seriousness criterion medically significant), FATIGUE (feeling tired), HYPOAESTHESIA (numbness in her hands and fingers), PARAESTHESIA (tingling in her hands and fingers), BACK PAIN (lower back pain on the right side/lower back starts to hurt sometimes), MUSCULAR WEAKNESS (weakness in legs/legs are weak), DYSPNOEA (shortness of breath), FEELING ABNORMAL (feeling off) and EYE CONTUSION (black eye). The patient was treated with Surgery (heart monitor) for Atrial fibrillation. The action taken with APIXABAN(Oral) was unknown. At the time of the report, ATRIAL FIBRILLATION, FATIGUE, HYPOAESTHESIA, PARAESTHESIA, BACK PAIN, MUSCULAR WEAKNESS, DYSPNOEA, FEELING ABNORMAL and EYE CONTUSION outcome was unknown. The patient stated that she had the coronavirus Pfizer vaccine and a few days later she had a black eye. The patient was concerned about this because she takes Eliquis so she asked a healthcare professional for advice they then informed her that the vaccine had caused her black eye. She was told that she cannot miss her second vaccine and that she might have to stop Eliquis. Patient was concerned about having to stop and had some questions. The patient reported that, she had been on Eliquis for a while and she had been doing just fine. She recently took the Pfizer Covid vaccine and a week or two later she developed a "black eye". She described the color around her eye as eggplant purple. She remembered her mother would have blood vessels burst around her eye, so at first, she thought nothing of it. She said the day before yesterday she went with her daughter while she got the Moderna Covid vaccine. She asked the nurse administering her daughters Moderna Covid vaccine if the Pfizer vaccine could cause black eyes. The patient said the nurse did some research and told her the the Pfizer vaccine was known to cause hemorrhaging, and that the vaccine caused the black eye. The nurse told the patient she should go to her HCP as soon as possible and get blood work done. The patient did not

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

say anything else was abnormal about her blood work. She told the HCP what happened to her eye after she was given the Pfizer Covid vaccine. The HCP told her that no matter what the patient should get the second Pfizer vaccine, even if she had to stop the Eliquis for a few days. The patient said she did not want to stop the Eliquis because she has been doing wonderful on the medication and did not think the Eliquis was the cause of the black eye. She said she will have a talk with her normal primary care doctor as well as her cardiologist. The patient said she rather not get the second covid then stop the Eliquis. The patient started Eliquis two years ago after her heart went into "full afib" she had an ablation procedure and they shocked her heart three times to get it back into rhythm. Since starting the Eliquis the patient said her heart went back into afib one time. She wore a heart monitor and her heart went back into sinus rhythm on its own. She also mentioned that her HCP prescribed her a diuretic but she said she has a terrible reaction to it. She was prescribed the diuretic to help with the swelling around her ankles. She said the diuretic was also to help "keep congestion from her heart". The diuretic makes her feel "terrible" so her HCP allows her to cut the pill in half or quarters and take as needed to keep swelling down. She said the diuretic makes her feel faint and she even passed out one time while walking in the mall. She said she has not taken it in a while. The patient said she had a lot of allergies to medications, to many to list.

DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 17-Mar-2021, Prothrombin time: 16.2 seconds. For APIXABAN(Oral), the reporter did not provide any causality assessments. Patient received apixaban for the indication of Atrial fibrillation. The consumer reported that in Mar-2018 during a trip with her daughter, she began feeling tired and her legs hurt. When she returned home, she was hospitalized and diagnosed with Atrial Fibrillation. The strength of Eliquis was 5 mg. Most recent follow up information received on 18-Mar-2021 from Non-Health Professional incorporated above includes : New events added, lad data, concomitant drugs and narrative updated.; Sender's Comments: BMS Medical Evaluation Comment: This 79-year-old patient had atrial fibrillation after therapy with apixaban. Elderly age and underlying atrial fibrillation can be associated with increased risk of arrhythmias and

1161180	4/2/2021	CA	61	F	3/3/2021	3/3/2021	Initially I reported a definite numbness/ tingling lips & in left side of brain/head immediately following vaccine, plus sharp pains in my body, numbness in my left leg/foot, and a very sharp pain in left big toe that later showed purple under toenail. Then 3/7 I experienced a start of numbness on left side of full face additionally present until today, varying in intensity. It can be intermittent. Now, I wish to also report, I experienced uncontrolled repeated darting eyes, as I would look from one activity to another when focused on a project, and it occurred primarily in evenings. Then eyes would settle on object I was trying to look toward. This has resolved now. I can still feel a slight numbness in left side of face and in brain/head, and lips, and pain in left toe which is still purple under nail. I read online it is recommended to take B12 liquid for cranial nerve inflammation due to Pfizer vaccine. Plus I took Orange Juice with Mango, and Organic Milk to attempt to provide a way to rid body of toxins from vaccine, plus hot baths.
1161169	4/2/2021	PA	81	F	3/11/2021	3/11/2021	Got the vaccine and about an hour later started losing vision in the left eye. Everything appeared blurry and had to stop wearing contacts and switch to glasses.

1162919	4/2/2021	CA	24	M	4/2/2021	4/2/2021	On Friday, April 4, 2021 client (DOB 5/3/1996) received his first dose of Pfizer COVID vaccine (LOT # EW0150, EXP 7/2021) at approximately 12:56pm. Per EMT report: at 1:06pm, client fell out of chair, landed on his left knee and regained consciousness immediately. Upon assessment, client stated his left knee pain was a 3 out of 10 scale. At 1:07pm, client was sat in the zero-gravity chair in supine position and given a bottle of water. Client stated he "felt pressure in ears-mainly right ear." EMT & 2nd EMT coached client to breathe normally. At 1:09pm vitals were taken: BP: 120/70, HR: 52, RR: 10, O2 sat: 95%, skin: pale, moist, cool, eyes: PERRLA, LOC: A&O x4. Lead RN was notified and advised vitals be taken every 5 minutes for an additional 30 minutes. At 1:13pm vitals were retaken: BP: 120/70, HR: 69, RR: 12, O2 sat: 94%, eyes: PERRLA, skin, pale, moist, cool, LOC: A&O x4. On assessment, client stated he has no history of fainting, no allergies, and not taking any medication. Client stated he had a small amount of food and water intake and was not currently experiencing nausea. At 1:20pm, client stated the pressure in his ear subsided and was experiencing no headache, light-headedness or dizziness. At 1:25pm vitals were retaken: BP: 120/70, HR: 69, O2: 98%, skin: warm, pink, dry, LOC: A&Ox4. At 1:35pm, vitals: BP: 120/78, HR: 72, RR: 12, O2: 96%. Client was lowered to sitting position in gravity chair. No changes in vital signs were assessed by EMTs. At 1:40pm one final set of vitals were taken: BP: 120/76, HR: 66, RR: 13, O2 sat: 97%, eyes: PERRLA, A&O x4, skin: pink, warm & dry. At 2:15pm, client was able to safely stand up. No further interventions indicated. Client was educated by Lead RN & EMT on signs and symptoms of adverse reactions and when to go to the ED/call MD. Client was also encouraged to sign-up. Client left vaccination site at approximately 2:15pm with a steady gait. A family member was able to pick him up and drive him home.

1162869	4/2/2021	CA	37	F	4/2/2021	4/2/2021	04/02/21 12:45 pm ? At approximately 12:45 pm I was called to vaccine tent #1 after reports from staff that a patient was feeling sick after receiving her Janssen injection. I discovered the patient slumped in her chair, head back with eyes closed, skin clammy and cool. Alert and oriented x3, speaking slowly but clearly. Per vaccine nurse, she administered the Janssen injection to patient at 12:41 pm (Lot 1805020, exp 5/25/2021, Left Deltoid) and a few minutes later the patient started to close her eyes and leaned back in chair requiring assistance to sit up. Nurse was able to stabilize patient in chair and then called for help and that is when I came to assist. Patient remained in this state for several more minutes. Activated EMS for further evaluation as patient did not stabilize immediately. Measured vital signs ? Blood Pressure 98/62, O2SAT 97, Pulse 68. I continued to monitor the patient until EMS arrived. EMS evaluated patient and cleared but advised to continue to monitor for an additional 15 minutes before leaving the site. Patient verbalized understanding and agreed with plan. Patient remained in observation for an additional 15 minutes with no incident.

1162085	4/2/2021	AZ	66	F	2/26/2021	2/26/2021	short of breath; fear and anxiety or from the vaccine; fever blisters; fear and anxiety or from the vaccine; like bells palsy; numbness of the right side of her face from her jaw to her ear and up to her right eye; This is a spontaneous report from a contactable consumer (patient). A 66-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number: EL9267), via an unspecified route of administration, on 26Feb2021 (received at the age of 66-years-old), at a single dose for COVID-19 immunization. Medical history included cold sores, 2 knee surgeries, and ADD (Attention deficit hyperactivity disorder) from an unspecified date and ongoing (diagnosed at 30-years-old). Concomitant medications included methylphenidate hydrochloride (RITALIN), amphetamine aspartate, amphetamine sulfate, dexamphetamine saccharate, dexamphetamine sulfate (ADDERALL) and other regular medication. The patient received first dose of Pfizer BioNTech vaccine and developed numbness of the right side of her face from her jaw to her ear and up to her right eye on 26Feb2021. It felt like she had received a lidocaine injection. Her doctor said this can happen with RNA vaccines, affect the 7th cranial nerve and develop Bell's Palsy. She was prescribed Valacyclovir 1mg and has taken it for 3 days. She wants to know what the other Bell's Palsy cases were like. She wants to know what their treatments were. Her doctor said it was okay to receive her second dose at 8am on 20Mar2021 but she wants to do her due diligence and see if there is a case report or study on these patients that developed this side effect. The patient further explained that she had her first dose on 26Feb2021 and was there for the 15 minutes for observation. On her way home, the right side of her mouth and the right side of her nostril were numb like Novocaine that you get at the dentist. She said that the numbness traveled up the right side of her jaw to her ear and then over to her right eye. When she got home, she told her daughter and she said that she thought it was because she volunteered all day and was worn out and anxious (26Feb2021). She said that she slammed water and ate crackers and after about a 1.5 hours she started to feel better. She said that she then she called her physician and the doctor told her that it was flaring the nerve root like bells palsy and that it is a RNA Virus. She

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT

said that she was placed on some medication for it, but was wondering if she should get the second dose of the vaccine. She said that the doctor asked her if she had previously had cold sores and she said yes. The caller said that her doctor said that it is exactly what that is. The patient stated that she was also short of breath on an unspecified date, but thought it was from fear and anxiousness. She does not know if it was from fear and anxiety or from the vaccine. She said that the doctor told her to take the medication 3 days before and 3 days after her second dose. She clarified that the doctor put her on Valacyclovir HCl 1Gm tablets 1 a day. She said that she broke out with fever blisters on 02Mar2021. She really did not think anything of it until speaking with friends in the medical field and they told her to follow up with this. She added that the fever blisters are healing and only a tiny bit left. It is at the scab and end of healing. Outcome of numbness of the right side of her face from her jaw to her ear and up to her right eye was recovered on 26Feb2021. Outcome of fever blisters was recovering. Outcome of other events was unknown.

3/10/2021

I felt OK for the first 3 days and then I started having worse symptoms of my MCAS and POTS condition. Note, I had NOT had POTS symptoms for 7 years. I was originally diagnosed with POTS in 2010 but slowly got better over 3 -4 years time and have not had issues with POTS since until after the 1st dose of the Covid 19 vaccine. Once my mast cell issues seemed to improve after the first week or so then the POTS symptoms kept getting worse. I am now one month out from the first shot and my heart rate and blood pressure are so bad I'm mostly couch ridden. I'm seeing a cardiologist on Monday. Heart rate even when sleeping at night is shooting up to 125-136 without exertion, just sleeping or standing. I have almost passed out while driving 5 times. Until I improve I won't be driving on major freeways. My vision has also been severely effected. Very blurry and one time all I could see were prisms blinding my view of almost everything. Also very weak all of the time and a lot of pressure in my head, it feels like someone is pushing my head forward. Some ringing of the ears as well.

1162087	4/2/2021	MI	69	F	3/15/2021	3/1/2021	Left side of neck, site of injection, elbow, joints and muscles down left side; Left side headache continuing to spread; Left jaw, cheek, nasal area swelling; left eye sagging/ occasional eye droop; Tired; general aches mostly on left side; wobbly; hives; skin itching; This is a spontaneous report from a contactable consumer (patient). A 69-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EP7534 and expiration date not provided) via an unspecified route of administration, administered in left arm on 15Mar2021 15:45 as a single dose for COVID-19 immunisation. Medical history included hypertension, chronic dry eye, Bells Palsy, arthritis, allergies to penicillin, injected iodine and food sensitivities. The patient is not pregnant. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included losartan, multivitamin and ciclosporin (CEQUA). On 15Mar2021 15: 45, the patient experienced left side headache continuing to spread. Left jaw, cheek, nasal area swelling and left eye sagging (previous site of Bells Palsy attack)- Left side of neck, site of injection, elbow, joints and muscles down left side. She was tired and progressed to general aches mostly on left side and was somewhat "wobbly" on 15Mar2021 15:45. She later had hives and skin itching on an unspecified date in Mar2021 which lasted a couple of days. Tiredness continues and swelling in face and occasional eye droop at 4 days out. No treatment was given in response to the events. The outcome of the event fatigue was not recovered while the outcome of the rest of the events was recovered on an unspecified date in Mar2021. The patient has not been tested for COVID-19 post vaccination.

1162692	4/2/2021	TX	35	M	4/2/2021	4/2/2021	Gave patient shot. He left the vaccination room. A few minutes later he tells me he is dizzy and his vision is blurry so I bring him back into the vaccination room, give him some water and tell him to relax. 10 minutes later I check his BP which is elevated along with his pulse. I check again another 10 minutes later and it has lowered (pulse 80). BP still elevated so I mentioned it could be due to the nervousness to the reaction or just that he has hypertension and he should get it checked out. After a while his spouse came into the vaccination room and he said he was better and they left.

1162555	4/2/2021	OR	41	F	3/19/2021	3/20/2021	Started with a headache the next morning around 10:00am then progressed throughout the day to a horrendous migraine similar to the effects of when I took immitrex and had the worst migraine in my life. All day on the 20th, I felt lethargic and dizzy and would start blacking out when doing even light activity. In the evening, I got chills even being under the blankets and having the thermostat in my room up to 75F. I had a low grade fever at 100F, super fatigued, shortness of breath. Sunday the 21st I was fatigued so much that with activity such as walking to my garden shed and getting chairs cause me to start blacking out. I had to sit for a moment to regain eyesight and even out to walk. This lasted through the 23rd of March, I had fatigue, brain fog, and shortness of breath. On the 24th and 25th I still felt fatigued but less brain fog. By the 26th of March I was feeling more myself. I am worried what the 2nd shot will do.
1162117	4/2/2021	IL		F	2/27/2021	3/1/2021	experiencing profuse nose bleeding; not feeling well; had some issues like sinus in her eyes; lot of pain; This is a spontaneous report from a contactable consumer via Pfizer-sponsored program. A female patient of an unspecified age received bnt162b2 (BNT162B2), dose 1 via an unspecified route of administration on 27Feb2021 (Batch/Lot number was not reported) as SINGLE DOSE for covid-19 immunisation. Medical history included diabetic. The patient's concomitant medications were not reported. The reporter was calling for a reschedule on behalf of her sister, who was supposed to be due for her second dose of the vaccine today, 20Mar2021 but cannot make it since the patient is not feeling well. According to the reporter, the patient is experiencing profuse nose bleeding. The patient is not feeling well today and she doesn't have Covid or anything but she just had some issues like sinus in her eyes. She is in lot of pain and so she was wondering if she cancel her Covid appointment, can she get another one or you have to have it that is 3 weeks after they did the first shot. The outcome of the events was unknown. Information about lot/batch number has been requested.

1160683	4/2/2021	FL	65	M	2/28/2021	3/3/2021	65yo male presented to ED with left eyelid droop, blurred vision, and headache. Pt reported that HA began 3 days after COVID-19 vaccination (Pfizer); pt presented to ED 10 days after dose #1. Unknown where patient received vaccine, but able to pull lot #, etc. from Shots Registry. Pt discharged from ED, but then returned 3 days later with worsening HA. At this time, he was admitted for 4 days for extensive work-up. Of note, pt with hx of R-sided Bell's palsy in the past. Per discharge summary from Neurology: "Despite extensive work-up, pt ultimately deemed to have a pupil-sparing CN III palsy likely related to either recent COVID vaccination or his history of DM.~~
1160668	4/2/2021	WV	42	F	3/12/2021	3/22/2021	Ten days after the vaccine was administered I woke up feeling like something was wrong. I just didn't feel right. I tried to lay down to see if I could feel better but this did not help. Even while in a relaxed state my blood pressure was up to 170/97 and heart rate of 220. I was very dizzy and felt like fainting but did not lose consciousness. I had a terrible pressure in my chest, in the left side of my neck and along the inside of my left arm. Also notable my vision was blurred. Called 911 ambulance took me to the Hospital ER and the ekg they performed was abnormal and also notable when they drew my blood my sodium level was below the normal threshold. I had taken 3 nitroglycerin tablets and my symptoms subsided enough for them to let me go home. Since coming home my bp has remained elevated much higher than normal at around 135/85. I continue to feel not quite normal and have the pressure in my left side of neck, chest and left arm. I feel very certain this is all due to the covid vaccine I received.
1160833	4/2/2021	TX	38	M	3/29/2021	3/29/2021	Patient called and stated feeling some tingling on spots around my face. Nothing serious. Just like random small areas. Pt can still smile, talk and stick my tongue out normally. Pt states he had a red itchy spot over his eyebrow dime size but gone now, skin under his lower lip felt itchy and numb. He denies any chest pain pressure, SOB, wheezing, throat/tongue itching/swelling, diff swallowing, edema, GI sx. No hx of GB or Bells. He is able to move and talk, blink, stick tongue out w/o issues.

1160611	4/2/2021	PA	40	M	3/17/2021	3/25/2021	Experienced moderate debilitating flu symptoms day after vaccination and recovered the following day. Over one week later (3/25) developed skin sensitivity on the neck which later spread to back, torso, and legs. Skin sensitivity persists still one week after onset, is a severe chafing feeling when skin comes into contact with clothing. No rash or any visual signs. Along with the skin sensitivity, mild to moderate chills from day to day as well as muscle fatigue and upper/lower back pain. Symptoms varied in severity day to day; used ibuprofen and it seemed to offer limited, temporary relief. Concurrent with second onset of symptoms, noticed gradual abdominal inflammation and developed sensation similar to UTI but urine dip and lab test results were all normal. Doctor concluded immune reaction to vaccine as no other allergies or changes in routine as well as no prior medical history of any of these symptoms. Prescribed daily prednisone for three days to calm immune response; after one day symptoms were greatly improved. Abdominal inflammation has improved and UTI sensation improved. Still experiencing slight chills and skin sensitivity unchanged.

1160927	4/2/2021	IL	33	F	2/2/2021	2/4/2021	I ultimately suffered from Acute Disseminated Encephalomyelitis and was hospitalized for 5 days due to brain and spine inflammation. I had numbness in my feet 2 days after my vaccine, then suffered from dizziness and nausea 3 days after my vaccine, and had face paralysis 4 days after my vaccine. I went to the ER 4 days after the vaccine and was told I have Bell's Palsy and Vertigo. I was prescribed oral steroids and anti-nausea medicine. In the following weeks, I had more tingleness/numbness of the legs, brain fog and confusion, blurred vision, unsteady gait, loss of balance, blurred vision and leg muscle weakness, increased anxiety, hearing sensitivity, lethargy, sleeplessness, 6th cranial nerve palsy, tingles in the face, and headaches. I finally got an MRI and when doctor's saw the MRI results 3 days later, I was told to go to the ER immediately because I had brain and spine inflammation that needed treatment, and was diagnosed with ADEM. I then spent 5 days in the hospital to receive intravenous steroids and monitoring. During this stay, I had more MRIs and a lumbar puncture. I was released on oral steroids for 25 days, as well as follow up appointments and monitoring progress in recovery. Inflammation has decreased. I continue to have tingleness in lower extremities, headaches, pain in legs, and sensitive hearing.

1160844	4/2/2021	AZ	48	F	3/29/2021	3/29/2021	I started with a very itchy scalp as I was driving to the office after my shot. Shot was at 9:45, I arrived at the office around 10:23 and felt very itchy. I took two Tylenol when I arrived as advices for soreness. I felt hives/rash on the back of my neck around 12:15 or so. Then in my underarm, back of my knee and inner elbow area. I started feel nausea. I drank plenty of water and had a few bites to eat. My hives/rash were popping up and I was using topical Benadryl. Soon after, I took on 25 mg Benadryl. I called my doctor?s office for guidance around 4: 10 pm and then started throwing up. I had someone drive me home. No fever. I developed red hives around my hairline and around eyes. Felt very tired. Next day, I stayed off work and drank plenty of water and slept a lot. Rash had cleared but the red hives around my hair line and eyes were visible. Called doctors office and was told to continue Benadryl.

1160891	4/2/2021	WI	32	M	3/26/2021	3/26/2021	Pfizer-BioNTech COVID-19 Vaccine EUA 32-year-old male with history of anxiety and hypertension presents with possible reaction to the COVID vaccine. He was in his usual state of health and doing well until he received his first dose of the Pfizer vaccine around 0740 this morning. Around 10 minutes following the vaccine, patient became short of breath, lightheaded and had his vision gray out before losing consciousness for few seconds. Patient was sitting in a chair at that time and did not fall or hit his head. He was then given juice and was able to ambulate and felt better. Patient was directed to the emergency department for evaluation. He states that he now feels back to his baseline with no lightheadedness or difficulty breathing. Patient states that he has passed out following blood draws in the past and usually lies down afterward. Patient's presentation is overall most consistent with vasovagal syncope, especially given his history of similar events following blood draws. Patient was observed in the emergency department for nearly an hour and remained asymptomatic so he was discharged home with return precautions
1160860	4/2/2021	CA	39	F	4/1/2021	4/1/2021	Received first shot of COVID 19. Felt fine until 4 hours after. Migraine like symptoms with chills and shaking and nausea. Driving home and had photophobia and aura like vision. Took Tylenol and tried to sleep. Woke up today and felt ok.
1160974	4/2/2021	OK	22	F	4/2/2021	4/2/2021	I stayed for 30 mins because after my first shot my arm ended up VERY swollen and I had a rash. So I was okay after the 30 minutes but when I started driving I felt like I was high on strong drugs. Like as if I'd taken an extremely strong marijuana edible and it just hit me. I had to pull over because my eyes wouldn't stay open, my whole body was feeling very heavy and I was extremely tired and out of it. I didn't have another way to get home (I had traveled about an hour) so I just kept driving and taking 15 min rests along the way. When I got home I fell asleep as soon as I sat down and slept for about four hours. I feel better now that I'm awake, still light headed but not near as bad.

sensation, Pain ran along left side of neck is Recovered. Follow up (17Mar2021): New information included clinical information and description of product complaint: Is there a Product Complaint: Taking benadryl last two nights to sleep, did not help last night. Product strength and count size dispensed: 25mg. Additional lot numbers: P117225. Is a sample of the product available to be returned, if requested: No No follow-up attempts are possible. No further information is expected.; Sender's Comments: Considering a plausible temporal association, a causal relation between the reported events and the suspect drug BNT162B2 cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1162044	4/2/2021	MA	88	F	2/8/2021	2/23/2021	She needs to get her magnifying glass, she states she's going blind/macular degeneration; She needs to get her magnifying glass, she states she's going blind/macular degeneration; temperature 99.2; vomiting; very tired; arm was sore, couldn't lay on it; This is a spontaneous report from a contactable consumer (patient). An 88-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number: EM9809) intramuscularly, administered in left arm on 23Feb2021 at 10:30 (at age of 88 years old) at a single dose for COVID-19 immunization; gabapentin, via an unspecified route of administration from 08Feb2021 to 15Feb2021 at 100 mg, daily, then via an unspecified route of administration from 15Feb2021 (Batch/Lot number was not reported; Expiration Date: 08Feb2022) to an unspecified date, at 200 mg, daily for feet burn. Medical history included hiatus hernia surgery from Nov2019, surgery from an unknown date, vomited after surgery for three nights/days, gastroesophageal reflux disease (GERD), cancer, feet burning, feet red, asthma and thyroid. Concomitant medication included paracetamol (TYLENOL EXTRA STRENGTH), fluticasone propionate, salmeterol xinafoate (ADVAIR) taken for asthma, montelukast sodium (SINGULAIR), fluid pill, vitamin D, vitamin C, potassium, acid reflux pill before nighttime before supper, thyroid pill, singulair pill. The patient previously took Codeine and percocet [oxycodone hydrochloride;oxycodone terephthalate;paracetamol] and experienced allergies. Two years before in Nov2019 she had hiatus hernia surgery. Her stomach went into her chest. She was in rehab. She had to have the surgery done twice. She went from one hospital and then she went to another and it was taken care of there. When she went to rehab after her surgery, all she did was vomit day in and day out. Her current vomiting reminds her of this experience. They finally did take care of it. She came out of the hospital and was vomiting. She clarifies she had problems with vomiting for the last 6 months before this current experience. She doesn't know what she's eating. They say it's acid and she has Gerd. She does try to get her exercises in. When she was in the hospital, they found she had cancer, which they are just watching for now. When querying what kind of cancer she has, the caller explains she didn't have them do a biopsy. She

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

didn't want to go that far into it. She didn't want any extensive treatment. At first, they were keeping check of the cancer every 3 months. Now, she is going ever year. She last went in November. The patient experienced macular degeneration on an unspecified date, vomiting on 23Feb2021 at 17:30, temperature 99.2 on 25Feb2021 at 10:00, very tired on 23Feb2021, arm was sore couldn't lay on it on 23Feb2021. Patient had the first Covid vaccine Tuesday morning, clarified to 23Feb2021 at 10:30AM and around 5:30PM that night she started vomiting. She vomited all night long and all day Wednesday and Wednesday night, and this morning. So far, it had stopped. She was trying to hold water down, but she couldn't keep water down, the water would come up. She clarifies further she tried to take a sip but it kept coming up. She called her doctor who was a practitioner and she told her to drink ginger ale and maybe crackers. She told the doctor that her daughter sent her electrolytes and she was told that was fine to take. She tried toast this morning and she couldn't hold it down. She's been eating very slow, taking little bites at time and she had been holding it down. She did have temperature of 99.2 on 25Feb2021, but half hour or so before it was down to 96 now. She couldn't take medicine that she normally takes because she'll throw it up anyway. She tried to take a few of her pills but it didn't stay down, she threw them up. Around 9am, she took her thyroid and that stayed down. So far, that's doing good. She takes Advair for asthma and she took that, that's okay. She took her singulair pill. So far, the three of these medications have stayed down, and she took 2 Tylenol. Patient took Tylenol twice. She knows it was Extra strength, took 2 pills Tuesday night but it didn't stay down. She Took 4 Tylenol today, 2 pills this morning and 2 right before her CNA left at around 3pm. Caller mentions she can't see the dosage on her Tylenol bottle. She doesn't see the dose. She mentions she will get her magnifying glass to check it out. She's afraid because she had surgery a couple years before and she vomited after surgery for three nights/days, or whatever. Today (25Feb2021), when she spoke to her doctor she was advised to call Pfizer to let them know how the vaccine is affecting her. Right now, she feels pretty good, but she was very, very tired. She's going to lay down when she gets off the phone. She had a CNA with her today and

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

she also spoke to the nurse practitioner. The last time she vomited was around 10am. When the CNA came in, she told the caller to call the doctor but she told the CNA she'd be fine. However, the CNA urged the caller to call her doctor and let them know what was going on. Her second dose was scheduled for 16Mar2021. Her doctor told her don't drink the water, drink the ginger ale and don't drink it too fast, and try crackers and toast. The patient took her temperature last night (24Feb2021) but couldn't read it that great, she thought it was 98. When the CNA came this morning (25Feb2021), she took it around 10:00AM and it was 99.2. She told the CNA to take another temperature because she didn't think she had a fever. When the CNA left, she had to leave at 3:00PM, her temperature was normal, it was 96. She thinks maybe her temperature went to 99.2 because she was drinking her tea. However, she wasn't drinking it right away, because she threw up on it. She stopped drinking an hour before her temperature was taken. She clarifies wasn't drinking the tea when the CNA came. She also mentions she broke up her the toast into little tiny pieces and felt like she was eating like a bird, but it didn't stay down so she stopped. The CNA came around 9am, maybe 8am, and clarifies it was maybe around 1030AM when she took the temperature. When the CNA left her temperature was at 96. The patient was very tired the same day she received the vaccine. She remembers went to bed with clothes on. Last night, she wanted to go to bed again with her clothes on but she couldn't stand it and she changed into her pajamas. Then, she went to the bathroom and vomited, she has a bucket by the side of her bed. It wasn't the dry heaves, stuff was coming up. She was still very tired currently. She makes the comment "I forget things and then I remember afterwards". She had to get under the light to see the Covid card, it's small, it is handwritten. Caller mentions she sees the month on it. Caller reports her arm bothered her for quite a while. Last night, she went to sleep on her left side and her arm was feeling better which gave her some hope. Her arm started hurting her the day she got the vaccine, but her arm wasn't red or anything. Her arm was feeling better this morning. She thinks if she can sleep on it and didn't hurt, it's getting better. The last pills she took were Gabapentin she has been on for about 2 weeks. She explains her feet burn during the night and

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

the doctor recommended the Gabapentin for now. However, she has had too much time trying to stop the vomiting that that took over her feet burning, so her feet didn't bother her as much. She was initially prescribed 1 pill at night before going to bed at 10pm, then when the 1 pill didn't work for a week, the doctor increased it to 2 pills at bed time at 10pm because it takes an hour to work. She stated that she was going to take the Gabapentin on Tuesday night, which was a mistake because she threw it right up and it tasted awful. Caller makes the comment she has not given the doctor the report of how that reacted yet. When probed for an NDC, Lot number or expiry date for the Gabapentin, the caller explains she can't see writing, it's in small print. She does see the Discard After: 08Feb2022. She needs to get her magnifying glass, she states she's going blind. She's been told she had macular degeneration. She doesn't think the Gabapentin is agreeing with her. She reads that it "May cause drowsiness, operating vehicle which she doesn't drive, may cause dizziness, may cause vision. Call if you experience mood changes, sadness, depression.." She started out taking one pill of the Gabapentin every night from Monday to Monday. The second Monday, 15 Feb2021, she started taking 2 pills at night for a total of 200mg. She took it this past Monday night until she had the vaccine and then she took it again, and now she was not taking it anymore. Her burning feet wake her up during the night, it starts at her ankles and goes halfway up her leg. She had to put her feet on a cold floor. Normally, she feels good and she usually doesn't get pain so whatever little bit of pain she has, that's the pain she gets. Her feet were burning like that for month before she called the doctor. she didn't know. Her feet were red before they started to burn, this is the latest thing. During the day, she is fine, only a nighttime her feet burn. The patient underwent lab tests and procedures which included body temperature: 98 on 24Feb2021; 99.2 on 25Feb2021; 96 on 25Feb2021. Therapeutic measures were taken as a result of vomiting. She was going in for a test, clarified as an MRI on the 3rd of March for her eyesight. The action taken in response to the event for gabapentin was permanently withdrawn on an unspecified date. The outcome of the event "Pain in arm" was recovering, the outcome of the event fatigue was not recovered, the outcome of the events

1155550	4/1/2021	SC	41	F	3/25/2021	3/26/2021	She got the vaccine she was fine, had a mild cramping in her stomach. She wakes up at 5:00 AM in the morning for work and on Friday she could not put her feet on the ground for pain in her legs. She also had a bad headache on the left side and took Advil for that, and then the headache switched to the right side. She then took another Advil, and that was all she took that day and was that way the whole weekend. She had pain all weekend and could not touch herself as the pain was so bad. She also had chills, nauseated, her vision was going in and out as if she was at the eye doctors office. Her uncle brought her mother over to her as she could not take care of herself or drive to take care of her cousin who she takes care of. She went to go work on Monday 3/26/21 then she started having difficulty breathing and her employer called the EMT's, they checked her heart rate which was high and did her oxygen level which was fine, and were afraid she may have gone into cardiac arrest, and told her to rest. She called her doctor who told her that it was a bad reaction to the vaccine. She is still having difficulty breathing after walking so far, she weighs 115# and has always been a small person. She was not given any medications by her doctor and told her to rest and if it worsened to call her back. She had been seen two weeks prior by her doctor for a sinus infection and was given an allergy shot and some other injection of which she does not know what it was, possibly a steroid.
1155518	4/1/2021	OK	20	F	3/16/2021	3/17/2021	MODERNA EUA--The patient complained of having a rash on her face the day after receiving her first Moderna dose on 031621. She denied any fever, itching, shortness of breath or wheezing. She was also noted to have some bruising under her left eye. The initial encounter with the healthcare provider occurred two days post-vaccination via virtual visit on 031321. She was followed up in person on 031921 at which time her rash was improved after taking Benadryl. She reported some pain of her lower left eyelid that continued but no vision changes. Another virtual visit was conducted on 032621 at which time all symptoms had resolved without further sequelae.

1155519	4/1/2021	VA	51	F	3/25/2021	3/25/2021	Several hours after receiving the 1st vaccine, began to feel very dizzy. Checked blood sugar and it had spiked to 319, which is highly unusual for me. I kept an eye on it to ensure it did not increase further. Within a few hours it did go back down so medical treatment was not necessary. I just wanted to report this so people with diabetes can be informed that this might happen.
1155538	4/1/2021	MO	42	F	3/18/2021	3/18/2021	skin under my mask turned red, splotchy, got very hot and slightly swollen. Eye sockets slightly swollen. Left side of face more severe in reaction than the right side. Throat slightly swollen. Left ear became plugged feeling. Scalp slightly numb, again more intense on the left side of head than right side. Even after I took my mask off symptoms continued and got slightly worse, not life threatening, but surprising. Pharmacist gave me 2 benadryl pills which I took with a 12 oz of water and symptoms began to lessen within a few hours. Came back the next day with moderate exercise. They were not nearly as pronounced but my face did turn red, get hot and my ear plugged up again. No medicine needed, I just rested and it went away. Same thing happened the third day but even less severe reaction and went away quickly when I stopped walking around and just rested. The shot was injected at the very top of my shoulder near the clavicle bone, it should have been administered lower in the deltoid and I think I might not have had such severe reactions. Perhaps nerves were interfered with due to the proximity of the injection.
1155525	4/1/2021	CA	55	M	3/24/2021	3/25/2021	I was woken up at about 1:15AM with major night sweats and vividly scary dreams of scary faces . I opened my eyes and I was still seeing the scary faces that were scaring me and causing me to yell and move around in bed while asleep. I girlfriend said I was yelling and moving around a lot prior to waking up. Once awake, I was still seeing the visions for about 2 minutes until I turned on the light and my eyes adjusted to the brightness. When I turned the light off and tried to go back to sleep, the faces appeared again. I was not able to go back to sleep and ended up getting out of bed and going out on the couch to watch TV to avoid being in the darkness and closing my eyes. I'm not one to dream very often and this was certainly and vividly scary night.

1155451	4/1/2021	WI	26	M	3/27/2021	4/1/2021	I woke up with hives over my arms and chest. My left eye was nearly swollen shut and my hands were swollen and in a lot of pain. Whole body is very itchy and sensitive to touch. I took sudafed because it is all I had available at the time.
1155302	4/1/2021	NJ	38	F	1/14/2021	1/21/2021	A week after getting the shot the left side of my body went numb/tingling. My left foot felt like I was stepping in a puddle of water. Left facial cheek went numb, left side of my neck hurt, left eye went blurry, left ear pain and sore throat. Went to ER to rule out a stroke. They did blood work, CT scan and EKG. Since then I have seen a neurologist, ENT, Cardiologist and my primary doctor. I have had multiple MRI's and blood work done. I still am having chest pains, sore throat, ear pain, tingling in my left arm, and blurred vision.
1155527	4/1/2021	WI	16	F	3/31/2021	3/31/2021	They made initial contact with young lady when she entered the holding area (as they do with every car). Their second contact came when the mother showed up on scene. At that time the patient reported that at one point her vision began to get dark on the peripherals and she may have passed out. She stated she turned on her hazard lights (four-way flashers) at that point. Our personnel never noticed a vehicle not progressing forward at any point. Our personnel then removed her from the line for evaluation: She no longer had any complaints, vitals: BP 106/57 P-64 and regular SPO2-99% and did not want transport to the hospital. The patient and mother were given instruction of things to watch for and what warranted calling 911. They report the mother and patient had no concerns upon their departure. Further, there were 4-6 personnel in the 15-minute holding area yesterday. They are constantly on foot moving between all the cars.

1155543	4/1/2021	GA	62	M	3/19/2021	3/19/2021	Shortly after receiving vaccine, participant's wife summoned nurse, found him sitting in car with eyes open, but unresponsive. After approx. 30 sec. he was responding to questions; c/o feeling light headed, nauseated and had 'limited' vision. B/P 110/74, O2 sat 87%, HR 51. EMS arrived and assessed participant. Repeat B/P 160/102 and BG 118. Due to cardiac hx., participant agreed to be transported to E.D. On 4/1/21 made a f/u phone call to participant and he stated that lab work in the E.D. indicated that he was anemic.
1155440	4/1/2021	MI	36	M	3/11/2021	3/12/2021	Day 1: Common symptoms: Fatigue, chills, headache. Day 2-Day14: Began experience upper gastrointestinal symptoms. Pain, Bloating, Feeling of extreme fullness, Nausea, constant gurgling of the stomach. This lasted for approximately ~ 2 weeks. These symptoms have not fully resolved but have improved 85-90%. Day 3-current: Twitching and muscle spasms began in the arm that I got the shot in. Shoulder, bicep, and into the forearm were CONTINUOUSLY twitching all day long. Sleep became difficult for a period of a few days due to this. This muscle twitching then began to occur in all other parts of the body. Eye lids, arms, legs, torso. Everywhere. The rate of the twitches at worst was approximately 30 twitches per minute bouncing around from one area of the body to another. I am currently 3 weeks post vaccination and although I have seen significant improvement in the twitching, I am still currently experience this symptom.
1155400	4/1/2021	PA	71	F	4/1/2021	4/1/2021	Dizziness & shakiness after the vaccination. No diaphoresis, nausea, tunnel vision, SOB, CP. Initial BP was 162/76, Pulse 66, O2 sat 98%. BP progressively improved to 149/81. Pulse & O2 sat remained normal. No orthostasis. Symptoms resolved completely on their own with 20 minute observation.
1155363	4/1/2021	CA	22	F	3/31/2021	3/31/2021	Patient complains of dizziness, headache, and nausea 5 minutes after receiving vaccine. Denied difficulty with breathing, blurry vision or weakness. BP 106/62, HR 72, O2 Sat 97%. Symptoms resolved with rest.

1155333	4/1/2021	UT	47	M	3/5/2021	3/6/2021	<p>Day 1: Saturday morning March 6 at 5:00am I was shaken out of my sleep with a nasty migraine, sour stomach, intense body aches, stuffy nose, fever (102f). Classic flu like symptoms. I was extremely sick all day Saturday (level of sick: 8/10). Day 2: Sunday morning March 7 I awoke again extremely sick, just as sick as Saturday. All same symptoms (level of sick: 7/10). Sunday night I was incredibly miserable, all flu symptoms, I did not sleep Sunday night, up all night and up all day the next day Monday. Day 3: Monday I continued to be sick, all same symptoms, all day long. This time the blood shot eyes &amp; bloody nose came on, fever was steady at 101f (level of sick: 6/10). Day 4: Tuesday woke up still sick, same flu like symptoms. I feel the headache has gotten worse, in fact way worse. Fever steady at 101f all day. Overall I'm not as sick except the headache and fever (level of sick: 6/10). Day 5: Wednesday I was really hoping I'd make a full recovery but still still sick, fever dropped for a few hours then came back, fever peaks and bounces around at 101f. Headache is absolutely nasty, I feel intense pain in the back of my neck and head, hard to sleep or lay down. (level of sick: 5/10). Day 6: Thursday I feel like I'm just about kick this sickness, feeling way better. I dont have a fever today but I still have an incredibly nasty headache, really intense, my eyes hurt, back of my neck hurts. (level of sick: 3/10). Day 7: Friday, no flu symptoms, finally!! But the headache continues, really bad. It sort of disables my ability to function with the headache. Back of my neck and back of head hurts, inside my brain hurts. Ugh! Day 8: Saturday, no flu, no fever, although still bad headache. I've been taking Advil all week to help reduce the headache. It helps, but after about 6 hours later the headache returns. Late in the evening Saturday my head was pounding. Day 9: Sunday headache not that bad, mild headache lingered throughout the day, tolerable. Day 10: Monday no headache!! Today was the first full day of full happiness!! *NOTE*: In July 2020 I got COVID extremely bad, spent 4 days in the ICU, couldnt breathe!! I had a fever of 103 for 6 days straight before calling 911 to come and get me. I was in bad shape, lost 30 lbs, had respiratory breathing issue for about 2 months after hospital stay. Most sick I've ever been, total game changer, I will never be the same. To this day I feel my respiratory is at 90%, fatigue still comes around every so</p>

1155255	4/1/2021	NM	60	F	3/23/2021	3/23/2021	She got her vaccine and within 15 minutes she was having a hard time breathing. She told her husband that she needed to go to the bathroom and see if she could get the feeling to stop. She went into the bathroom and she was gasping and choking for breathe. They got her into the ambulance and her BP was extremely high 128/90 and her BP normally is 98/60. They started an IV, breathing treatments and oxygen. She was gagging up saliva and having a hard time breathing. They got her to where she was calm. Her body when it is under extreme amounts of stress goes into seizures, which it did. She then was transferred to in for observation. By the time she arrived her BP had come down and was starting to stabilize. She was given steroids, discharged home. She has had problems breathing, extreme/sharp pain on the left side of her head behind the eye, which has been going on for over a week. By the end of the day she is exhausted. She has never had a hard time breathing at high altitudes and now she can walk up the stairs and be winded. This has all happened since receiving the vaccine. She sent a message to her doctor who did seem concerned. The pharmacist at the facility at the time said that she was fine, to leave her alone. The EMT's said that there was something wrong with her and took her to the hospital. The hospital did not give her any long-term medications to take. She does have a routine APT with her PCP on 4/6/21. On Thursday she woke up and asked her husband if her face was swollen, and he asked why, she stated that her face was numb, and some spots so sensitive that she could not brush her hair. This was on the left side. The sensitivity is still there, but not as intense.

1155832	4/1/2021	OH	25	M	3/30/2021	3/30/2021	<p>Patient reported to clinic for Pfizer Covid-19 vaccination. Patient did not indicate on questionnaire that he had experienced fainting or severe reactions from receiving vaccinations before. About 5 seconds after receiving vaccination patient said he would like to sit for just a minute. The clinic had a designated waiting area about 25 feet away where patients sit for 15 minutes after receiving vaccination. My technician and I agreed that patient should stay seated in the same chair he was receiving the vaccination in so we would be right next to him. After 2-3 minutes I noticed the patient had his eyes closed and then his head began to nod and he started to slump down in the chair. As I went to patient's side to stabilize him he pushed his chair backwards away from me about 5 feet which caused him to roll to the right side of the chair and fall off hitting his head on the floor. My technician immediately called 911 and EMTs arrived in about 5 minutes. A bystander who was a nurse helped me roll him onto his back and we propped his legs up with 2 cushions. We took his blood pressure and pulse. Patient regained consciousness in about 30 seconds and the EMTs cleared him to stand up after about 15 minutes. After patient had recovered, patient's mother who was there with patient and other siblings stated that the whole family has fainting episodes when receiving vaccinations. I informed patient's mother and patient to please inform any future vaccinators of these fainting episodes so they can be prepared.</p>

1155919	4/1/2021	PA	28	M	4/1/2021	4/1/2021	Patient has a history of syncope after vaccinations (last occurred with a vaccination 10 years ago) but did not state this prior to receiving his first COVID-19 vaccine. About 1 minute after sitting down in the observation area, he fell to the ground and briefly lost consciousness. Multiple staff members came immediately to assess, rolled him over, and he immediately came to and was alert and oriented. He was taken to a medical area and laid down on a cot. He had unremarkable vitals and was breathing normally. He initially endorsed feeling lightheaded, but denied any other symptoms. He was given crackers and water given that he had not had much to eat or drink before the vaccination. He had a normal neurological exam. He was noted to have a superficial abrasion above and below the left eye (lower forehead and upper cheek), and a small Bandaid was placed on the forehead. Fire rescue on site called EMS, who assessed him. There were no immediate concerns and he refused transportation to a hospital for further assessment. After 1 hour had passed, the patient confirmed that he was feeling normal and he was allowed to leave. He was able to walk out of the facility of his own volition and did not have further symptoms when standing. His wife verified that she would drive him home. Prior to leaving, he was given strict instructions of reasons to seek immediate medical care should he have any new or worsening symptoms. The patient indicated understanding. Communication was performed via a Language Line medical interpreter.

1155668	4/1/2021	TX	63	F	3/31/2021	3/31/2021	Approximately 5 minutes after vaccination, the patient c/o "swelling in my mouth". She was reclined and vital signs taken: BP 180/120, P 97, R 18, O2 Sat: 97%. She also c/o blurry vision. EMS was called and 50 mg Benadryl was given IM in the Right Deltoid. She was able to swallow small sips of water. Approx. 5 minutes later, she stated that she could feel the swelling receding in her mouth. EMS arrived and she was feeling better, but her BP remained elevated at 180/120 and she was transported to Medical Center via EMS for elevated BP. The patient called us this morning 4/1/2021 to report that she is home. She was treated at the hospital for elevated BP and sent home when BP returned to normal.
1155650	4/1/2021	SC	65	F	1/21/2021	1/21/2021	About 8 minutes into the 15 min time, I felt a wave go across my stomach and about 2 min later, I felt another wave go across my stomach. When my 15 min was up, I told the RN I didn't feel good. I told her I felt like I was going to pass out and I needed to use the bathroom. She pushed me forward and back. I pulled myself back to try and keep from passing out. The RN was taking my pulse, said it was Bradicardic. Then they got more people, I saw them running in and I remember hearing a CODE going over the speaker. I remember them saying check my blood sugar and keep the pulse ox on my finger if I didn't have oxgen on. When I came to, my vision was blurry and kinda in a fog. I remember saying I took a nap. When they put me on the stretcher, I had riggers and remember thinking, " put a coat on me!" After some tests, I was discharged.

1155844	4/1/2021	OH	18	F	3/30/2021	3/31/2021	Pain and soreness in vaccination arm was immediate for the rest of the day. Started feeling achey and feverish at the end of the day towards nighttime and bedtime. Took a Tylenol before going to bed. Woke up at 6:00a.m. feeling achey and feverish again, more severe this time. Attempted to walk to get another Tylenol and take my temperature, vision blurred and was extremely cold, immediate nausea, felt like I was going to pass out. Shaking and chills. After drinking Gatorade, ginger ale and water and eating peanut butter toast, nausea settled. After a bit, experienced severe stomach cramps. Drank more ginger ale and Gatorade and took a Tylenol to relieve pain. After 30-45 minutes, pain relieved and I was able to go back to bed. Rest of the day experienced pounding headache and feverish and achey body. Experienced fever highest at 99.8 during the day. After 24 hours passed, feel 100% better and all symptoms and side effects relieved. Only thing sustaining is a little bit of pain and soreness in the arm.

1154090	4/1/2021	MD	66	F	3/3/2021	3/4/2021	<p>Bell's palsy; Sore Arm; This is a spontaneous report from contactable consumers (one is the patient). A 66-year-old female patient received bnt162b2 (Pfizer-Biontech Covid-19 Vaccine) first dose, via an unspecified route of administration, administered in Arm Right on 03Mar2021 11:40 am (Batch/Lot Number: EM9810) as SINGLE DOSE for covid-19 immunisation. The patient was vaccinated at a hospital. Medical history included Type 2 diabetes mellitus: Diagnosed one year ago; Gastroesophageal reflux disease (GERD) Diagnosed 2 years ago; Hashimoto's disease Diagnosed 5 or more years ago; High cholesterol and blood pressure abnormal (reported as Blood pressure); all from an unknown date and unknown if ongoing. No history of all previous immunization with the Pfizer vaccine considered as suspect. No additional vaccines administered on same date of the Pfizer Suspect. No prior vaccinations within 4 weeks, also no Family Medical History Relevant to the adverse events. Concomitant medications included metformin 500 mg once a day by mouth taken for diabetes (reputed Has been taking that about a year); pravastatin sodium (PRAVACOL) 40 mg once a day by mouth taken for High cholesterol; levothyroxine sodium (SYNTHROID) 50 mcg once daily by mouth taken for an unspecified indication; omeprazole 20 mg once a day by mouth taken for an unspecified indication; and losartan 50 mg once a day by mouth taken for blood pressure; all start and stop date were not reported. It was reported that the patient is calling about the COVID Pfizer vaccine shot. The patient took the first dose of the shot on Wednesday 03Mar2021. The patient now has been diagnosed with Bell's Palsy and she believes that it is from the shot. The patient's speech is impaired because of the bells palsy. The only thing the patient had was a sore right arm on 04Mar2021. Then on 10Mar2021 the left side of her neck started to really hurt and behind her ear, it was severe pain, frequently she would get a jolt of pain on top of the existing pain. The patient had this pain 10Mar2021, 11Mar2021, 12Mar2021, and by Saturday 13Mar2021 her face started to distort, now she couldn't close her eye, her lips were numb, and her speech was interfered. Monday (15Mar2021) morning the patient was seen by her primary care provider and her doctor told her it was Bell's Palsy. Blood was drawn at that time, but the patient doesn't have the results yet. The patient was</p>

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

given prednisone and an anti-viral which after she took them it helped with the pain significantly. The patient's face still has the paralysis on the left side of her face. No other parts of her body were affected other than a sore arm at the site on the right side, which was not a big deal. It was reported that the patient is taking COVID vaccine as she heard she should get it and her husband had the shots and was fine. The patient mentions that her husband had one bad day after the vaccines but he was fine, so she decided to get it. The patient wanted to know, she is going to follow up with her primary care provider on 22Mar2021 but she was scheduled for her second Pfizer shot on 24Mar2021, should she get the second dose. The patient read that 40,0000 people were given the vaccine and 4 people had bell's palsy and because of that they discounted it as a side effect, and the placebo group did not develop this. It was noted that the patient did not required emergency room visit but to the Physician's office (Primary Care Provider). The patient does not have the results of her blood work back yet. The outcome of the event a sore right arm was recovered on 06Mar2021; for the other event was not recovered. The relatedness of drug to reaction(s)/event(s) for the event Bell's palsy was reported to be related.

1154078	4/1/2021	MA	74	F	3/12/2021	3/13/2021	<p>it takes her a while to get the body parts moving; She does not feel like eating; headache; her stomach is pretty upset; her neck is kind of stiff/Aches were Neck/back of head is kind of stiff; pain around the arm/her arm was hurt/upper left arm to bottom of arm was sore; This is a spontaneous report from a contactable consumer (patient) reported that: A 74-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection), dose 1 via an unspecified route of administration, administered in Arm Left on Friday, 12Mar2021 in the early morning probably about 08:30 AM as single dose for covid-19 immunisation. She was 5'4, but thinks she shrunk a little bit and is now 5 feet 3 inch. Initially stated no medical history, but then reported she gets migraines. Caller reported she does not get them on a regular basis; had more in her younger years, migraines are hormone driven and once she went through menopause, she stopped having them regular; she maybe gets them 5 or 6 times a year now. The patient's concomitant medications were not reported. No additional vaccines administered on same date of the Pfizer Suspect. The patient really did not have a reaction on the day of the vaccine, no swelling or soreness. The next day, Saturday, 13Mar2021, and Sunday, 14Mar2021, she noticed her arm was hurt, she wants to know if that could be a reaction. The patient stated that, at the time, she just dismissed it. It stopped hurting on Sunday. Today, 16Mar2021, on Day 4, she woke up with a headache and her stomach is pretty upset. She heard people say right after they got the shot that they had side effects, the same thing she is having, so she doesn't know if this is random and doesn't know if it's connected to the vaccine or not. She is concerned and wants to know if she should get the next dose of the vaccine. Clarified the pain was not at the injection site; her upper arm and maybe to her elbow was just sore, no swelling or redness, just sore arm. This lasted through the next couple of days after the shot. Patient mentioned that she absolutely did not have much of a reaction; she has had issues with bee stings in the past, described as big, huge swelling and redness, no breathing associated with it. Patient stated she has been told that is a reaction. She clarified she did not have anything like that on the day of the injection itself. She is in between doctors right now; she doesn't have PCP.</p>

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

She hears from friends that the PCPs do a lot of diagnosing and treatment over the phone. She doesn't know if it's a state thing because she's been to dermatologist, eye doctor, had her teeth cleaned twice at the dentist during this pandemic. It feels like maybe she has some aches; her neck is kind of stiff, maybe because she has been in bed all day, because of her age, she can feel aches and pains more often. Patient also mentioned that in the morning, it takes her a while to get the body parts moving. She has not been up and has been in bed. She is laying back down again because her neck or back of her head felt kind of stiff. No treatment was taken. She did not take or eat anything today yet because her stomach has been upset. It has been 4 days since she received the vaccine, and she would assume she would've gotten the side effects closer to the day of injection. She is scheduled for the second dose on 29Mar2021, and she has questions about that: if this means anything, is this connected to the injection. Headache started at about 6 AM when she woke up this morning. She has been holding off on taking Aleve or Excedrin because of the upset stomach waiting for that to calm down because she does not want to throw up. She does not feel like eating. She has not eaten yet, but she knows she needs to. She doesn't know if it's her neck or the back of her head, but it is kind of painful when she stands up. Her stomach might feel a little better, not that she's hungry, but she's thinking more that she needs to eat whereas this morning she was not going to do it and didn't care. She has basically been in bed all day; she spent more than an hour on hold. Clarified that she was not sleeping, but in bed. When she got up, she noticed pain in her neck or back of head. She had not been up long enough to tell if it's still going on, she just got up once or twice for a quick bathroom break. She does not know when the pain started, she could've had the pain before, but she just noticed it. Patient mentioned that while she is laying down, it doesn't hurt. Aches were Neck/back of head is kind of stiff; kind of painful when she stands up exact time unknown but hurts when she gets up. She had nothing on the day of; she was bragging to everyone it didn't hurt. Caller clarified the upper left arm to bottom of arm was sore. She asked one of her friends if she had a sore arm after the shot and she said no. No additional information provided. she just went

hours. He used to be able to do his business all day but now after about 3 to 4 hours on his feet he got so tired and he needed to sit. He didn't know why this happened. He has talked to others that have received COVID vaccines and none have had this kind of reaction like him. He has asked them about it. It was very frustrating to him on an unspecified date. Every month he sees a physician. He would like for Pfizer to contact him with further questions, he can't understand the pain. This was really killing him especially when the pain goes to his bones. He will keep him up until 3 in the morning and he stays awake on an unspecified date. He then took medicine and he had to wait for 30 minutes for it to start working and then he will be able to sleep. But other than that, the pain jumped. He has had the chicken pox and the shingles vaccines and none did like that. The pain was not going away in his muscles or joints. And now he was getting a headache on an unspecified date, it was really frustrating. He didn't have good memory from the torture. This morning, when he woke up, he had the pain in his joints and his bones. He didn't like to use too much medication. He liked to use it only as he needs it. Pain medications are strong. But this COVID vaccine somehow made him need to use more medication and then that caused him to have a headache. His pain should get better with his medications but today, he had pain all over him and he didn't have any energy to move. He didn't know how to explain it. The COVID vaccine had really kind of made him weak. Sometimes he drinks a lot of cranberry juice to try and take the vaccine out of his system and it was frustrating because he hasn't ever been like this. When he had pain like this it reminded him of his torturing and what had happened to him. When the pain came on strong was when it reminded him of that. The medications he was taking were supposed to kill the pain. That was the reason he got so pissed and was trying to ask what was going on. This COVID vaccine is not safe he believed because it has been almost 10 days and it was not helping him. He was still not good. After he got his COVID vaccine on 06Mar2021, he had a little bit of small itching, not much, just a little bit that made him feel not comfortable with it. That was why they kept him for 20 minutes after his vaccine. When he got back home, he was okay, it was nothing serious. But then the day after his COVID vaccine on 07Mar2021, his joints,

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

his muscles and his bones had pain. On 06Mar2021 the itching lasted about 20 minutes. He felt like he was chewing his lip, he was a little uncomfortable and he felt his ribs moving quicker. Nothing happened but he could feel it. He tried to chew his lips a couple of times, but not that much. But after that, he had pain all over on the day after his COVID vaccine, 07Mar2021. By the time this vaccine started getting into his body, it was really hurting and getting worse. He had the shingles vaccine and for 1 1/2 to 2 days, he had pain all over and then 2 days after it was all gone, he was back to normal life. The pain was gone. With this COVID vaccine he thought that maybe it was going to be the same but it was not the same and it was hurting. The shingles vaccine was last year in 2020, 3 months before people knew about the coronavirus that was when he got the vaccine for shingles, so maybe Jan2020 was when he had the shingles vaccine. He had no medical conditions or heart and chest problems. No other vaccine he has taken has ever had this type of side effect to him. He took his shingles vaccine in his right arm and the COVID vaccine was in his left. With both he had the same start of having the bad pain. This COVID vaccine goes deeply to the body. The vaccines job is to wake the body. The vaccine's job is to wake up the body for the virus. The body has to make some kind of soldiers to stand up on the virus and this COVID vaccine had actually made his body weak. After the vaccine is supposed to wake the body, little by little the side effects are supposed to go away. His body was not learning this vaccine. It kept fighting to learn whatever was in this COVID vaccine, his body can't learn it and fight it. That was the reason his body got weak and the pain has not gone away. His body is still in alert and that's why the pain was still there. His body was still fighting. Somehow it didn't match the inside of the body. Maybe for some people that this will happen to, they will be okay but for some they will not be okay. It is not because some people have nothing wrong with them. The patient recovered from itching and discomfort on 06Mar2021; not recovered from any place in his body, his muscles, joints, and bones have had pain previously/ pain in his joints and his bones and it was getting worse/ pain all over on the day after his COVID vaccine; while outcome of other events was unknown. Information about lot/batch number has been requested.

1154038	4/1/2021	TX	52	F	3/4/2021	3/4/2021	<p>left hand was cold in the pinky and into half of her palm; left arm feels a little heavy; prickly feeling around her right eye; prickly feeling around her right eye and then she started feeling it in her left cheek on her face. She said that it then went to her left arm; prickly feeling in her lips. Then it went to right nostril and then to the roof of her mouth; numbing feeling in her palm and pinky in her left arm/ numbness in her left arm; difficulty swallowing; This is a spontaneous report from a contactable consumer (patient). A 52-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration at the age of 52-years-old, administered in Arm Right on 04Mar2021 17:15 (Lot Number: EN6206) as single dose for COVID-19 immunization. Medical history included, rotator tear, surgery, nerve block, muscle relaxant therapy, sciatica, neuropathy, numb in her leg in her thigh and from the knee down. She had a reaction to muscle relaxers that she was taking for sciatica and stated that it caused her to go numb in her leg in her thigh and from the knee down and it took 3 months for it to go away, but she still has neuropathy in that leg since then. There were no concomitant medications. The patient previously received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration at the age of 52-years-old, administered in Arm Left on 11Feb2021 (Lot Number: EL9269) as single dose for COVID-19 immunization. Patient is a schoolteacher that was calling about the Covid-19 vaccine and reported that within 10 minutes (04Mar2021) she felt a prickly feeling around her right eye and then she started feeling it in her left cheek on her face. She said that it then went to her left arm and then she got a numbing feeling in her palm and pinky in her left arm. She had no difficulty breathing. The paramedic came and looked at her and asked her to drink the rest of her water. She waited another 30 minutes before leaving and she said that she was fine. She said that when she was leaving she felt the prickly feeling in her lips. Then it went to right nostril and then to the roof of her mouth. She still has the numbness in her left arm, palm, and pinky. She said that she took some Benadryl and it helped. At one point she did have difficulty swallowing and that is what is what prompted her to take the Benadryl. She said that she stopped and</p>

When the patient arrived home, he went straight to bed. The patient was hospitalized on 11 Mar 2021 for Anaphylactic reaction, Hypoaesthesia, Eye swelling, Hypoaesthesia oral, Hypoaesthesia oral, Oropharyngeal discomfort, Blood pressure increased, Pruritus and released on same day after 4 hours. The next day, Friday (12 Mar 2021) the patient got up around 10:00am. Then at 10:05am, the symptoms began to reoccur with numbness of the lips, tongue, closing of throat and extreme itchiness. As soon as patient's husband noticed, he did not apply EpiPen and drove the patient to the emergency room. The emergency room followed the same protocol with methylprednisolone steroid, EpiPen and diphenhydramine. On Saturday (13 Mar 2021) and Sunday (14 Mar 2021), the doctor was seen and the patient was advised to take diphenhydramine every 4 hours. Then this past Monday (15 Mar 2021), patient started developing shortness of breath and a resting heart rate of 135bpm. That day, the patient was taken to urgent care. There he was administered diphenhydramine and the patient's heart was checked. Urgent care agreed that his heart was acting up and his blood pressure was acting up for an unknown reason. Reporter states that the patient had been developing tachycardia for no reason for a week now. Since the tachycardia had occurred, reporter would check patient's oxygen (O2) levels. When the tachycardia had started, the patient's oxygen saturation (O2 sat ) would drop as well. O2 levels were reported to be 88% and resting heart rate of 103bpm. The reporter would let 5 minutes pass, recheck, and everything would return to normal. On Monday (22 Mar 2021), patient is scheduled to see a cardiologist who will place the patient on a machine to check his heart rate for 3 days to see what is going on. Follow-up with various health care providers was scheduled for the rest of the week. Nephrologist will be seen on Monday, Neurologist will be seen on Tuesday, and Kaiser will be visited on Wednesday. Reporter stated that even though asked to run bloodwork and images, the emergency room did not do it. Lab work was performed on Monday (15 Mar 2021) which came back normal. A check for blockage of the heart, also had looked fine. Action taken with mRNA-1273 in response to the event Anaphylactic reaction, Hypoaesthesia, Eye swelling, Hypoaesthesia oral, Hypoaesthesia oral,

1154953	4/1/2021	CA	28	F	3/31/2021	3/31/2021	On Wednesday, March 31, 2021 client (DOB 4/30/1992) received her first dose of Pfizer COVID vaccine (LOT # EW0150, EXP 7/2021) at approximately 11:50 am by vaccinator RN. RN instructed client to self-monitored at the observation area. EMTs found a 28 years old female sitting up while leaning forward and waving for assistance in an observation chair. Client had a chief complaint of dizziness. Client reported dizziness and fatigue to EMTs present after having sat in the observation area for approximately 10 minutes. Client had no known allergies or major medical history. Client denied pregnancy. Client agreed to be assisted walking up to the front EMT station so that she may be assessed more closely and with greater privacy. While walking over to the EMT station, the client experienced sudden loss in weight bearing and was prevented from falling by EMT present. EMT promptly came over to assist with transferring the patient to a chair for safety. Client was kept safe in her chair by EMT. It was at this point client experienced syncope. Client was then transferred to the gravity bed and laid supine until she became more alert. Client was then transferred to sitting semi-fowlers at 45 degrees once she was alert and tracking. lead RN came to assist EMTs as needed. Assessment revealed no hives, swelling, redness, difficulty breathing, wheezing or pain throughout her body. Client's skin was free of any signs of anaphylaxis throughout her body. Client's first set of vitals at 11:50 am was as follows: blood pressure 100 / 64, O2 - 99% on room air, pulse was 64 and regular at radial, respirations was 20 and regular. Client was fully alert and oriented x 4 (person, place, time, situation) and eyes were equal and reactive to light. Client stated that she had breakfast and denied any pain throughout her body. Client agreed to stay in the observation area for another 30 minutes after the onset of the incident per lead nurse's instruction to EMT. Client's vitals were reassessed at 5 minutes intervals as follows: 11:50 am- 110/64 (BP), 20 (respirations), 64 (pulse), 99% (O2); 11:55 am- 102/64, 18, 64, 99%; 12:00 pm - 104/ 68, 72, 18, 99%; 12:05 pm - 118/ 72, 72, 16, 100%; 12:10 pm - 118/ 78, 99%, 16, 78; 12:15 pm - 118/ 78, 100%, 16, 78; 12:20 pm - 118/80, 100%, 16, 78. After approximately 10 minutes, the client was asked to sit up so that her orthostatic vitals could be reassessed. Throughout her observation, client's vitals slowly returning to normal with

This 51-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in left arm on 12Mar2021 08:15 (Lot Number: EN6204) at single dose for covid-19 immunization. Medical history was none. Concomitant medication included diphenhydramine hydrochloride (BENADRYL Tablet). The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: EN6200) on 19Feb2021 and experienced felt really tired, and received flu shot. The patient experienced bell's palsy on 18Mar2021, sore arm over weekend on an unspecified date in 2021, Left eye felt weird/weird feeling like when went to the dentist and get the Novocain shot on 18Mar2021, left side of mouth muscle not holding water while brushing teeth on 18Mar2021, cannot close left eye/eye wasn't moving on 18Mar2021, left eye burning during shower on 18Mar2021, sick in 2021, cannot move that part of your mouth in 2021, hard of hearing on an unspecified date. She felt great over the weekend other than a sore arm. Morning on 18Mar2021 when she woke up her left eye felt weird. When brushing her teeth she noticed the left side of her mouth muscle was not holding water to spit out. Looked in the mirror and noticed when she smiled her left eye wasn't moving. Went to the emergency room and the doctor told her she has Bell's Palsy. Explained that was why she cannot close her left eye. Was given two medications to take; one a steroid and one a antiviral. Left eye has been feeling weird, like when you look away from your cell phone and one eye hasn't dilated or adjusted to the darkness yet. Stated she took a sick day from work today. Mentioned again her left eye burning in the shower and that she has to sleep with an eye patch. She was hard of hearing. Stated she had hearing aids and can currently hear call handler fine. Had a CAT scan and everything at the emergency room this morning. Her grandmother and aunt died from a stroke

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

and she was concerned that she had one. She cannot close her left eye completely. Stated was a weird feeling like when went to the dentist and get the Novocain shot and cannot move that part of your mouth. The doctor told her he thought it will last for 2 weeks. Stated that it could've started overnight but she was uncertain as she was sleeping and didn't notice it until this morning. Mentioned her husband was at the hospital all day yesterday for procedures. After receiving her second dose of the vaccine she thought she didn't feel too bad at all, not tired like with the first one; until she woke up with this today. Stated no for medications but mentions that on 11Mar2021 she had bad allergies and was like a water faucet. She took Children's Benadryl 12.5mg 2 tablets and some eye drops. Stated that it helped. Thought she was allergic to something in the building. Stated was given Prednisone, as she was reading the label she notices she was supposed to take two a day and had only taken 1 this morning. Prednisone is prescribed as 20mg 2 tablets by mouth every day for 7 days. Spelt out name of antiviral medication as IC Valacyclov. Prescribed as 500mg 2 tablets by mouth three times a day. Also has eye drops to keep eye moist. Has eye patch for bedtime. Was instructed to manually close left eye and cover with eye patch at night. Mentioned that she had a flu shot in October no issues voiced. Nephew with Covid, Niece that had Covid. Stated she was not around them. There was no physician office visit reported. The patient underwent lab tests and procedures which included blood sugar: normal, blood pressure: normal, CAT scan: normal on 18Mar2021. There was treatment and emergency room visit except event hard of hearing. The outcome of the events was unknown.

1154887	4/1/2021	IL	37	M	3/31/2021	3/31/2021	Patient noted he had no adverse reactions with his first dose of the Covid vaccine or other vaccines he has had in the past. He was informed that there are more chances of side effects experienced with the second dose ( such as headaches, flu like symptoms, nausea). He was directed to stay in the store for at least 15 minutes and to inform the pharmacy immediately if he felt anything out of the ordinary. He said he walked down several aisles then started feeling light headed and having tunnel vision. He was on his way back to the pharmacy when he ended up on the ground. He does not remember how he ended up laying on the ground. He said his head did not hurt but does not know if he hit it. When started regaining conscience, his right arm and leg jerked somewhat then calmed down. When he came to, he said he didn't feel dizzy when he tried to sit up. The ambulance was called so he was instructed to remain laying on the floor. The EMT personnel asked him his name, the date, and where he was while he was laying down and after sitting up on the floor. He answered correctly both times. He was then asked to sit down on a chair to take his blood pressure. The EMT personnel were having trouble getting a good reading so he was transported to Hospital.
1155192	4/1/2021	KY	48	M	3/29/2021	3/31/2021	Pt is a 48 yr/o male who presents with transient episode of lightheadedness and feeling like he was going to pass out with blurry vision which started while he was driving to work today. Symptoms have resolved upon arrival to the ED. He had no other associated symptoms. Denies headache, numbness tingling weakness, chest pain, palpitations, shortness of breath. He ate a ham sandwich and drank plenty of water prior to leaving the house. He states he is often "dehydrated "because he works in a hot warehouse and sweats a lot on the job but had not begun working yet this evening. He tries to drink lots of water and electrolyte drinks such as Pedialyte when he is at work. Of note, he states his doctor was concerned recently because of some abnormal liver enzymes and mildly elevated blood glucose readings on routine lab work.

1154509	4/1/2021	FL	68	M	3/9/2021	3/17/2021	Developed an absolutely maddening case of tinnitus, not normal ringing but excruciatingly loud clicking recurring usually every 2 minutes. (quite unbearable) (on same side as vaccination) 2 days later my same side eye became quite bloodshot. later the other eye also became bloodshot.
1154495	4/1/2021	TX	74	M	3/5/2021	3/6/2021	New onset of right sided headache. Pain initially described as sharp, and throbbing starting on top of right side of head and radiating down. Intensity increases as it moves down and peaks at 3-4 hrs before it starts to ease. Pain starts late afternoons and worse in the evening. It is not associated with position changes. Pain initially rated a 10/10. Had little relief with acetaminophen or ibuprofen, and heat or cold packs. He denies n/v, vision changes, light sensitivity, rashes, neck stiffness, or neuro deficits. He does not report tenderness but stated he can sometime feel a pulsation if he presses near his ear. Does have a hx of sinus headaches but never had a headache like this before. He is unable to identify any triggers. He did see his PCM and was told it may be a migraine and was prescribed Sumatriptan 50 mg. He was reluctant to take at first but has taken two with improvemen
1154491	4/1/2021	FL	27	F	3/4/2021	3/4/2021	Immediate onset facial warmth/flushing. "Brain disconnect" she says she felt like her brain wasn't telling her to breath but she put her hand on her chest and felt herself breathing. Also reports blurry vision. Denies feeling dizzy or faint. Medic assessed her in her seat and she reported all symptoms resolved after 2.5 minutes. She did fine the rest of the day but then in the next couple weeks developed a facial rash that lasted 2 weeks and resolved after a high-dose steroid burst.

1154457	4/1/2021	GA	38	F	3/31/2021	3/31/2021	Allergic reaction within 1-2 minutes. My eyelid and upper lip started to swell and my face and lips became numb and tingly. I have had hives in the past and this is how it always starts. They were accompanied by the sensation of heat in my face as well. I drove myself to an urgent care and my BP was extremely elevated. I believe the highest was 190/114. The staff at Urgent Care waited to medicate me, perhaps due to my elevated BP. My forearms became very flushed, almost a purple hue, but no hives developed. My throat started to swell and they called an ambulance to take me to the hospital. In the minutes before the ambulance arrived, I was given epinephrine and Benadryl via injection in my right arm. I wish they had given me that more quickly. I started to feel better very quickly. By the time I was hooked up to monitors at the hospital, right across the parking lot, my BP had gone down to 123/71. There was never any sign of swelling of the tongue, but my throat felt tight the remainder of the evening and I had difficulty swallowing. I am still itchy in my legs today and my cheeks and eyebrows still feel numb. I am currently taking Prednisone for the next few days and was given an Epi Pen prescription. I was given the vaccine at 12, arrived at Urgent Care about 1:00 and was transported to the hospital around 2:30. I was discharged around 5:00.
1154437	4/1/2021		78	F	4/1/2021	4/1/2021	Pt has allergic reaction w/ her 1st dose. She was in the middle of her graded COVID-19 Challenge (dose 2) under a physician's supervision. Pt just received 0.03ml (10% ) of full dose. Pt then started experiencing increased mucus in her throat, clearing of throat, and states that her ears feel weird about 11 minutes later. Her Vitals at this time were 168/78, 85 HR, 14Resp, 100% Spo2. 5 minutes later another set of vital signs were taken at 152/84, 86 HR, 16 resp, 95% Spo2. Epi 0.3 mg was administered immediately. Pt states that her throat feels better about 3 minutes later, but her chest still feels irritated. Her Spo2 was up to 100% at this time. Pt then stated that she is starting to feel shortness breath after using the bathroom. Pt is then transferred directly to the ER .

1153878	4/1/2021	OH	63	F		3/6/2021	LOSS OF CONSCIOUSNESS, FAINTED; HEART WAS RACING; DIZZY; VOMITING; CANKER SORE UNDER TONGUE; HEADACHE; NAUSEA; FATIGUE; INFLAMMATION ON LEFT EYE; FALL ON BED; SMALL HIVES UNDER EYE; This spontaneous report received from a patient concerned a 63 year old female. The patient's weight, height, and medical history were not reported. The patient's concurrent conditions included seasonal allergies, and codeine allergy. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1802068, expiry: UNKNOWN) dose was not reported, administered on 05-MAR-2021 to left arm as prophylactic vaccination. No concomitant medications were reported. On 06-MAR-2021, after vaccination, she felt fine all day and night. The next morning she woke up and felt sick. She had nausea, headache, hive under eye. She laid back down and tried to sleep. A few hours later, she woke up to use the bathroom. She was very nauseous and dizzy. She lost consciousness and fell trying to get to the bathroom. She fell on her bed and was uninjured. The paramedics took her to the hospital. She was given medication for nausea, headache, and IV fluids. She gave blood for lab tests and they came back normal. No COVID test was administered. When she felt better, she was released. A few days later, she discovered her tongue was sore and red. She called her primary care physician (PCP). PCP said the red and sore tongue was probably related to allergies. Two weeks later, her tongue was not sore, but still red. They advised her to get a second opinion with another HCP. She was going to visit her allergy specialist.. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from loss of consciousness, fainted, heart was racing, dizzy, headache, nausea, fatigue, inflammation on left eye, and small hives under eye on MAR-2021, and vomiting on 07-MAR-2021, and had not recovered from canker sore under tongue, and the outcome of fall on bed was not reported. This report was serious (Hospitalization Caused / Prolonged). Additional information was received from the patient on 23-Mar-2021. The following information was updated and incorporated into case narrative: Patient's medical history added as seasonal allergies and codeine allergy, Vaccination site as left arm added; Additional events as small hives under eye, fall

1157280	4/1/2021		56	F	3/29/2021	3/30/2021	Moderna COVID-19 Vaccine EUA Patient presented with swollen eye lids, painful eyes, itchy eyes morning after vaccine administration. 2 days later patient complained of redness(blood shot) eyes. 3 days after vaccine administration patient called pharmacy complaining of blurred vision. Patient was instructed to seek medical care. Patient was seen by ophthalmologist who prescribed prednisolone and cyclopentolate eye drops and will continue to follow until improved.
1157267	4/1/2021	IL	34	F	4/1/2021	4/1/2021	Overall weakness and dizziness within minutes of the shot, had to sit down for a while/close eyes, legs tingling, hands shaking, had almost no energy in limbs or to stand, etc extreme sweating/hot then chills later, nausea, muscle pain upper neck/back/shoulders, and some symptoms continued an hour later including diarrhea. Some symptoms were better in 30 minutes or so as I stayed at Walgreens until I felt better, and hours later much better but still mild symptoms.
1157264	4/1/2021	OK	44	M	2/26/2021	3/27/2021	Day after vaccine I developed sever jaundice including yellowing eyes. One week after vaccine I had blood work done and my liver enzymes and bilirubin levels were. On 3/23 I admitted myself to ER with jaundice and vomiting. My liver levels were normal but bilirubin was still high. At this point I had lost 30 pounds since my shot. I was in the hospital for 5 days where the ran UT, CT, and MRI on my abdomen with none showing issues. Jaundice and itchiness/jaundice got progressively worse. The hospital ran multitude of blood tests to pin point the issue and even did a liver biopsy. No tests showed anything abnormal but biopsy isn't back yet. At this point 4/1/21, I am still jaundiced, extremely itchiness, lethargy and a total of 33 pounds weigh loss.

1156997	4/1/2021	TX	51	F	3/29/2021	3/29/2021	Slight headache overnight after 1st dose on 3/8. Adverse reaction after 2nd dose on 3/29 at 3:30 that afternoon. I started seeing ?floaters? in my right eye only. Floating dark strings, dots, squiggles in my peripheral vision. Took my blood pressure and it was elevated at 168/93. I immediately took an additional 25 mg of losartin and called my eye doctor and was told to come in the next morning for an eye exam. My blood pressure lowered to normal over the next few hours. I felt tired and restless overnight. The next evening 3/30 after my eye dr appt, I developed a very severe headache, first in the front area of my head, then finally on the left side of my head. Overnight the pain in the left side of my head increases and I experienced nausea, body aches and fatigue. The floaters in my right eye remained the same. No floaters or problems with my right eye.
1157235	4/1/2021	CT	63	F	3/13/2021	3/14/2021	Eyes red and itchy, face blotchy and swollen. Scalp itchy and bumpy. Rash across stomach. Chills. Took Benadryl for 3 days.
1157670	4/1/2021	NC	44	M	3/19/2021	3/20/2021	I had shingles. Starting next date I had a poking feeling in my forehead, and head heck for couple days guess 3rd day started seeing pimples in forehead and it started developing on my left forehead and until my left eye.
1157210	4/1/2021	MO	64	M	4/1/2021	4/1/2021	After patient was vaccinated, it was discovered that there was approx 1.4 mL of vaccine left in the vial of Moderna vaccine. Eye-witness accounts from fellow staff members report that patient may not have received a full dose of the vaccine. Guidance was sought and it was recommended by CDC that this dose needs to be repeated. Pt was called and dose was repeated same day at approx 17:30.
1157192	4/1/2021	PA	60	M	3/30/2021	3/31/2021	fever of 101.8, aches from tips of right fingers to tips of left fingers and down my back to my buttocks, headache, blurry vision,extreme fatigue. all lasted about 28hours. now just pain at the injection site.

1157191	4/1/2021	CA	36	F	3/28/2021	3/28/2021	Vaccine on 3/28. 45 min after vaccine felt cold sweats, nausea. 3/29 ongoing cold sweats, nausea, fatigue, mild body aches. Went to work, symptoms worsened and developed severe body aches, headache, photophobia, gasping for air (but could breathe ok). Got up from a chair and syncopized, unknown amount of time unconscious. Taken to ED, normal exam, diagnosed with vasovagal syncope, went home to rest remainder of day. 3/30 still fatigued, tried drinking coffee and it spilled out right side of mouth. Looked in mirror and thought right eye and lip were drooping. Touched face and could not feel anything on right side. Also noticed splotchy red rash bilateral cheeks and left arm (same as injection) that was itchy. Saw PCP (via tele) who documented decreased right smile, forehead elevation, cheek puff and decreased sensation on face. Prescribed 7 day course of Valtrex TID and Prednisone 60mg daily which she began on 3/31. Seen by neurology (via tele) 4/1, patient indicating 50% improvement in symptoms but states she cannot feel entire right side of face or ear. When talking appears to only be talking out of left side of mouth but no flattening of right nasolabial fold, normal smile, cheek puff, questionable asymmetry of right forehead elevation but symmetric eyebrow furrow. Unable to assess forced eye closure. States she cannot feel pinch or nail on right side of face.
1157183	4/1/2021	CA	68	F	4/1/2021	4/1/2021	Pt developed blurry vision and burning to eyes several minutes after vaccination. lasted for about 20 minutes. sx somewhat similar to hyperglycemia symptoms. Felt better after observation period as above. Well for dc home.

1157172	4/1/2021	CA	18	F	3/19/2021	3/19/2021	On Friday 3-19 she had a swollen lip. It went down and she had her first dose of COVID vaccine. Saturday she was well and had a fever on Sunday. Fever went away and she felt better until Tuesday when she had a high fever on Tuesday night. Wednesday she had swollen puffy eyes but they were never red in her conjunctivae. Thursday seen by Dr. Labs showed mild increase in LFTs and Cr. She had lymphocytosis and atypical lymphs consistent with a viral infection. She was negative for EBV and had a negative COVID swab. She does not have history of exposure to COVID a month ago. She is careful at school. They are tested frequently and no one has been sick, however one of her roommates had mono. Friday and Saturday fevers continued. Saturday repeat labs showed higher LFTs and negative CMV. ESR and CRP and ferritin are elevated. She has no rashes, cough or congestion. She is mentally clear and not light headed. She has a headache when her fever is high but otherwise is okay. No conjunctivitis, No sores in mouth or lips, and no swollen LNs.
1157143	4/1/2021	OH	42	M	3/12/2021	3/30/2021	On March 30th I lost taste on half of my mouth. When I woke up March 31 my entire right side of my face was dropping and was not responsive to facial motion. Went to the ER to get checked out. They did testing to make sure to rule out a stroke. And found it to be Bell's Palsy. I was given a prescription of steroids, antibiotic, and eye ointment. I was told to go for a follow up with my Family doctor. I have that scheduled for April 5th at 3:15pm with Dr.. I have had to miss two days of work so far due to this adverse side effect.
1157108	4/1/2021	AZ	67	F	3/15/2021	3/15/2021	Pressure Headache that lasted 12 days, right facial tingling around day 5, visual disturbances on day 2, foggy thinking 10-12 days, fever 100.6 after 30 hours, body aches lasted 48+ hours, irritability for 7+days, neck pain lasting 7-10 days with thoracic pain lasting 12-14 days, left arm soreness lasted 4-5 days, loss of appetite lasted 2 days
1157107	4/1/2021	OK	55	M	3/31/2021	3/31/2021	Several hours after injection, the patient began shaking with chills, burning eyes and a fever of 101. This continued most of the night and subsided by 9 AM on 4.1.21. Since then he has continued with regular activities with minor discomfort.

1157078	4/1/2021	WV	53	F	4/1/2021	4/1/2021	Roughly 5 minutes after vaccine administration, patient experienced dizziness while waiting in the store for monitoring. The patient stated she had a headache, fuzzy headed, weird taste, dry mouth, tingly head, felt like she was going to pass out, blurred vision, and all around felt strange. Emergency services were called and took over care once arrived.
1157047	4/1/2021	NY	39	F	3/8/2021	3/8/2021	Extreme fatigue. Feel asleep within 5 minutes. It came on so fast...,like I hit a wall. Chills. 99.9 temperature. Couldn?t open eyes or move fingers. Light headed...blacking out when I got up to go the bathroom. Couldn?t have any sounds (like tv) on. Just needed to lay still and sleep. The above lasted 19 hours. Then my temperature ended. I had trouble walking and standing for another 20 hours. No stamina. I went to work near the end of this and noticed I had trouble looking at my paperwork and figuring what to do for my job. Not sure if this was still the fatigue just in a different way. Then it disappeared.
1157247	4/1/2021	OH	38	F	3/30/2021	3/31/2021	It started with my nerves being hyper sensitive, where anything brushed against my arm needle like pain would shoot through my arm. Also whenever I turned my head I got dizzy. That lasted about an hour and half, then turned to full body aches and a slight headache. Over the next few hours the headache grew worse and worse. Then about noon I got the chills and my face became super flush and my eye lids felt like they were on fire. When I arrived home from work at 1pm I took a warm/hot bath to try help with my body aches. Then I went to bed to help my body fight it. I was also drinking lots and lots of water and a few gatorades throughout the whole day. When I woke up at 11pm all of my symptoms were gone.
1158038	4/1/2021	PR	48	F	3/30/2021	3/30/2021	Face numbness (left side, same side of vaccine administration), starting 5-7 minutes after injection. Lasted for about 10 minutes. Mild contraction of periorcular muscles (right eye) started about 1 hour after shot and have lasted for at least 48 hours after dose.

1158076	4/1/2021	TX	27	F	3/29/2021	3/29/2021	Started feeling nauseous and woozy around 10PM so I went to bed. I woke up shortly after midnight to back pain and severe chest pressure, a migraine, and tingling and numbness all over my upper bod. My face was swollen and I could hardly open my eyes. I couldn't move my left arm (the arm I got the shot in) and within 20 min I couldn't really move much at all. I called 911 at 12:38am and they instructed me to use my EpiPen. I felt like I was going to pass out any second. My swelling went down and I was able to breathe much better after that, but was still unable to really move. I began shaking involuntarily, which the 911 operator told me was normal following the use of an EpiPen. I was able to slowly crawl to the front door. The paramedics checked my vitals but I don't really remember much after that. I think they lifted me onto a stretcher. The next thing I remember is being at the hospital. They did an EKG because I was still having heart pain (they said it was from the epi pen and would subside after 10 min but it just got worse). They also did some blood tests and an x-ray of my lungs. Everything looked good at that point. When they told me the results it was probably about 2AM. The doctor concluded that it was some sort of allergic reaction, although they emphasized that vaccine reactions usually occur close to the time of the shot.
1158073	4/1/2021	CA	23	F	4/1/2021	4/1/2021	Patient received vaccine at 6:03 pm, patient was in recovery area and experienced syncope at 6:07 pm, patient fell to the group face down, nurses responded turned patient on left side, patient had 5-10 second seizure with full body seizing and eyes rolled backed. EMS called. Right frontal area hematoma due to hitting head on floor. Patient confused at first, BP 98/64, HR 80 at 6:10, patient diaphoretic, reassessed BP 105/60 HR 82, EMS assessed, patient LOC returning A&Ox4, able to remember she does have seizures and takes seizure medications but cannot remember medication name. Nurses advised patient to be transported by EMS, patient refused, patient boyfriend and mom also refused and stated they would take her themselves. Boyfriend to drive patient to ER for follow up per patient and family.

1156298	4/1/2021	GA	24	F	4/1/2021	4/1/2021	Pt received vaccine and was waiting in a chair for the required 15 minutes with her dad. after 10 minutes, she told her dad she was feeling dizzy and wanted a water. He left to get water. Another RPH saw pt. falling over in her chair. Patient's eye were open and tears were coming down but she could not speak. Her eyes began to close and she kept trying to pass out. We took pts mask off and fanned her and kept talking to her. After about 3 minutes, she was able to focus her eyes and could say her name. After about 3 more minutes, she was able to count to 10 backwards. Her dad returned. She drank water and was feeling much better after about 20 more minutes.
1156282	4/1/2021	CT	90	F	3/4/2021	3/25/2021	experienced dizziness for 4 days following the shot then on day 7 following the vaccine, she developed an eye hemorrhage.
1156277	4/1/2021	NY	63	F	3/11/2021	3/13/2021	Severe post-nasal drip followed by nausea and itching of mouth and throat. Next day symptoms were improved but experienced flushing of face and swelling of eyes. Also had rash around eyes. Took Benadryl and relieved symptoms. Also had low-grade fever. Felt exceptionally ill on the Wednesday following vaccination and had rash on upper thighs which disappeared after approximately 6 hours. Other than ongoing nausea, no further symptoms.
1156272	4/1/2021	VA	58	F	3/19/2021	3/20/2021	After both Covid vaccines (first one on Feb 17, 2021) I got a pressure-headache that was present all the first and second day after and then subsided to intermittent every few days for about a week. After the second vaccine, I've also had daily occular-migraines and/or light-sensitivity/auras for week2-post-vaccine (from about Mar 25 to Apr 1). In my younger years, I experienced occular migraines from time to time but usually for not more than one day, and only one or two per year. After going through menopause 8 years ago, such migraines ceased, until this recent round post-vaccine and persisting daily.

1156996	4/1/2021	MI	25	F	3/31/2021	3/31/2021	Within seconds after the shot I experienced a sensation where I had trouble breathing and it felt like my throat was constricting. It felt like my heart was beating irregular, vision went blurry, full body flush, skin was hot, my chest was heavy and I had shortness of breath. I told the staff that I was having a reaction so they had me sit in a private room and watched me. After sitting for a few minutes the feeling went away. I have not had any side effects since.
1157721	4/1/2021	WY	63	F	4/1/2021	4/1/2021	Arm felt itchy after the injection. Notably, it was not itchy at the injection site. Instead, it was itchy on the shoulder. The itching spread down to the inside of the arm, avoiding the injection site. About 10 minutes after the shot, the other arm started itching. We checked in with the pharmacist at the 15 minute mark and got the go-ahead to go home, since it was only itching. On the drive home, about 20 minutes after the shot, the face and lips started itching. After arriving home, about 25 minutes after the shot, we noticed a small rash forming on the face. She took a benadryl and retired for the day, to be safe. The itching was still spreading about half an hour after the benadryl (60 minutes after the injection), reaching the back of her neck. However, the rash has improved since taking the benadryl and the face is less itchy. (She describes the itchy patches as moving to different parts of her body.) It's currently only 65 minutes after the vaccine, so we're still keeping an eye on things! We wanted to report symptoms while they're fresh in mind.
1156178	4/1/2021	GA	24	F	3/31/2021	3/31/2021	Pt was waiting required 15 minutes in a chair. After about 8 minutes from receiving vaccine- Pt began to pass out and lose consciousness. Pt could not speak and her eyes began to roll back in her head and her body began to convulse slightly. Administered Epipen to pt in left thigh and she responded immediately. She came to and within a few minutes was able to say her name and count backwards from 10. 911 had been called. paramedics assessed pt. They asked her if she wanted to go to ER and she said yes.

1156697	4/1/2021	TX	58	F	3/26/2021	3/27/2021	Moderna vaccine. Work up the next morning a left side of face, eye, upper jaw was extremely swollen. Shot was in the right arm. Went to emergency clinic and skin cellulitis was diagnosed. I was given antibiotics to take. I had a root canal 7 days prior to the shoot. Went to dental surgeon the next Monday and he said the swelling was not related to the tooth. No fever.
1156980	4/1/2021	WI	71	M	3/26/2021	3/28/2021	Pink eye (conjunctivitis). Continuing currently
1156958	4/1/2021	TX	44	F	3/25/2021	3/25/2021	5:15pm Pt c/o itching on face secondary to injection of first dose of Covid-19 vaccine. Before alerting staff, pt. self-treated with Benadryl 25mg. p.o. EMT on scene found BP 138/90, lungs clear bilaterally. This nurse called to assess pt. 3 minutes into 30 minute observation. Pt reports?, throat swelling? and history of anaphylaxis?. 5:18pm Epinephrine 0.3mg IM administered per protocol in Right anterolateral thigh. BP 130/90 p. 85, visual inspection with light shows airway appears open. Pt. alert and oriented. Skin warm and dry. 5:30pm Paramedics arrived and assume responsibility for follow-thru with patient. At that time patient reported feeling better. Declined transport to hospital and was driven home by husband.
1156176	4/1/2021	NH	38	F	3/8/2021	3/8/2021	-About 3 minutes after receiving the shot mouth and throat felt itchy. The itchiness lasted until the following day. -Later that day in the afternoon around 3pm I had heavy breakthrough bleeding like I got my period which lasted for several days. I finished my birth control pill pack the following weekend and got my normal period. - In the afternoon of the 7th day after the shot my mouth was itchy again. Later that night my arm was sore, hot to the touch and had a rash. The next day the rash had spread down my arm. My throat, tongue and eyes were itchy. I called my PCP and spoke to a friend is an a doctor. I took Advil and Benadryl which helped. The rash and itchiness persisted from Mon - Thurs. - 15 days after the shot I got a bloody nose that lasted for about 45 minutes. I have not had a bloody nose since I was a child so thought this was worth mentioning. - Around the same time I had headaches in the back of my head that felt like burning.

1156421	4/1/2021	MI	75	F	3/18/2021	3/21/2021	Following first dose, only experienced fatigue and slight headache for one and a half days. Following second dose I experienced painful injection site for 2 days along with fatigue and generalized "out of sorts" for 2 days then felt quite well enough to resume normal activities and even took a 40 minute walk. That night (3/20) I had serious night sweats (fever?) and the following morning my arm at the injection site was hot and swollen and splotchy red, my face was swollen on the left side (side of injection, and my left temple was extremely painful to touch. I had a slight fever (100.5) and experienced a period of horrible chills. Later in the day my left eye became swollen and the area above my ear and eye and about one third of my forehead were bright angry red although the sensitivity of the temple had lessened. It was a Sunday and there was no walk-in clinic available so I contacted a Zoom style doctor through insurance. She advised she believed it to be an allergic reaction and that I should go to an emergency room. I wasn't experiencing any breathing issues and was no longer feeling feverish and chills so decided to wait and see what the morning would bring. Monday am the redness and swelling had spread to the right side of my face and the areas behind both ears and down my neck so decided I should be seen. I had already come to believe these were swollen lymph nodes and the Physicians Assistant I was able to see diagnosed as lymphadenopathy. The swellings and pain receded over the next few days. I still (4/1) have some stiffness in my left jaw and slight redness around my right eye above my ear.
1156886	4/1/2021	MD	49	M	3/9/2021	3/29/2021	Numbness on left side of face similar to receiving Novacaine...continuing eye issues
1156783	4/1/2021	WA	48	F	3/26/2021	3/27/2021	Mild headache; Sensation of random but frequent, almost rapid, fluctuating air pressure in left ear causing left eye to water and want to close with fluctuation, and psychologically distressing. Some intermittent ringing in left ear. Intensity decreased over the course of about two hours to the point I could go to bed and just fall to sleep, hoping it would be gone by morning, which it was. My "awake" experience lasted about 2.5 hours.

1156644	4/1/2021	VA	67	F	3/13/2021	3/22/2021	Patient had developed a sever case of shingles. She has had them before but never this bad. It appears on the same side (left) as she got the shot in. It has even affected her eye. Now she is hesitant to get the second shot next Saturday and likely will not be able to due to this illness. If she takes it it will probably be at the end of the maximum allowable time, which is 60 days I believe. Have researched this on line and there do appear to be some related cases of shingles associated with COVID 19 and the vaccine
1156624	4/1/2021		40	F	3/31/2021	3/31/2021	burning eyes within a few minutes of vaccination, no swelling, no SOB, no tingling
1156528	4/1/2021	NJ	54	M	3/29/2021	3/30/2021	101.5 fever for 28 hours, chills, headaches and eye strain, and fatigue and joint pain over a 28 hour time period.
1156456	4/1/2021	CO	69	F	3/27/2021	3/27/2021	Got the shot at 12:30 pm Saturday 3/27. Around 6 hours post-shot, soreness spread from the injection site across my back, into my neck, created a low headache, then went into my right arm and down both arms. Around 7 hours extreme fatigue set in. Chills hit at 9 hours. The headache became more generalized, extreme thirst, aches, shivering, and fatigue went on for exactly 24 hours. No appetite, rolling nausea (no vomiting), mental anxiety, cognitive fuzziness, sleepiness. Unable to read (short term memory and cognition), low attention for television. I never checked for fever. Around 6:30 the next evening (Sunday, 3/28), the symptoms retreated except for the fatigue and headache. Still a bit anorexic, but did eat lightly around 8 pm. Read, watched TV, and slept better. Monday, March 29: I felt very fatigued and fuzzy-brained, but otherwise normal in the morning; the afternoon brought more energy, less headache. Tuesday, March 30: Everything back to normal. Energy and clear thinking returned last.

1156487	4/1/2021	CA	31	M	3/27/2021	3/27/2021	a 31 year old man who received the COVID-19 vaccine on March 27, 2021 in the Public Health Department parking lot. Upon arrival and check in, the patient declined any comorbidities and health history but did state that he was nervous. After administration of the vaccine by NP, the patient lowered himself to the ground, from a sitting position, and had a 60 second tonic clonic seizure. Seizure precautions such as turning the patient on his side, supporting his head, and calling EMS were taken during the seizure. After 60 seconds, the patient came to and asked what happened. PPHD staff oriented the patient to what had happened, to which he proceeded to say "oh that is normal for me when I get anxious." With the help of PPHD staff and his wife, the patient was brought to a sitting position and given a granola bar and water to his request. According to clinic lead RN, "his skin was normal in appearance for race, ethnicity, and age. He was mildly diaphoretic. He verbalized feelings of anxiety and worry surrounding the vaccine." As EMS arrived on the scene and began assessing vital signs the patient's anxiety appeared to increase; he became less verbal, closed his eyes, and his breathing pattern became shallow. The patient then had a second seizure at this time lasting approximately 25 seconds. When the patient came to he immediately verbalized, "I'm good, I'm good, I'm fine?". He was slow to respond to verbal cues, but persistently refused transport to the local acute care hospital for further evaluation. He rested on the ground in supine position for approximately 25 minutes, with his partner and EMS at his side. Upon further evaluation of the patient and his wife, it was determined that the patient has a history of seizure activities when he is nervous and that he was "expecting" this to happen. The patient continued to decline medical care and transportation to the hospital. The patient left in medically stable condition with his wife operating the vehicle.
1156536	4/1/2021	CA	64	F	3/31/2021	3/31/2021	Swelling in left lower eye and cheek within minutes of the injection. Has not resolved itself as of this reporting.
1156547	4/1/2021	NJ	75	F	3/30/2021	3/31/2021	After approximately 24 hours after 2nd dose of Moderna, ppt noted left eyelid was starting to droop. She was seen by PCP (4/1/2021) and determined to have Bell's Palsy. She was started on Prednisone 60mg daily x 7 days.

1156548	4/1/2021	NC	63	F	3/22/2021	3/22/2021	Headache, chills, joint pain, over-all aches, eye sensitivity, local pain at injection site, thirst, fever of 101.9, slept for 18 hours after onset of symptoms. The fever broke within 24 of onset. Headache remained and felt tired and somewhat confused for most of the next day. Then third day I was much better. On 4th day I had very bad diarrhea.
1156561	4/1/2021		68	F	4/1/2021	4/1/2021	high blood pressure, headache, blurred vision
1156603	4/1/2021	MN	54	F	3/31/2021	3/31/2021	Vaccine was administered at 1:10pm on 3/31/21. PT stayed in monitoring area for 30 minutes and then went out to the parking lot and states that is when she noticed that she had double vision. At 1:55pm she came back to clinic area and was evaluated by PHN. Vital signs: P-78, R-18, BP-110/70. PT was talking and conversing appropriately, in good spirits, no other s/s other than pain in back of head she states. Laid down for 15 minutes with cold wet cloths on forehead and wrists and then re-evaluated. Continued to have double vision and pain in back of head, she also was talking on phone and sent a text during this time. Reevaluated at 2:30pm after another 15 minutes of laying on the cot.
1156493	4/1/2021	NH	34	M	4/1/2021	4/1/2021	Patient in recovery for approximately 3 minutes. Patient suddenly slumped over and unresponsive. Patient did not respond to painful stimuli immediately. After approximately 20 seconds patient inhaled deeply, opened eyes and was confused as to where he was. VSS. Rapid response called and patient transported to emergency department as per protocol.

patient has not been tested for COVID-19. Outcome of events was recovering.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. Clinical presentation is suggestive of allergic reaction. There is limited information provided in this report. This case will be reassessed upon receipt of follow-up information. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1150860	3/31/2021	WI		F	2/4/2021	2/5/2021	Headache; vision was unclear; blood pressure was 190/104; This is a spontaneous report from a contactable nurse (patient). A female patient of unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration on 04Feb2021 at single dose for covid-19 immunisation. Medical history included History of High blood pressure. The patient's concomitant medications were not reported. The patient reported that she had the vaccine last Thursday, and Friday she woke up with a horrendous headache she also reported that her vision was unclear when she was trying to read. She said that she has a history of high blood pressure, it was well controlled and has been fine and said that her headache lasted all day and she took Motrin and nothing touched it. She took her blood pressure at 15:00 and it was 190/104, which is really high for her. It scared her. Being a cardiac nurse, she knew to take her blood pressure medication early, and she took additional amounts that she knew was safe. She said that within 1.5 hours her headache was gone. That night her blood pressure was back down. She is really concerned about getting the second vaccine. She said that her blood pressure is fine and has been fine since. The seriousness was reported as non-serious. The outcome of the events was resolved. Information on the lot/batch number has been requested.

1150917	3/31/2021	OH	52	F	3/8/2021	3/1/2021	high level of shortness of breath; Diarrhea; spinal column hurt the worst (the spine from the top of her neck to her butt); butt muscles hurt really bad; caller's spinal column hurt the worst, the front of her calves and hip joints; spinal column hurt the worst, the very edges of her back, the side of her back was excruciating; Dizziness; Vomiting; not feeling well enough; shaking; shivering/ chills; pulse ox and it dropped down to 93; Excruciating body pain; Headache; sore arm / front of her calves, front of her thighs, left arm, 3 left fingers; Exhaustion; no appetite at all; This is a spontaneous report from a contactable consumer, the patient. A 52-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot number: unknown), via an unspecified route of administration in the left arm on 08Mar2021 at 10:15 (at the age of 52-years-old) as a single dose for COVID-19 immunization. Medical history included ongoing epilepsy since Oct2015 (officially diagnosed in Oct2015, but the doctors believed it was in her early 20s but she was misdiagnosed for decades), post-traumatic stress disorder (PTSD) from 2020 (diagnosed a year ago), sleep apnea since 2016 (patient thought she was diagnosed in 2016), COVID-19 in Nov2020 from which the patient almost died, memory loss (left over COVID symptom) for which the patient was in speech therapy, intermittent body pain (aftereffects of COVID-19), relapse in seizures due to COVID-19, her eyesight was terrible, epilepsy migraines. Concomitant medications included unspecified epilepsy medications. There was no other vaccine given on the same day, or 4 weeks prior to the vaccination. The patient previously received a flu shot and fainted, on an unspecified date. On 08Mar2021 at 11:15, the patient experienced sore arm (pain 2/10). On 08Mar2021 at 22:00, the patient had headache which got progressively worse, then it got so bad she wanted to pop her head off at midnight. On 09Mar2021 at 00:00, the patient had shaking and shivering where it looked like she was convulsing (she had history of epilepsy and knew what a seizure felt like, her husband may have thought she was having a seizure). The patient had chills to the point where she had multiple blankets and could not stop shaking, took her pulse ox and it dropped down to 93. The caller's baseline temperature was 97.1 and her daughter took her temperature and it was 98.9, most people wouldn't

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

consider that a temperature, but it was a temperature for her. The caller kept shaking like that for hours. On 09Mar2021 between 21:00-23:00, the patient had chills again. On 09Mar2021, the patient experienced excruciating body pain (pain 9/10) in very specific parts of her body. On 09Mar2021 by 12:00, the caller's spinal column hurt the worst, the front of her calves and hip joints, the very edges of her back, the spine from the top of her neck to her butt and then next to it was not so bad but the side of her back was excruciating, the butt muscles hurt really bad, the front of her thighs, left arm, 3 left fingers, but not the other 2 fingers. Oddly enough, she was considered a long hauler, it was the places that her occupational therapist and physical therapists were working on. On 09Mar2021 at 00:00, the patient experienced dizziness (that was on and off all day until bedtime last night on 09Mar2021) and vomiting (she couldn't hold down water). On 09Mar2021, the patient was not feeling well enough. On 10Mar2021 at 08:00, the patient experienced diarrhea (she's only gone to the bathroom twice). On Mar2021, the patient experienced exhaustion and no appetite at all. On an unspecified date, the patient experienced a high level of shortness of breath (patient was unsure if this was due to COVID-19). The patient underwent laboratory tests and procedures which included an echocardiogram on an unspecified date: her left atrium was enlarged and her cardiac numbers were high, they were going to monitor her heart and the doctors didn't know if it was because she had COVID-19 or if it was that the doctors got lucky and found it, they had nothing to compare it to because she only had this one echocardiogram. The patient had history of epilepsy migraines (can pinpoint the spot where it hurts), she thought she would try sumatriptan succinate (IMITREX) for this headache (her whole head hurt), as it didn't interact with her other medications. The patient also took acetaminophen/diphenhydramine (TYLENOL PM; Lot: GF6062, Expiry: Jun2022), ibuprofen (patient thinks the Lot is QWE2546A, but is unsure) for the headache. The patient took ondansetron (ZOFTRAN) which she had from a previous prescription and that made the vomiting stop. The events did not require an emergency room or physician office visit. The patient did not think that the reactions were due to her epilepsy medication. The clinical outcome of excruciating body

1150953	3/31/2021			F	3/10/2021	3/1/2021	<p>Eye pain; headache; nausea; some weakness later; dehydrated; watery eyes; felt horrible; eyes got to burning; This is a spontaneous report from a contactable patient (nursing aid). A 70-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration on 10Mar2021 as single dose for covid-19 immunisation. The patient medical history included Potassium high, she was already sick and she had a sinus infection and was on an antibiotic when she took the first COVID-19 Vaccine shot. The patient concomitant medications were not reported. The patient experienced headache, nausea &amp; some weakness later that day after the vaccine. The following day experienced pain &amp; watery eyes. The patient got her first COVID-19 Vaccine shot on 10Mar2021 shot and had a reaction in her eyes. She said she was on a sinus pill and steroids at the time she received her first COVID-19 Vaccine. She said her doctor told her it was ok for her to take the COVID-19 vaccine. She said her eyes got to burning and running after she got the COVID-19 Vaccine. She said she was dehydrated at the time too. She said she was feeling better. She said she was taking an antibiotic and prednisone to build her body up. She said she was already sick anyway, saying she had high potassium. She said she felt horrible, and her eyes got to running, so her doctor called an antibiotic in and everything for her. She stated her eye doctor told her she was having an adverse effect to the COVID-19 Vaccine shot. She said the person who administered her first COVID-19 Vaccine shot told her she would be sick for 48 hours. She said she felt a little better now, but her eyes were bad. She said she was scheduled to get her second COVID-19 Vaccine on 05Apr2021 and was scared to take the second COVID-19 Vaccine. She said her eyes were runny, burning and painful after she got the first COVID-19 Vaccine shot. The outcome of event headache, nausea, some weakness later, Eye pain, watery eyes, dehydrated, felt horrible, eyes got to burning was recovering. No follow-up attempts are possible. No further information is expected.; Sender's Comments: There is not a reasonable possibility that event dehydration is related to BNT162B2. It's most likely intercurrent medical condition. The impact of this report on the benefit/risk profile of the Pfizer product is</p>

							evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.
1150726	3/31/2021	NY	31	M	3/31/2021	3/31/2021	Fainting, dizziness, blurred vision, sweating, feeling clammy, blood pressure dropping and sugar dropping.
1150893	3/31/2021	AL	49	F	3/6/2021	3/6/2021	Anaphylactic reaction: other; This is a spontaneous report received from a contactable consumer (patient). A 49-year-old female patient (not pregnant) received BNT162B2 (lot number: EN6205) second dose on 06Mar2021 11:00 on Right arm at single dose for COVID-19 immunization. Medical history included Asthma, allergies to Sulfa, CT dye, Reglan, Morphine, and Gastrointestinal issues. Concomitant medications within 2 weeks of vaccination included Omeprazole, metformin, fluticasone propionate, salmeterol xinafoate (ADVAIR), cetirizine hydrochloride (ZYRTEC), galcanezumab (EMGALITY). No other vaccines within 4 weeks prior to the COVID vaccine. The patient previously took BNT162B2 first dose on 13Feb2021 13:00 (age at vaccination was 49-year-old) on Right arm for COVID-19 immunization. Patient had Adverse events: Anaphylactic reaction: rash, itching, cough, throat swelling and closing, difficulty breathing, rapid heart rate, face swelling, eye problems, dizziness, nausea, headache on 06Mar2021 11:15. The events resulted in Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. Patient received treatment included Epinephrine, Benadryl injections, O2, Breathing Tx. Prior to vaccination, was the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The outcome of the events was Recovered with lasting effects.

1150958	3/31/2021			F			lost vision in one eye; had eye pain and was diagnosed with optic neuritis; burning, tingling in both legs; burning, tingling in both legs; general muscle weakness; This is a spontaneous report received from a contactable pharmacist. A 42-year-old female patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date in 2021 at a single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. HCP calling regarding a patient, who reached out to the Pharmacist inquiring about treatment recommendations and any information regarding her diagnosis, that received her 2nd Pfizer Vaccine dose 2 weeks ago and started with reactions after 2 days. The patient reported burning, tingling in both legs and general muscle weakness. She also had eye pain and she was diagnosed with optic neuritis and had lost vision in one eye as a result. Reporter was asking if there have been any reports of this. The outcome of the events was unknown. HCP was asking if any "post market research" has shown any reports of "multi system inflammatory syndrome as seen in children post Covid 19 illness." HCP also inquiring about Guillain-Barre syndrome reports in post EUA reports.; Sender's Comments: Based on the information provided, and on plausible temporal association, the Company assessed that a reasonable possibility could not be completely excluded that the reported events optic neuritis and lost vision were related to the PFIZER-BIONTECH COVID-19 VACCINE.

1150647	3/31/2021	NY	73	F	1/30/2021	1/30/2021	sore arm; Left arm achiness; a little light headedness/slight lightheadedness; slight blurred vision/slight blurry/ fuzzy vision; slight headache; This is a spontaneous report from a contactable Consumer. A 73 year old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection; Lot number: UNKNOWN, expiry date: 31May2021), via an unspecified route of administration on 30Jan2021 as single dose for covid-19 immunisation. The patient medical history included ongoing Lymphocytosis and the patient is allergic to eggplant, Aspirin and penicillin. The patients concomitant medications were unknown. On 30Jan2021, the patient received the 1st dose of the vaccine and experienced nothing major but a sore arm that resolved, a little light headedness and ever so slight blurred vision that resolved on the night of the shot. she had her first Pfizer shot and she had the usual side effects that evening of a slight headache and feeling achy afterwards. She says after the shot she was fine, but a little bit of lightheadedness and a little bit of fuzzy vision but it was minimal. She says it's like if you're looking in the distance at a stop sign, it was a little fuzzy. These happened last Saturday. These two symptoms were very slight, the lightheadedness was nowhere near passing out and the little bit of blurry vision was ever so slight and gone several hours later. Outcome of event sore arm; Left arm achiness, a little light headedness/slight lightheadedness, slight blurred vision/slight blurry/ fuzzy vision and slight headache was recovered. No follow up attempts are possible. No further information is expected.

The patient's medical history included COVID-19 and concomitant medication included Vitamin B12. On 24-FEB-2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 011A21A) intramuscularly on left deltoid for prophylaxis of COVID-19 infection. On 25-FEB-2021, one day after receiving mRNA-1273, patient started to experience sore arm. On 26-FEB-2021 patient had severe severe ice pick headache, it felt like the biggest wasp in the world stung her head. She states that it was so painful, and it scarred her. Patient claims she searched it up and it was the cranial 7 nerve from her temple to the back of her head that was on fire which lasted for 5 minutes. The next day 27-FEB-2021 patient states the headache was gone however the nerve still throbbed a little and she was afraid to go to sleep that night. She then woke up that same night with severe ice pick headaches that were slamming into her head. On 28-FEB-2021 the patient took protective measures and got up early and did not experience anything on that day. On 1-MAR-2021, she accidentally touched her husband's forehead with her head lightly and had the most severe ice pick headache

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>

(like hot lava running through that nerve for 20 minutes). It alleviated when she took two Advil's. The next morning 2-MAR-2021 the patient nerves felt like little electricity lines zapping through constantly. Patient had looked up Bell's Palsy within our clinical trials and when she went to the doctors on 3-MAR-2021, they said the wrinkles in the right eye was very smooth compared to the left but her eyes were not drooping), doctors believed it to be Bell's palsy and prescribed her Gabapentin, and Zovirax. Since then her ice picks have left but there is still nerve pain. She feels like the cranial 7 nerves are still on fire. All her headaches happened in bed while laying down. Patient states that the headaches feel dangerous and feel like they will cause her permanent damage. Patient still feels pressure in her brain and is scared there may be swelling in her brain. Treatment medications included Advil, Gabapentin, and Zovirax. Seriousness criteria included medically significant events. Action taken with mRNA-1273 in response to the events was not reported. Outcome of the event sore arm, severe ice pick headache, felt like the biggest wasp in the world stung her head, nerve pain, afraid to go to sleep, most severe ice pick headache/headaches happened in bed while laying down/headaches feel dangerous, patient nerves felt like little electricity lines zapping through constantly/still feels like cranial 7 nerves are on fire were considered recovered but bell's palsy, wrinkles in right eye was very smooth, patient feels pressure in her brain/scared there may be swelling in her brain and heart muscle is a little sore were considered unknown.; Reporter's Comments: Based on the current available information which shows a temporal association between the use of the mRNA-1273 and the reported events and excluding all other etiology, a causal relationship cannot be excluded. Headache is consistent with the known safety profile of he vaccine.

----------	-------	-------	---------	-----	----------	------------	--------------

other vaccines around the time of BNT162B2 vaccination. She was calling about the Covid vaccine. She had her first dose this past Friday, clarified 05Mar2021. It's been a week. On the evening about 8 hours after the Covid 19 injection she got a rash on her shoulder that she had the shot in. The rash went across her chest to the other shoulder. On her neck she had hives up to her face and down her chest a little bit. She has been taking Benadryl for the past 6 days. She is very concerned what is going to happen with the next dose. She contacted her primary health care provider and it was recommended that the caller pre-medicate. The caller states it says not to pre-medicate. She has her next Covid 19 vaccine in 2 weeks and she was nervous. She did file a report with the government. It was in the information she received from the hospital where she got her Covid 19 injection. Every day at 2:00PM she gets a text message. They monitor her for up to a year. Every day she checks in and says how she feels, is she having trouble completing daily activities, did you have to call your doctor. They gave her a paper at the hospital where she had it done. When querying if this government program had given her a report number she states she doesn't have a report number, she deletes the text messages every day. She is due for the second Covid vaccine on 26Mar2021. It was reported that several hours after the injection in the evening, maybe 8 hours after she had the injection is when her symptoms began. She does feel like she is improving. Today was the first morning that she didn't take the Benadryl. She had no respiratory problems. But she was very concerned because the hives were pretty prevalent. It was very uncomfortable. She was taking 50mg of Benadryl for 5 days. When she went to the pharmacy to pick up a cream too, the pharmacist thought that a steroid would be good. She was concerned. She emailed her primary care doctor with pictures. When querying seriousness of events, caller states it was bad enough that she went to the pharmacy and called her primary care doctor and sent her pictures. If she had developed any respiratory issues she would have gone to the emergency room. If she was non medical she would have gone to the emergency room but because she's a nurse she thought she would ride it out. When querying information for the Pfizer Covid 19 Vaccine data capture aid, the caller

---

reports the hives were 48 hours later. She also reports urticaria, her head and ears were itchy. She is using steroid cream on it. It is driving her crazy today. Still going to be using the cream. A little bit of erythema, worst part was her neck. When querying red and itchy eyes, she reports only the eyelid. When querying gastrointestinal issues, she reports she has diarrhea, but she has gastrointestinal issues. The diarrhea is nothing worse than what she normally has. She doesn't think this has anything to do with the vaccine. The patient did not visited to emergency room and physician office. The patient was not hospitalized or admitted to an intensive care unit. Therapeutic measure were taken with Benadryl 25-50mg (Lot Number:P134952, Expiration date: Sep2021) and Hydrocortisone cream 1% maximum strength for the events. It was reported that Benadryl makes her hyper and her heart racey.The outcome of the event diarrhea, gastrointestinal issues were repoorted as unknown, event head and ears were itchy was not recovered and recovering for other events. The events rash on shoulder that she had injection in, hives on neck, rash on neck up to her face were assessed as serious (medically Significant) by the reporter. The causality of the events rash on shoulder that she had injection, hives on neck, rash on neck up to her face were reported as related to vaccine.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of serious events cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1148776	3/31/2021	KY	68	F	3/2/2021	3/3/2021	MS/Optic Neuritis; MS/Optic Neuritis; sore arm; fatigue; overslept; Color fading/washed out symptoms left eye/decrease color discernment; poor vision left eye/vision from 20/30 to 20/60 corrected in left eye/decreased vision; This is a spontaneous report from a contactable physician. A 68-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot Number: EN6198) intramuscularly administered in the right arm on 02Mar2021 08:00 as single dose for COVID-19 immunisation. Medical history included addison's disease, hypertension and optic neuritis from Aug2020 to Aug2020. Patient was not pregnant. Concomitant medications included hydrocortisone (HYDROCORTISONE), metoprolol (METOPROLOL), fludrocortisone (FLUDROCORTISONE), amlodipine (AMLODIPINE), estradiol (ESTRADIOL) and olmesartan (OLMESARTAN). Historical vaccine includes first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot Number: EL9265) intramuscularly administered in the right arm on 09Feb2021 02:00 PM as single dose for COVID-19 immunisation. On 03Mar2021 07:00, patient had multiple sclerosis (MS), optic neuritis, sore arm, overslept and fatigue. It was also reported that when the patient woke up on 03Mar2021 07:00, she had poor vision in the left eye and experienced color fading; further reported as washed out symptoms in the left eye. She went to the ophthalmologist and saw that she had decreased vision, further reported as from 20/30 to 20/60 corrected in left eye and decrease color discernment. Patient was treated with Methylprednisolone 250mg intravenous (IV) every 6 hours x 12 doses for the events multiple sclerosis (MS) and optic neuritis. The events resulted in physician office visit. The patient underwent lab tests and procedures which included CT angiogram: negative for arteritis on an unspecified date, fundoscopy: normal on an unspecified date, intraocular pressure (IOP): normal on an unspecified date, lumbar puncture: increased protein 79 ms panel pending on an unspecified date. Outcome of events was recovering.; Sender's Comments: The events most likely intercurrent conditions and unlikely related to suspect BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot Number: EN6198). This case will be reassessed when follow-up information is received.

blood clots on Mar2021 with outcome of unknown, whether the injection was done in the wrong location on Mar2021 with outcome of unknown, her arm was very itchy and a red papule-like round rash developed, it was pigmented on Mar2021 with outcome of unknown, her arm was very itchy and a red papule-like round rash developed, it was pigmented on Mar2021 with outcome of unknown, her arm was very itchy and a red papule-like round rash developed, it was pigmented on Mar2021 with outcome of unknown, it was "highlighted" and "dot-like" on Mar2021 with outcome of unknown, had a sharp pain, and tingling or pain-like sensation at the fingertips/she was going "through a world of pain", and from the arm down to the side of body on Mar2021 with outcome of unknown, had a sharp pain, and tingling or pain-like sensation at the fingertips on Mar2021 with outcome of unknown. The patient underwent lab tests and procedures which included body temperature: 99.4 fahrenheit on Mar2021, body temperature: 100 fahrenheit on Mar2021. The consumer reported that "Who makes the vial label? What syringe did they use to give her the vaccine? How big was it? Where is the vaccine administered? Did we make a second batch with "much less" side effects? She thought there was an earlier version which should have more side effects. Did she have to share a vial with other people? Is it multiple doses? How much is the dose of a vaccine?" Consumer stated the lot number was a "so vague looking thing" to come with the Pfizer vial. Upon clarification, said she did not see the lot number on the vial, but on the vaccination card, where the lot number was very small. She would include 5 labels with lot numbers to split to each person who gets the dose from the same vial. The clinical course was reported as follows: She got the second dose of Pfizer's COVID-19 vaccine on 05Mar2021 and has developed side effects. Her nervous system was affected, she has weakness on her leg, had very tight calf muscles, eye pain. When she was working, she started to have difficulty breathing, she was dragging her feet, could not take the next step. This was 2 weeks ago and went away for a while. Today she had "such a tight feeling" of the calf, and a little bit of pain to it, she was nauseous. She was wondering if it was a lung issue or blood issue, such as blood clots. She had a fever too, 99.4°F at one time and over 100°F for a day or so. The

---

first dose didn't give her any side effects. She was also concerned about whether the injection was done in the wrong location, she thought it was in the deltoid, but 10 days later her arm was very itchy and a red papule-like round rash developed, it was pigmented, she wondered if it was a hair, it was "highlighted" and "dot-like". It was located in the 2/3 lower to the elbow from the shoulder, she thought it was "really low" and they missed the deltoid muscle, she had no idea if the nurse didn't know the exact location and putting it "in the skin" was the cause of her symptoms. Stated they put a bandage in the wrong location, there was nothing there. She additionally had a sharp pain, and tingling or pain-like sensation at the fingertips, yesterday she was going "through a world of pain", and from the arm down to the side of body. With the first dose she didn't have any pain, but it was "very weird", afterwards she had some "sharp pain" under the scapula and didn't know why. She thought it was "echo" through the nervous system. Stated when she got the vaccine, she saw 3 dark marks on the syringe and two thirds were filled with the liquid. She wanted to know if this dosage was correct. Mentioned a lot of people had side effects, a lot of times they are given in the wrong location, in an entirely different place. She thought there was an earlier version of the vaccine which should have more side effects. She had a "very bad bad" experience 4 years ago when she got a rabies vaccine, it was given at 45°, the nurse gave the injection "cutaneously", after 5 min she was "so in pain".

he lowered his head below his shoulders, the dizziness gets really bad. the dizziness won't go away. the Emergency Room doctor thought his dizziness may be due to his inner ear. The Emergency Room doctor told him he should see an ear doctor about his dizziness. He said the his dizziness happened directly after he got his first COVID-19 Vaccine. Reported he went on the internet, and read that other people who got the COVID-19 Vaccine were experiencing same thing he was. No further details provided. It was Reported patient blood pressure was very high. He clarified his blood pressure reading that was taken in the ambulance on his way to the hospital Emergency Room was 190/114. He said he believed his blood pressure was taken again, and his blood pressure was a little bit better. He said his dizziness hadn't stopped. He said the dizziness gets so bad, he can't get around. He said if he lowered his head below his shoulders, the dizziness gets really bad. He said the dizziness won't go away. He said he was nauseous too, but only when he was dizzy. He said his dizziness was fine last night, but then he got up this morning and the room started spinning out of control. He said he felt lightheaded, and was afraid he might fall. He said if he tried to pick up something off the ground, his dizziness really comes on. He said the Emergency Room doctor thought his dizziness may be due to his inner ear. He said the Emergency Room doctor told him he should see an ear doctor about his dizziness. He had an EKG done in the Emergency Room, and since the doctor didn't say anything about his EKG, he assumed there was nothing wrong with the EKG results. He stated that he went to hospital as he was fearful he was having a heart attack; it was determined that he was not. However, he was advised him to consult a specialist as he may be suffering from vertigo. Treatment was given a low dose of oral Lorazepam 0.3mg to calm him down. He stated he did not have the Lorazepam 0.3mg NDC. He said his paperwork from the Emergency Room listed his diagnosis as Vertigo symptoms, and it was recommended he go for a hearing test because his dizziness maybe caused by his inner ear. The outcome of event was unknown.

A 55-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 intramuscular, administered in arm left on 19Feb2021 10:00 (Batch/Lot Number: EN6201), at the age of 55 years, as single dose for covid-19 immunisation. Medical history included ongoing asthma diagnosed 3 years ago, ongoing gastroesophageal reflux disease diagnosed 4 years ago, ongoing hypertension diagnosed 4 years ago, ongoing food allergy: allergic to eggs, shellfish, dairy/lactose intolerant, ongoing allergies to environmental: standard- hay fever, dust, mold, ongoing allergies to dogs and cats, contrast media reaction (IV contrast CT scan dye- respiratory distress, throat tightens), urticaria, pruritus. She had Covid on 18Dec2020 and "Covid rash it attached her muscular system. She had muscular pain in the wrist and hip on the right side and mild double vision." The patient previously took vitamin k 2 and experienced anaphylactic reaction, Toradol and experienced urticaria, influenza vaccine and experienced rash at the injection site, at the age of 34 years (because she's allergic to eggs). The patient received the first dose of bnt162b2 on 29Jan2021 Lot: EL3247; 9:30 AM; Right arm for covid-19 immunisation and she did not have any symptoms whatsoever with the first shot. The patient did not receive any recent vaccines for any other conditions prior to the event being reported. Vaccination Facility Type: Hospital. Concomitant medications included omeprazole taken for gastroesophageal reflux disease; lisinopril taken for hypertension; montelukast sodium (SINGULAIR) taken for asthma; salbutamol sulfate (INHALERIN) taken for asthma; start and stop date were not reported for all. The patient experienced anaphylaxis on 26Feb2021 with outcome of unknown, throat starting to close/throat started tightening on 19Feb2021 with outcome of

recovered, severe rash- latus stranding, purple dots, and hives from face all the way down to toes on 19Feb2021 with outcome of not recovered, double vision on 20Feb2021 with outcome of not recovered, right eye is going cross eyed/left eye is dropping on 20Feb2021 with outcome of not recovered, right wrist pain increased dramatically after the vaccine on 20Feb2021 with outcome of not recovered, hands got very swollen and rash and itchy beyond itch on an unspecified date with outcome of unknown for Hand swelling and recovered for Localised itching. Therapeutic measures were taken as a result of the events: Benadryl, Zyrtec, Pepcid, New glasses for double vision, Prednisone 7 day ween. The patient underwent lab tests which included Hematology test on unknown date with unknown results; Immune markers on 11Mar2021 with unknown results. Clinical course: The patient received the vaccine on 19Feb2021at 10:00 AM and five minutes after, her throat started tightening and they put her in observation for another hour and then her throat felt fine and they let her go. Caller confirmed she was not referring to this occurrence as anaphylaxis. The anaphylactic reaction occurred days later. She mentioned from 19Feb2021- 26Feb2021, her symptoms were progressing and then on 26Feb2021, it was full blown out; the actual anaphylaxis was 26Feb2021. Between this, she had severe double vision, severe rash from face all the way down to toes, one eye going cross eyed (right eye), left eye is still drooping. On 20Feb2021, she started having double vision that started with the sunlight and fluorescent lights and the next day she couldn't see anything without double vision, and her eye started going cross eyed. She still cannot see normally now. She is under eye doctor care for that too. The patient was treated with Epi-Pen into leg and then into the Emergency Room. She received 50 mgs of Benadryl and 125 mg of Solu-Medrol IM injection, but still have to give Epi because her throat was still closing. Her airway was intact and no nebulizer treatment needed. The patient reported also that her hands got very swollen and rash and itchy beyond itch. The patient reported that her weight at that point was 204, the she had been on Prednisone for a week, and her weight has gone up to 210 now. After her throat closed on the 26Feb2021, caller reports she gained 7 pounds while on it for one week. Caller stated she was

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

also put on prednisone when she got diagnosed with asthma, reactive airway. She confirmed her throat stop closing immediately after the Epi. The patient was also treated with 25 mgs of Benadryl, Zyrtec, and Pepcid a day. Outcome for throat closing was improved with medication. Outcome for rash was not improved and she is taking medicine to counteract it; itch went away when she took the Zyrtec. Regarding right wrist pain, it increased dramatically after the vaccine. Caller reports it felt like a spiral fracture down the ulna and it started to ache on 20Feb2021, by the next day it hurt a 5 out of 10. By 22Feb2021, she was wearing a splint, it was 8 out of 10, and she felt like she fractured it and it was swollen on the ulnar side. Regarding eye disorder, she is now under the care of an eye doctor for her severe double vision, eye crossing, and eye drooping. The blurred eyes give bad balance and that kind of stuff. The cross eyedness gives her poor peripheral vision and also her depth perception has now been compromised. They say the glasses will fix it. As of 22Feb2021, a new pair of special lenses with prisms were ordered for her. The patient was not hospitalized.

1151244	3/31/2021	WI	61	F	3/24/2021	3/25/2021	<p>On Wednesday, March 24th my husband and I got our 1st Moderna vaccine at 8:30 am. Felt good the rest of the day. On Thursday, March 25th I woke up and the bag under my right eye was really swollen and I felt like I had a big cold sore coming out on the top right side of my lip. My arm was swollen like a 2x2 area and tender but other than that I felt good. At 9:30 am that same day I started getting a headache and my stomach felt really upset. I didn't throw up but felt like I was going to. About 10:00 am I really felt sick to my stomach and extremely tired. My headache was more intense and mostly on my right side (same side as my eye and cold sore). By noon I had the chills and was running a temperature over 100. At 3:00 when I got done with work I slept. I was only awake for a total of 1 hour and went to bed for the night at 8:15 pm. I still had a bad headache, upset stomach and chills and my arm was swelling bigger but I slept all night. On Friday, March 26th I woke up and my face looked worse. The cold sore was getting bigger and the bag under my eye was huge making my eye almost shut. I still had a bad headache and the injection site was getting bigger and stuck out far. It was hot to the touch. It was bright red and bumpy and hurt to touch it. I no longer was sick to my stomach and I had no fever. My face was still looking awful and about 2:00 pm I started running a fever again. I still had a headache. I still felt tired. On Saturday March 27th, my bag under my eye looked a little better but the cold sore was getting worse. I had a slight headache, no fever and not sick to my stomach. However, the lump at the injection site got huge. It was the size of the palm of my hand and stuck up about an inch. It was hot to the touch and red. By 9:00 pm my eye and face were worse and the right side of my face was drooping. On Sunday March 28th 8:00 am my face was worse and itchy. The cold sore was spreading up the right side of my drooping face and my eye was almost shut. I called the Teledoc and had a video call. She said that the vaccine triggered a virus in my system. She called in a prescription for Valacyclovir 1GM 4 pills. Took 2 pills at noon and then the last 2 that night before bed. She said to give it 2-3 days and it should clear up. On Monday, March 29th 6:30 am the lump in my arm is a little smaller but my eye is worse. I looked horrible. On Tuesday, March 30th I still had a low grade headache and my lip and right side of my face is kinda numb. I called my doctor and made an</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							<p>appointment for Wednesday, March 31st. On Wednesday, March 31, 2021, I woke up and now had a canker sore inside my top lip on the right side of my face in addition to looking like a monster. I went to the doctor's office at 7:30 am and she said that I definitely have a virus going on and now I have Bell's Palsy as a result. The doctor gave me a prescription for Valacyclovir 1GM tablets to take 3 times a day for 7 days. She also prescribed Prednisone 20 MG to take 3 tablets for 7 days to relief the itching and irritability of my face.</p>
1151226	3/31/2021	WA	82	M	3/17/2021	3/17/2021	<p>Approximately four hours after administration of Moderna vaccine the patient had a sudden syncopal event without warning. He suffered a scalp contusion. His equilibrium, hearing and vision were diminished for 7-10 days thereafter, gradually returning to normal.</p>
1151181	3/31/2021	TX	23	F	3/16/2021	3/29/2021	<p>The night of my vaccine, I had a 100 degree fever, body aches, and chills. That was resolved by the next day. On 3/29, I woke up with itchiness behind my right ear. around 4:30pm on the same day, I had broken out into hives on my face and arms. By 5:30 they had become itchy and had spread to my neck and chest area. I had also developed swelling around my eyes, above and below them. I woke up at 1:30am on 3/30 with itching and burning and more swelling around my eyes. At 7:30am on 3/30, my eyes were almost swollen shut and I sought medical attention. I had itching and burning on my entire body, swollen eyes, full body aches, and joint pain. I was prescribed steroids and began that course around 1:30pm. I was also prescribed two epi pens. Around 6:30pm that night, I had a 100.7 degree fever. It dropped without the use of a fever reducer within the next two hours. The swelling reduced around my face by 8pm. This morning, I had almost no swelling, but still a full body rash. I am treating it with benadryl, zyrtec and maximum strength pepcid, steroids, and calamine lotion.</p>

1151168	3/31/2021	DC	69	F	1/21/2021	1/29/2021	Sick, minor cold; sick, minor cold; Watery eyes; headache; This is a spontaneous report from a contactable consumer received from a Pfizer Sponsored Program Pfizer First Connect. A 69-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE: Solution for injection, Batch/Lot Number: EL3302), intramuscular, administered in Arm Left on 21Jan2021 13:00 as single dose for covid-19 immunisation at Hospital. The patient medical history and concomitant medications were not reported. On 29Jan2021, The patient experienced sick, minor cold, watery eyes, headache. Patient has already got her first dose of the Covid vaccine on 21Jan2021. She took 600mg Ibuprofen two hours before getting the vaccine. She was reading that taking ibuprofen prior to getting the vaccine could have been a problem as far as the efficacy. on 29Jan2021, she started to get sick, she does not think it is related. She has a little cold. She wondered what she should do. She is scheduled for the second dose. HCP stated She will have the first consult with hcp on Monday. She does not have a hcp right now. no email When querying outcome of her cold, states it is different, on the night of the 29th she had watery eyes and a tiny headache. She sneezed twice maybe the next day. She is slightly nasally and now it has gone to her throat and down to her chest. It is like a typical cold. She does not think she had a fever, but she did not take her temperature. She did not take ibuprofen. She normally would take ibuprofen if she does not feel good. She knows she has a cold, she did not have a sore throat. Normally when she get sick she gets a sore throat and that nose like feeling, but with this cold her symptoms are super slight. Reports she has had some doozy colds in the past. She wanted to mention that Friday night she was in a car with a driver running errands, and she thinks she may have picked up a cold from the driver that was nasally and blew his nose. States when she gets a cold, she really gets a cold and this cold is minor compared to colds she has had prior. When she got the first shingrix shot, she developed a large red, swollen, elliptical circle thing that took up half of her arm from elbow to the top of the arm. She had two doses of the shingrix. When she took Benadryl and ibuprofen before getting the second dose of shingrix, she did not have a reaction. Patient took 1st dose of Covid vaccine and developed a cold about 8

1149432	3/31/2021	OH	60	F	3/27/2021	3/27/2021	Patient was 10 minutes post vaccine sitting in observation area. She was talking to her friend and suddenly asked to be taken to her office. She said that she was seeing 3 of him. The friend went to the EMS personnel who were staffing the event for assistance. 10:15-BP was 176/112 R arm, 10:20-167/114. Double and triple vision continued. She was put on a stretcher by EMTs. Head was elevated 45 degrees. 10:25-153/101, HR 88, still seeing "double". Began to chill and entire body was shaking profusely. Blankets were given. 10:30 AM-154/81, SaO2-99%, P-87. Husband, a retired paramedic, who had been notified, arrived. 10:35 AM-154/95, P-91 10:40 AM-156/94, 10:45 AM-158. Paramedics and nursing staff advised for patient to go to the ER or Urgent Care but she refused. 10:50-BP was 166/138, P-91. Husband insisted that he would monitor her at home. Taken to car by stretcher to go home. 9 PM, I called patient to follow up. She said that her double vision lasted for hours but finally subsided and that she had a "wicked headache". She said she did not feel like herself.

1149327	3/31/2021	CA	25	M	2/10/2021	2/11/2021	I had some type of allergic reaction in my eyes that caused them to burn, be sensitive to light, and felt grainy. This happened the days after getting both of my vaccines. The only thing that helped was resting my eyes but laying down caused them to burn more than compared to laying down. I could only keep my eyes open for a couple of seconds at a time but then they would start to burn. After those symptoms started to wear off, my eyes were sensitive to sunlight for more than a week.
1149314	3/31/2021	MO	28	M	3/26/2021	3/26/2021	Patient reported "blurry vision" during his observation period following COVID vaccine #1 Moderna. BP found to be elevated at 178/120. No prior history of high blood pressure was reported. His blood pressure came down to 130/100. Patient advised to be checked at a nearby urgent care center. No further information available.
1149291	3/31/2021		35	F	3/26/2021	3/28/2021	Severe period cramps which I haven't had in months since I've gotten COVID-19 back on Jan 29th. I believe I got it then bc I wrote on Feb 14 exactly 2 weeks after seeing our factory partners. My head felt shaken like astigmatism in my brain. So haven't had a real period for a year and then after the vaccine worst cramps in my life. Then I have stomach hurting and GI issues every hour or so. Lastly my eyes have been red at night a lot and I would keep getting headaches from time to time for no reason and I'm not a headache person.

1151616	3/31/2021	KY	32	F	3/12/2021	3/15/2021	I didn't have many side effects in my arm right after the shot other than it being really sore for about 20 min after leaving while I was on the way home. Other than that, it just felt like I had a bruise at the injection sight. I ran a slight fever of 99.4 on and off for the first few days but felt okay. No longer have a fever (but hard to tell because I'm taking Tylenol around the clock) but symptoms have progressed since the first few days and not getting better. Now for the bad... I've experienced tightness in the middle of my chest randomly, extreme fatigue, feet turning more blue/purple than the usual, sleeplessness, and headaches that are in the middle front part of my head (don't experience these types of headaches. Usually I get more of a pressure headache to the left side of my head). I'm having random shooting pain under my eyes where the eye socket/cheekbones are (not usually correlating with my headaches). Started with the left side and now both get random shooting pains. I've never felt the pain under my eyes before until I got the vaccine. Random falling/rising stars (usually falling stars indicates a migraine) just happening more often than normal. My lymph nodes in my neck where my throat is, have been swollen on both sides worse on my left side (similar to how they react with strep). My joints and muscles have been worse than ever and swollen all over. Already had issues with my knees but now can hardly walk up and down stairs. I've also had ringing in my ears that can sometimes be intense. Vertigo and randomly feel like falling over. Collapsed on stairs a week after vaccine.

1148777	3/31/2021	SC	70	M	1/21/2021	1/24/2021	Experienced blindness after first shot in right eye after first shot; TIA; headaches; This is a spontaneous report from a contactable consumer. A 70-year-old male patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in the left arm on 21Jan2021, 13:00 (Batch/Lot Number: EL 3249) as a single dose for covid-19 immunization. The patient's medical history included diabetes from an unknown date and unknown if ongoing. The patient was generally in good health. Concomitant medications included apixaban (ELIQUIS); pravastatin (PRAVASTATIN); and vitamin d [vitamin d nos] (VITAMIN D [VITAMIN D NOS]) all taken for an unspecified indication, start and stop date were not reported. The patient previously took morphine and ceclor and experienced allergies. On 24Jan2021 at 13:00, the patient experienced blindness after first shot in right eye after first shot for about 20 minutes (Most likely a transient ischemic attack (TIA)). Have had headaches every day since the first shot. The patient underwent lab tests and procedures which included negative test for Covid-19 on 11Feb2021 (via nasal swab). The outcome of the event was not recovered.
1152064	3/31/2021	NY	22	F	3/30/2021	3/30/2021	Nausea, blurred vision, loss of vision, loss of hearing, out of it, heart racing, body became hot, ice packs were placed all over my body, in a couple minutes my vision came back and my heart rate started to slow

1148774	3/31/2021	AZ	60	M	3/9/2021	3/1/2021	I don't know if I hallucinated that or not; I feel like I am on drugs like I on 'some acid'; my vision is blurry and it's kind of hard to concentrate on television; hard to concentrate; This is a spontaneous report from a contactable consumer (patient). A 60-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported)\ via an unspecified route of administration on 09Mar2021 (Batch/Lot number was not reported) as a single dose for COVID-19 immunisation. Medical history included mental issues since 1988. The patient stated "I am calling about an adverse reaction to the second Pfizer shot. If you guys have anybody called in and find out if anybody is having the same. After the second shot, about a day after the shot, it was terrible. I got the shot last Tuesday and I feel like I am on drugs like I on 'some acid' (not clarified). But I am not hallucinating, I am not seeing things, I am not hearing things, I just physically feel that way. Everything is kind of blurry, my vision is blurry and it's kind of hard to concentrate on television and stuff like that. It seems like some people are playing mind games with it but I don't think they have (further clarification unknown, hence not captured as event). I don't know if I hallucinated that or not (consumer was not sure). That's pretty much here I feel like I am on drugs constantly and it is just kind of scary. I have mental issues since 1988, I take psych meds but it seems whenever I take my psych meds (unspecified medications) I feel worst for couple of hours." Outcome of events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

1150044	3/31/2021	OH	19	F	3/31/2021	3/31/2021	I got my shot, sat down, and was reading through the information that the clinic provided me. A few minutes after, I noticed my right arm was getting warm, but I thought I was being paranoid (placebo effect). I began to feel nauseated. About another 5 minutes after feeling warm and nauseous, my ears began to ring and my vision went white. I was cold but sweating. I have passed out a handful of times before for various reasons, so I knew what was happening. I tried to signal to a volunteer from my seat that I needed help, but I ended up laying on the ground by my chair before someone came over. Once I laid down, the attention of the volunteers and nurses was on me. Three came over to assist me. They held my legs up, kept a hand on my wrist for a pulse, and fetched water. I talked myself through the dizziness and ringing in my ears. They put a cold rag on my forehead and had smelling salts on hand. Once I began to feel better, they helped me slowly sit up, and eventually helped me stand up and get into a chair. They kept a close eye on me for the next 30 minutes to make sure I didn't have any other reactions.

1150374	3/31/2021	NJ	60	M	3/10/2021	3/12/2021	loss of taste; possible allergic reaction to the drug; Can't pronounce words right; can't close right eye; eyes started to tear a lot; can't smile; right side of his face started drooping like that of a stroke; right side of his face started drooping like that of a stroke; headache at the back of his head; mouth started to feel numb; mouth started to feel numb; This is a spontaneous report from a contactable consumer (patient) via Medical information team. A 61 year old male patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) at the age of 60 years old, via an unspecified route of administration, administered in Arm Left on 10Mar2021 (Lot Number: EL6205) as SINGLE DOSE for COVID-19 immunization. Medical history included high blood pressure, mouth started to feel numb and allergies to tree pollen; and family history of diabetic and heart disease (father); all from an unknown date and unknown if ongoing. Concomitant medication included losartan potassium (TEMISARTAN), gabapentin, escitalopram oxalate (LEXAPRO), furosemide, potassium, valproate semisodium (DIVALPROEX) and tizanidine; all taken for an unspecified indication from an unspecified start date and ongoing. The patient received the first dose of BNT162B2. The next day, he said his mouth started to feel numb, and he had a loss of taste. Then on Saturday, his eyes started to tear a lot, and the right side of his face started drooping like that of a stroke. He also said he had headache on the back of his head, and his eyes do not. The patient wanted to know if he should go to the emergency room or if this is a normal reaction to the vaccine. The patient did have a sensation starting on Thursday of numbness in his mouth. The patient describes it as a feeling like when he was younger and would use chloraseptic spray, it feels like same numbness. He states that on Saturday his eyes started tearing up, and he does have allergies to tree pollen. The right side of his face feels and looks like he had a stroke, it is droopy on right side. The patient can't pronounce words right, can't smile, and can't close his right eye. The patient was checked with heart rate and EKG with his little machine and his temperature, and they all seem fine. The patient was also getting headaches at the back of his head. The patient took Advil for headaches, but it is not improving. The patient ran out of the Advil and doesn't have the bottle anymore. The patient took allergy

The patient underwent lab tests and procedures which included body temperature: fine, CAT: not reported, EKG: fine, complete blood work: not reported and heart rate: fine; all on 15Mar2021. The outcome of loss of taste was unknown. The outcome of the rest of the events was not recovered. Information on the lot/batch number has been requested.</p> <p>When she passed out; feeling real dizzy; since her leg and knee feel bruised; right eye was swollen; felt unwell; weak; This is a spontaneous report from a contactable consumer (patient) reported that a 59-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 13Mar2021 as a single dose (at the age of 59-years-old) for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. It was reported that the patient got the Pfizer-BioNTech COVID-19 Vaccine first dose on Saturday, 13Mar2021, and was fine after the shot but had a reaction on Sunday, 14Mar2021. On 14Mar2021, she got up to make breakfast and started feeling real dizzy and the next thing she knew, she was on the floor; this happened twice. When she passed out, she must have hit something on her right side, since her leg and knee feel bruised and right eye was swollen. She felt unwell, dizzy and weak; no dizziness today (15Mar2021). She planned to discuss further with her physician. The outcome of the event dizziness was recovered on 15Mar2021 and unknown for the rest of the events. Information on the lot/batch number has been requested.</p>

1150321	3/31/2021	MD	78	F	1/19/2021		Swelling on her right ear; Symptoms of the flu/side effects like the flu; Diarrhea/bad diarrhea; Urinating like crazy/had to urinate non-stop; Sick; Swelling on her right eyelid; Pain down her neck; Everything was swollen, her one eyelid and the outside of her ear then down her neck on the right side; This is a spontaneous report from a contactable consumer (patient). A 78-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number: EL1283, Expiry date: unknown) via an unspecified route of administration, administered in Right Arm on 19Jan2021 (at the age of 78-years-old) at a single dose for covid-19 immunisation. Medical history included mastectomy (she had a mastectomy before, so she has no lymph nodes, she doesn't let them touch her left arm. She says this was done 26 years ago when she was 52), arthritis (she has bad arthritis in her back), Blood pressure high (she takes a high blood pressure medication), High cholesterol (she takes a high cholesterol medication) and eye surgeries (she has had all kinds of eye surgeries before this). The patient's concomitant medications were not reported. The patient experienced swelling on her right ear, symptoms of the flu/side effects like the flu, diarrhea/bad diarrhea, urinating like crazy/had to urinate non-stop, sick, swelling on her right eyelid, pain down her neck, everything was swollen, her one eyelid and the outside of her ear then down her neck on the right side on an unspecified date in 2021. The patient stated that she had a lot of side effects and she talked to her doctor who said to go ahead and get the second dose. She says she had no fever, but had all the rest of the side effects, such as swelling of her neck, ear, and eye, which all went away fast. She says she was sick almost 4 days, and her doctor said side effects shouldn't last that long, so she called to get advice about whether to get second shot or not. She says her appointment for her second shot is the 09Feb2021, she would like to know if it is safe for her to get. She says her side effects started in the evening, the swelling of her right ear didn't last, it went away. She says during the night she woke up and had to urinate non-stop that started that night a day later. She says that lasted the next day, then the day after, until Saturday she felt better. She says she had all side effects like the flu, then later bad diarrhea too. She says she finally took something for

							diarrhea (no further information provided about this) and took Tylenol. she doesn't see the expiration on that bottle, she thinks it is good for 2021. She says that she doesn't see too good. She clarifies that they Tylenol she had took before, with no issues, and her not seeing too good had nothing do with the vaccine, she has had all kinds of eye surgeries before this. She says her right ear was swollen, everything was swollen, her one eyelid and the outside of her ear then down her neck on the right side. She says that the pain started about a day later Pfizer COVID-19 vaccine. Caller says that she called her doctor today, that was the first time she did that, she was trying to wait and see, and her doctor said normally side effects don't last that long, so he has her worried. She says if she does not take the vaccine she will not be protected, but if she does, she may have worse side effects. Therapeutic measures were taken as a result of diarrhea/bad diarrhea. The patient recovered from the event swelling on her right ear on an unspecified date in 2021, outcome of the event Urinating like crazy/had to urinate non-stop was recovering, while outcome of other events was unknown.

3/16/2021

3/17/2021 I had my Pfizer vaccine on March 16, 2021. On March 17th I had a headache, body aches and fatigue which I expected since I had Covid in November 2020. Most of these symptoms only lasted 3 days. After the 3 days I had a continuing headache and started having jaw pain. On March 22nd I started having dizziness and a severe headache with jaw pain, fatigue and nausea. On March 23rd I got up abruptly and felt extremely dizzy and almost passed out. I am having continued sporadic headaches, nausea, dizziness behind my eyes with fatigue and a metal taste in my mouth especially when my mouth is dry. As of March 30th, only side effects lingering are dizziness behind my eyes and nausea

1149750	3/31/2021	PA	67	F	3/23/2021	3/24/2021	Events: itching over the entire body, a rash, not raised, shingles came out after 2-3 days. Vision is blurring Treatment : went to PCP, could not take anything because she has had reactions to vaccines in the past, did take antihistamine for itching, which helped. She still has some itching, but it does not seem to be getting worst.
1149693	3/31/2021	TN	39	F	3/29/2021	3/29/2021	Day of Shot #1: PM: Started to feel extremely dizzy then got really tired. I could not keep my eyes open at this point. Came on really strong; was feeling fine one minute to the next minute not. Next Day of Shot #1: Extremely tired and sleepy - had a hard time staying awake. Pain in arm where injection was administered, and underneath in armpit area. Pain also rode all the way down arm and into hand. Arm felt heavy to move and just hurt. Afternoon of next day after shot I started to get a really bad headache. Felt like sinus but not. Not really a headache I've had before. PM of next day after shot: Really tired still lingered and I just felt sick at that point. Like a was coming down with something or my body was fighting was felt similar to the flu. Day #2 after shot: Woke up feeling ok (not as much pain in arm) and not nearly as tired or sleepy. Still have headache lingering.

1150380	3/31/2021	FL	82	F	3/1/2021	3/8/2021	overwhelming feeling of dizziness/she felt the sudden urge to faint and then became so dizzy that she had to lie down on the couch; very weak; very tired; she has slept a lot; she felt the sudden urge to faint; unable to visually focus, if she closed her eyes and she opened one eye it would be blurry and the people on TV were sliding off the screen and everything was sliding away; pain behind her left eye into her head; she tried to get up to go to the bathroom the room was spinning; an inner ear problem or problems with the "crystals in her ear"; When she got up, she couldn't put her two feet on the floor out of bed without leaning towards the left; This is a spontaneous report from a contactable consumer (patient). An 82-years-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot Number: EN6200) via an unspecified route of administration, administered in Arm Left on 01Mar2021 11:00 as SINGLE DOSE for covid-19 immunisation, at 82 years old. Medical history included history of a stroke from an unknown date (previous history of a stroke 19 months ago). There were no concomitant medications. The patient previously received BNT162B2(Lot# EW5318) on 07Feb2021, at 82 years old for COVID-19 immunization and experienced no adverse event (no reaction). Other historical vaccine included Flu shot (influenza vaccine) on an unspecified date and experienced almost killed her. The patient reported no reaction and no problems (no pain, no nausea, no anything) from the second dose until the evening of 08Mar2021 when she was in her kitchen cooking and chopping vegetables, she felt the sudden urge to faint and then became so dizzy that she had to lie down on the couch. She had an overwhelming feeling of dizziness. A feeling like she wanted to faint, and she never faints. Her daughter got her to the sofa. She couldn't get off the couch. The room spun unbelievably. Everything spun. She went to bed and when she woke up, she felt worse. She states that the dizziness was worse, she was unable to visually focus, if she closed her eyes and she opened one eye it would be blurry and the people on TV were sliding off the screen and everything was sliding away, and she had pain behind her left eye into her head. When she tried to get up to go to the bathroom the room was spinning. It lasted through the next day (09Mar2021). When she got up, she couldn't put

VAERS\_ID RECVD STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

her two feet on the floor out of bed without leaning towards the left. She didn't fall. It was so bad she had to grab onto things to walk. During that day they brought her downstairs and she stayed on the sofa and it just got worse. Her daughter had her call her primary care doctor and he said that if her neurologist had heard any of what had happened, then go to the emergency room, to which is where she was 19 months ago with her stroke. She spent the 11Mar2021 and 12Mar2021 in hospital (due to dizziness). They couldn't find anything. She had not had a new stroke. She had every test known to man. They did a full neurological work up including an MRI, CT Scan, carotid artery studies and checked everything and could not find the cause of her extreme dizziness. They did confirm that she did not have a stroke. The told her that she could potentially have an inner ear problem or problems with the "crystals in her ear" which could be causing her dizziness, however, they could not positively identify the cause of her problem. They found evidence of her previous stroke. When they were sending her home, it says on her discharge paperwork, they were going to put her in a vestibular clinic. It has to do with crystals in her ear. She was still dizzy and still walking with a walker which she hasn't had to use in 19 months since her stroke. And she has slept a lot, the night she was discharged on 12Mar2021 and the following day. On 14Mar2021 she woke up a little bit. But on 15Mar2021, she is very tired and very weak and still very dizzy. The dizziness is not the room revolving kind. She is taking an anti dizzy pill. She has to see her doctor tomorrow morning, her neurologist at hospital. The dizziness is still persisting but not as bad and she can jump up and walk and do things with the walker. Regarding tests done at the hospital, she came out with shining colors apparently. All tests came through fine. There was no evidence of stroke, her blood pressure, triglycerides, fluids or liquids, everything tested perfect. When querying if she had gone to her physician's office, she reported she had a morning call with her doctor on a phone appointment and he sent her straight to the hospital. She is still dizzy and walking with a walker which she has not had to use in 19 months. She states that doing a lot of hand-eye coordination exercises at home. She has the television on to check her vision which seems to be returning to normal. She stated, "I just don't know where

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							to go from here." She stated that she has a follow up appointment the following day with her neurologist. She wanted to know if this side effect has been reported and how long she can expect to feel this way. The patient underwent lab tests and procedures on Mar2021 which included blood pressure, triglyceride, fluids or liquids: tested perfect; and CAT scan, EKG had unknown results. On 11Mar2021, CT Scan: unknown results (could not find the cause of her extreme dizziness. They did confirm that she did not have a stroke/they could not positively identify the cause of her problem); MRI: unknown results (could not find the cause of her extreme dizziness. They did confirm that she did not have a stroke/they could not positively identify the cause of her problem). Therapeutic measures were taken as a result of overwhelming feeling of dizziness and unable to visually focus. Outcome of the event dizziness was not recovered; outcome of the event unable to visually focus (visual disturbance) was recovered on an unspecified date in Mar2021; while room was spinning (spinning sensation) was recovered on 09Mar2021, while unknown for the other events.
1150056	3/31/2021	ME	53	F	1/27/2021	1/28/2021	2 days after first injection developed rash on face, over eyes and nose. After 2 injection developed rash on face near nose, and top lip swollen couple hours after injection. Also developed rash in left armpit and what looks like pimples under armpit and on my side, almost 2weeks later. Still have that rash as of today.
1153416	3/31/2021	AZ	38	F	3/29/2021	3/29/2021	My arm felt as if I could feel the vaccine moving down it, then began to tingle. My vision went weird for a few minutes and I felt light headed and as if my whole body was vibrating/buzzing a bit. It's hard to describe, but I knew something wasn't right. I spoke with a nurse on site who suspected I had a vasovagal reaction to the vaccine. I had to wait 40 minutes before I felt okay enough to leave the site. I continued to feel off for the rest of the night, along with extreme fatigue and soreness in my arm, neck and back. The day after the vaccine I still had extreme fatigue, muscle soreness, was nauseous, with hot flashes and chills throughout the day. Currently on day 2 past the vaccine and still have fatigue and muscle soreness. The other symptoms seem to have improved some. I have not been able to sleep much that last 2 nights either.

1154308	3/31/2021	MT	62	F	3/4/2021	3/4/2021	Shot @ 250pm; couldn't even Tell she'd poked me! Mentioned Dr reiterating advice re tylenol and ibuprofen; that I take Both, ibuprofen due @ 3pm. 2 nurses said should be okay since I'm used to it. Advice is re prophylactic use against side effects. ~ Left @ 305p (15min watch for allergic reaction) Left grocery @ 345pm, headed north to pick up dinner Almost immediately, it felt like I'd been hit in the left eye with a baseball bat (cheekbone & eye socket); REALLY Intense 'migraine', left side only. Took back road to dinner, finally subsided to an odd ache. Called clinic as soon as I parked. Checked w nurse - it IS a side effect. "Don't take any ibuprofen." I'd taken mine @ 305pm with my Gaba. Don't take any more. Tylenol is okay. Recording this, it is now 5:55pm, and ache has migrated to center forehead; also experiencing facial numbness, left side & lips. ARGH! 607pm, now into the right side of forehead, somewhat into the temple. Oh! At the left lower back of the skull, near lymph node. Man! This thing just keeps bouncing around! 620pm back at the left cheekbone & eye socket Oh! I Did take my temp shortly after getting home, 97.6° - my norm ?? Slept well, thru the night. Left arm pain when I rolled, so Nope. Called clinic to ask about advil, Can resume taking as usual. Per nurse. Fri evening, sat w chin in hand; pain in left jawbone along the bottom. That passed/eased at least. Then, have 'pain to touch' at base of skull. (Was rubbing neck) ~ as of Wed 3.31, haven't experienced any more 'vac migraines' for a while. Did have some (approx 5) intermittently for abt two weeks after. ~ also experienced extreme fatigue/exhaustion 1st 60 - 72 hours before back to my norm.

1153515	3/31/2021		86	F		2/1/2021	<p>had worsening vision loss in her eye; had worsening vision loss in her eye; This is a spontaneous report from a contactable consumer (patient) based on the information received by Pfizer. An 86-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number unknown) dose 2 via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as single dose for covid-19 immunisation; pyrimethamine (Tablet, Lot Number: AM0737A; Expiration Date: 31Jul2022) via an unspecified route of administration from an unspecified date and ongoing at 25 mg once daily for toxoplasmosis retinitis. Medical history included toxoplasmosis retinitis (eye infection toxoplasma), vision loss (Blindness), and an allergy to sulfa medications. Concomitant products were not reported. On an unspecified date, the patient had a second dose of the Covid vaccine. On an unspecified date in Feb2021 (over the last month of 01Mar2021), after starting the products, the patient had worsening vision loss (visual impairment) in her eye within one month of receipt of the second dose of the COVID-19 vaccine. The patient felt the only thing that was new was she had just received the second dose of the Covid vaccine. As of 01Mar2021, the statuses of treatment with pyrimethamine and the worsening of vision loss in her eye were ongoing. An association with pyrimethamine cannot be ruled out. However, the event is confounded by toxoplasmosis retinitis, vision loss, and receipt of the COVID-19 vaccine, which the reporter notes was the only new occurrence. The action taken in response to the events for pyrimethamine was dose not changed. Therapeutic measures were taken as a result of had worsening vision loss in her eye. The outcome of the events was unknown. The reported was considered as other serious (important medical events). No follow-up attempts are needed; information about lot/batch number cannot be obtained.</p>

----------	-------	-------	---------	-----	----------	------------	--------------

horrible headache, bodyaches, dry heaves recovered on 26Feb2021, and was unknown for the rest events. Reported as: Caller states that on 04Feb2021 she received her 2nd vaccine at around 3:30 pm, and then around 10 pm she had injection site soreness. The morning after the second injection around 4 am, she had site on her arm soreness, erratic body temperature with slight fever, horrible headache, bodyaches, and dry heaves. Her lymph nodes also swelled up again. Caller clarifies that this also happened after her first injection of the Pfizer Covid19 vaccine and on a similar timeline. Caller clarifies that 2 weeks later on 26Feb2021 she had ended up with horrible headache, dry heaves, headache, body temperature 104.4. She states that this lasted Friday night and Saturday night and Sunday she was feeling better. Clarifies that was the week of 26Feb2021. Caller states that her events were on a similar timeline and that her first vaccine was 14Jan2021 at 3:30 pm on Thursday. States that by 10 o'clock that night, injection site was sore. At 4 am, injection site was very sore. A couple of days later, her lymph nodes were swollen in her left leg, groin area, right arm under armpit. Adds that area under armpit was the size of her thumb. Also, on the left underneath her chest wall. She states that she has had breast cancer in that left breast. She states that the swelling went away completely, but that the groin area swelling took 2 weeks to go away. Unable to verbalize exact dates. Confirms that this was after the first vaccine and also occurred after the second vaccine. Caller then adds that she was feeling better Sunday, 28Feb2021 but that her husband then found her on the floor Sunday night at 8:45 pm. She states that she passed out. Monday she passed out again and was taken to the hospital where she stayed until 02MAR2021. Healthcare Provider also provides information that her son ran her to emergency room, and she is not familiar with the doctors there. Also, a doctor that she does not remember the third physician but it was a neurologist. Caller states that she was 155 lbs before when she was in the hospital - and now 160 lbs. States that she was dehydrated in hospital and did not eat a thing. Normally she runs around 160 lbs. States she had breast cancer so left arm cannot be used, so they used her right arm for both vaccines. caller adds that she had a cruise she was going to go on but refused to go on in 2020. States that

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

she heard you will need to have a vaccination passport to travel in the future so she wanted to get vaccine. States she did not want to get covid. States that so many people have died. Caller clarifies that she was admitted to (Hospital Name) on 01Mar2021. Caller adds that she went to the hospital 2 weeks after the second dose. She states that is what makes them wonder if it is from the Covid vaccine. Adds that she is not saying that is what caused all of this, but that it is just a coincidence that it was exactly 2 weeks after the vaccine, exactly 2 weeks out when this happened. She states that she has been thinking if she should be wasting Pfizers time reporting this but it could be a coincidence or maybe a reaction. Caller adds maybe it is because she had 34 radiations, 8 chemo treatments, 1 year of Herceptine, and breast cancer. States that maybe she can save somebody else, or if a possibility, people can be prepared two weeks early. She adds that she is lucky she did not break an arm, leg, or bone. States that she doesn't know if maybe she can save some other person by sharing this information. Injection site sore: States that this was after both first and second vaccine. It stayed sore for about a week, and was just tender after that. If she touched it, she noticed, but it didn't hurt her from doing anything. With the first vaccine, injection site soreness started 14Jan2021 around 10 pm and completely resolved after about a week. She adds that with the second vaccine she also noticed injection site soreness that same day on 04Feb2021 around 10 pm also. She adds that it lasted about six days or seven days or so. It was the same way, tender the first day and then at 4 am was when it got really bad. That Friday 05Feb2021 was when it hurt worse. Adds that she went into hospital on 01Mar2021 on Monday. States she was feeling okay, stayed dizzy and confused and thought she was getting Alzheimer's or dementia but it cleared. At 11 pm on Sunday felt completely different, like the old her. States she was fine yesterday 15Mar2021. She had felt disoriented but is now feeling better and back to normal. Erratic Body Temperature: States that she started watching and recording her body temperature on 09Mar2021. She states that it was 104.5 on Friday, and Saturday and Sunday night she used a wet washcloth to her forehead. States that her body temperature initially was variable starting on 26Feb2021. She adds that it continued until

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

Sunday 28Feb2021. On 26Feb2021, her body temperature was 104.5. She states that it was then low on Sunday 28Feb2021 and was 98 or 99. Adds that it had been erratic but that once the fever broke it has been between her normal which is 98.6 to 98.7. Adds that her and her husband know for sure that when she passed out the three times, her temperature was 94.4. States that her husband gave her aspirin for the temperature. Adds that her temperature has been between 97.9 to 94.9 and dropped to its lowest on Saturday 13Mar2021 at 10:35 am. She states that it is still doing this erratic behavior and that this morning it was 96 at 1 am and then 96.8 at 8 am. While on phone today, it is 97.1. Lymph nodes swollen: States noticed swelling at 4 AM 16Jan2021. States this occurred 4 am after both first and second injection. Occurred to groin area, right arm, and left arm. It was there for a couple of days and then it would just remind her it was there. The arm lymph node swelling went away after a few days, maybe before a week or so. The one in the groin was there for about two weeks. On a scale of 1 to 10, it was a 1.5 and was not something that people need to take an Advil or something for. Clarifies it was in the armpit except in the left side because they took those lymph nodes out during surgery in 2008. Also, she noticed lymph node swelling in the chest area. Lymph Nodes at second vaccine she also noticed them starting at about 4 am after the vaccine and it started hurting again. Caller reiterates both shots were given at 3:30 pm and then at 10 pm injection site gets sore. Then 4 am injection site gets more sore. She's been telling everybody to get the vaccine in the morning. Her symptoms lasted two weeks and then she was fine. Caller adds that her husband never felt a thing from receiving the vaccine. She states that the injection site was tender on her husband but gone the next day. Investigations: stated they looked at her in the hospital and said she was fine. The girl came back up and did more cultures and nothing grew. They were confused and so was she and she has been debating whether to call and waste time reporting but thinks that Pfizer needs to know what happened to her. Simvastatin: Adds that asked doctor if this caused her symptoms and he said no. Phillips colon: doctor 6 to 9 months later did scan, the next day was in emergency surgery and it was her appendix. It enlarged and had grown into the other

organs. Doctor said it was a mess and it was ready to rupture as a precaution they wanted to remove it. Bayer product Code above expiration date states 0C09C and expiration is Mar2023. Thumb pink: thumb nail to finger print past where you bend it was where she noticed it was pink. States it is now 98% better. Friday 26Feb2021 afternoon at 1 pm, right thumb turned pink. She took a pen and marked where it was vertical and horizontally pink to scarlet in color. She put herself on antibiotics. She was not sure if maybe she cutting chicken and cut it, or closed finger in drawer. It swelled up twice the size, turned purple. Went all around the finger and it was hot. She thought it was going to pop off. She kept wondering what she was going to do to her thumb. She did jam it and cut herself 2 months ago. Clarifies it was right hand thumb. Treatment: took antibiotics, which she states they kept her on in the hospital in IV form. She started the antibiotics on Friday 26Feb2021. Took it Friday afternoon, Friday night, and Saturday and Sunday. She thought it was doing better Sunday night before she passed out. Clarifies Cephalexin, 500 mg daily (Keppra) three times a day and by mouth. Adds that she keeps this medication on her because she travels the world and it is good to have on hand since it is broad-spectrum. Passing out: 28Feb2021 Sunday night noticed the volume on television was driving her crazy and it was irritating. Around a quarter to 9 she got up to brush her teeth and go to the bathroom. She went pee and then fell off toilet. She got really really dizzy, and her husband was standing over her yelling asking what happened. She saw the wall and she did not know what happened. States she was out cold and he was calling her name but she did not hear him. She heard him asking what happened but it was in the distance. He got her to bed and about 20 minutes later (husband reports 30 minutes later) she was so dizzy and passed out again. She adds that this may have happened Saturday also because she was sleeping a lot and it was like she was seeing words repeat themselves over and over again and her vision would get very narrow. Her husband was not sure if she passed out on Saturday also, but said both times Sunday she was out cold. Monday 01Mar2021 she called her husband's office and woke up to the nurse on the other line screaming. She dropped the phone and heard her name being screamed over and over on the phone and

VAERS\_ID RECVDDATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

when she picked it up the nurse said that she must have passed out even though she thought she was sleeping. The nurse got ahold of her husband in his office. She believes she passed out again Monday morning and was then in the hospital Monday and Tuesday.

Hospitalization: On 01Mar2021, her husband is a physician and suggested she go to the hospital. She was trying to get ahold of her son and daughter in law. She sent them a text and called and they did not answer. Her sons phone was charging and when he looked at it he was on his way to her. She states that when she came to all three times, she was extremely dizzy foggy and confused. Adds that the nurse at her husband's office alerted her husband and he told her to stay in bed and her son came to help her and then drove her to ER. States she was there Monday 01Mar2021, and discharged Tuesday night 02Mar2021 about 4:30 to 6 pm. Caller does not want to file a report for her husband regarding the injection site soreness. She states it was like the flu shot. She clarifies that it was not his arm, it was the injection side. She states that these people who are going on and on about their arm hurting, it is the injection site. She states it is the injection site and will not be the arm. States that it is like the flu shot. States she does not want to file a report regarding her husband because it was injection site soreness and went away. Provides no additional information. Adds that this is a new drug and new disease and we do not know what the future holds Caller adds that she keeps a diary and started a diary so that she has everything recorded in terms of medical history. States that it is important that everybody do so. Family Medical History Relevant to AE(s): callers dad passed out at age 85. He found out he was diabetic and had heart issues. Also had a stroke at age 87 and passed away. Adds that between ages 85 and 87 he passed out every few months, he would do one of his passing out things. Caller also had a brother who passed out sitting at table and went forward into table. She states at that time her brother didn't realize he had stage 4 lung cancer, and her brother passed away 1 and a half years later. Caller adds that he smoked from ages 15 to 64, and quit at age 63 because the doctor told him to. No follow-up attempts possible. No further information expected.

1153492	3/31/2021	MI	73	M	3/3/2021	3/6/2021	body heated up from stomach to brain, vision went gray, and legs gave out; body heated up from stomach to brain, vision went gray, and legs gave out; body heated up from stomach to brain, vision went gray, and legs gave out; thighs ached; This is a spontaneous report from a contactable consumer (patient). A 73-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot and expiry were not reported), via an unspecified route of administration in left arm on 03Mar2021 14:55 (at the age of 73 -years-old) as single dose for covid-19 immunisation. The vaccination facility type was a clinic and the vaccine was not administered at a military facility. There were no vaccines administered on same date of the Pfizer suspect. The patient had no medical history, no family history and no concomitant medications. The patient got the first dose of the Pfizer vaccine on 03Mar2021, states it went well for a couple of days and on the 3rd day (06Mar2021) his thighs really ached really bad, that lasted 2 days and cleared up. On Saturday night (13Mar2021) he went to his grandsons soccer game, all of a sudden it was like his body heated up, from stomach to brain and could not see anything, vision was gray and black, and then legs started to give out. The episode lasted about 15 minutes, he did not pass out, the same thing happened again yesterday. The patient talked to the family physician and heart doctor office, they told him to call and report the event. The events did not require emergency room visit. The outcome was recovered on 08Mar2021 for pain in extremity and on 14Mar2021 for diplegia, body temperature increased and chromatopsia. Information on the lot/batch number has been requested.

1153479	3/31/2021	CA	70	F	3/10/2021		<p>This is a spontaneous report from a contactable consumer (patient) received from a Pfizer-sponsored program. A 70-years-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE: Solution for injection, Batch/Lot Number: EN6204), via an unspecified route of administration, administered in Arm Left on 10Mar2021 as single dose for COVID-19 immunization. Medical history included blood pressure abnormal from an unknown date and unknown if ongoing, surgery from 22Sep2020 to an unknown date (I had surgery on 22Sep), ongoing deafness (so actually loss of hearing 2 days before I got my second vaccine/five days later she woke up in the night and could not hear). Historical vaccine included at the age of 70 years patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE: Solution for injection, Batch/Lot Number: unknown), via an unspecified route of administration, on 17Feb2021 as single dose for COVID-19 immunization cause severe sores in my mouth, possibly have shingles or shingles in my mouth and it appears to be canker sore and shingles vaccine. Concomitant medication included Irbesartan 75 mg, orally for blood pressure abnormal. On an unspecified date, the patient reported I had loss of hearing in my ear, in my right ear, sores in her mouth. Reporter stated, I am, I have called because I got my COVID-19 Vaccine just last Wednesday, my second one and I had loss of hearing in my ear, in my right ear and then middle of night it just went away and went to my doctor and she sent to me eye, nose and throat doctor and Friday after the vaccine, I had to be put on Prednisone and that lower your immune system, so when I talk with the Pharmacist I asked her is that would appear with the shot, I had on Wednesday and she was unable to tell me because she said it was so new, so I was just wondering is that going to affect me on my immunity of the second vaccine, that I had start taking prednisone on Friday after day after I got the vaccine. When paraphrased the above concern, Patient stated, I actually I had my first vaccine on 17Feb and then 5 days after that I got severe sores in my mouth and then I went to my doctor, they call it I could possibly have shingles or shingles in my mouth it appears to be canker sore but I had the shingles vaccine then after I got back 5 days later that's when I woke up, so actually loss of hearing 2</p>

							<p>days before I got my second vaccine and I talk to my doctor and she said, she thought I still go ahead and have the second vaccine but she said she didn't want to put me on the Prednisone because she said that will weaken my immunity but then it didn't get better and she sent me to Ear, Nose and throat he told my if I have any hope to getting my hearing back I had to start this medicine but that's what I am concerned about, so I took it but I was wondering if it interfere all with the second dose of giving me protection. The mouth sore that is improved, the hearing I still dealing with it, like I said I have been taking the medicine the Friday and then this Thursday the doctor said to come in and he is going to do some testing on my ear but it just come on, so it just middle of the midnight, persisting. patient stated, For my ear its like Prednisone. For the first 2 week I am taking 60 mg and then after 3 weeks, I take 2 tablets 40 mg and then the next week I take 10 mg for 2 days. Reporter stated that five days after she got mouth sores diagnosed as oral shingles after the first dose and then five days later she woke up in the night and could not hear. She thinks she has another reaction. This reaction occurred between the first and second dose of the vaccine. Reporter reported that she lost hearing in one ear. Reporter had the second vaccination on Wednesday and put on prednisone on Friday. Reporter was concerned about not having immunity because of taking prednisone so soon after her second dose. The patient underwent lab tests and procedures which included laboratory test: unknown results on Sep2020. Therapeutic measures were taken as a result of i had loss of hearing in my ear, in my right ear. The outcome of event i had loss of hearing in my ear, in my right ear was not recovered while for sores in her mouth was recovering.</p>

1153343	3/31/2021	MI	71	F	2/5/2021	2/19/2021	<p>Eye floaters/ doesn't have eye floaters before but now she does/ now she sees it more and it is pretty much every day; Eye floaters/ doesn't have eye floaters before but now she does/ now she sees it more and it is pretty much every day; did the CRP and it was elevated. C reactive protein- elevated; small bruises; Itching; Difficulty chewing; Joint pain; having difficulty walking; Dry skin; This is a spontaneous report from a contactable physician. A 71-year-old female patient received second dose of bnt162b2 (BNT162B2; batch/Lot Number: EN5318; expiration date not provided), intramuscular on 05Feb2021 as SINGLE DOSE for COVID-19 immunisation. Patient's medical history included ongoing 'Diabetes/High sugar/ Diabetes', lymphoma (reported as in remission now) from 2010 and ongoing, 'General wellbeing' from an unspecified date and unknown if ongoing; eye floaters from an unspecified date and ongoing. Concomitant medications included glipizide from Jan2021 and ongoing for 'High sugar'; metformin from an unspecified date (taking for a long time) and ongoing for 'High sugar/ Diabetes', colecalciferol (VITAMIN D [COLECALCIFEROL]) from an unspecified date (taking for a long time) and ongoing; calcium from an unspecified date (taking for a long time) and ongoing; and cyanocobalamin (VITAMIN B12 [CYANOCOBALAMIN]) from an unspecified date (taking for a long time) and ongoing for 'General wellbeing'. Patient previously took bnt162b2 (BNT162B2; batch/Lot Number: EL1283; expiration date not provided) on 17Jan2021 for COVID-19 immunisation. The patient experienced joint pain and 'having difficulty walking' (both serious, disabling) and dry skin (medically significant) on 19Feb2021; itching, difficulty chewing, and small bruises (all serious, medically significant) on Mar2021; eye floaters on an unspecified date; and 'did the CRP and it was elevated/C reactive protein- elevated' (non-serious) on 08Mar2021. Patient's clinical course is as follows: a physician reporting on behalf of his wife (patient). It was reported that patient received both doses of the COVID-19 vaccine. Reporter stated that they have side effects to report and wanted to find out how common these side effects are and how long they are going to last. Patient received first dose on 17Jan2021 and second on 05Feb2021. It was reported that the patient has been having joint pain starting from 19Feb2021 and it</p>

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

fluctuates from one joint to another so if the patient's shoulder is affected, the joint pain goes to the other side and then to a different joint such as her knee joint. The pain was continuous, and it doesn't disappear. Reporter mentioned that it gets better with medication but it's still not going away. Regarding patient's treatment, it was reported that in the beginning, patient was taking ibuprofen but now the doctor switched it to naproxen (ALEVE) and also added hydrocodone bitartrate and acetaminophen (NORCO). Reporter mentioned that sometimes not only the patient's joints gets affected, patient also experienced difficulty chewing, but it goes away and then comes back. Patient also had dry skin, itching, and sees eye floaters sometimes. Initially, reporter mentioned that patient doesn't have eye floaters before but now she does, then clarified she has seen it before the vaccine, but now she sees it more and it is pretty much every day. Patient also had small bruises. Reporter just wanted to know if someone can tell him if it's related to vaccine and how long this might last. Seriousness criteria for joint was reported that this is disabling as the patient was having difficulty walking, getting up from the bed from the chair, patient has to use a walker to walk and needs help going to bathroom and taking a shower. It was reported that joint pain has definitely affected patient's normal walking. Reporter also mentioned that he was not exactly sure when the dry skin started but it was around the time the joint pain started. Seriousness criteria for dry skin and itching was reported as medically significant because it does bother the patient. Patient was scratching even in her sleep, even though they use the moisturizer and cream. Reporter clarified it was not debilitating but it does bother the patient. Reporter mentioned that difficulty chewing started over the last few days, on Friday or Saturday. It comes and goes, one day patient might have it in the afternoon, but it goes away in the evening. Reporter added that the eye floaters started more in the last one week. They do not know why this is happening, if it was vaccine related or not. The medicines the patient takes shouldn't be causing these, but they don't know if it was the medicine causing it or if it's the vaccine. Causality for was reported as 'didn't have these issues before, thinks it's related, this is for all the events'. It was further reported that the doctor did the CRP and it was elevated

1153319	3/31/2021	CA	70	M	3/11/2021	3/1/2021	blood clot formation that went to my brain; stroke; numbness; paralyzed; vision is messed up; trouble concentrating; This is a spontaneous report from a contactable consumer (patient) . This 70-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot number: unknown, may be EN8199 or EN6199), via an unspecified route of administration on 11Mar2021 at single dose in right arm about 16:00 for COVID-19 immunisation. Medical history included ongoing probably overweight and blood clot about 20 years ago. The patient's concomitant medications were not reported. It was reported that, the patient who was administered the first dose of Pfizer-BioNTech COVID-19 Vaccine on 11Mar2021. He reported on 14Mar2021 he got a blood clot and had a stroke. He asked if he should or should not still get the second dose of the Pfizer-BioNTech COVID-19 Vaccine related to these events. He had in the hospital from 14Mar2021 to 15Mar2021. He was supposed to have an appointment with his Family Care Physician, Doctor next Monday or Tuesday. He had to go to the emergency room because of these events where he was admitted to the hospital from 14Mar2021-15Mar2021 when he was discharged home under family care. They let him go so soon on 15Mar2021 because he insisted on it, if he was just going to be laying in the hospital he could be laying at home. There was not much they could do in the hospital except observe him, monitoring symptoms of when his numbness and the being paralyzed like in the face for improvement, then they figured the clots were clearing up. They put him on an Aspirin and other unknown things to keep events from reoccurring soon after these events. He was still does not feel 100%, his vision was messed up, he has trouble concentrating, vision was blurred sometimes; that was what happened, he knew he had a stroke when his vision went south on him on 14Mar2021. While in the hospital they did everything except no x-rays; he had CT scan, lots of bloodwork and stuff like that. He does not have further information on those tests or results. The seriousness of the events blood clot formation that went to my brain, stroke, numbness and paralysed was reported as serious (hospitalized). The outcome of events was reported as unknown. Information about lot/batch number has been

1153300	3/31/2021	MN	67	F	3/9/2021	3/13/2021	<p>also had a headache; her eyes have been really sore, red and she has several broken blood vessels in her eyes; her platelet levels dropped; having muscle pain or some kind of pain, maybe joint pain that is in her hips; has had nausea and she has generally felt unwell; muscle pain; she slept for almost two days; felt unwell; diarrhea; abdominal pain; her eyes have been really sore, red and she has several broken blood vessels in her eyes; her eyes have been really sore, red and she has several broken blood vessels in her eyes; tiredness; eyes were yellow when she woke up that morning; This is a spontaneous report from a contactable consumer (patient). A 67-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Lot Number: EN6200), first dose via an unspecified route of administration, administered in Arm Left on 09Mar2021 11:45, single dose as SINGLE DOSE for covid-19 immunisation. Medical history included lung transplant from May2011, immunodeficiency from May2011 and ongoing, strokes. The patient had dtap vaccine before Jan2021. Concomitant medications included acetylsalicylic acid (BABY ASPIRIN); prednisone acetate (PREDNISONE); tacrolimus monohydrate (TACROLIMUS). Patient reported that it has been about a week and a half of maybe more since her first COVID vaccine and she gets new symptoms almost everyday. Most of the symptoms aren't like put-you-down sick, horrible symptoms, they can be dealt with, but she has had a lot of them. She never got injection site pain and her arm never got sore. She had tiredness on the second day after her COVID vaccine, she slept for almost two days. She has a headache almost constantly. She is having muscle pain or some kind of pain, maybe joint pain that is in her hips. She doesn't have chills, a fever, injection site swelling or redness. She has had nausea and she has generally felt unwell all the time for a week and a half now. She is immunocompromised because she has had a lung transplant, that is the one thing that probably sets her apart is that she is immunosuppressed. She had the lung transplant almost 10 years ago now and she has been doing well. She is not on blood thinner medicine but she does take a baby aspirin everyday. Those are the only two things that she can think about. She doesn't know if all of that would make the symptoms from the COVID vaccine different for her. Most people</p>

---

she knows who have received the COVID vaccine have only had a couple days of tiredness and a sore arm. But she has a headache, been achy, and she just doesn't feel good. She also had a headache then and slept a lot, she was really tired. Later in the report caller clarified the first dose was actually 09Mar2021. She is not tired right now but she does still have a headache today, it is a pretty good headache. Her tiredness was Sunday and Monday of this week, confirmed to be 14Mar2021 and 15Mar2021. She says that she has recovered completely from the tiredness even though she feels like she could nap right now but she can't since she has a blood draw later. It is like she wakes up and every day she gets new symptoms. She had two symptoms that are not on the sheet of symptoms. The two she experienced are weird. On Saturday, a week and a day after her vaccine, her eyes were yellow when she woke up that morning. Confirmed date to be 13Mar2021. It was only that one day. She thinks that she has recovered completely. Also, her eyes have been really sore, red and she has several broken blood vessels in her eyes. Some of this is normal in the winter for her, but the yellow isn't normal for her. Normally, when she does get the blood vessels in her eyes they will heal in a day or so but the ones now have lasted much longer. They have been much slower to go away. It is not like there is a red spot, but it looks kind of red and kind of weird. The other symptom that is strange is that her platelet levels dropped. She was at 49 before her COVID vaccine and now her platelet level is down to 29. She does have normally very low levels for platelets but they are usually around 50. They have dropped substantially since her COVID vaccine. They dropped from 50 to 33 and then 5 days later her level went to 29. She is getting another platelet level drawn today, confirmed to be 16Mar2021. Her eyes being sore, red, and having broken blood vessels occurred probably a couple of days after she received the COVID vaccine. Specifically, her left eye felt like it had something in but she doesn't believe that it did. She used eye drops. Her eye just felt gritty. This is not like she had pink eye and she didn't wake up with this eye shut. It wasn't pink eye she knows what that is like. Her eyes had broken blood vessels and then they turned yellow then they turned red and have remained red. They are not sore today and she doesn't feel like she has gravel in her eye but the whites

---

of her eyes don't really look clear. She says so far it has improved some but she will see since she wakes up every day and something new has happened, or something different or something has come back again. The good news is that she doesn't have all of these symptoms at the same time. She can't the remember the day pain in hips began but it is ongoing. She noticed this morning that the pain in her hip was not as bad when she had gotten out of bed. That pain has lessened there but the pain went to her head. Nausea and generally not feeling well: Probed for when this began and caller says that it has occurred for several days after she eats dinner, her stomach will be growling loud and that comes along with abdominal pain which doesn't really fit in with muscle or joint pain, she has no muscle there unfortunately she jokingly says. Sometimes this is all accompanied with diarrhea. It is not ongoing as of now, no date provided. She noticed that it comes and goes and sometimes she can eat and she is fine and sometimes she gets really sick feeling. It seems like if she doesn't eat then she doesn't get the symptoms but she knows that she needs to eat. Investigations: Her doctor has been having her do platelet blood tests about every 5 days since she took the COVID vaccine. She does not remember the dates of these tests off of the top of her head. She had a blood draw at the clinic the day before her COVID vaccine and her platelet count was 49 on 08Mar2021. For the result of 29 that was either last Thursday or last Friday, 11Mar2021 or 12Mar2021. Te outcome of the event scleral discoloration was recovered on 13Mar2021, tiredness was recovered on 15Mar2021, headache was not recovered, pain in hip was recovering, other events was unknown.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021299104 similar report from same reporter

1153258	3/31/2021	FL	63	F	3/5/2021	3/5/2021	really bad headache, excruciating headache; nauseous, nausea/queasy; blurred vision; holes in her vision; not right; like an allergic reaction; She had soreness in the arm; This is a spontaneous report from a contactable consumer (patient). A 63-year-old female patient received the first dose of bnt162b2, via an unspecified route of administration, administered in Arm Left on 05Mar2021 16:32 (Lot Number: EN6198; Expiration Date: 30Jun2021) as single dose for covid-19 immunisation. Medical history included allergies to Sulfa drugs, Penicillin, and believes she has allergies to Ploymers (She cannot wear polyester and she has to wear 100% cotton). The patient's concomitant medications were not reported. The patient (at the age of 62-year-old) previously received the second dose of Shingles Vaccine in Jan2021 for immunization. The patient experienced really bad headache, excruciating headache on 09Mar2021 21:00, nauseous, nausea/queasy on 09Mar2021, she had soreness in the arm on 05Mar2021, blurred vision on 09Mar2021, holes in her vision on 09Mar2021, not right on 09Mar2021, like an allergic reaction on 09Mar2021. She developed a "really bad headache" around 9pm on Tuesday 09Mar2021, that caused holes in her vision and pain "straight across my forehead". She did treat with Tylenol and was able to finally sleep around 5am. She states that the headache has persisted, and she's felt "nauseous, queasy, and not right" since the headache started. She is hesitant to get the second dose. She was experiencing headache following. She mentioned she is allergic to sulfa drugs, penicillin, and polymers, and thought maybe the headache was a result of an allergy to the vaccine? Ingredients don't appear to have any of her reported allergens. She had soreness in the arm the first 48 hours, which was to be expected and no big deal for her. However, starting on Tuesday, she had an excruciating headache. She normally does not typically get headaches. She believes in vaccinations and as a teacher the minute she could sign up to get one she did. Now she is terrified to get the second one. When this excruciating headache began she woke her husband up to tell what happened. She thought she was going to die, that is how bad it was and she wanted him to be aware and prepared if anything should happen. The excruciating headache started at 9PM. It was

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

excruciating all night. The headache made her queasy because she hurt so bad. It continued into Wednesday. Today and today the pain is duller in her head, much duller than it was. However, she still feels queasy/nauseous. The headache also started with blurred vision. The blurred vision has gone away. It was like there were holes in the TV. She was thinking it was interesting and did not think much of it at first. She thought one of her contacts had a hole in it, but she did not even have any on. The blurred vision lasted 24 hours. The soreness in arm lasted until Sunday or Monday. She confirmed the pain in arm is gone and was gone by Monday. She initially could not wait to get her shot. Now she is terrified to get the second one. She took Tylenol in the middle of the night on Tuesday and Wednesday for the headache. Has allergies to Sulfa drugs, Penicillin, and believes she has allergies to Polymers. She cannot wear polyester. She has to wear 100% cotton. She is questioning if the vaccine has polymers in it. From what she heard it does and is wondering if this caused her to have like an allergic reaction. The outcome of the event vaccination site pain was recovered in Mar2021, the events Nauseous and headache was not recovered, other events was unknown.

A 72-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EN6200) via an unspecified route of administration, administered in the left arm on 01Mar2021 (at the age of 72 years old) at a single dose for COVID-19 immunization. Vaccination was done in a baseball stadium. Vaccine was administered not administered military facility but firefighters and military were the ones giving the vaccine. Medical history included headaches from an unknown date and unknown if ongoing, ongoing cholesterol, ongoing seasonal allergies, ongoing sinus gets stopped up and high blood pressure and severe migraines (gets a shot every three months both from an unknown date and unknown if ongoing. Concomitant medications included cetirizine hydrochloride (ZYRTEC) taken for seasonal allergy and sinus gets stopped up/helps sinuses from Feb2021 and ongoing; lisinopril taken for high blood pressure and atorvastatin taken for cholesterol, both from an unspecified start date and ongoing. It was reported that the patient started taking lisinopril and atorvastatin years ago in her 50s. The patient experienced severe headaches, ringing and "thump thump thump" in her head comes back, blood pressure goes up, chilly, had some sniffles and vision and her blood pressure and everything went up on 02Mar2021, and feeling dizzy like going to pass out, like I'm going crazy, like I'm losing my mind and it is hard for her to sleep on an unspecified date. It was reported that the patient experienced severe headaches she's having was normal after receiving the Pfizer BioNTech COVID-19 vaccine on 01Mar2021 at around 13:00 or 14:00, appointment was between 13:00 and 15:00. She has had these headaches before but these were different since she had her vaccine. The patient stated severely when asked if she still has headaches. She sometimes takes a break from having the headaches, and she writes down medications she takes. Then, headaches will come back.

It was not a long break, stated that the ringing and "thump thump thump" in her head comes back. She received her first dose and felt fine afterwards, had no side effects; and waited at the facility for 15 minutes. She left and got something to eat and came home after 4-5 hours. However, on the following Tuesday and Wednesday, the headaches started rolling in and have not stopped since. When she takes something for the headaches, her blood pressure goes up. She was feeling dizzy like she was going to pass out and like she was going crazy, like she was losing her mind. She has tried taking Tylenol and Ibuprofen but it seemed to aggravate it and says everything she takes make it worse. It was also reported that it was hard for her to sleep. She was concerned if she was in any kind of danger with these headaches and would like to know if there was any other medications she can take for it. It was also reported that on the second day, she was kind of chilly and had some sniffles and took a Zyrtec and said that her vision and her blood pressure and everything went up. She said that it seemed like if she takes a Tylenol or anything her blood pressure goes up. Her blood pressure only goes up if she takes something, she gets rush so bad and that blood pressure goes so high. When she feels this, she takes her blood pressure medication. She said that she thought maybe her headache would go away but has not gone away and she had another bad attack of a headache today and she took one of her medicines for headache, Butal-acet-caff 50-325-40 mg which did not make it worse. Also, tried Tylenol and Ibuprofen. She was trying everything all week but scared to take anything else because it brings a rush and feels like she's going to have a blackout. Took Tylenol at 10 o'clock last night, it seemed like she went crazy and it drove her nuts so she went and got high blood pressure medication so she could lay down. Took three Tylenol. She stated that somebody told her to take three, and that it was the worst mistake she made. Stated extra strength Tylenol. She wanted to know what advise she can get, with the virus going on she did not want to go to the emergency room. She also would like to know if it was recommended that she take the second dose of BNT162B2 vaccine following these severe headaches that she was experiencing after receiving her first dose. The patient underwent lab tests and procedures which included

1154665	3/31/2021	IN	31	M	3/31/2021	3/31/2021	I gave him his shot and he was a bit nervous about it. He went directly to the waiting room afterwards. About a minute later he started hollering for us. We went over to him and he said he was dizzy and his eyes were blacking out. I took his BP. It was 88/64. He said he had not eaten so we got him some fruit juice and crackers. He said he was feeling better so I took his BP again. It was 130/94. He waited a few more minutes and then went home. This happened over a period of 15 min.
1154857	3/31/2021	CA	23	F	3/29/2021	3/29/2021	One hour after administration, body aches, fever, eye irritation, felt anxious, 5 hours later fatigue; presents to ER 2 days later due to eye irritation
1154834	3/31/2021	WI	21	F	3/22/2021	3/23/2021	Extreme blurred vision, light sensitivity, and eye pain the next day. Eye muscles were inflamed and pupils had delay in reaction to light. Have to wear sunglasses even inside due to light sensitivity, otherwise I get very nauseous. Has lasted over a week and have had to see ophthalmologist twice. Got steroid eye drops to take 4 times a day for 2 weeks.
1154821	3/31/2021	CA	21	F	3/31/2021	3/31/2021	C/O body aches, dizziness, palpitations, dizziness, nausea, chills, blurred vision, & SOB. Up in chair with legs elevated. BP 129/90, pulse 71, & O2 sat is 97% on RA. Stayed for additional Observation & consumed water. Symptoms subsided prior to discharge, Awake, Alert, & oriented. Encouraged to go to ER, Urgent Care, or F/U with primary physician. Verbalized understanding.
1154811	3/31/2021	UT	41	F	3/31/2021	3/31/2021	Upon injection it felt like heat entering my body. No less than 10 seconds after the shot my chest started to feel hot and my heart started to flutter before beating very rapidly. I was breathing very rapidly in response. People nearby were telling me that my face was very flushed and bright red. All of this subsided after a few minutes but the experience of this reaction felt significant. It felt like my heart was going to seize. During the reaction the pharmacists looked at me for an allergic reaction, checked my blood pressure, and oxygen level. Blood pressure was elevated but normal. Oxygen was normal and they could visually see any signs of an allergic reaction. They had me wait at the pharmacy for 30 mins for monitoring before I went home. I felt okay when I left the pharmacy.

1154778	3/31/2021	MI	50	M	2/15/2021	2/25/2021	<p>HISTORY OF PRESENT ILLNESS: HPI Patient is a male presenting to the emergency department with concerns regarding left-sided facial droop. The patient tells me that he received a COVID-19 vaccine (1st dose) 10 days ago. Patient states that he went to sleep around 23:00 last night. He woke up this morning with left-sided facial droop and inability to close his eye completely on the left. Patient presented to the emergency department for evaluation. He denies any symptoms otherwise. He denies any facial numbness, but states that her rather feels like it is ?paralyzed.? Patient denies any numbness or tingling in his arms or legs. He denies any unilateral arm or leg weakness. He denies any visual changes. No blurry or double vision. He denies any difficulty with speech or finding words. He denies any headache or dizziness. No chest or abdominal pain. No nausea or vomiting. No fevers or chills. No flu-like symptoms. He denies any loss of taste. He denies any numbness or tingling in his tongue or lips. He has no symptoms otherwise. There is no problem list on file for this patient. No past medical history on file. Reviewed and negative. He denies any personal medical history. Denies any family history of strokes or personal history of strokes. Vital signs reviewed. Patient evaluated. Based on exam and history, it is consistent with left-sided Bell's palsy. He has no other neurological symptoms and his neurological exam aside from the facial droop is otherwise unremarkable. I have low concern for stroke based on evaluation today. He has involvement of the forehead muscles. At this point, I did discuss with him that this is Bell's palsy and he will be treated with prednisone and valacyclovir . I do not feel additional workup indicated. He was agreeable. He was given an eye shield that he was given eye lubricant to help avoid dry eye. I did discuss with him that this also may be related to the vaccine given recent administration. I discussed that he should talk to his doctor about this prior to his 2nd dose. Patient instructed to monitor symptoms and all questions were addressed. He was discharged in stable condition Follow-up Information No Results Physician, MD. BLOOD PRESSURE SCREENING: HTN (&gt;=140/90), recommend follow up with PCP within 1 month. Orders Placed This Encounter Medications ? hypromellose (GENTEAL) 0.3 % GEL ophthalmic gel Sig: Apply 1</p>

1154660	3/31/2021	MO	32	F	3/29/2021	3/29/2021	Disorientation, lightheadedness, dilated pupils, slurred speech starting around 3 hours after vaccine dose. Felt like I had been heavily drinking, but I had no alcohol or drugs in my system and hadn't for several days. Lasted through when I went to bed around 10:30 p.m. (about 7 hours after vaccine dose). Felt mostly normal when I woke up the following morning (around 6 a.m.) except for eyes ached. Felt completely normal by noon the next day.
1154651	3/31/2021	CO	31	F	3/30/2021	3/30/2021	Patient called the pharmacy 2 hours after vaccination and reported hives over large areas of the body. No swelling of lips, tongue or throat or difficulty breathing. Instructed patient to take benadryl 50mg QID. Checked with patient 3/31/21 and she was doing better. Hives had diminished, but still there. Told her to continue Benadryl for 1 day after hives resolved. Told her to contact her dpctor to follow-up, and to get dose 2 under medical supervision.

1154608	3/31/2021	CA	59	F	3/29/2021	3/29/2021	After 10mins of vaccine shot, her vision was getting slightly blurred and her head started to throb a little around the temple. After 30mins her she felt a little better and stepped outside for fresh air. Symptoms did not fully go away so the nurse on site took her blood pressure reading 195/100. Nurse on sight assumed that it was due to anxiety of the shot and her progress was getting better and blood pressure was slowly dropping. Nurse said it was ok to go home and rest. 4 hours later, blood pressure was measure at home with a machine and it read 135/85. Next day(3/30/2021) around 12PM, 1 hour after taking her blood pressure medication, her blood pressure jumped to 190/100. The blood pressure medication is a daily routine and have been taking it since January 2021. Blood pressure then dropped back down to 135/85. Then it went up to around 190/100 again. She was taken to hospital Emergency room where they monitored her for 5 hours. Was given medication to help her blood pressure go down. After it stabilized, she was discharged and was prescribed 5mg of Amlodiphine Besylate. During her time in the ER she was given a CT scan and blood work. Results came out negative 3/31/2021 currently have no issues with blood pressure. Still monitoring closely at home.

1154699	3/31/2021	CA	70	F	3/18/2021	3/18/2021	First when leaving site after 15 min. I felt weird (only way to explain it). Once I arrived home I started having a sever headache as the light on my eyes hurt. I was very sick to my tummy, felt hot/then cold. I felt after a couple hours I should try to walk it off - but could only walk to end of block. sat down for a while and the sounds and light were making me sicker. I got up from neighbors house as she felt I should go lay down This is now 4 hours after shot. I got up and was very dizzy. walked back to house and laid down. very dizzy, I tried hard to relax, but decided I should eat a little something even though tummy was sick. I had a little bite to eat and laid back down. I finally took my heat rate, now about 5 hours after shot and AT REST IT WAS 90. my normal rate is 57-63 at rest. I drank water and stayed in bed the rest of the day,, although I did not sleep all night. Next day go up and felt the same. but my heart rate was lower at rest to 63. I was hot/cold all day, felt sick and very very tired. I rested that day as well and rested for 3 days. I made myself walk my dog, but no energy. I made myself eat, but not really hungry, food tasted different. and to this day still does. I am still feeling very tired and get hot/cold, but after almost two weeks feeling better. I don't take flu shots because I get sick, I got very sick on this shot. too bad you don't tell these stories on the news. I am healthy don't take drugs, hardly take a aspirin.! I am in good health but now feel my chest is heavy and still tired.
1152044	3/31/2021	TX	46	F	3/10/2021	3/10/2021	Within 3-5 minutes after my injection, my heart rate increased and my blood pressure increased. I became very dizzy and my hands were tingling. I felt like I had tunnel vision, couldn't catch my breath. The nurse monitored my heart rate and then notified the rapid response team. While monitoring my blood pressure, they made the call to get ENT's to get me to the ER. I was in the ER for 5 hours for monitoring, iv fluids and testing.

1152470	3/31/2021	VA	70	F	3/31/2021	3/31/2021	<p>Patient presented healthy and in good spirits at the time of administration. Was counseled on typical side effects of the vaccine and that the second dose can have more pronounced side effects because we already have built up an initial defense against the first exposure. Patient was understanding and aware of what to look for as well as courses of symptom management. Immediately after administration, the patient reports feeling hot and "funny." Upon visual examination she appeared flush with no visible signs of sweating. After monitoring her for 10 minutes she reported feeling better but still funny and hot. During this time we learned that she has a history of hypertension and was treating with daily verapamil and Telmisartan, and assures us that she hasn't missed any recent doses. At this point, her blood pressure was taken and noticeable sweat stains were evident around her axilla. Her first blood pressure reading, using an automated electronic sphygmomanometer, came up 249/119 with a heart rate of 138bpm. A second reading was taken after more than 5 minutes had elapsed and the patient was given water for complaints of dry mouth; this came up 245/110 130bpm. At this time we asked the patient if she wanted us to call for EMS to be transported to the hospital. She declined stating she was feeling a bit better, but now she was feeling congested and chilly. We continued to monitor her and build rapport to ensure she was keeping alert and responsive. Around 14:40 after speaking with her for several minutes, we found that she may have been hesitant to seek medical attention because she didn't want to be the first patient needing to be taken by EMS, and we were able to explain that even if she was experiencing the same symptoms prior to vaccination, we would have recommended EMS assistance because she was experiencing a hypertensive emergency. she accepted since she was experiencing a hypertensive emergency. She then requested that we call for EMS and a call was placed at 14:45. By 15:00 EMS arrived and took her to the nearest facility.</p>

1152456	3/31/2021	OH	19	F	3/31/2021	3/31/2021	A few minutes after the vaccine was administered, the patient appeared to have a seizure for a few seconds. Her eyes rolled back, stiff arm, and she urinated herself. Her mom was holding her hand and after a few seconds, she was able to talk and said that she thought that she fell asleep for a few seconds. We called an ambulance and they are taking her to the hospital for a CT scan.
1152432	3/31/2021	MA	42	F	3/31/2021	3/31/2021	42 yo female with c/o itching to neck/throat, sensation of throat swelling/SOB, dizziness ~1:43 pm. She has prior h/o anaphylaxis to IV contrast and appeared to be very anxious. Pt was given Benadryl 25 mg PO, water, and rested in a recliner. BP 140/80, HR 88, o2 sat 100%. 911 was called as pt's symptoms were not improving and she had travelled to vaccination clinic alone by bus. She remained A&Ox3, was speaking in full sentences, and no swelling or erythema to throat visualized.
1152375	3/31/2021	LA	54	F	3/24/2021	3/29/2021	WE WERE REPORTED THE FOLLOWING INFO BY HER FRIEND BEGINNING 3/29/21: Monday Patient collapsed at work and was taken to hospital. She was intubated and sedated. They did a CAT scan and labs and ruled out heart attack and stroke. Her blood sugar was also fine. Doctors did not know what caused this and started to lean towards stroke again and scheduled a MRI for Tuesday. Tuesday She was taken off sedation but has not regained consciousness and she is breathing 70% on her own w 30% oxygen supplement. MRI was done and again ruled out stroke. Lumbar puncture was done and came back clear for meningitis and West Nile viruses. EEG was done and waiting on results. They did a reflex test and she responded well. She does have random eye opening and hand movements just not on command. Wednesday She ran fever during the night and they were able to control it. Waiting on EEG results. Dr is going to repeat all tests especially for stroke, said her heart is weak but it's functioning.

1153126	3/31/2021	FL	42	F	3/5/2021	3/5/2021	Really really dizzy; Weakness; Blurry eyes; Severe headache; Fever; Muscle pain; Bad nausea; not able to work; A spontaneous report , was received from a consumer (patient), concerning a 42 year old female patient, unknown race and ethnicity, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced severe headache (headache), fever (pyrexia), dizziness (dizziness), weakness (asthenia), blurry eyes (vision blurred), muscle pain (myalgia), inability to work, and bad nausea (nausea). The patient's medical history was not provided. No concomitant medications were reported for the patient. On 5 Mar 2021, prior to the onset of the events, the patient received the first of two planned doses of mRNA-1273 (lot/batch: 030A21A), intramuscularly for prophylaxis of COVID-19 infection. On 05 Mar 2021, two hours after the vaccination, the patient experienced severe headache, fever, dizziness, weakness, blurry eyes, muscle pain, inability to work, and bad nausea. On an unspecified date, headache and fever went away. The events muscle pain, dizzy, eyes blurry, and little weak were not recovered/not resolved/ongoing. The patient was not able to work, got dizzy when she tried to get on the computer. Treatment details included taking aspirin for headache. Action taken with second dose of mRNA-1273 in response to the events was not reported. The outcome of events, severe headache and fever was considered recovered. Dizziness, weakness, blurry eyes, and muscle pain were considered not recovered. The event of nausea was unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1153132	3/31/2021	NY		F	3/8/2021	3/14/2021	Violent vertigo attack; Felt like the world was going in one direction and she was going in another; legs felt very heavy; Eyes are burning; Head was heavy; Tired; Head felt like it was splitting; Aches and pains; A spontaneous report was sent by a consumer who is a female patient of unknown age that received Modern's COVID-19 vaccine (mRNA-1273) and experienced vertigo, legs felt heavy/restless legs, fatigue, head was heavy/ tension headache, head felt like it was splitting/headache, and aches and pains/myalgia. The patient's medical history was unknown. Concomitant medication included Nexium. On 08-FEB-2021, the patient received the first dose of mRNA-1273 for prophylaxis of COVID-19 infection. She developed adverse events after this initial dose but these are part of a separate case. On 08-MAR-2021, prior to the onset of the events, the patient received the second dose of mRNA-1273 for prophylaxis of COVID-19 infection. Around 14-MAR-2021, she experienced violent vertigo attack where the world is going in one direction and she was going in another. Her head felt like it was spitting at this time. The patient was admitted to the hospital on 14-MAR-2021 around 12 AM and discharged by 6 AM on the same day and prescribed with Meclizine. The provided treatment made her head heavy and it made her feel tired. Her legs feel very heavy and she has aches and pains. She also described her eyes are burning. The seriousness criteria for the event vertigo were reported as hospitalization and medically significant. The patient received both scheduled doses of mRNA-1273 prior to the events; therefore, action taken with the drug in response to the events is not applicable.. The outcome of the events, vertigo, legs felt heavy/restless legs, fatigue, head was heavy/ tension headache, head felt like it was splitting/headache, and aches and pains/myalgia was unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the vertigo and headache, a causal relationship cannot be excluded. Based on reporter's causality, the head felt heavy, tiredness, and eyes burning is assessed as unlikely related to mRNA-1273 and related to meclizine.

The patient's medical history, as provided by the reporter, included diabetes. Concomitant medications were insulin glargine and insulin lispro. The patient said he was compliant with his insulin injections. On 29 Dec 2020 , prior to the onset of events, the patient received their first of two planned doses of mRNA-1273 (Lot number: unknown) intramuscularly for prophylaxis of COVID-19 infection. On 29 Dec 2020, the patient experienced a spike in blood sugar. He tested his blood sugar immediately following the vaccination and it was in the 280-380 range. Prior to the vaccine, it was 100 to 150. On an unspecified date, his hemoglobin A1C was below 7. On 05 Jan 2021, he experienced hearing impairment "whoosh". On 09 Jan 2021, the patient experienced complete vision loss. On 11 Jan 2021, he experienced blurred vision. Action taken with mRNA-1273 in response to the events was not reported. The event of complete vision loss resolved on 11 Jan 2021. The outcomes of the events of fatigue, blurred vision, hearing impairment "whoosh", and blood sugar spike were unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. The patient's medical history of diabetes remains a confounding factor. Further information has been requested.</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1153098	3/31/2021	ME		M		3/10/2021	<p>HEART ATTACK; HIGH FEVER; This spontaneous report received from a patient concerned a male of unspecified age. The patient's height, and weight were not reported. The patient's concurrent conditions included heart disorder ("born-in" heart issues). The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin, and batch number were not reported) dose was not reported, administered on 10-MAR-2021 12:30 for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On 10-MAR-2021 at 19:30, the patient unexpectedly broke out into a very cold sweat, high fever, extreme stomach nausea, and his heart raced to levels he had never felt. The patient could not walk and could barely respond verbally to his fiancé for help. The patient was admitted to the hospital. The patient was taken on a wheel chair and was attended to immediately because of the severity of his condition. The emergency room doctors and nurses thought the patient was having a heart attack, as did he. The patient informed emergency room doctors and nurses that he had been given covid-19 vaccine ad26.cov2.s earlier in the day. After several hours of testing including electrocardiogram, computerized tomography scans, intravenous and constant blood pressure monitoring, it was determined that the patient should be transported to a hospital that was better equipped to service his apparent condition. The hospital staff was concerned about a possible heart attack and not knowing the patient's history or having the equipment and staff to service this, they decided the patient needed to be taken to a hospital that specializes in heart events. Having had cardiology care in the past for "born-in" heart issues, the patient wanted to be transported to Medical Center where all of his doctors were residences. According to the patient, they had a fabulous team of world renowned cardiology experts from Cardiology. The hospital staff at the Hospital offered to send the patient to Hospital. Both hospitals were about equal distance from the Hospital. The patient obviously wanted to go to where his doctors were and who know him personally for almost his whole life. According to the patient, the staff at the Hospital were fantastic, and as they stated to him verbally, probably saved his life. An Ambulance ride followed at about 3:00 AM on 11-MAR-2021 arrived at</p>

----------	-------	-------	---------	-----	----------	------------	--------------

approximately 04:30 at medical center. The patient's cardiologist's covering doctors met him on the cardiology floor to immediately begin monitoring and performing every test at their disposal. The patient also informed the cardiology team that he had received the covid-19 vaccine ad26.cov2.s vaccine on 10-MAR-2021 (Wednesday) afternoon. According to the patient, their eyes lit up immediately believing that the vaccine might have caused this. After almost 2 days and countless tests, blood screens, monitoring and consultation, the patient was released late afternoon on 12-MAR-2021 from hospital after being stabilized to a normal level. According to the patient's doctors, the only cause of these events could have been the covid-19 vaccine ad26.cov2.s vaccine. According to the patient, the severity of this events were only curtailed by the excellent care he received from both of his hospital visits and the almost 2 day stays. The patient's doctors had instructed him to stay close to home and continue to monitor his condition in the upcoming weeks because no one knows if these events could happen again. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from high fever, and heart attack on 12-MAR-2021. This report was serious (Hospitalized and Other Medically Important Condition).; Sender's Comments: V0: 20210333833- Covid-19 vaccine ad26.cov2.S- Heart Attack. This event is considered not related. The event has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There are other factors more likely to be associated with the event than the drug. Specifically: MEDICAL HISTORY. 20210333833-covid-19 vaccine ad26.cov2.s- high fever. This event is labeled and is therefore considered potentially related.

1153081	3/31/2021	AZ		F	3/9/2021		STROKE; ALWAYS RINGING IN THE EARS; This spontaneous report received from a patient concerned an 87 year old female. The patient's weight was 153 pounds, and height was 67 inches. The patient's past medical history included strokes but the last one was a long time ago. The patient was not pregnant at the time of reporting. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unk) dose was not reported, administered on 08-MAR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. The reporter state that, the patient was taking two vaccine shots and was halfway between the two vaccines (2 weeks) second one would be on 29-MAR-2021. On 09-Mar-2021, the patient experienced TIA symptoms (feeling fuzzy, batch of color lights in her left eye, very slurred speech, difficulty understanding and difficulty in communication) and stated she was having a stroke. Patient also informed that she already had this a lot of time before, and her doctor told her to lay down, take an aspirin. Treatment medications (dates unspecified) included: acetylsalicylic acid. On 2021, the subject experienced always ringing in the ears. The reporter stated that, the patient had severe hearing impairment as patient continuously complained that her ears were "always ringing an patient was unable to answer all the questions as she stated that she had to go for some physical therapy exercise and could not continue the discussion. Treatment medications (dates unspecified) included: acetylsalicylic acid. The action taken with covid-19 vaccine ad26.cov2.s was not applicable The patient had not recovered from stroke, and the outcome of always ringing in the ears was not reported. This report was serious (Other Medically Important Condition). Additional information was received on 18-Mar-2021. The following information was updated and incorporated into the narrative: The patient's demographics details (age and age group),event (Always ringing in the ears), reporter address details and other reference number.; Sender's Comments: V1: The following information updates addition of event (always ringing in the ears), patient's demographics details (age and age group), reporter details and other reference number. 1152583	3/31/2021	WA	55	F	3/29/2021	3/29/2021	I walked away from my shot to the 15-minute resting area, joked with a couple of people, looked at my phone to get a time so I could time my 15-minute wait period...1:04pm. Then...bam...hot feeling in my left chest that travelled to my heart. The my heart started pounding out of my chest. Like immediately. I felt a little light headed and walked a few feet to the helper and said I didn't feel well, That my heart was racing and pounding out of my chest. I sat down near him. He had me take my pulse using my phone's timer. 53 beats in 30 seconds. He went to find a nurse. He came back and we took my pulse again. 55 beats in 30 seconds. My life was flashing before my eyes. Honestly thought I might die. No better after 15 minutes so we decided I needed 30 minutes. He moved me to a couch. A nurse came over. She took my blood pressure which usually ranges lowish, 106/65 (?), and it was 122/88, my heartbeat was beginning to go down. This was about 1:40pm. Still felt on the edge of a precipice. I called my husband to give last words of love. Couldn't get in touch with him. Called my sister to say a goodbye, just in case. NO KIDDING. Pulse now going down to the 70s per minute. She said my oxygen level looked good with the little finger device. Nurse gave me grape juice and water and had me lie down. A piece of candy. She went to see if she should give me Benadryl. Other nurse said no. So I waited it out. Couldn't take a deep breath. I called my husband, and he came to pick me up. Nurse thought I had a vasovagal reaction; I have never had a problem like this before. I get shots and vaccines each year. On the way home about 2:40pm, I suddenly felt very burpy. Had discomfort in my upper abdominal area. Felt "off" until 9pm that night. I called my doctor and the nurse there said vasovagal too. I seriously do not think this is what it is. I mean I felt it traveling to my heart and my heart was THUMPING not slowing.

ACCORDING TO MOTHER CLIENT WHO WAS SITTING ON A CHAIR FOR OBSERVATION POST VACCINATION, DROPPED HIS PHONE TO THE FLOOR AND RAISED BOTH OF HIS ARMS UP WITH PALMS OPENED AND STARTED TO SHAKE A LITTLE WITH EYES CLOSED. MOTHER ASKED FOR HELP. WHEN HELP ARRIVED CLIENT WAS CONSCIOUS AND NO SEIZING ACTIVITY WAS WITNESS. CLIENT LOOKED PALE AND SWEATY.
1152779	3/31/2021		57	F	3/30/2021	3/31/2021	Fatigue, short of breath, blurry eyes, achy
1152812	3/31/2021	NY	73	M	3/24/2021	3/25/2021	I have a history of visual floaters. Eight hours after the shot, simultaneous with the initiation of soreness at the vaccination site, these increased, while they are usually minor. Also, i experienced a new phenomenon: a translucent paramecium-shaped image in both eyes: lower left of left eye and lower right of right eye. All these symptoms disappeared after 20 minutes or so and did not recur. Yesterday, I visited my optometrist, who did a dilation to check the retina and found nothing amiss. But she thought my experience should be reported.
1147290	3/30/2021	AZ	54	F	1/4/2021	1/7/2021	I did not have a reaction until I got home on Jan 4th, 2021. I had a headache for a solid 2 weeks. Lost my vision right eye on Feb 1st with extreme vertigo ended up in the hospital. After a few tests they found a heart defect ASD. Never in my life have I been told I have had a heart condition. I am correlating it to the vaccination because for the 4 solid weeks before I ended up in hospital I was so sick.

1147291	3/30/2021	AR	34	F	3/30/2021	3/30/2021	Is 17 weeks pregnant with her first child. I do not know her estimated date of delivery. She fainted approximately 5 minutes after receiving her vaccine and fell from a chair. She landed on her side face down, so we turned her face up so we could see her face. Her eyes were barely open, but she nodded her head the second time we asked if she could hear us. We took her blood pressure, and it was 107/71 with a heart rate of 85. EMS came, and she felt better, so she decided not to go with them. They asked her to stand up to sit back in the chair. When they left, she slowly progressed to walking around while talking on the phone with someone to come pick her up so she didn't have to drive herself. She told us this was the first time she had fainted in 3 years and the first time ever fainting due to a vaccine.

1146240	3/30/2021	NJ	54	M	3/28/2021	3/28/2021	Came home after the vax...all was well until a wave of overwhelming weariness came over me...i sat on the couch to close my eyes and slept 5 hours. Moved into bed around 8pm and slept til 4am on the 29th...was up for a matter of hours then slept for maybe 15 hours total...morning of the 30th i am feeling much better. This was not sleep...more like passing out.
1147060	3/30/2021	NY	30	F	1/14/2021	1/20/2021	1/14 vaccination About 5 days later, I noticed swelling on my eyes, mild. 6 days later, I woke up, my whole face was swollen. No other symptoms, just swelling of face to include lips, eyes, cheeks. I went to the ER that Thursday. Friday I saw the allergist via telehealth. Didn't know if due to vaccine. Benadryl was not helping. Dr. put me on oral steroids for 7 day taper. It cleared up the swelling.
1147600	3/30/2021	OH	56	F	3/16/2021	3/16/2021	The vaccine site was Community Center being done by Paramedics and Fire Fighters. I received the vaccine and sat down in the chairs to wait the required 15 minutes. Within 2-3 minutes my face got very hot. I could feel the heat under my mask. Another minute or two, just below my knees to my toes started tingling. Another two minutes or so, I felt like my eyes were swelling. I took my glasses off and looked at my husband and asked if my eyes are swelling, he said, they sure are and called over one of the paramedics that were there. They directed me to a more private are and put me on a monitor and monitored my vital signs. My blood pressure which is well controlled on my meds (which I did take that morning) climbed and climbed to 200s/100s. My chest was tight and uncomfortable and getting more difficult to breath. They put and O2 mask on and gave me Benadryl IM. By that time the squad was there and took me to the local hospital ER. In the squad my tongue started to swell. At the hospital they gave me Solumedrol IV which took care of it all. The swelling quickly went away in my tongue and face, the chest pressure went away, and all the other little annoyances like the tingling. The hospital did a chest x-ray and bloodwork. I went home after 3-4 hours with a prescription for Prednisone 50 mg daily for 5 days. No further reactions after that.

1147555	3/30/2021	NJ	76	F	3/30/2021	3/30/2021	Patient received the first moderna vaccine. She was waiting the 15 minutes after the vaccine, at about 8 minutes I checked up on her again and asked if she was doing okay. her eyes were open but she was not responding. I ran over there and tried to get her to respond to my touch and voice. She was breathing but was non responsive. She also had incontinence and when she came to she stated that she was asleep. We called 911 at this time and the paramedics came and took all her vitals, all of which were within range. The paramedics came within 10 minutes and at this time she was already responsive. She kept stating she was just asleep and told us she does sometimes have incontinence and has to wear pads. She refused further medical care and I contacted her when she was at home, where she stated that she would rest up but overall feels fine.
1147539	3/30/2021	UT	56	F	2/25/2021	3/2/2021	Patient had swelling of her face five days after the vaccine and fluid accumulated under her eyes. This lasted for 3 days and she took Benadryl to make the symptoms bearable.
1147537	3/30/2021	CA	74	F	2/13/2021	2/13/2021	As soon as I got the 2 nd vaccine zi got sharp pain in my left eye and it turned all bloody. I was able to see. It took a full week for the eye to be back to normal

1147494	3/30/2021	KS	30	F	3/30/2021	3/30/2021	Patient called back about an hour later having blurred vision, followed up a couple hours after and was not longer having.
1147471	3/30/2021	FL	49	F	3/11/2021	3/11/2021	day 1; Soreness in injection site. Slight dizziness at 3:00pm; chills and headache at 8:00 with night sweats all night long. day 2; chills and headache all day. Right hip and back pain started at 5:00pm. Noticed bruise in injection site at about 4:00pm. day 3: nausea at 8:00am and 11:15 am; knee and back pain + fatigue started at 11:00 am. Left eye pain at 11:08. Chills all day. Symptoms resolved completely on day 4 at 3:00pm. Soreness in injection site with bruise lasted 8 days.
1147403	3/30/2021	OK	52	F	3/24/2021	3/27/2021	3/25 - Did not feel well, tired, eyes hurt 3/26 - Felt better during the day. Took a Benedril when I went to bed (10:00pm) 3/27 - 03:00am - woke up, couldn't swallow, throat on fire, got glass of water was able to take a few drinks. Looked at throat, tonsils and uvula very swollen almost one in back of throat. Felt like throat was closing. Kept drinking water and hot tea to try to keep swallowing. Was a little better in AM. 3/27 - 09:00AM - went to Urgent Care. Saw Nurse Practitioner. She did strep test which was negative and said no bacterial infection. Did nothing else. 3/27 - I took Benedril every 6 hours throughout day. Throat sore and red, but better. 3/28 - Throat better - still a little red and swollen 3/19 - felt fine.
1147374	3/30/2021	ME	62	F	3/29/2021	3/30/2021	I had my 2nd Pfizer vaccine at 8:15am yesterday....felt fine all day...toward the end of the day the right upper arm was sore, but had no other symptoms. I woke suddenly at 12:45am....the middle of the night....feeling ill....slightly nauseous and as if I needed to get to the bathroom and my chest hurt on the left side....immediately I felt that my hands and feet had no feeling....told my husband I needed some help....and lost consciousness. He said my eyes rolled back in my head and my throat made gurgling noises. He talked to me until I came to....according to him. Then we put a cold damp cloth of my neck and forehead. No fever or other symptoms.

1146392	3/30/2021	FL	31	F	3/25/2021	3/29/2021	On March 29, 2021, severe vertigo and fatigue began. I woke up at 7am feeling as if I was slammed with fatigue after about roughly seven hours of sleep. I stood up to walk my dog, and a simple chore like that felt undoable. Everything felt unbalanced and I felt and still feel as if I am weak and about to pass out doing simple things like even taking a shower. My left eye feels very heavy and my head just feels like it's swaying on a cruise ship.

1146219	3/30/2021	VT	41	F	3/24/2021	3/25/2021	1. First: Rash between breasts appears that evening. It is very very itchy and red. There are five raised hives which are white and dime-sized. They appear almost to have a pinhead sized pus in them. At the 36 hr mark, it remains the same in discomfort, but there are more hives and it has spread out by three inches across the chest and is halfway up to the neck. The rash does not improve or spread further and remains the same at the 4.5 day mark today. 2. Around day 1.5 or 2, a mucousy film fills throat making it necessary to constantly clear my throat in an almost violent way order to feel comfortable. It feels like there is lots of post nasal drip in my throat, however, I have completely clear sinuses. Sometimes this means coughing though I would not say I have a cough. 3. I need to use my inhaler in my car on Sunday, day 3.5 to breathe deeply. This is very unusual. I have shortness of breath and deep wheezing more than usual. 4. Day 3, I realize I am very very tired, which I had though was just because I have been busy, but with alight myalgias starting, now recognize that the fatigue is abnormal. I feel like if I let my eyes close at 3pm, which they feel like doing, I would fall asleep. This continues day 4. Ironically, I have trouble sleeping. ... 5. Day 4.5, Myalgias, see above. And skin also feels fender in spots. ... 6. Today started a general unease, day 4,. I had this with Covid. It is hard to explain. The feeling of just "bad" -- an experience I have only ever had with Covid. Like a dread mixed with a fear with a stomach bug. Maybe that helps. 7. Day 2 on -- Headache off and on. A tension headache. Could be from not getting enough sleep but it was persistent throughout the day yesterday and today.
1146424	3/30/2021	IN	66	F	3/26/2021	3/28/2021	Sunday afternoon had vision problems with my left eye. the left peripheral vision was wave like heat waves. for about 20 minuets. After that, it felt like a headache in the eye. Lasted the rest of the day. Monday to now if feels like the eye has been numbed or dilated.

1146198	3/30/2021	IL	22	M	3/29/2021	3/29/2021	Pt received the first of the two-series COVID vaccination at 1512. Once in observation area, pt became unresponsive shortly after sitting down. This provider was called over by staff to pt, which was noted to have become unresponsive while sitting in the chair. Pt remained in the chair, did not fall or injure self. Upon arrival to patient, he was noted to have severe diaphoresis, prominent pallor, with shallow, slow breathing, no cyanosis noted. His head initially fell back and head was aligned/adjusted to maintain an open airway. This provider was speaking to the pt and performed a sternal rub to elicit a response, pt remained unresponsive and with eyes closed. Pt remained in this state for approximately 10 seconds. Pt noted to suddenly have some muscular rigidity to arms and torso and in order to prevent injury upon possible onset of seizure activity, pt was lowered to the floor by this provider and RN . Once on the ground the pt was relaxed and opened his eyes. Pt was immediately verbally responsive and asked if he passed out. Pt was able to sit up and was assisted into the wheelchair. Pt moved to treatment area where vitals and blood glucose were obtained. (@1525 BG- 104 mg/dL, VS BP 116/72, HR bradycardic @51 bpm, O2 sat 95%). Patient responses/speech was clear and pt was oriented to self, place, time and situation. Pt stated that he felt nauseated upon sitting in the observation area and admitted that he only had a coffee today, nothing to eat all day and attributed this as the cause of his reaction. Pt verbalized that he would not respond to the hospital with the paramedics and was encouraged to at least call someone to take him to the hospital. This provider spoke with the patient's mother and explained the events. The patient's mother stated that the patient had febrile seizures when approximately 4 years old, associated with asthma exacerbations; but pt was evaluated with a neurologist and there were no abnormal findings. Pt admitted that he has a similar syncopal episode after washing a laceration and seeing his finger bleeding. Pt states this was a few years ago and witnessed by his father that told the patient he initially fainted and then became momentarily rigid before responding appropriately (similar to today's events). Ambulance - arrival @1536 report given and pt stated he was feeling better and declined further evaluation in truck and also declined transport to ED ( departed at 1545).

							Pt's overall condition, appearance, including color was much improved. Pt denied any allergies or medication history. Past medical hx of febrile seizures at approximately age three and four, childhood asthma and one syncopal episode as an adult. Pt girlfriend arrival and she agreed to drive patient from the vaccine clinic. Pt and girlfriend were both provided with an explanation of the many concerning causes of syncope and the necessity for further evaluation in the Emergency department to rule out any underlying conditions. Both patient and girlfriend verbalized understanding and although they still declined to respond to ED directly from the clinic, both did agree to respond to ED if any changes in mental status occurred. Pt lives alone, but agreed to stay with parents and family in order to have others watch him for any changes. Pt was advised to followup with PCP and made aware that an provider would contact him tomorrow to check on his status, understanding verbalized and agreed with plan of care. Pt in no acute distress, awake, alert and oriented. Color within normal limits for and departed facility with girlfriend at 15:56, steady gait noted. Patient's appointment for second dose was cancelled and will need to obtain clearance prior to second vaccine dose.

1146742	3/30/2021	PA	67	M	3/12/2021	3/21/2021	I was very tired the night of 2nd vaccine, aside from that absolutely no side effects, hardly any arm pain, so all well. I actually felt great for about 9 days. Then on 3/22/21 I was suddenly awoken by an intense, and peculiar, bout of vertigo. I am familiar with vertigo from ear infections in the past (last one about 15 years ago and the one prior about 22 years ago). For me vertigo is a generally mild sensation that stays with me until it clears up. This was, and is, much different, it ebbs and increases during the day, if I concentrate on a physical task it sort of diminishes, then comes back, at times it goes away completely for an hour or two then comes back strong. At same time that this started my thoughts and mental acuity started to suffer kind of a "brain fog" is the best explanation I can give. I also have a slight headache at the back of my head wrapping around to the temples, I don't know if I can link the headache to the brain fog since my neck often gives me trouble. I have ruled out ear infection by purposefully spinning myself around to see if I would lose balance, did not affect my balance. I can also walk a relatively straight line of about 20' with my eyes closed without stumbling. It feels like a kind of vertigo, but much different than any I have experienced in past and much longer lasting.
1147036	3/30/2021	TX	34	F	3/29/2021	3/30/2021	Vaccine was given in my left arm and I woke up in the morning with blurred vision in left eye. Could not read text, except for when I closed the left eye. However, the symptoms resolved after 3 hours

1146715	3/30/2021	WI	26	M	2/26/2021	3/1/2021	For BOTH initial (022621) and booster (032621) of Moderna, pt had moderate/severe eye reaction. Overnight about 3 days after first injection and 4 days after second injection. Initial injection: pt went to bed on the 3rd night after vaccine having taken no medications and noted mild eye irritation. He woke up a few hours later (~midnight) to severe eye watering and blurriness which required him to keep his eyes closed with mild sinus congestion. No difficulty breathing noted. Pt had trouble getting it to stop despite taking loratadine 10mg and rinsing eyes with water. Pt seriously considered going to ER due to risk of blindness. Pt eventually fell asleep a few hours later and woke up with very sensitive eyes (irritated, very red) that took about 36h to fully recover. Second injection: pt was on scheduled loratadine 10mg daily. Noted a similar eye irritation (this time four days after injection not three) when going to bed and took 50mg diphenhydramine (about 14h after loratadine dose). Woke up a few hours later to more minor but still debilitating eye watering with proportionally more sinus involvement. No difficulty breathing noted. Pt took an extended release pseudoephedrine, rinsed eyes with water and waited for it to resolve about an hour or two later. Pt awoke the next morning to much less sensitive eyes than first time. Note: due to first experience. From time of administration of second dose, pt was on scheduled naproxen (440mg loading dose followed by 220mg q12h), loratadine 10mg q24h, and pseudoephedrine (120mg ER q24h). Pt took these scheduled days 1-3 and at time of second eye episode was only on scheduled loratadine still. Pt also had 50mg diphenhydramine on hand in case of episode.

1146642	3/30/2021	RI	41	F	3/26/2021	3/26/2021	Driving home from the vaccine I had double vision and a feeling like I was going up and down in an elevator. The next day I had the sore arm, aches and headache as expected. Sunday, started with carpal tunnel pain that extended from my left shoulder through my fingers as well as some vision issues where my eyes sort of had double vision again but I couldn't blink it away for a minute. Monday morning I felt my right eye suddenly change vision where the one eye suddenly saw at a 45 degree angle. My husband said my eye looked ok but I could clearly see 2 of him and couldn't blink it away for a solid minute or so. Today my eyes are blurry and I'm dizzy. I reported this to my doctor yesterday to see if what was happening was vaccine related and she asked me to report it here.
1146609	3/30/2021	NY	55	M	2/10/2021	2/17/2021	Sudden onset at rest of blurry vision and tingling paresthesias of trunk and limbs bilaterally.
1146466	3/30/2021	NC	53	F	2/28/2021	3/8/2021	With the first vaccine, I had mild symptoms (sore arm, body aches, and headache. However, 8 days later, I had a large red welt on my arm at the vaccine site. It was warm to the touch and a little itchy. After several days, that was gone and I was left with a small black and blue mark which lasted for a few days. After that, I was fine. With the second vaccine, I was fine for several hours but about 6 hours after receiving the vaccine, I started getting a headache, had a site arm, and had body aches/pain across my shoulder, up my neck and down my spine. I woke up in the morning with a 102.3 fever, severe body aches, a headache, and burning eyes. My fever finally broke around 6pm. I woke up the next day with a mildly sore arm and mild body aches. Much better than the day before.

1148834	3/30/2021	MN	28	F	3/30/2021	3/30/2021	PT reported feeling normal immediately after vaccine was administered. According to PT, they began feeling extremely lightheaded approximately 5 minutes post-injection. Approximately 8 minutes post-injection, I observed the patient rise from her seat and begin to stumble towards me. The patient was exceptionally pale, and reported to me that she was feeling light headed. I promptly directed the patient to sit down, but before she was able to reach a chair, she collapsed entirely. She fully regained consciousness within a few seconds and was alert to presence, place, and time. PT was able to seat herself at this point. Her blood pressure registered 82/51 mmHg immediately after the episode. PT was visually slowed and confused, but was otherwise fully present. PT was given water and allowed to recover in a seated position. Blood pressure registered at 117/71 mmHg 15 minutes later, and PT reported feeling much better. PT was visually much more alert and cognitively present. After 15 minutes of no change in condition, patient was allowed to leave facility with the accompaniment of her mother. No epinephrine or antihistamines were administered.
1149056	3/30/2021	WA	48	F	3/30/2021	3/30/2021	Wave of what felt like adrenaline. Shaky, dizzy, head pulling to the left and tears coming from eyes (but not crying)
1148809	3/30/2021	WA	56	F	3/29/2021	3/29/2021	20 minutes after vaccine was driving home and noticed face feeling flush. Then itching, tingling on lips eyelids and cheeks along with mild chest tightness. My husband observed that my face was visibly flushed. We drove to Hospital and parked outside the emergency room in case it got worse. I took 20 mg hydrocortisone that I have as an emergency medication for my adrenal insufficiency. We waited until one hour after I'd been vaccinated and agreed my face was less red, the itching had also decreased and decided it was safe to go home. This is the same reaction I have if I eat shrimp, my perception is that it was a mild allergic reaction.

1148572	3/30/2021	TX	59	F	1/12/2021	1/13/2021	The day after vaccination I felt lousy and the next day, I felt worse on the following day. On day two the doctor gave me antibiotics. On the Third day I also felt some paralysis on the right side of my face. I felt terrible I had the worst headache, body aches and I had a tingling in my head and on the side of my face and I couldn't close my eye. My right ear was swollen and painful. I went to see my doctor and he diagnosed me with shingles specifically Ramsay-Hunt Syndrome with Bells Palsy. As a result of my condition I had to take four weeks of medical leave. I was very fatigued that I was stuck in bed for two weeks. I felt a little better after four weeks my energy level was still very low. I still have residual dizziness. I am working three quarters of my work schedule after eleven weeks. I still have a lot of the paralysis and I can't blink my eye I have to tape it shut. I have trouble eating and My right ear swelling is reduced but it is still itchy. My doctor prescribed Acyclovir for one week and now I am taking Famciclovir. I do not have as much pain as I did.
1148559	3/30/2021	NJ	90	F	2/23/2021	2/27/2021	Within a couple days of second shot, legs became very weak, one was swollen and the other was atrophied. She can barely walk as a result. Can't keep eyes open, can't smile and trouble speaking. Back pain and all over pain.
1148557	3/30/2021	CA	25	F	3/30/2021	3/30/2021	tunnel vision, felt like passing out, diaphoretic, brought to obs, given water, felt better and sent home. VSS

1148544	3/30/2021	AZ	24	M	3/28/2021	3/29/2021	got up about 5:15AM to use the restroom, parents heard a huge crash and we came running - he had collapsed and fainted in the bathroom, against the toilet, (with shelves and glass crashing down him - he grabbed the shelves and had a few cuts and bruises), was unresponsive, no color in his face, could not stand or move, could barely speak - slumped against the toilet. Parents called 911 and tried to get him to respond, he was listless but opened his eyes - we lifted him and moved him to recliner in living room. Fire Dept./EMT's arrived within a few minutes, blood pressure was 87/43, glucose was normal. EMT's determined it was a reaction to the vaccine and asked if he wanted an ambulance or if parents should drive him for further care - he opted for us to drive him (his Mom called the Dr. on staff first - Dr. said it was a reaction to the vaccine and he should not get a 2nd dose). Patient's Dad took him to Urgent Care - they ran an EKG (normal), and stayed there until his blood pressure showed (although still low) normal/acceptable again. I looked at the CDC website for covid anaphylaxis and it appears it was an allergic reaction (cardiovascular), on the site, he had these symptoms: "Cardiovascular: fainting; hypotension (abnormally low blood pressure); pallor. ... Symptoms of anaphylaxis often occur within 15-30 minutes of vaccination, though it can sometimes take several hours for symptoms to appear.~~
1148534	3/30/2021	PA	60	M	3/25/2021	3/29/2021	Severe hives outbreak all over the body 4 days after second dose of Pfizer vaccine. Hives started in groin and armpit then expanded to forearms, knees, neck, eyes, hips, back, tailbone area, head, and was severe in the hands and wrists. Also -- The evening and through the night after the second dose (given at 8:35 AM) side effects included headache, chills, fever, muscle aches.
1148533	3/30/2021	MD	29	F	3/30/2021	3/30/2021	DURING THE 20 MINUTE WAIT AFTER THE VACCINE, PATIENT REPORTED A TIGHTNESS IN HER CHEST AND WAS HAVING DIFFICULTY BREATHING. WE CALLED 911 AND HAD THE PARAMEDICS CAME OUT. WE KEPT OUR EYES ON HER BUT DID NOT ADMINISTER ANY MEDICATIONS AS SHE WAS TALKING TO US AND STILL ABLE TO BREATH ON HER OWN. PARAMEDICS TOOK HER TO THE HOSPITAL FOR OBSERVATION.

1149225	3/30/2021	CA	49	F	3/18/2021	3/18/2021	At 10 minutes, tongue irritation. At 25 minutes, hives on palm of hand which resolved after 10 minutes. At 90 minutes, drop in blood pressure, dizziness, weakness, severe stomach cramps, nausea, vomiting, diarrhea, tightness in chest and head. Took Benadryl, Albuterol and Pepcid. One hour later, 103 fever, severe pain in all joints. Stayed on Benadryl for 24 hours. Once Benadryl was stopped, developed hives all over chest, various spots on arms and stomach, continued dizziness, swollen lymph node in arm pit. Eyes were swollen and itchy. and red. Resumed Benadryl x5 days, every time Benadryl stopped, hives resumed. . Periodic hives still surface as of this date but mostly improved. My MD suggested I report event.
1148942	3/30/2021	KS	57	M	3/30/2021	3/30/2021	Vision became blurred. Not able to read for about 45 minutes. Took 50mg of Benadryl and after 15 minutes the blurriness went away. Informed my doctor and they advised to continue taking 50mg of benadryl ever 4 hours for the next 24 hours.
1149172	3/30/2021	TX	37	F	3/26/2021	3/26/2021	Several minute after getting vaccine: -Temporary loss of vision, throat swelling, difficulty breathing,= duration 5-10 min. (Unsure) -drop in blood pressure and pulse. Duration 30 min (unsure, doc was monitoring) -sporadic numbness throughout body including back of head. Duration: 1 hour and then tapered off, but total of several hours. Some sporadic vision issues occurred after the initial burst over the course of an hour as well.

1149100	3/30/2021	IN	54	F	12/14/2020	12/25/2020	Noted haziness in left eye and floater 11 days after shot I wear prescription glasses and I noticed a difference in terms of my vision both near and far. I ignored at first but it got worse. I was due for my annual Ophthalmologist eye exam in mid January and they did the visual exam That looks behind the eyes. it was noted that o had CEBTEAL RETINAL VEIN OCCLUSION . I was emergnetly referred to. a retinal Specialist that same day and he injected my eye with AVASTIN. after one month, another visual exam was done and marked improvement was noted but I still had hazy vision despite corrective lenses and lthat annoying floater seems to be permanent. I will see retinal Specialist again in 2 weeks.
1149096	3/30/2021	WA	49	F	3/29/2021	3/29/2021	40 mins after inoculation, my left arm and hand felt tingly like my arm went to sleep. Lasted for about an hour. Left arm sore at the injection. 4 hours after inoculation, eyes were extremely heavy, felt tired and had a slight headache.
1149091	3/30/2021	TX	45	M	3/25/2021	3/25/2021	Patient stated he experienced lost of taste on the same day that vaccine was administered. The next day, patient was fatigue. Stated speech was sluggish and was not able to consume food due to drooping of the left side of mouth. Also stated that he was not able to close the left eye. Patient was seen at emergency clinic on 3/27/2021. Stated that he was diagnosed with Bell's Palsy. Patient was prescribed steroids and was advised to follow up with primary care physician.
1149083	3/30/2021	VA	30	F	3/24/2021	3/30/2021	Swollen eye and eye lid. Took an Allegra and it appears to go have gone down a bit. Woke up with a swollen eye and it had some mucus. Looked to be pink eye.
1149082	3/30/2021	CT	23	F	3/24/2021	3/26/2021	It started when I woke up and my eyelids were severely swollen. Then throughout the day the swelling started to go down but then my neck began getting red. I then developed a light rash on my neck, chest, and arms. The only part that was slightly itching was my neck. I continued to take Benadryl and used cortisone cream on my neck. I woke up the next day with my eyelids being swollen again. Benadryl helped. The rash is going down and all I have left is a rash on my left wrist which developed on the 4th day after my vaccine.

1147936	3/30/2021	SC	64	F	3/26/2021	3/27/2021	Mild discomfort at injection site on day of vaccine. Next morning every muscle, joint, bone and hair hurt. Extreme fatigue. Didn't want to keep eyes open. Proceeded to carry on with daily activities, but after 2.5 hours was so fatigued had to be taken home. Took Tylenol 1000 mg for pain relief. Woke up from sleep in about 2 hours because both thumbs and index fingers were in spasm/cramp like a fist and tingling started in right ring, middle and index fingers and left ring finger only. No loss of sensation or capillary refill. Placed wrist braces (for carpal tunnel) to hold fingers in correct position. No real relief, When removed, symptoms were worse. Tingling eventually spread to whole fingers and thumb pad area. Soaked in warm/hot bath for 20-30 min. Slowly noticed relief of tingling. After bath, went back to bed with hands propped on pillows. Slowly over the next hour the spasm/cramps resolved and as well as all tingling. Note: at no time was the ability to move or control all fingers and hands lost. After eating about 1 cup of food, was fatigued and went to sleep. The next morning fatigue remained, but not as bad. Ate 1/2 of a breakfast at 1030. Went immediately back to bed. Upon waking at 1400 it was noted that I must have sweated, but was never aware that there was a fever. at this time all symptoms were resolved. None have followed.
1147923	3/30/2021	IA	25	M	1/2/2021	3/10/2021	Adverse event started the morning of 3/10/21 around 08:00 am. Symptoms included headache, fatigue, brain fog, memory issues, feeling feverish, and itching on torso, arms, and legs . Symptoms seemed to improve over the next week or two before worsening again on 3/27/21 around 10:00 am. On the day of 3/27 /21 I experienced headaches, fatigue, brain fog, memory issues, muscle aches, diarrhea, and vision problems. Currently on 3/30/21 symptoms have improved but I am still experiencing dull headaches and brain fog, as well as itching on torso, arms and legs and some vision problems. I have not seen a provider for these issues but have an appointment scheduled for 3/31/21. Treatment includes ibuprofen as needed.

1148437	3/30/2021	OR	55	F	3/26/2021	3/28/2021	Pt reports symptoms starting roughly 48 hours after administration. Pt states right sided facial abnormalities. Pt states she cannot wink the right eye but can shut the eye when she blinks normally with both eyes together. Pt also states right sided weakness and paralysis of mouth, says she has to drink out of the left side of her mouth only or else she spills on herself. Pt states this started on Sunday morning 03/28/21 and has progressively gotten worse every day since. I advised the pt that this could possibly be Bell's Palsy from the COVID vaccine that I gave her on 03/26/21. I told her to call her rheumatologist but she said she no longer has one. I advised the pt to call her primary care physician and they would be able to advise the best course of treatment.

1148436	3/30/2021	ND	23	F	3/26/2021	3/27/2021	Was sitting on couch, and became nauseous around 4:00 pm when significant other was making making. Ate food and nauseous feeling got more overwhelming. About 5 pm I vomited up all my food. I also started having very bad diarrhea. I puked again about 7 pm after eating a few crackers and drinking water. Then puked four more times between 8pm and 11pm with absolutely nothing in my stomach. I continued having bad diarrhea during this same time. I also got cold chills during this time too. I was intensely nauseous and couldn't keep my eyes open. I went to the Emergency room around 11pm and they gave me an IV with Saline and nauseous medicine. I went home around 1 am. On Sunday I proceeded to be slightly nauseous and have had a constant headache from Sunday and still have it today on Tuesday. But I am just starting to more solid foods. Had diarrhea until Monday afternoon. And haven't pooped since.
1148429	3/30/2021	MN	71	F	2/23/2021	3/14/2021	No reaction from first shot. Second shot was at 10_00 am on March 16. On or about March 14 I noticed vision loss in left eye, a spot. On March 17 I made an appointment to be seen on March 23 by optometrist. Was seen and he identified an inflamed optic nerve d rate tests. That night or by the following morning I had lost more vision, in a halo around the first blind spot. Doctors are still trying to determine origin of problem, not tumor and not disease.
1147979	3/30/2021	IL	27	F	3/16/2021	3/16/2021	I lost vision and became dizzy and lightheaded five minutes after shot. I returned to the clinic and sat down. My blood pressure was under 90/60 once I regained stability.
1148400	3/30/2021	NJ	69	F	1/7/2021	1/17/2021	Jan 17 blurriness in left eye... went for eye exam n the 21st, had emergency surgery Jan 22nd for a severely detached retina
1148319	3/30/2021	AL	31	M	3/30/2021	3/30/2021	Patient fell out of chair and was unresponsive about 10 minutes after vaccination. When able to talk complained of itching all over. EpiPen was administered. During fall landed directly on face resulting in laceration to nose and subconjunctival hematoma to left eye. Patient continued to be alert and responsive and itching resolved with EpiPen. He was transported by ambulance to Emergency Department.

1148306	3/30/2021	OK	66	F	3/30/2021	3/30/2021	Thirty minutes after the injection while driving home, my left eye got this weird sensation, maybe light pins and needles, it's hard to describe. Just the skin, not the eyeball. Lasted about 15 seconds. Two hours later my right ear started itching along with the right side of my throat. Lasted 30 minutes. The itching was mild compared to my old food allergies and penicillin reactions. No need for a Benadryl.
1148273	3/30/2021	NJ	32	F	3/9/2021	3/9/2021	I?ve had neurological problems since vaccination 3x weeks ago. I?m suffering from brain fog and dizziness. I have aura (blurred vision). I can feel the vaccine in my spine. I?m having skin sensitivities and muscle aches.
1148229	3/30/2021	OH	47	F	3/30/2021	3/30/2021	About 5-10 minutes after vaccination, patient reported dizziness and blurred vision. Patient then started feeling nauseous and sweating. Patient in and out of consciousness until squad arrived
1148221	3/30/2021	NC	49	F	3/5/2021	3/6/2021	She got the vaccine, had no reactions. On 3/6/21 she had blurred vision and being a little confused. On the 8th when he returned back from work and she took her blood sugar which was 579. So he rushed her immediately to urgent Care, they checked her blood sugar and there was no reading, and they sent her to Hospital. In the ER at the hospital it was 408. They gave her insulin, stabilized her and they told her to check with her doctor. She consulted with her physician the next day and they put her on Metformin, which did not bring the blood sugar down at all. On 3/10/21 he took her back to the ER again and they stabilized her again and did more testing to rule out any stroke or anything else, but also informed her that the vaccine pushed her over the pre-diabetic stage to being a diabetic. She went back to the doctor again who increased her Metformin on 3/16/21, and her levels are still not within acceptable range but better than 300-400, but are in the 200+ ranges. She is very dizzy, weak for the last 3 weeks and her vision is blurry as well, and she is not able to work as a nurse due to these reactions. She does have a doctors note that she can return to work tomorrow without restrictions. Her blood pressure was extremely high as well, and her physician increased her medicine.

1148100	3/30/2021	NJ	34	F	3/17/2021	3/17/2021	Pain on arm where the vaccine was administered (immediate and ongoing after 11 days) Nausea, headache, tightness in chest, metallic taste in mouth (30 mins after vaccine until 5 hours after) Extreme tiredness, blurry vision, heavy eyelids (30 mins after vaccine and ongoing after 11 days) Cold Sores (3-5 days after vaccine) Warts on fingers (7 days after vaccine) Vaginal Vesicles (5-7 days after vaccine) Oral vesicles and irritated gums (9 days after vaccine and ongoing)
1148177	3/30/2021	TX	29	F	3/15/2021	3/23/2021	My first vaccine was on Monday March 15, 2020. 8 days later, on March 23rd, I woke up with a blotchy, raised, bumpy rash where the vaccine was administered. Through out the day, it got bigger and bigger, itchier and itchier. By nighttime, the blotchy-ness turned into 1 big red/pink rash about 3 by 4 inches. The next day, March 24th, it was even bigger. I started taking benadryl which helped a lot! On this day it stayed around the same, I did draw a pen mark around it and the rash grew a few more centimeters. The third day (March 25th), it was now the biggest it had been but the middle of the rash started to clear up. It looked like there was a red ring/oval around the rash. By Thursday night, the redness has started to clear up. Friday, March 26th, the rash was almost gone, but I had an itchy rash on my face. I am not certain this is a cause from the vaccine, or natural allergens in the air. I typically have allergies through out the year, but have not had a rash like this on my face before. It was very itchy on my forehead and around my eyes. All rashes are clear today (March 30th). My arm does not itch, I can barely see a red hue on my arm from the rash, but it is there. I took pictures of my arm, day by day, if that would be helpful to see.
1144054	3/29/2021	PA	61	F	3/28/2021	3/29/2021	PAIN THROUGHOUT BODY, ESPECIALLY EYES AND HEAD. NO ENERGY, DRY MOUTH
1143855	3/29/2021	KY	61	F	3/27/2021	3/28/2021	24 hours later I developed a "black eye" on the right eye. No swelling. No tenderness. Just a very dark purple black bruise appeared on right eye in the inner corner.

1144014	3/29/2021	OH	73	F	2/24/2021	2/25/2021	She received the Moderna COVID-19 vaccine and was seen in our office on 3/1/2021. It was administered in her right arm. She said later that day she had itching on her arm, tachycardia, short of breath with wheezing, felt like she could pass out, muscles felt like jelly. She had to use her husband's supplemental oxygen. Later that night she felt pressure behind her left eye as if it was ready to explode. She felt dizzy When she would try to walk, she would feel so weak that she felt like she could pass out. She then developed a feeling of pressure like an elephant sitting on her neck and her chest. It was hard for her to take a deep breath. Her pulse would sometimes go up to 114. She had headaches. She has felt like she cannot focus or concentrate. She has been using Benadryl 25mg every 4-6 hours since the reaction started. When she goes about 12 hours without the Benadryl she starts to feel short of breath and the chest heaviness again. She was given Depo-Medrol 80mg injection in the office that day. She will continue taking the Benadryl until she is no longer having a reaction.
1143984	3/29/2021	FL	54	F	3/27/2021	3/28/2021	it took about 24 hours for: oral ulcers /sores, stye in right eye, 3.5 above normal degree fever. It took 36 hours for: diarrhea

1144039	3/29/2021	NY	54	F	3/25/2021	3/26/2021	Vaccine at 6:30pm on Thursday. Arm was very sore. Woke up at 7am, tired, arm still very sore. Took 2 tylenol, went to work, started to get a headache, on top of head, above my eyes. Took 2 more tylenol at about 1pm. Starting to feel worse, finally left work at 3:30pm. Went home, had fever about 100 or so. As the evening went on, I had 102 fever, extreme pains, more so on my legs (especially my bad knee felt even worse), the worse headache I think that I ever had. Even my breasts were sore. it hurt just to lay down. Took 2 more tylenol, felt the same. Woke up the next morning, less pains, but my bad knee still hurted more than usual, 100 fever, tired, headache much less. Basically, had to lay down all day. I had no energy. Arm still very sore. Sunday, felt much better, slightly more energy, arm still very sore. Monday, feeling much better, but my arm is still very sore.

1143862	3/29/2021	FL	72	F	3/3/2021	3/3/2021	She had a lower GI procedure done on 3/1/21, 2 days prior to the vaccine. A few hours after being discharged from the lower GI procedure her lower lip began to swell and get large and then fill with pus. She got the shot 2 days later, and started getting blisters all over her body with itching, and so forth. She finally went on 3/19/21 to get some sort of assistance for the reaction, went to UC as she did not have a doctor yet, and Dr. there. He prescribed Fexofenadine HCL 180 mg for the itch, then he gave her 14 tablets of Prednisone 10 mg tablets for the blistering. After depleting both scripts she has a worse situation that ever. The blistering is now in her eyes, ears, nose and the entire body. She is going to go back to the doctor or UC today.

1143845	3/29/2021	FL	50	M	3/24/2021	3/24/2021	-Sore arm: started about 2 hours after injection. By 18 hours after, it felt like I had a really bad bruise there. It was throbbing always, more painful to stretch the deltoid where the shot was given, and sharply painful if I used that muscle to lift my arm. This continued until about 30 hours when it started to reduce in intensity until being gone about 60 hours (2.5 days) after the shot. -General lethargy: started about 6-7 hours after shot. Peaked about 24 hours. Still able to get up and move around but very tired. Gone at about 43 hour mark. -Body aches: timeframes the same as lethargy. Felt at worst like a bad flu. - Headache and lightheadedness: Started about 2 hours after injection. Never got really bad, but was fairly consistently there until about 36 hour mark. - Burning eyes: started about 7 hours after shot, was annoying and lasted until about 33 hour mark. - Coughing: mild but distinct dry cough started about 18 hours after shot and lasted to about 30 hour mark.
1143843	3/29/2021	MI	52	F	3/24/2021	3/24/2021	~~Moderna COVID-19 Vaccine EUA", 8 hours after shot - muscle aches all over body and chills, 24 hours after shot through today - headache, eye pain when moving eyes, chills, cough, head congestion .
1144110	3/29/2021	OR	80	F	1/27/2021	1/30/2021	3 days after receiving 1st shot, I woke up as usual & after putting on coffee I returned to dressing room to put in my eye drops...a morning ritual, and as doing so I completely 'blacked out' & fell against the dressing room counter and floor. I have fainted before and this was nothing like that. I don't think I was 'out' long nut when I cam to I was on the floor afraid I had had a stroke or heart attack..ruling that out I slowly got up and after sitting for a minute, called my neighbor and then she called 91. I was taken to the emergency at Hospital where they ran all kinds of test
1144297	3/29/2021	IL	53	F	3/2/2021	3/3/2021	Extreme lethargy experienced after shot. Localized soreness went away within 2 days. But feeling of fatigue has lasted this entire month since and I go for Shot number 2 tomorrow. I'm scared of what it will do. I pretty much had to sleep 85% of the 2 weekends after injection. Left work early a couple of times as a result because I just could no longer keep my eyes open.

1143289	3/29/2021	OH	38	F	1/15/2021	1/15/2021	I had shingles 3 to 4 weeks prior to receiving my vaccine. Within 2 to 3 hours after the vaccine, I felt a burning sensation on the left side of my forehead going up into my scalp and then the shingles rash appeared. I was put on antiviral medication. I also had to see an eye doctor because the shingles rash started to both my vision.
1143027	3/29/2021	MD	61	F	3/26/2021	3/29/2021	While she was in her 15 min wait period post injection she complained of palpitations. HR was 82 on Pulse ox and O2 sat was 97%. Listening to her heart with stethoscope she was regular at 82. That night she stated she had hearing and visual disturbances. Saturday morning March 27 2021 she had a severe headache and took tylenol and went back to bed. Sunday still with same complaints.
1142936	3/29/2021	TX	46	F	3/11/2021	3/12/2021	facial drooping/Bells Palsy; This is a spontaneous report from a contactable consumer (patient). A 46-year-old female patient (not pregnant) received dose number 1 of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EN6206) via an unspecified route of administration, administered in the left arm, on 11Mar2021 08:15 AM at a single dose for COVID-19 immunisation. Medical history included diabetes, thyroid, and hernia. The patient had no known allergies. Concomitant medication(s) included metformin hydrochloride (METFORMIN ER); levothyroxine; and omeprazole. The patient had no other vaccine in four weeks. On 12Mar2021 at 2AM, the patient woke up and had facial drooping; went to the ER and was admitted for possible stroke. It was further clarified that it was not a stroke but she has Bell's palsy. The adverse event (AE) resulted in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care, and hospitalization (duration for 1 day, from 12Mar2021 to 13Mar2021). AE treatment included medicine, methylprednisolone, valacyclovir, eyedrop. The patient had no COVID prior to vaccination. The patient underwent lab tests which included COVID test type post vaccination (nasal swab, rapid test): negative on 12Mar2021 (COVID tested post vaccination). The outcome of the event was not recovered.

1142923	3/29/2021	NY	65	F	3/4/2021	3/4/2021	Dehydration, hospitalized/dehydrated; My fever broke on Monday; Cruel, incapacitating headache/have such a painful headache that I can't eat; Eye pain; Aversion to food/ can't eat; Constant watery diarrhea despite not much food/diarrhea I have so bad; Constant nausea; Utter and complete lassitude/ exhausted; Being in bed, low energy; Stomach upset; Cough; This is a spontaneous report from a contactable consumer (patient). A 65-year-old female consumer patient received her second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration in the left arm on 04Mar2021 16:00 as a single dose for COVID-19 immunisation. Medical history included, in the 1990's, was diagnosed with systemic sclerosis (limited, used to be called CREST scleroderma), pretty severe Raynaud's syndrome, telangiectases, fatigue and sometimes joint aches. Patient was healthy despite this. Patient was not pregnant. The patient was not diagnosed with COVID prior vaccination. Concomitant medications in two weeks included amlodipine besylate, escitalopram oxalate (LEXAPRO), and clonazepam (KLONOPIN). The patient previously received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration in left arm on 11Feb2021 04:00 PM and felt unwell but went to work and was fine in 2 days. On 04Mar2021, it was very different, the patient began having symptoms within 4 hours after receiving vaccine at 9 o'clock that night. The patient stated "symptoms worsened and it is one week today and I am still sick. My fever broke on Monday. I still have cruel, incapacitating headache, eye pain, aversion to food (extremely weird for me), constant watery diarrhea despite not much food, constant nausea, utter and complete lassitude, dehydration (hospitalized, 2 liters of fluids), pain meds and anti-nausea meds. I have missed a week of work and this is a serious issue for many. I am OK but using precious sick time." Events resulted in doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care. Patient stated "I missed whole week to work and I'm still sick. I have had so many different symptoms and some have gone away like my fever is gone but I have such a painful headache that I can't eat, nausea and constant diarrhea,

you get the idea. I'm not against the vaccine but I think it would be good if people like me, people that have had my experience know, I hope it's within the normal range, I still don't know I would love to talk to somebody and find out if what I am experiencing is in the normal range, but it's not, people saying they experience so far the kind of the level of being in bed, low energy, unable to eat, fever, headache, stomach upset, I didn't have a cold, I had respiratory, I had a cough that has cleared up. I was hospitalized yesterday with fluids to become hydrated. It's important for us, you know, I mean, I leave the work that not good, people need to be prepared, it should be sick time I think it's important there is a follow up, absolutely. I was very happy I got the vaccine but I am so sick and it's been a week today so, that's why I decided to call and I was in the hospital yesterday, getting fluids dehydrated and I was admitted (reason for hospitalization was not clarified). I wasn't admitted, I was in the hospital for the day on IV fluids, anti-nausea medication, pain medication also, 3 things they gave me in an IV. They sent me home but the diarrhea I have so bad, I'm exhausted, but I have to spent all my time in the toilet, I thought today might be, I might wake up it would be healing today but I'm still pretty sick." Outcome of fever and cough was recovered, and of remaining events was not recovered. The patient underwent COVID-19 virus test via nasal swab on 03Mar2021 with negative result. Information about lot/batch number has been requested.

1142922	3/29/2021	NY	51	M	12/29/2020	12/29/2020	Developed paresthesias in right arm, into axilla, nex and right side of face; burning irritation of right eye; This is a spontaneous report from a contactable nurse (the patient). A 51-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot#: EL0142), via an unspecified route of administration, in the right arm on 29Dec2020 at 15:00 PM (at the age of 51 years) as a single dose for COVID-19 immunization. Medical history included sciatica. There was no known allergies. There were no concomitant medications. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 29Dec2020, within 4 hours of vaccination, the patient developed paresthesia's in right arm, into axilla, neck and right side of face, burning irritation of right eye. The patient was evaluated by neurologist. No treatment given. Symptoms resolved in 10 days. The clinical outcome of the events paresthesia's in right arm, into axilla, neck and right side of face, burning irritation of right eye was recovered on 08Jan2021. It was also reported that since the vaccination, the patient had not been tested for COVID-19.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified.

1143479	3/29/2021	AZ	68	F	2/27/2021	3/9/2021	body ache from head to toe; chills; sore throat worsening; sore throat worsening; fever of 101.8F; dry cough; weakness; This is a spontaneous report from a contactable nurse reporting for herself. A 68-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Lot number reported as "G or E N6202"), intramuscular in left arm on 27Feb2021 (age at vaccination 68-year-old) at 11.30 at single dose for COVID-19 immunization. She is due to take the second dose of the vaccine on 20Mar2021. Medical history included: she has history of AFIB but has been in regular rhythm and has not taken any medications since 3-4 years ago. Her blood pressure is so low and she was falling all the time, was dizzy and bumping into wall. The doctor said it was a good thing she is off. Her blood pressure is still 90's/60/s. She got shingles two shots and she got it last fall. Those were pretty awful. She had a lot of local tenderness, trouble lifting arm up and the next two days, she felt blah and had pain in clavicle and scapula on left side. That pain in the bone lasted about a week afterwards; diagnosed allergies, compromised immune status, respiratory illness, genetic /chromosomal abnormalities, endocrine abnormalities (including diabetes) and obesity, she has had low white cell all of her adult life (she has gone between 3.5 and 4.0). Family medical history: Cardiac history. Concomitant medication included: eye vitamins and that kind of stuff. She did not take Tylenol or aspirin two days prior. On 09Mar2021, 11 days after getting the first dose of the vaccine, she had symptoms namely sore throat, chills, body ache from head to toe, dry cough, fever and weakness. She said that it lasted for 36 hours. She felt so crappy on 09Mar she did not take her temperature. She did not take it until 10Mar2021 when it reached a maximum of 101.8 degrees. Patient said she now feels pretty good except she has no energy at times. She wondered if she had COVID, so she got a test on 10Mar2021 and it was negative. Patient reported that she actually had a sore throat for about a year. That may not have been started with the vaccine, but it may have been exacerbated. She thinks she may have Reflux. She made an appointment with her gastroenterologist. She said her throat was red when she went to Urgent care to get the COVID test. She has had a dry cough for about a

Around 8pm that evening, he began having chills and didn't sleep well. On 19MAR, patient states he felt tired and vision got blurry while driving. Last thing he remembers is EMS personnel in ambulance stating that BP was very low. Patient states that while trying to brake prior to accident, he felt like he couldn't move his foot and stayed on the accelerator because he couldn't move his foot. MVA 19 Mar 2021. States following his COVID vaccination on 18 Mar, he had fevers, chills, and body aches that night and into the next day. While driving to work on 19 Mar at 0900, he struck another vehicle from behind while traveling 40mph. States his vision went blurry and he was unable to move his leg off the accelerator. He was wearing his seatbelt and the airbags deployed. Denies any LOC. He was taken via ambulance to. Imaging performed, as above, unremarkable. SM denies any issues today and feels well, besides neck pain. Unremarkable neurologic exam in clinic, no focal neuro deficits. MACE completed and showed a 2 point improvement from yesterday. Discussed importance of physical and mental rest, limit caffeinated products. Light indoor duty and no PT for next 3 days. Will f/u on Friday, 26 Mar 21.
1143659	3/29/2021	NJ	70	F	2/27/2021	3/12/2021	On the 13th day after receiving first shot at around 230pm I was eating late lunch in restaurant when I felt a flutter on left side of my face, my lips went numb and my taste dissappeared. My left eye began to burn and tear profusely. My mouth felt like it was on the side of my face and I had trouble drinking and chewing. I thought it was an allergic reaction to the food. Three hours later I looked at my face and was alarmed because my entire left side was paralyzed and drooping and my mouth was twisted to the right. I rushed to Hospital in around 6:30 pm. After numerous test (inc brain scan) and consultation with Neurologist I was diagnosed with Bell Palsy.
1143242	3/29/2021	NY	43	F	2/9/2021	2/9/2021	2/9/2021 Almost instantly had nausea, dizziness, blurred vision. Lower extremities hot to touch, almost sweating. Upper extremities cold. R hip pain to the point I almost thought I broke my hip. Urgent care; steroid shot for hearing loss. ENT; stated I have Meniere's disease. Will have the rest of my life. Weeks zero appetite, diarrhea.

1143558	3/29/2021	MD	43	F	3/28/2021	3/28/2021	About 18 minutes after receiving the vaccine, I started to feel a little numb on the right side of my collar bone and then a tingling in my right pinky toe and finally under my right eye. We had already left the vaccine site so I told my daughter who was driving that I felt a little funny and would let her know if she needed to take me to the hospital. I had not eaten yet that day, only coffee in the morning so we ran a couple of errands and then grabbed lunch. Around 3:30pm on the same day (3/28/2021) I started to feel better and the only side effect I currently have is tenderness in my arm where I received the shot. I did not seek medical treatment as it went away within a couple of hours.

1143815	3/29/2021	CA	55	M	3/12/2021	3/12/2021	<p>started to lose his vision; he couldn't see anything; Shot was painful; he started to get hot with the sweats; he started to get hot with the sweats; terrible headache; dizziness; nauseated; This is a spontaneous report from a contactable consumer (patient). A 55-year-old male patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration, administered in left arm on 12Mar2021 00:30 (lot number: ENG6199) (at age 55 years old) as single dose for covid-19 immunization administered in a pharmacy or drug store. The patient had no relevant medical history. No known allergies. The patient had no covid prior to vaccination and was not tested post vaccination. Concomitant medication included tramadol taken for numbing shot for tooth, start and stop date were not reported. No other vaccines received in four weeks. The patient experienced the following with his first dose of the Pfizer vaccine. Shot was painful and in about 15 to 20 minutes later everything felt fine. But by the time he and his wife drove out of town, he started to get HOT with the sweats, terrible headache, dizziness and started to lose his vision. He pulled over to let his wife drive and by the time he got out of the car he could barely navigate to the passenger side. They turned around and headed for the hospital, 8 min away, at this time he couldn't see anything, he was nauseated but knew the hospital was pretty close. During this whole time his heart rate never raced just kept and even beat. His breathing was also just fine. By the time they got into the parking lot his vision was slowly getting better, so they sat in the parking lot for 30 minutes with the air conditioner on as high as it could go. His wife read through the side effects, he was experiencing many on the list. They left without going in. Onset of the events was reported as 12Mar2021 12:45 AM. Treatment was not given for the events. The patient recovered from the event "shot was painful" on 12Mar2021; while recovered from the rest of the events on an unspecified date in Mar2021.</p>

1145381	3/29/2021	MI	45	F	3/26/2021	3/26/2021	<p>HPI: Patient is a 45-year-old female who presents for evaluation after COVID-19 vaccine reaction. Patient just received 1st vaccine this morning. She was being observed in the vaccine clinic when she started to experience numbness all over her body and hives over the upper chest. She was brought immediately to the emergency department for treatment. Upon assessment, she is lying flat in the bed. States she feels weird. No difficulty swallowing, no difficulty breathing. She is not itching. She has no known allergies. MEDICAL DECISION MAKING Upon arrival to the emergency department patient was immediately assessed at the bedside. She was lying in the bed, eyes closed, appeared somnolent with answering questions. She did have urticaria on the upper chest. She was also tachycardic. IV was established, she was treated with intramuscular epinephrine, IV Benadryl, famotidine, and Solu-Medrol. Patient was observed in our emergency department for 3 hours and had complete resolution in her symptoms. She was reassessed on multiple occasions during her emergency department stay and continued to show signs of improvement. I do feel that she is safe for discharge home. Recommend not getting COVID-19 vaccine in the future given her allergic reaction today. Patient is in agreement with this plan, she was discharged home in improved condition. Medications EPINEPHrine anaphylaxis kit 0.3 mg (0.3 mg Intramuscular Given 3/26/21 0814) methylPREDNISolone sodium succinate (SOLU-Medrol) injection 125 mg (125 mg Intravenous Given 3/26/21 0818) famotidine (PEPCID) injection 20 mg (20 mg Intravenous Given 3/26/21 0818) diphenhydrAMINE (BENADRYL) injection 50 mg (50 mg Intravenous Given 3/26/21 0816) sodium chloride 0.9% bolus injection 1,000 mL (0 mL Intravenous Stopped 3/26/21 0948) broke out in hives, heart started racing, went to ED where they treated her. Patient got home a couple hours ago and back of neck is breaking out again and says throat feels funny.</p>

She endorses nausea, vomiting, and headache. Her symptoms are worse with position changes. She states that she has a hx of vertigo with her last episode being 11 months ago. She states that she does not normally have a headache with her episodes of vertigo, but today she developed one. Denies chest pain, sore throat, visual disturbance, or diarrhea. She reports chronic shortness of breath. She is a former smoker. Denies alcohol use. No other complaints at this time.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1145290	3/29/2021	WI	73	F	3/9/2021	3/16/2021	<p>Pt seen in ophthalmology clinic 3/16/21 for evaluation of c/o bilateral vision loss and admitted to hospital for further evaluation and management based on their findings. She has known history of cataracts, macular thinning of the left eye and bilateral pseudophakia, but no recent vision issues. Pt states that approximately 3 to 4 days after getting her first COVID-19 vaccination (Pfizer) on 2/16/2021 she noted blurred vision in left eye and over the course of the next several days, started to have worsening blurring as well as darkening of her vision to the point where she was only able to see faint outlines of objects. Did also have some associated visual hallucinations with this. Seen in clinic (exact date unknown but sometime between 2/16/21 and 3/8/21) where a visual acuity exam was done, and no further evaluation was recommended. But pt had ongoing issues and was ultimately seen by ophthalmology on 3/8/21 and was then directed to the ED on 3/8/2021 for possible stroke evaluation. In the ED, CT of the brain was negative for acute stroke. MRI was advised, but patient declined during that ED visit and voiced preference to schedule outpatient, however, she was never able to make that appointment. On 3/9/21, pt received her second COVID-19 vaccine, and 1 to 2 days later, she developed the same symptoms in the right eye, though does not feel that her visual acuity decreased by as much in that eye as it had in the left eye. Pt also has had mild associated frontal headache since her first COVID-19 vaccination, but it responds readily to acetaminophen. Pt seen in ophthalmology clinic again on 3/16/21. At that appointment, she had a funduscopic exam which showed mild temporal pallor and ophthalmology felt that this is likely inflammation of the optic nerve or optic nerve sheath, likely secondary to retrobulbar optic neuritis versus perineuritis possibly triggered by recent vaccination. Request was made for admission to Hospital for further evaluation and management. Hospital Course (admitted 3/16/21 ? 3/22/21): MRI of the brain and orbits revealed optic neuritis. In consultation with neurology and neuro-ophthalmology the pt was started on a 5-day course of methylprednisolone 1 g IV daily. The pt noted improvement in her vision rapidly. Primary diagnosis at discharge was optic neuritis, possibly triggered by covid-19 vaccination.</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1145268	3/29/2021	CA	42	F	3/26/2021	3/26/2021	Right after injection my eyes burned an I had a strong metallic taste in my mouth that made my old fillings tingle (similar to metal touching them.) The next day I had a large red rash that was hard and radiated heat at the injection location (size of baseball then enlarge to size of softball next day). I took anti-histamine and alieve and felt better. Large rash still remains on my arm but not hard.
1145425	3/29/2021	MA	64	F	3/26/2021	3/26/2021	3/26/21 4 hours after injection she started feeling sore, took Motrin. The next morning she was unable to lift arm, took Motrin several times over the course of the day and when she couldn't take the pain any longer she decided to go to the ER. 3/27/21 Went to the hospital after she had no relief from the Motrin. . 3/29/21 Went to the ER today, due to cold hands and feet, numbness and tingling, could barely stand, she stated she felt like she was going to die. Examined, states she had no deficits with vision or neurological. It lasted about an hour and then states she was fine. Dr. states she had a vasovagal response.
1145868	3/29/2021	NC	44	F	3/29/2021	3/29/2021	Almost immediately upon injection the patient asked if it was supposed to burn and radiate down her arm. She said her arm was feeling "hot." Then she said she felt "dizzy and light-headed." She said she was having trouble focusing her eyes (vision changes). I had her sit down and she started to sway in a circle. I called her husband into the vaccination room at that point. She started to flush and said she felt hot. She said she wasn't feeling normal. I asked if she wanted me to call 911. She said yes. We called 911. Then she started to slump over and faint. I administered Epipen 0.3mg IM in her left thigh at 4:30pm. She started to have trouble swallowing until 4:32pm. The police arrived and started to talk to the patient. The patient started to respond to the Epipen injection, and soon wasn't having any trouble breathing. She experienced tremors, shakiness, and teeth-chattering until EMS arrived at 4:38pm. She indicated she wanted to go to the hospital for observation. EMS administered IM Diphenhydramine on the scene, and she left with them at 4:52pm.

1146084	3/29/2021	OR	51	F	3/28/2021	3/28/2021	I had the first dose of the Pfizer vaccine last night (6 p.m.). Within 15 minutes my left hand and left arm started to itch. I saw the medical folks on location but since there were no hives or anaphylaxis, I was told "it must be eczema" (which I do not have. The itching continued to get worse and spread to under my eyelids, inside my ears, and "under" the surface of my skin - mostly on my face, skull, neck, behind my knees. I called the advice nurse at 7:30 but there was still no hives, visible rash, or breathing issues. I started taking 10 ml of Benadryl every four hours but the itching was awful and the Benadryl only "took the edge off" and the itching persists enough I could not sleep last night (3/28). There is still no visible rash or breathing issues but the itch is awful. I reached out to my primary care Dr and I was instructed to take Zyrtec in addition to the Benadryl. It helps but makes it slightly tolerable, it does not stop the itching. As of right now (7:36 p.m. the day after the shot), I am still experiencing itch...but it is less than it was this time last night (however, I am taking both Zyrtec and Benadryl).
1146048	3/29/2021	TX	29	F	3/6/2021	3/8/2021	Blurry vision for 4-5 days along with a headache
1145970	3/29/2021	NY	61	F	3/26/2021	3/26/2021	Minor -pain at injection site, pain in right wrist and vision change which started about 3 hours after injection on Friday. Later in day I noticed a new dark circular floater. Saw retinologist on Monday and learned I had a posterior vitreous detachment and Weiss ring. Seems like more than a coincidence as I had no prior injury, my blood sugar is fairly well controlled, and I was well hydrated.
1145537	3/29/2021	WA	60	F	1/4/2021	1/7/2021	My gums started bleeding and I don't normally have bleeding gums. It continued on for about two weeks - about 10 days into it, I called the dentist. And he took a look and it didn't look like anything was infected. And it did just go away after about two weeks or so. Subjunctoval hematomas - looks like my eye is bleeding - it was my left eye - that symptom started about a week or two weeks ago. That lasted a few days and I haven't gotten anything else since then with my eyes.
1145881	3/29/2021	TX	54	F	3/28/2021	3/29/2021	Sudden onset of red flushed face, burning sensation of face, red bloodshot eyes 30 hours post injection No other body part impacted. No fever, no other symptoms

1144623	3/29/2021	FL	18	F	3/29/2021	3/29/2021	At 1428, patient mother alerted medical staff, stating her daughter had a seizure. Upon arrival, daughter was sitting upright in passenger seat, mother holding her, eyes open, appearing pale. No convulsions , incontinence, or other seizure activity noted. EMS notified and arrived within a minute and evaluated patient. No medications or additional treatment given. Patient ambulated to EMS stretcher with one person assistance. Awake and talking. Patient transported via ambulance at 1437.
1144589	3/29/2021	MI	50	F	3/17/2021	3/17/2021	March 17th - The night of injection I felt like a small SUV ran over me. By late night it turned into a MAC truck. I had a massive headache, 101.6 fever, chills, and overall just feeling unwell. I felt "plugged in". I could taste metal taste. March 18th - I just felt flu-ish. March 19th - I started having right ear pain and all my lymph nodes felt heavy. Still tasted metal. March 22nd - I was up all night and mouth pain on both sides. I went to Urgent Care thinking I had an ear infection and/or sinus infection. My sinuses and ear were fine and they believe it was an adverse reaction to the vaccination. I received Prednisone, but that has only made things worse. Today, March 29th - I went to my dentist, still in pain, and wondering if a tooth infection. My teeth were fine and he felt it was neurological, possibly connected to the vaccine. He prescribed me some Norco, told me to go to the hospital tomorrow if I'm still in this much pain. Today - eyes blurry, face hurts to touch, lymph nodes swollen, tongue tastes metallic, ear hurts, head hurts, fatigue.
1144708	3/29/2021	NY	56	M	3/12/2021	3/24/2021	Per MD note: Notably patient received Pfizer COVID 19 vaccine on March 12 th. He was doing well but then 3/24/21 patient noted his right eye was feeling "funny" and the next day or 2 it continued and then was hard to close eye on its own. In the last 1-2 days he is having a right facial droop and cannot hold his mouth closed with puffing out cheeks. Separately he also has tenderness like a bruised area just anterior to the right ear and describes a fullness/swelling of the tissue there and more anteriorly on the cheek. He does not recall similar sensation with his prior Bell's Palsy which was on the left side 2 years ago. He denies other symptoms , with out fever or chills. No other suggestion of sicknesses.

1144446	3/29/2021	WA	79	F	1/26/2021	1/28/2021	Received vaccine on 01/26/2021 and unknowingly experienced event. Early morning of 01/28/2021 had fainting spell and thought it was caused by low blood pressure. Felt fine for remainder of day. On evening of 01/29/2021 I started having strange symptoms. Could not concentrate, vision impaired and couldn't figure out what evening meds I needed to take. Decided to go? to hospital on 01/30/2021. Getting ready, I passed out and husband called emergency services. Husband learned later in the day that I had a stroke. Doctors informed that had blood clots in heart and lungs. Doctors advised not to get second vaccine shot.
1145177	3/29/2021	CA	54	F	3/27/2021	3/27/2021	Patient received her second dose of the covid-19 Moderna Vaccine today at Vaccination site. Pt began feeling ill about 10 minutes after receiving the shot. Assistant came to inform me as the RN on site. She assisted with translation as Pt is a native Spanish speaker. Pt stated that she felt numbness and tingling in her Left leg, numbness and scratchiness in her throat, and nausea. Pt was noted to be visibly diaphoretic. Pt denied any trouble swallowing, speaking, or trouble breathing. Pt denied any chest pain or pain anywhere. Pt received shot in her Left arm and denied any pain or tingling in her Left arm. Pt did not have any facial droop, slurring of speech, changes in vision and was able to demonstrate ability to lift both arms equivocally. Pt A&O x 4. I decided that calling the paramedics was best practice as Pt was borderline appropriate for administration of Epinephrine. Paramedics arrived on scene within 5 minutes of 911 call and assessed Pt. Paramedics stated that they did not feel that Pt necessitated taking to the hospital at this time and that it was good judgement on holding giving Epinephrine at this time. Pt son was brought in to speak with paramedics who informed him to monitor patient for the rest of the day and that if anything changed with her symptoms or became worse- that he needed to either call 911 or take her straight to the ED. Pt was released by paramedics and her son took her with him.

1145115	3/29/2021	CA	38	F	3/28/2021	3/28/2021	At 12:20 patient began to feel dizzy and began closing her eyes. She stated that everything went black around that time. She was minimally following commands, but unable to do so reliably. She became diaphoretic and pale, and her pulse was thready and difficult to palpate. Her vitals were taken. Her heart rate was 35 and O2 saturation was 96% (both of these were taken by pulse ox). Her blood pressure was 110/86 taken manually. For about 5 mins, she was having a very difficult time keeping her eyes open, and the EMS was called. After several more minutes, she began feeling much better, color increased, HR increased, and Level of consciousness increased as well. The paramedics evaluated her and suggested she be further evaluated at the hospital but the patient refused. The nursing staff and EMS agreed that it was most likely a vasovagal/syncopal event.
1145063	3/29/2021	WA	47	F	3/8/2021	3/19/2021	LEFT EYE DRY AND RED ON MARCH 19TH; FACE SWOLLEN, NUMB AND DROOPY THE 20TH. PATIENT FOLLOWED UP WITH PROVIDER A WAS DIAGNOSED WITH BELLS PALSY
1144471	3/29/2021	CA	17	F	3/28/2021	3/28/2021	Hives to arms, trunk and face within 8 hours of receiving vaccine. No swelling to lips or eyes, no wheeze. Hives improved with antihistamines.
1144727	3/29/2021	OH	58	F	3/16/2021	3/16/2021	Immediate reaction within 10 minutes. Faint, dizzy, sweating, eyes having trouble focusing. This got better within 15-20 minutes. One hour later a rash appeared on chest and both arms with tingling/numbness in left hand . Face was swollen with a hive on one cheek. Some chills over the first 10 hours. Walmart pharmacy nurse called to check on me and suggested taking Benadryl. The rash disappeared about 3 days later. The swelling did not go away. 5 days later began to have migraines and dizziness. Left hand still had some numbness and facial swelling was still there. Called my health provider - they assumed it was just reaction to the vaccine. Visited a clinic on 3/28. It appears the vaccine triggered 5-year old shingles symptoms (swelling in face, pain and migraines). Am taking Prednisone and Zyrtec and have an upcoming appointment at the clinic with an infectious disease doctor on 4/1. Continuing headaches and swelling.

1144874	3/29/2021	CA	27	M	3/25/2021	3/25/2021	I've been experiencing mild, but consistent adverse side effects to the vaccine. This vaccine. Is completely Terroristic. This vaccine is a biological warfare. I've been very active in obtaining vaccinations. Flu shots, up to date with tetanus, and obtaining a second Immunization for chicken pox because I actually received the chicken, but had no vaccination. And. I need the vaccination record for school. So I had to get the chicken pox vaccine. I've been having mild, but very uncomfortable and consistent headaches. My sinuses all over my face are so filled. My eyes are watery, turn red, and at time so painful that it's difficult to open them. I have muscle weakness. I'm always so thirty all the time. My urine smells like uric acid. Has a rancid toxic smell to it. And. My urine is clear. But smells. My skin feels silky. And. the perspiration from my body, smells like formaldehyde. Smells clean, but smells like toxic formaldehyde and dead sticky body residue. The most uncomfortable is the partial blindness. Headaches. Muscle aches. Joint aches. Neck pains. Eye pains. The consistent thirst. I can't go to the doctor because I don't have insure. But. Most importantly. I don't have employment, because of the Government's illegal employment system that accounts for me. I've been unemployed for 6 years. And. Have a private college degree from one of the top Universities in the USA. Also. I've been very active in producing sputum. Flem. My neck is swollen. And parts of my body are swollen. Not severely. But you can see there is minor swelling. All the symptoms I'm disclosing in this report, are minor. But. When collectively experienced. Is unbarable. Extremely Uncomfortable. And. You're expecting me to get another dosage of this experience. Being. 2 months incapacitated. This is even illegally distributed. What the hell. In God's name. Are you people in there doing. And. Why are you people in the Government even able to get away with this.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1144857	3/29/2021	OH	45	F	3/26/2021	3/26/2021	On my way home from getting the vaccination, the Left side of my face (cheekbone around left eye and above eyebrow) felt like it was on fire, felt swollen but was not visually, and was painful to the touch. After about 3 hours the burning sensation was reduced to an ache but to the touch it felt numb. Almost like I had had novacaine and it was wearing off without the tingling sensation. I called my PCP and left a message. The next day, Saturday, it felt like I had been punched in the face. It was very sore and ached. Sunday was better, with just a slight ache, but not 100%. As I write this, it feels a little off (best way to describe it) but no pain or ache. My PCP has not called me back.

1144839	3/29/2021	OH	24	F	3/29/2021	3/29/2021	Patient was vaccinated around 10:55 AM. Within a couple of minutes she started feeling lightheaded, sweaty, and had blurry vision while sitting. She reported no history of blood sugar issues, but she said she only had some donut to eat today. I initially gave her three glucose tablets and a bottle of water, which she sipped. She reported feeling better within a few minutes. I checked her blood pressure at 10:59 AM. It read low at 81/44 with a pulse of 73. But, I checked again since I doubted the accuracy of the reading. The second reading was 101/56, with a pulse of 79. Patient said she was feeling better, but continued to sit. I gave her one more glucose tablet to equal a total of 16 g of carbs given. She sat for at least fifteen minutes until she felt well enough to get up and shop. She checked back after shopping and said she was fine.

1140674	3/28/2021	FL	72	F	3/5/2021	3/6/2021	<p>Bell's Palsy - right side of face is paralyzed, right eye doesn't close fully, teary right eye, blurry right eye, and headache; This is a spontaneous report from a contactable healthcare professional (patient). A 72-year-old female patient received her second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6200), via an unspecified route of administration in right arm on 05Mar2021 10:00 as a single dose for COVID-19 immunisation. Medical history included hypertension (HTN), hypothyroid, chronic achilles tendonitis, pre-diabetic. The patient had no known allergies. Concomitant medications included losartan, metoprolol; thyroid (NATURE THROID) reported as 'Zinc Berberine Nature Throid.' The patient was not diagnosed with COVID prior to vaccination. She was not pregnant. No other vaccine was administered in four weeks. The patient previously received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9262) via unspecified route in right arm on an unspecified date at 12:00PM. On 06Mar2021 12:00PM, the patient experienced Bell's palsy - right side of face was paralyzed, right eye doesn't close fully, teary right eye, blurry right eye, and headache. Events resulted in Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. Treatment received included CT scan of brain, prednisone 60 mg total, and valaciclovir (VALTREX) 1. Outcome of the events was not recovered. The patient had not been covid tested post vaccination.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the event facial paralysis cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.</p>

1141135	3/28/2021	FL	26	F	3/27/2021	3/27/2021	Patient was administered vaccine and told to wait the 15 minute monitoring period. After about 4 minutes, I heard her say "I'm not feeling right." I went to where she was sitting and asked "are you ok?" and had her take some slow, deep breaths. I then saw her eyes roll back and she lost consciousness. Thankfully, I was there and grabbed her as she toppled from the chair. I told the staff to call 911 and supported her neck and body in the chair. I could tell she was breathing and she was sweating profusely. I held her and spoke to her, and after about 15 seconds, she began to come out of it. After about a minute she was alert and orientated again. I had her slowly sip a little water. The EMTs arrived in about 5 minutes and the assessed her vitals. She indicated that this was the first time anything like this had happened to her. They advised that since she had fainted, she should go to the hospital for observation, but she declined, stated that she felt fine at that point. Since she was driving, I insisted that she remain another one-half hour before leaving. During that time she drank more water and alternately sat and walked around the pharmacy. She did indicate that she had drank a protein shake that morning, but not eaten. I advised her to in the future, tell her doctor and/or any immunizer about the event. She left, stating that she was feeling fine, and I called her several hours later to make sure that she had indeed gotten home ok. She again said that she felt fine.
1141169	3/28/2021	NJ	36	M	3/26/2021	3/28/2021	Pfizer-BioNTech COVID-19 Vaccine EUA. Ocular/retinal migraine (kaleidoscope vision) in right eye. Lasted 10 -20 minutes. Went away on its own.
1141212	3/28/2021	MA	61	F	3/27/2021	3/27/2021	Approximately 25 minutes after receiving the vaccine I noticed my eyes were beginning to itch and my throat felt odd and was accompanied by a hoarse voice. I was driving home at that point and considered turning back for medical advice (should have but did not). Over the next few hours itching sensation on my tongue, face including eyes, head and back. Developed just one hive on my eyebrow approx 3 hours after vaccination, and one on my thigh at least six hours after vaccination. The symptoms were not severe but obviously I monitored them. Now 24 hours after the vaccination and still have some itching as described above. Throat is somewhat better. Eyes feel odd more than itchy at this point.

1141481	3/28/2021	IL	53	F	3/26/2021	3/26/2021	I had the vaccine at approximately 7:35 AM and by 1:30 PM I was not running a temperature, however, it felt like my insides were going to burn as my core felt like it was on fire. I still feel like more core is on fire, but it has subsided and is less concerning as it was on Friday, 3/26/2021, and Saturday, 3/27/2021. My eyes became sensitive to light on Friday, 3/26/2021 night and my eyes are still sensitive especially to artificial lighting. Natural light hurts as well but is more tolerable. My heart rate definitely increased Friday, 3/26/2021 through Saturday, 3/27/2021 however I did not experience the other symptoms on the critical list (such as inability to breathe) therefore did not go to the hospital. I suffered from muscle weakness on Friday, 3/26/2021, and Saturday, 3/27/2021. The muscle weakness was only in my legs.
1141295	3/28/2021	OH	38	M	3/28/2021	3/28/2021	Syncope Sweating Shaking Tunnel vision
1142467	3/28/2021	IN	50	F	3/25/2021	3/25/2021	Within two hours: slight nausea, some aches and chills. Within 5 hours severe aches, sore and loose joints, headache, eye lashes hurt (weird, I know), low fever, side of lungs felt heavy and had a hard time breathing deeply. Inability to sleep for more than 15-30 minutes because it felt like the blood was congealing in place if I stayed in one position (again, weird and not reality, but that's what it felt like). Above severe symptoms lasted 24 hours. Most of the next day and night I slept. After 48 hours feeling very much improved, but napped multiple times that day. Third day out just fine, only minor aches.
1142274	3/28/2021	AZ	63	F	2/28/2021	3/8/2021	Right Eye Pain for a few days, about a week later glandular right breast pain for a few days. Both mild but never had either at any other time

1142326	3/28/2021		58	M	2/14/2021	2/22/2021	Got COVID Arm about eight or nine days after first dose. See previous submission on 2-23-21 with the Temporary VAERS #318903. First dose was on Feb. 14th and second dose was on March 14th. It's now been two weeks. Did not have any symptoms in arm this time. Swelling was less after a couple days, did not get "hard" like after first dose. Also, did not get COVID Arm after second dose like I did a week or so later after first dose. Am blood type A. Had only minor side effects after second dose - pressure behind eyes and fatigued, for about 30 hours which began about six hours after second dose. Did not get fever, chills or anything like that.
1142343	3/28/2021	TX	45	M	3/17/2021	3/21/2021	Bells palsy- pain and pressure on rear left side of head and ear. Numbness on the left side of face ,jaw and tongue. Left eye does not blink so constantly tears, slurred speech and no taste. Symptoms started on 3/21/21 and got worse. Meds prescribed acyclovir 800mgs , prednisone 10mg and Diclofenac sod dr 75 mg for pain.
1142363	3/28/2021	IL		F	3/28/2021	3/1/2021	Patient had received her first dose of covid vaccine and was sitting in waiting area and within 5 minutes became pale and was sweating profusely. She then slouched over some and seemed to have loss of consciousness for a few seconds with eyes closing and rolling back. We went to lie the patient down and she became more alert so I put a cold compress on her face and she started feeling better and telling us how she felt. She sat for around 15 more minutes and said she felt fine. Just a slight headache. I called a few hours later to check on her and she was feeling fine per her mother.
1142364	3/28/2021	AZ	71	F	3/24/2021	3/24/2021	Bell's Palsy - pain under left ear, facial drooping on left side, left eye lid swollen, pain in left eye, loss of facial muscle on left side

1142416	3/28/2021	AZ	23	M	3/24/2021	3/24/2021	After taking the vaccine husband started to feel a bit dizzy then 30 seconds later his whole body when into a shock and no longer control himself and started to shake a little. He had his eyes open but was unconscious for about 1 minute. Then he released his bladder and peed on himself. The pharmacist noticed and came over then he responded and was consious again. Then he began to sweat excessively all over his body. His face turned pale and the pharmacist began taking his blood pressure which dropped very low. He then began to feel nauseated. Then he started to get body chills. We monitored my husband there for another 30min and he slowly was coming back to his normal self. He had a small headache but was fine enough to leave.
1142418	3/28/2021	IN	65	F	3/23/2021	3/24/2021	Had vaccine. Went Home; was okay until that evening. Had slight headache, tired achy so took 1 tylenol pm and went to bed. Woke up to to go bathroom and felt nauseous and light headed. Went to bathroom was washing hands and room was spinning. Called for my husband and he came to help hold me but a passed out, slipped out of his arms and landed on floor. I came to, he took my oxygen which was 77; fever of 100. He put my oxygen on and got me to bed. Woke up next morning, nauseous all day, headache, and have a black eye from fall. Felt tired but felt better the following day.
1142420	3/28/2021	AZ	62	F	3/14/2021	3/14/2021	Very itchy right eye, for 2.5 days, (same length of time as arm soreness), followed by sudden onset, noticeable vision loss with diagnosis of epiretinal membrane and vision loss from BCVA from 20/20 or 20/40
1142439	3/28/2021	IL	60	F	3/25/2021	3/26/2021	First dose I was fine,second dose I had reactions next day with face swelling lip swelling tired next day swelling went down then I have big lymph node knots on both sides of neck with chills and fatigue. I am on third day and still have nodes on neck and tired with chills. My eyes fill little swollen also.

Vitals stable. No shortness of breath. Able to squeeze paramedics hands and lift both arms. Allergy to penicillin, peanuts, cooked blueberries, apple cider vinegar, latex, spermicide, macrobid antibiotic. Vital signs stable Monitored pt for another 30 minutes. Did not need to transport to ER.
1142451	3/28/2021	FL	43	F	3/14/2021	3/18/2021	Red rash on both arms, chest, and face. Red eye.
1142596	3/28/2021	KS	55	F	3/25/2021	3/25/2021	First night, hot sweats. follow day very weak, dizzy, nauseated, fatigued, felt feverish, but no fever,. Also, my eyes feel like a sinus cold and my right ear is tender. Two days later still feeling very nauseated, I have GERD, and had a severe GERD attack, very tired. Third day(today) still feeling nauseated, tired, all my senses are heightened, skin tingling, ears and eyes.
1142482	3/28/2021	NY	36	F	3/11/2021	3/11/2021	Puffed/swollen and itchy left eyelid at 11:06pm and swelling of the throat. Symptoms did not get significantly worse by 2am so I went to sleep and did not seek medical attention. Did not take any medication as didn't have any Benadryl or anything available
1142497	3/28/2021	WA	71	F	3/24/2021	3/24/2021	About 13 hours post-vaccination, extreme chills, shivering, body aches and headache commenced. I ran a temperature of 101 degrees for about 24 hours. The headaches/neck aches were so extreme that no food, noise, or light could be tolerated. Hot pads were applied. Only sips of water were tolerated for the first 48 hours. After 24 hours additional pain occurred in lower back and right hand knuckles (sites of previous injuries). Headaches occurred from the sides, radiating up from neck to top of head, and behind eyes at various times, dulled slightly by ibuprofen. On day three small amounts of simple food were tolerated, Ibuprofen was continued. At about 72 hours post-vaccination, all symptoms disappeared, as if there were an "off" switch.

1142240	3/28/2021	CA	45	F	3/25/2021	3/26/2021	I woke up at approximately 2:30 AM feeling very sore, achy, clammy, and feverish. I felt like I needed to get out of bed because laying there felt very uncomfortable. I got up to go to the bathroom. On my way to the bathroom, I fainted in the hallway and landed flat on my face. My front left tooth was knocked completely out of my mouth, and the two adjacent teeth were knocked loose. I found my tooth on the floor, placed it on a shelf in my bathroom, and then took a shower as I was in shock and felt very sweaty and out of sorts. At 2:41, after the shower, I called 911, but declined an ambulance ride and hung up. I then googled what to do when your tooth is knocked out, and learned that I should put the tooth back in its socket immediately. I put the tooth back in and then at 2:57, I called an emergency dentist dispatch line. The dispatcher told me about a dentist who could make an urgent appointment for me when their office opened at 7 AM. I felt like I needed to be under medical supervision right away, so at 3:37 AM, I took a Lyft to the ER at , where I was observed and given an IV. I was discharged at 6:45 AM, and caught a Lyft home at 6:51 AM. My husband returned from work at 8:15 AM. He took me to my emergency dental appointment at 10 AM, where the dentist gave me multiple novocaine shots, straightened my two loose teeth and wired all my front teeth together to stabilize the front tooth that had been knocked out. It is unclear at this time whether my natural tooth will be able to be saved.
1141992	3/28/2021	MI	58	F	3/26/2021	3/26/2021	Immediately after receiving vaccination my lips went numb. About 20 minutes later my lips were better but my face went numb all below the eye area and nose got cold. Below the eyes is still a tingly numb which is now over 48 hours later.

1142002	3/28/2021	CA	27	F	3/27/2021	3/27/2021	27 year old female comes in 3/27/21 at 4:15pm to get Pfizer COVID vaccine. She has no family doctor. On her VAR form she states no seizure or history of seizure but does have reaction to HPV vaccine where her throat swelled up and her MD had to give her oxygen year ago. I asked about any other reactions to any other vaccinations and she said no and was willing to get this vaccine. I told her to wait 30 minutes after vaccination to make sure no reaction. At 4:25pm her sister and mom tell us that patient is feeling weak and dizzy and ask for water, I go out and check and she is pale and is ready to faint. Mother asks for orange juice which she takes a sip. I ask her if she has any health conditions like diabetes, seizures and they say no, then patient has what looks like a petit mal (absence) seizure. While sitting in the chair her eyes flutter, roll back she tenses up and her body freezes for about 20-30 seconds. I tell staff to call 911 and her sister says she's having "another" seizure. We don't move her but make sure she doesn't fall, once the seizure passes we move her to the ground to lie down. She regains consciousness and is coherent but confused. I do not give EpiPen because I witnessed a seizure. The fire and ambulance arrive to assist her and then her family mentions she did have seizures years ago. After 20 minutes or around 4:50pm she feels better and does not want to go to the hospital and walks out assisted by fire/ambulance staff. The next day I call her and she says she feels better and just has a sore arm and will find new doctor check her out.

1142077	3/28/2021	CA	26	F	3/28/2021	3/28/2021	Client complained of feeling nauseous and dizzy after receiving 1st Pfizer Covid Vaccine(Lot# ER8734 Exp 3/31/21) at 1020. Client was walking out of restroom when she alerted EMT she was feeling dizzy and nauseous. Mother was present and had accompanied client to restroom. Per client could walk back to waiting room. Client was assisted by mother from restroom to walk to nearest chair. Fst assessment at 10:23: alert and oriented, blood pressure 130/100, pulse 83, oxygen 98. Per client no breakfast did morning and had not hydrated as well. Client given water and instructed to take small sips. Client denied headache, blurry vision, or vomiting in restroom. Client informed she would be observed for an additional 15 mins. Client asked if she could eat a snack as she felt she was feeling this way due to not having breakfast. Client advised to take small bites. Per client no history of allergies or reaction to vaccines and no current medication she takes. Within 5 minutes of sitting client stated symptoms were improving. Vitals at 1036: blood pressure 120/88, pulse 81, oxygen 98, alert and oriented. Client stated previous symptoms had resolved. Client advised to speak with provider prior to second dose. ER precautions given. Mother would drive client home. Client left facility at 1038 with a steady gait.
1142092	3/28/2021	VA	47	M	3/19/2021	3/27/2021	I have recently noticed an unusual bruise above my left eye, in the gap between my upper left eyelid and my left eyebrow. The bruise was dark brown in color, about 2cm x 1cm. This is a hidden area, unless I close my left eye or pull my left eyebrow upward. My son noticed it on March 27th, but it may have been there longer than that. Today I noticed the yellow-greenish color surrounding it today, so it appears to be somewhat new. I have not noticed unusual bruising anywhere else. It is possible that the bruise resulted from a mild physical impact from my son during play, but I do not recall any unusual impacts of note.

1139726	3/27/2021	AR	45	M	3/8/2021	3/10/2021	Right ear pain started on the Wednesday afternoon, two days after Vaccine shot. By Friday evening the ear pain was intense and it had moved below the ear to lymphnode area. Saturday, his ear was really swollen and red. He went to the Urgent Care and they prescribed an antibiotic Cephalexin thinking it could be some sort of ear infection or insect bite. Sunday morning he woke up with his face droopy. We tried to get an appt. with Urgent Care, but they sent us to the ER. The ER did a physical assessment and concluded he had an ear infection and Bells Palsy. The prescribed another antibiotic Doxycycline, an antiviral Famciclovir and a steroid of prednisone. By Monday he was extremely nauseas and had started having vertigo. We went to Urgent Care and they prescribed him Ondansetron for nausea and made the assessment that he had Shingles in his ear. We saw PCP on Wednesday and he assessed that this was a zoster ear infection causing facial paralysis and vertigo, also known as a rare condition called Ramsay Hunt Syndrome and that it was most likely attributed to his Covid vaccine shot and not to get the second vaccine shot. The Dr. took him off the antibiotics and put him on a higher dose of prednisone, a different antiviral (valacyclovir) and Meclizine for vertigo symptoms. He sent referrals for Neurology, ENT and Eye Dr. He saw the Neurologist that Friday and he concurred Ramsay Hunt Syndrome, most likley from Covid Vaccine and do not get the second vaccine shot. The neurologist referred him to Physical Therapy to treat his vestibular issues. He ordered an MRI and some blood work. We are still waiting for the results. We saw an ENT an he had him have a hearing test which showed moderate high frequency hearing loss. The ENT prescribed Gabapentin for the ear and face pain. He started to see a physical therapist this week, he had his MRI on Wednesday and we see the ENT again on Monday. He has no improvement yet, other than the nausea has subsided.

1139701	3/27/2021	MO	25	F	3/26/2021	3/26/2021	I received the Johnson & Johnson COVID-19 vaccine at 8:30AM on Friday, March 26. The only symptoms I experienced until that evening were mild soreness at the injection site, mild stiffness/soreness in my left arm and my neck, and mild body aches. At 6:00PM that day, I was driving and experienced sudden-onset nausea and dizziness. I experienced tunnel vision and my vision began to black out. I was able to pull off the road and began retching and dry heaving. I also experienced tingling/numbness in my lips and then in my right hand, each of which lasted for about a minute. The nausea lasted for 5-10 minutes, after which it dissipated and I started experiencing chills. After returning home, around 9:30PM I experienced a severe headache and a return of sudden-onset nausea. I also experienced tingling/numbness in my right hand again, which disappeared after about 5 minutes. I retched and dry heaved again, and I took two Advil. The nausea passed and I was able to go back to sleep. The next morning, the nausea had completely disappeared, and the only lingering symptoms were a mild headache and mild stiffness/body aches.

1139905	3/27/2021	IN	57	F	3/25/2021	3/25/2021	I have degenerative back disease and my doctor had given me a prednisone dose pack for me to have on hand if the pain got out of hand. When I started having numbness on the right side of my head (especially my eye lid, upper teeth on the right side, right cheek, ear and behind the ear), I first just used prednisone cream, and found it to help, but not fully. After reading that others had bells palsy after having the shot, and my symptoms seemed similar to bells palsy, I looked up the treatment for bells palsy to be prednisone dose pack. Since I had one on hand, and online stated it would be best to start immediately to avoid any long term effects, I took the first dose on Friday, March 26th. Within 20 minutes my tingling started to subside. I still am experiencing numbness on the right side of my face, but it is significantly reduced, I would say approximately 90% better.
1139922	3/27/2021	WA	83	M	3/23/2001	3/25/2001	Dizzy, throwing up, sore arm, chills, sweats, headaches, loss of appetite, could not stand due to dizzy or open eyes, temperature variance from 97 to 100.
1139923	3/27/2021	TN	79	M	3/6/2021	3/18/2021	I am not sure that this is a result of the vaccine but I have been diagnosed with shingles and I did take the shingles vaccine in 2014 and was waiting the required two weeks to take the shingrix vaccine when I started to have issues that made me think I might have shingles. I had cataract surgery on my left eye on March 17 but I don't think that had any bearing on me getting shingles. I have heard that others have developed shingles after being vaccinated for covid-19. That is only hear say and i have no direct information about that, So far my case of shingles is moderate.
1139926	3/27/2021	OR	78	F	3/27/2021	3/27/2021	Low grade fever (100), chills, slight sore throat, mild headache, eyes burning, lassitude, lack of appetite

1139453	3/27/2021	NY	44	F	3/11/2021	3/11/2021	3/11/21 Left side of face went numb, jaw pain, felt like electric bolts through head, involuntary muscle contacting in face (both sides), Jittery, Eye twitching, headache. Ear pain. 3/12 -3/13/21 Face numbness got worse, left side started to droop. Muscle soreness in left arm, headache, tired. 3/14/21 ER visit to rule out Stroke. Diagnosed with Bells Palsey. 3/15-3/17/21 Left side of face still numb, pain/muscle spasms come and go. 3/18/21 Woke up with skin hypersensitive- feels like I have a severe sun burn from my neck to waist area, swollen glands, eye twitching, lips, tongue and throat swelled up. Severe jaw and ear pain, trouble breathing. Face still tingly/numb. Legs became extremely sore and heavy feeling, hard to walk. Called Dr- put on Prednisone (60mg and decreasing) and an anti-viral. 3/19/21 Same symptoms as previous day plus stomach area began to hurt/burning sensation- like all my organs were inflamed. Uncomfortable pain in my right side. Took first dose of meds this am. 3/20/21 Extreme jaw/ear pain, clenching feeling, loss of strength on the left side of my face Symptoms tapered off fir a few days, face numbness decreased and swelling seemed to improve. 3/25/21 Woke up with Skin burning again and glands in neck swollen. Called Dr- placed back on a higher dose of Predisone . At night, throat and tongue swelled up 3/26/21 Tongue and throat swelling, still facial tingling and numbness
1139748	3/27/2021	CA	29	F	12/1/2020	3/1/2021	I have been experiencing chronic pain and burning within my sinuses and eyes. Also I have been experiencing bizarre phantom smells. In other words I'm smelling things that aren't really there. All of this started to occur after taking the moderna vaccine.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1140020	3/27/2021	SC	37	F	3/25/2021	3/25/2021	Started with lethargy and hot flashes, followed by extreme shortness of breath, difficulty speaking and holding up my head and keeping my eyes open. Then trembling. The local nurse at the vaccination sight reported high blood pressure, rapid pulse and seemingly extremely low blood sugar. I didn't go to the ER because my supervisor agreed to take me home since we were volunteering at the sight prior to me receiving the vaccine. I had to keep eating every hour or so due to blood sugar seeming very low. Shortness of breath continued. Pulse rate still high as I could sleep with my head down due to racing pulse in my head. Later that night I had small bumps on my arms with no itch. Then I had extreme fatigue and muscle fatigue. I kept experiencing extreme episodes of hot flashes. I woke up in the middle of the night with a headache and uncomfortable hot flashes. I drank 100% juice and ate a few goldfish. I had mild nausea and food aversions. The next day the bumps were gone. I went to work but was sent home. I was told I should have gone to the ER but I don't have insurance. Once home, I went through 5 hours of extreme chills unlike anything I have ever experienced. I had to cross my arms over my chest and stack on blankets to regulate. If I moved my arms for more than five minutes or pulled the blanket down, I began uncontrollably trembling. I still had trouble regulating my blood sugar on day two. It's day three and no bumps and no chills. Less muscle fatigue as well. I am still pretty exhausted and tire easy when doing things. I did experience the common soreness in the muscle the vaccination was administered, but I figure that is normal. I am hopeful that I am improving and out of the danger zone. I took Garden of Life Elderberry with added nutrients last night and today I took my normal detox probiotic. I have been pushing fluids and have broken my intermittent fasting to try and keep my blood sugar up. I feel like my system is finally regulating and now I just have lingering exhaustion from the events that took place.
1139190	3/27/2021	AK	36	F	3/20/2021	3/20/2021	Warm sensation all over body, blurred vision in right eye, flushing, hives over chest, neck, and arms, high heart rate and high blood pressure. Happened just minutes after injection. Given 50mg Benadryl and observed by Medics for an hour.

1139601	3/27/2021	OH	49	F	3/24/2021	3/24/2021	Itchiness starting in my shoulders then moving both up my neck and down my back until I was very itchy from head to toe. Fever of 99.5. Felt like an allergy attack with runny watery eyes and itchy ears. Throat felt itchy and dry.
1139473	3/27/2021	MO	58	F	3/20/2021	3/21/2021	Approximately 24 hours after receiving vaccination, patient reported a red, swollen left eyelid and surrounding area. Slightly itchy but not painful, and no affects to vision. Patient remembers having the same effect (but less), when she received the first shot, but at that time she assumed it was a sty or something else, and did not report it.
1139481	3/27/2021	FL	50	M	3/27/2021	3/27/2021	Patient felt dizzy, blurry vision and vomited. Paramedics arrived, and evaluated patient.
1139486	3/27/2021	NC	40	F	3/26/2021	3/26/2021	4 hours after the shot, I noticed that my left eyelid was a bit swollen. No pain or itchiness. Not sure when it began to swell. I didn't think much of it, until about 2 hours as I could feel that it was more swollen. I was with friends, they recommended benedryl. So, went and talked to a pharmacist. On the way there, back began to feel itchy (similar to when I have broken out in hives in the past when an allergic reaction starts). Pharmacist recommended 25 ml of liquid benedryl every 4-6 hours and increase to 30 ml if swelling remains. After 1-2 days, if still present to go to doctor. I already have a doc office visit early Monday morning.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1139493	3/27/2021	CA	52	F	3/13/2021	3/13/2021	Vaccination was 10:30 am. Around 6:30 pm, my right knee started to throb. I took an epsom salt bath, where my upper back started to hurt. I went to sleep around 8:00. I woke up around 10 pm unable to open my eyes all the way. I believe they were swollen nearly shut. I could see a slit of light coming in from outside. I couldn't move my left hand at all (left arm is where I received vaccination). I held it up to the outside light, and it was swollen. The light coming in from outside hurt my eyes. I couldn't see enough to call for help. Around 1:30 a.m., the swelling went down enough for me to open my eyes. I have never seen them look so bloodshot. It was scary. I could move my hand again as well. I spent next day in bed resting. Monday, I noticed a small rash on my right shoulder. I went to work and was there about 20 minutes before I started feeling hot and dizzy. I went home and spent the day in bed. I was able to go to work the next day, Tuesday, without problem. One week after vaccination, the rash on my shoulder went away, but a small rash broke out on my right shin. This one was deeper. One week later, there are just a couple of small scabs left in the spot on my shin. I feel my energy level is close to normal.

1139573	3/27/2021	IA	63	F	3/17/2021	3/18/2021	Severe dizziness and nausea. It woke me up at @ 5:30 am. I almost fell and was so sick to my stomach. This lasted for 9 hours!!! I had to hold on the walls when had to go to the bathroom. I was by myself and feared falling. I had to put a bucket next to me because I felt like throwing up. I couldn't move my head, eyes anything with out severe dizziness and nausea. Finally after 9 hours it started to ease off, but took another 15 hours for me not to stumble periodically. I am 10 days out now and still can't turn my head too quickly, or put it too far back when washing my hair, or moving my eyes to fast, I still have a few minutes of dizziness which makes me nauseous for several minutes. Still at night when I lay down, it feels like my head is spinning! I have heard about people with vertigo and how debilitating it is... and I now understand. I fear this dizziness and nausea will not go away!!!! It now feels like I am car sick several times a day.
1139314	3/27/2021	CT	52	M	3/26/2021	3/26/2021	Patient displayed bruise and swelling at injection site immediately after shot. Patient became limp and eyes rolled back and he collapsed to the floor. Epi pen admitted at that time. Patient immediately regained consciousness and said he felt ok. He was sweating heavily. Paramedics arrived and took him to hospital after taking vital signs and interviewing him.
1140883	3/27/2021	WA	68	M	2/26/2021	2/26/2021	Within 48 hours of second Moderna vaccine but after 24 hours from time of shot, while casually sitting and noticing that my body was uniformly extremely cold to the touch, I experienced flashing colored dots in my right eye and for several days after a "floater" in my right eye.
1140437	3/27/2021	WV	27	F	3/10/2021	3/11/2021	Extreme body chills, slight fever, body aches, dry heaving, extreme headache, tired, pain in chest when inhaling. These symptoms lasted 2 days, then I started having vision problems went to eye doctor on 03/26/2021 and got diagnosed with asteroid hyalosis.

1140453	3/27/2021	OH	63	F	3/11/2021	3/11/2021	within a couple hours of the shot I felt a nervous feeling inside. this continued to grow in me a couple of days along with an increasing headache. I started breaking out in a rash mostly on my head, around my right eye, chest and back, on about the third or forth day. I also developed diarrhea. I went to Urgent care on 03/17/21. the doctor there gave me a shot of prednisone and things quickly cleared up.
1140462	3/27/2021	IL	64	F	3/26/2021	3/26/2021	About 45 minutes after receiving vaccine in right arm the right side of my face became tingly and numb. Starting with my chin and going to the forehead and across to the right ear. That feeling started to dissappear around 2 pm and I was left with a headache, mild nausea, and an uncomfortable feeling in my right eye. The next day I had a slight headache and the right eye still feels uncomfortable.
1140474	3/27/2021	VA	67	F	3/19/2021	3/21/2021	my eyes are red and irritated and eye lids are puffy
1140767	3/27/2021	NY	28	F	3/27/2021	3/27/2021	Pt was being obs starting 5:25pm, post J7J vax. After 15 min obs, at 5:40pm, she fell out of her chair and onto floor. Pt's eyes were closed, not responsive, not breathing, and stiff. Immediately 911 initiated, VS initiated, Pt was turned to Right side-lying position. Stimuli initiated (sternal rub, verbal communication). Pt opened eyes after 10 secs and started breathing. at 5:41pm/ Pt was able to answer all questions Alert & Oriented x4. Pt supine, ice packs applied to neck and chest. 5:42pm: 1st VS = BP 110/60, HR 58, RR 18, O2SAT 98%. 5:44pm: Pt vomited into trashcan, yellow emesis. Pt said that last time she ate was 3:30pm. 5:47pm: 2nd set VS = BP 115/60, HR 75, RR 18,, O2SAT 99% 5:50pm: Pt sitting upright position on floor. Pt said she "feels warm" 5:53pm: Fire dept arrived 5:55pm: EMS arrived. 3rd Set VS = BP 118/60, HR 88, RR 18, O2SAT 99%. 1140901	3/27/2021	NV	42	M	3/26/2021	3/27/2021	Started was a very cramped stomach and then the rest followed. Whole body turned red including eyes. Upset stomach with vomiting and diarrhea. Body was shaking and didn't have a fever. Skin felt like it was burning whole body felt swollen. Started around 2:30am with the cramping. It woke me up. Once I got up everything came so fast. Was rushed to hospital where I was admitted very quickly. I was blacking out on the drive there and blacked out while in their care. This was from one dose of Pfizer vaccine for Covid. I was put on a GI, Allergy, and steroid medications. I was hooked up to an IV and 3 drugs were injected. I passed out numerous times but was discharged at 5am.

1139731	3/27/2021	TX	55	F	2/25/2021	2/25/2021	About 45 minutes after the vaccination I felt like my body was buzzing. This eventually rose upward until the buzzing sensation concentrated on the top of my head, at which point I developed an excruciatingly painful headache. About six hours after the vaccine, I started having a fever that eventually was so intense that I felt like my eyelids were going to peel off. Then I started having chills. I was so cold when I had the chills that I shook like someone having convulsions. When I felt hot, I felt like my eyelids would peel off. I drank some water at one point and felt like I'd vomit. Then, a bit later, I felt like I was going to have diarrhea. About eight-ten hours after the shot, it felt some my tendons were being twisted so that my bones were being ground together at the joints. Then I started having muscle pain. I have a very high pain tolerance. This was ungodly. I felt like I was being tortured. This lasted 36 hours. Then my hair started falling out. The week before the vaccine was the snow storm. I had no power for a couple days and no usable water for about five days. I think that my unfortunate telogen effluvium is the result of extreme stress during the storm followed by extreme stress due to the vaccine. However, given that I had beautiful, long, abundant curly hair, this is obviously not a felicitous event. On 3/11, my levator scapula and rhomboid on the left side (shot side) started feeling hot and very hard. Then my posterior and medial deltoid and triceps muscles started rippling (visibly). Then the injection site swelled up so that it looked like I had a large grain of rice sticking out from my arm. Then the anti tragus of my left ear swelled and turned red. I developed floaters in my left eye. This lasted for about 48 hours. My hair, which had stopped falling out, started shedding again. I have lost about 55% of my hair at this point. My arm never really stopped hurting. I have gotten my second shot (3/25) and am at present working through my adverse events after it, but will wait for a couple weeks before reporting them. I don't know if I'll have "Moderna arm" again, so once the two-week mark passes, I'll report. As best I know, I have never been exposed to COVID19, so the idea that I had such a reaction because of that is not relevant.

1140838	3/27/2021	MA	58	M	2/11/2021	2/18/2021	Approx a week after I got second (final) vaccine my left eye began twitching. I paid no attention to it. On March 5th I woke up with double vision. It went away within an hour and I worked a full 8 hour day. By the time I got home it was full blown double vision. I attended urgent care who diagnosed me "Cranial Nerve 4 palsy." I was recommended to see an ophthalmologist who confirmed this. I wasn't comfortable with this and asked to see a neurologist who also said cranial nerve 4 palsy. I asked for a brain MRI as I felt something more was going on. The MRI shown no abnormal findings (done 3/11/2021). On 3/16/2021 I woke up with a drooping eyelid of left eye. I immediately called ophthalmologist who suggested a diagnosis of Myasthenia Gravis. This was confirmed by neurologist on 3/23/2021. I am now on Prednisone and Mestinon. My next plan is to see a MG Specialist at A referral has been sent to them by my neurologist.

1140315	3/27/2021	SD	64	M	3/26/2021	3/26/2021	On 03/26/21 received my shot and about 20 minutes later i started to have side effects. My lower back started to hurt, a bad taste came into my mouth, I started to feel woozy like i was looking through a glass gallon jar. A PA came in and took my blood pressure which was very high for me. I walked around for awhile and felt a little better. Took a trip to to pick up a Discharged patient but had to stop several times because my heart was racing causing me to start sweating. On 03/27/21 around 02:30 am i woke up to a left arm swollen down to my finger tips. Both of my legs had severe muscle cramps in the upper and lower muscles. It took 2 hours to come out of that. My leg strength was almost gone and now I had a severe pain in the ball of my left foot. The site were I had to shot was burning like it had been branded. I had brain fog couldn't remember what i was doing up. Though I had no breathing problems I was sweating like I had a bad fever. I noticed also that my vision became light sensitive! It was hard to watch the tv with the screen light which looked too bright to me. The site on my left arm were I strained the muscle hauling 70 lb sandbags became a very sensitive area. the swelling on my left hand was so bad I had to put lotion on the creases to relieve the stretching pain I felt. The headaches are a constant now even with my ears starting to ache too. Also the my eyebrow hair was very sensitive to touch. Had to go to the bathroom a couple of times but not as much as i thought I would. Both shoulder blades are constantly aching like my left hand fingers.
1140347	3/27/2021	NM	38	M	3/27/2021	3/27/2021	Patient called me about 4 and a half hours after his immunization. He stated his eyes have become sensitive to light . He also stated that his bottom lip and chin started to tingle about fifteen minutes after the shot and then went away. . I recommended that he immediately take a Benadryl tablet and wait a couple of hours I said he can take Benadryl every six hours if he needs to. If his symptoms don't go away after two doses of Benadryl I recommended he go to the Emergency Room and be checked out. Pre -immunization I counselled him on the normal run of the mill possible side effects and how to treat them.

1137538	3/26/2021	FL	47	M	12/16/2020	1/6/2021	47 year old Gynecologist with PMH of severe MDD, GERD, asthma, referred to the ED by his PCP, after 5 days of gait instability, and about 4 weeks of altered mental status, confusion, short term memory deficits and malaise. ADEM suspected and extensive infectious, inflammatory and neoplastic workup was initiated. CT brain - reported NAD MRI brain consistent with Acute Diffused Encephalomyelitis and suspected ADEM. MRI cervical spine with evidence of demyelination involving posterior cord. ICU course complicated by new onset of aphasia, partial left frontotemporal seizures, LGIB due to proximal rectal laceration and central diabetes insipidus. Admitted 3/15/21. On 3/17 he developed aphasia with right sided facial droop and stroke alert was called. Later on 3/17 he developed GI bleeding and was taken for emergent colonoscopy, from which no significant conclusions could be made due to lack of preparation and subsequent poor visualization. No foreign body was reported. After he continued to have ongoing bleeding, the patient had a sigmoidoscopy, during which the migrated clip could be removed and two new hemostatic clips were placed. He subsequently developed large volume urine output and nephrology was consulted; the patient was diagnosed with likely diabetes insipidus. On 3/20 acyclovir was discontinued after HSV PCR was negative. High dose solumedrol for ADEM completed 5 day course 3/21. VDRL was non reactive. There were no oligoclonal bands. Solumedrol 1g daily was started 3/24/21: MRI showed L>R patchy enhancement and diffusion abnormalities consistent with ADEM. Repeat MRI showed new restricted diffusion of the left superior cortex, bilateral medial temporal lobes and hippocampi, genu of the corpus collosum, and pericallosal white matter, with ddx including status epilepticus, autoimmune encephalitis and infectious encephalitis including herpes simplex. Completed 5 day course of high dose steroids, 6 days of IVIG and on ongoing PLEX. Neurological improvement noted 3/25

1137771	3/26/2021	VT	59	F	3/24/2021	3/24/2021	Less than 10 minutes after injection, patient verbalized she did not feel well, then became unresponsive to verbal cues, eyes glazed over, pale face. Clinic was being held outdoors, clinic staff could not get accurate vital signs. Call EMS. Meanwhile, patient began to respond to verbal cues, was able to walk inside, said her stomach hurt. EMS arrived and also had difficulty obtaining vital signs, transported to the local ER. Patient was treated and released from the ER with a diagnosis of dehydration.
1137685	3/26/2021	KY	74	F	3/6/2021	3/7/2021	She got the vaccine, was feeling fine, went to church and did her normal things for the rest of the day, and approximately 24 hours after the vaccine around 12:30 to 1:00 and started getting chills. She wrapped up in a blanket and took a nap. Then approximately 1:30 PM she had blurry vision, couldn't see clear, and she felt very, very faint like she was going to faint and was sitting in a chair and continued to sit there for a few minutes. Then she was weak after that, and then a while later she was okay.
1137610	3/26/2021	PA	33	M	2/4/2021	2/5/2021	Severe headache not responding to treatments lasting 2+ months, blurred vision
1137798	3/26/2021	CO	45	F	3/17/2021	3/19/2021	Really sore arm the day after. Developed a full body rash about 36 hours after the shot. 48 hours later developed a bright red, burning and painful rash on my face. On day 3 I went to work and underneath my right eye started to swell up and a red streak from the inner corner of my eyelid went down my face. On day 4 I woke up with both eyes swollen. I started on benedryl. 2x a day. The redness, welts and hives traveled down my face, onto my neck, then up my forehead and onto my earlobes. On March 22, day 5, I woke with even more swelling on my face and both eyes. The rash was very bad. I called my primary care physician and made an appointment to see him on Tuesday. I went for that appointment and dr. gave me antihistamines, took pictures and reported it to CDC. I started the antihistamines, but on Day 7, I woke up with the worst of it. Hives all down my neck, lips swollen, bruising and swollen eyes and itchy red rash everywhere. I called the dr back and started prednizone steroids. Today, March 26, it is starting to calm down.

1137525	3/26/2021	AZ	53	F	3/25/2021	3/25/2021	I waited the required 15 minutes for monitoring. (I was a passenger driven to the site by someone else.) Just a few minutes after exiting, my face, back of my head, and top of my head went numb. No other side effects noticed (breathing was fine and no swelling or pain). It was a sensation more severe than when a body part "falls asleep" but less severe than what a novocaine shot feels like. It did not seem like something severe enough to turn around a return to the hospital. My face did not droop like with Bell's Palsy and was not tingly. It was just a numbness across my cheeks, under and above my eyes, across my jaw line into my ears, at the upper back of my head, and the top of my head. Effect lasted about three hours. Morning after still feel very slight effect, like a tightness feeling.

1137514	3/26/2021	MD	73	F	3/9/2021	3/9/2021	Got the vaccine and within 30-an hour she was seated, waiting and she developed a tingling/numbness on her bottom lip to the center of her lip. It spread throughout the entire bottom lip. Then it moved to the left hand corner of her mouth as well, and then moved up to the left side of her face to her eye, and then to the corner of the left hand of her head. This is a tingly pressure, and it then developed into a hard headache concentrated in one spot. She went into heavy sweating. The pharmacist was watching her and came over to her, she was there for about an hour and a half. She had a bottle of water trying to cool off, and her tongue was getting a bad taste in her mouth, and numbness in the back of her tongue. The pharmacist gave her Benadryl to take and she sat there for a while and was starting to feel really shaky, and she thought she would go back to her apartment to get out of being around other people. She was feeling weak to walk, and overwhelmingly tired. Once she did get into her apartment she her taste buds felt dry. After several days of this reaction, little by little it subsided, but the sweating and chills continue even up until today, 3/26/21. She goes to bed dry and wakes up soaked from sweat due to profuse sweating. She has been yawing a lot lately and if she does yawn she immediately has chills. It's been back and forth with the chills/fever. She can be perspiring on one end and the other end cold. She tried to talk to her doctor but told her to seek out UC for her symptoms as he is too busy. There is eye strain that is bothering her which leads her into wanting to sleep and sleeps for extended periods of time and really exhausted. Has also had runny nose, hands and feet swelling. Her right hand is kind of like a tingling/weakness sensation.
1137476	3/26/2021	VA	67	M	2/27/2021	3/19/2021	After 3 weeks on Mar 19th, he was diagnosed with Bell's Palsy. He is currently being treated with Prednisone (course completed) and Valtrex (course to complete this weekend). His left eye is unable to close by itself, his left side of the mouth doesn't fully open.

1137510	3/26/2021	PA	29	F	3/26/2021	3/26/2021	Almost immediately after receiving the vaccine I started feeling numbness in my left arm (injection site), dizzy, nauseous, and experienced tunnel vision. I also started profusely sweating (forehead). I reported my symptoms to the nurse who took my temperature, BP, and heartrate. I had a low grade fever (99 degrees) and slightly elevated BP. I drank water and remained at the site for another 30 minutes and my vitals were checked again before I left.
1137567	3/26/2021	ND	16	M	3/24/2021	3/25/2021	muscle fatigue and stiffness in both shoulders, minor runny nose, dry eyes, minor cough.
1137970	3/26/2021	WA	52	F	3/9/2021	3/15/2021	INTENSE VERTIGO, NAUSEA, DIZZINESS, EYE PAIN, CONSTIPATION, LOSS OF APPETITE, LOSS OF BALANCE, MIGRAINE, SENSITIVITY TO LIGHT, LEFT ARM PAIN WHERE SHOT INJECTED. SOUGHT MEDICAL ATTENTION TWICE AT ER.
1138106	3/26/2021	NY	72	F	2/27/2021	2/27/2021	She got the vaccine, and they asked her to stay for the 15 minutes and she was fine, but when she went out onto the street she started to have a few seconds of feeling faint but did not. That feeling passed and was able to walk home and was getting vertigo. She had a sore arm the next day, very fatigued and exhaustion. Three days later had redness appear on the arm and then had headaches, and insomnia that night. Her eyes were burning as well. A day later had irregular heart beat and then six days later had the red line, raised in a circle that lasted one day. She then continued to have the itching and then became a rash which was traveling under arm and onto her chest. She then went to the city UC and was spreading to her breast, and started to subside. Since then she has been having on and off headaches, on and off itching of both of her arms, as well as her scalp and other parts of her body. As a child had a history of hives. When she went to the UC they did an EKG due to the irregular heart beat and did not want to go to the ER during the pandemic. He gave her one Benadryl and 3 Ibuprofen which she only took one of, as she has a lot of allergies. She has been taking Zyrtec 5 mg for the itching when she has it, which works for her. The symptoms are subsiding, and has transient rashes on the vaccine arm, and on the right arm still have a few areas and still itching on and off.

1136991	3/26/2021	OK	67	F	3/24/2021	3/24/2021	Within an hour of the shot I felt very tired and took a long nap. Around 5 pm I began to feel a little achy and a slight headache. During the night, I ached all over, had a terrible headache, the muscles in my neck felt like they were drawing up, I had fever, but didn't get up to check it, my joints and bones ached, I had chills and it was a miserable night. The next morning I got up to make my breakfast and I kept trying to pass out and would have to sit down. I was sweating real bad and finally went to lay down. My husband fixed my lunch and I began to feel like my eyes were getting black, and then I slumped over and he said my head was bobbing on his shoulder. I could hear him saying my name, but I couldn't respond. Right after I came to, I began to throw up at the table. He called an ambulance and they came and check me out. My blood pressure, blood sugar, EKG, and pulse ox were all normal. I refused going to the hospital, but I didn't know what the hospital could do for me. I called my family physician's office, but never heard back from them. I hear the second shot is worse than the first, so I am not sure if I should take the second shot. Also, strangely enough, my arm wasn't sore. Every time I have the flu shot I feel bad for a couple of days. I also felt bad after my Shringrix shot and pneumonia shots.

1137009	3/26/2021	NM	56	F	3/23/2021	3/24/2021	Vaccine was given on Tuesday, on Wednesday evening she developed a red spot on right side of jaw. The next morning on Thursday she had a red streak growing up right side of face, lymph nodes of neck and ear are swollen and painful. She was seen by her physician on Thursday for evaluation, nothing was prescribed. Friday right side of face is red swollen from ear to nose, swollen/painful ear and earlobe, swollen under right eye, swollen lymph nodes worse under jaw and behind ear. She has been using a cold compress and arnica with little relief. She will take a benadryl and has a 1pm appointment with her provider today. She denies shortness of breath, difficulty breathing, swelling of tongue, lips, throat.
1136923	3/26/2021	VA	60	F	3/23/2021	3/25/2021	On March 25 I started noticing a light flare in my eyes, but more in the left eye. Even with eyes shut, it was still present. It started out as a small zigzag pattern in a crescent shape like the letter "C"; mostly white with colorful flares. It took about 45 minutes for the crescent to become wider, until it eventually disappeared. 24 hours later and it has not re-appeared.
1137138	3/26/2021	ID	44	F	3/19/2021	3/20/2021	1. Persistent rash and itchiness at the sight of the injection. Swelling and rash was noticed the afternoon after getting the shot. The itchiness started six days after receiving the shot. It's not horrible or unbearable. 2. Persistent fatigue and sporadic dizziness. This has been the worst side effect. I've felt drained every day and still feel the same, even after getting some sleep. The dizziness is like experiencing tunnel vision without actually seeing tunnel vision. It comes on suddenly and goes away after a few moments. This has not abated; I am still going through this today. 3. Nausea for the first couple of days. This was mild. But there has been a reduction in appetite for the past week.

1138926	3/26/2021	IN	49	F	3/24/2021	3/24/2021	Bitter taste within the hour of vaccine. Lightheaded 3 hours after vaccine with extreme tiredness, blurred vision, nausea, joint and muscle weakness with slight pain. 12 hours after vaccine the above mentioned symptoms continued in conjunction with a headache and increased thirst. 48 hours improvements but the following symptoms were present: slight muscle weakness, off and on blurred vision, headache and sized raised skin on my left shoulder with slight itchiness.
1138739	3/26/2021	PA	70	F	3/22/2021	3/23/2021	The following day after the shot , 3/23/21, I woke up at 7:00 am, itchy all over my body, had fatigue, &. Chills. Took 2 Benadryl tablets every 4-5 hours , a total of 8 pill. Then took 2 more in the night time. Continued doing the same the following 2 days. My husband noticed red spots like hives on my back , stomach, and. arms. On the 3 rd day I woke up with itching on the ears and eyes, as well as the body. Called Dr, and she advised me to be evaluated at the urgent care immediately. Went immediately and was examined by a PA. where she gave me a prescription for Prednisone, 5 mg. Take 1 tablet by mouth once daily for 7 days then take 1/2 tab once daily for 7 days. She also advised if no more itching after 5 pills I could stop.
1138731	3/26/2021	WV	30	F	3/22/2021	3/22/2021	pt had severe anxiety attack after receiving the vaccine. pt was very tense and not breathing with eyes rolled back into her head. mother stated she had had an attack at the hospital giving blood before bc of severe fear of needles. 911 was called and she was taken to the hospital

1139143	3/26/2021	CA	42	F	3/21/2021	3/22/2021	I am 5 days out from the 2nd dose. I had to make an urgent care visit because of shortness of breath, blurred vision, light headedness, brain fog, nausea, fatigue, feeling of fainting and tightness in throat. These symptoms have been present and overwhelming for over 3 days presented themselves after day 2 of vaccine. The original symptoms of headache, body aches and chills subsided by day 3.
1138804	3/26/2021	GA	46	F	3/24/2021	3/26/2021	Awoke in am with a hard swollen area the size of tennis ball reddened. Then at 4 pm tingling and swelling started to the right side of face from jaw line to below left eye. Became foggy headed and felt as though shaking all over. Then around 5 pm lt side of neck from shoulder to ear on left side I took ibuprofen at 8 am and 4 pm. At 6:30 pm a tightness across the top of my chest but no shortness of breath or fever or actual chest pain no difficulty swallowing. At that time I called the pharmacy and spoke with someone (I think that was his name). He advised me to take Benadryl and ibuprofen and to go to er if any shortness of breath and to report to this site.
1139074	3/26/2021	AZ	79	F	2/1/2021	2/15/2021	I detected high blood pressure while at an eye doctor's office--He had me verify it at my primary care physicians office same day. I have never had high blood pressure--always normal or even a little low.
1136799	3/26/2021	OH	43	F	3/23/2021	3/23/2021	Light headed and some blurred vision 20 minutes after shot that lasted just a few minutes then some tingling in left leg and then started to notice hives on my hands and body, also had welts on my stomach after arriving at home. all of these events took place within the first hour. now several days later I still have the hives and non stop itching even in places that I dont have hives. my over all skin on my body just feels itchy
1139147	3/26/2021	WA	68	F	2/27/2021	3/1/2021	I went into DKA, my left eye bled, my left arm has a blood clot I was in hospital 9 days and a rehabilitation place for 11 days.

1139135	3/26/2021	CA	53	F	3/24/2021	3/24/2021	Pfizer-BioNTech COVID-19 Vaccine EUA was administered at 1 pm. Within 10 minutes or less, my vision blurred and the store darkened and felt like it was closing in. I felt dizzy and nausea. I sat down away from people and let someone know. I got a pink in my eyes and some parts of my body. I waited about 45 minutes and my vision cleared and the dizziness faded considerably. The nausea remained and some pinkness remained. Slight headache off and on for two days. Had minor discomfort for two days.
1139134	3/26/2021	ND	62	F	3/24/2021	3/25/2021	On 3/25 I had a sore arm with firmness around the injection site. Today I woke up very early with fever and chills and feeling pretty ill. Urinated and crawled into bed and put electric blanket on high until I felt warm. Got up about 7:00 and took my temperature and it was about 100. Then it varied between 99 and 102.5 all day. Had blurred vision and body aches and bad headache and nausea. Took Tylenol or hydrocodone which helped with keeping temp closer to 100 but I'd fall asleep and forget to take Tylenol and it would go back to 102. I didn't have anyone to drive me that I felt comfortable enough to risk exposure in case it was an actual illness and not the vaccine. I considered calling an ambulance but decided to wait and see if I could get my temp under control. This evening I'm at 100 again (I just took it again) but thought my fever had broken as I didn't feel I was radiating heat like I felt when it was 102. My normal temp is usually around 97. I haven't taken anything Tylenol or hydrocodone since about 3:00 but I will take just plain Tylenol now.

1139132	3/26/2021	NY	36	F	3/24/2021	3/24/2021	Received the vaccine at 10:40am on 3/24/2021 and felt normal. At 1:20pm anaphylaxis set in - experienced tingling then tightness in throat, tongue swelled, swallowing would cause me to choke and tongue would get stuck blocking air passage. Hyperventilating began as I could not get enough air into my lungs. For 15 minutes tried drinking water and laying down to help open airways. Breathing slightly eased for 2-4 minutes and then the anaphylaxis would spike again. This happened 3x getting worse, I called my Primary Care Physician's office and was advised to go to the ER immediately. At 2:15pm I arrived at the ER and at 2:30pm I was given a 1mg shot of EPINEPHrine, and intravenous shots of diphenhydrAMINE, methylPREDNISolone, and famotidine along with oxygen. Anaphylaxis finally dissipated around 3:30pm and by 5pm I was breathing more normally. I was discharged at 7:00pm, and was feeling very energized. I was also given a prescription for an epipen incase I should have any further issues. The next morning, 3/25/2021 I woke up after 5 hours of sleep feeling extremely energized. I had a virtual doctor's appointment with my allergist, Dr. at 12:00pm. My doctor was surprised at how well I seemed to be doing and we made arrangements to do further allergy tests in 2 weeks. We came to the conclusion that I am most likely allergic to POLYETHYLENE GLYCOL. This ingredient is also in a cold medicine that I was taking in January and I was experiencing minor anaphylaxis (which I thought was due to the extreme congestion I was experiencing with the cold). It is also an ingredient (aka PEG) in an eye cream that caused a severe eczema patch under my eye in January. After my appt, at 1:30pm I went into anaphylaxis again. My throat got tingley and began to close, my tongue swelled and again was getting stuck in my throat when I attempted to swallow. I laid down and tried to get in deep breaths. My husband bought children's BENADRYL, which does not have polyethylene glycol in it, and gave me 15ml at 2:15pm. I reached out to my allergist, Dr. and updated him. He advised that I immediately take an additional 5ml of the BENADRYL. Dr. prescribed me 60mg/day Prednisone for 2 days followed by 40mg/day of Prednisone for 4 days, 40mg/day Famotidine for 2 weeks, 10mg/day antihistamine (I chose loratadine) for 2 weeks. Dr. also shared that I should have been prescribed steroids when

							I was discharged from the hospital, but my energetic state gave the impression I was OK. My manic energy was a result of the epinephrine, which had finally worn off 23 hours later, causing my body to begin the allergic reaction all over again. The evening of 3/25/2021 (after the first dose of 60mg prednisone, 40mg famotidine, and 10mg loratadine) and all three meals on 3/26/2021 I experienced minor anaphylaxis when I began to eat. Tightness in throat throughout the meal and lasting an additional 20 minutes following the meal. My throat has reopened after each incident on 3/26/2021 and I was able to breathe normally again.
1139117	3/26/2021	OK	29	M	3/16/2021	3/18/2021	I felt soreness and pressure build up in my arm starting a few hours after the receiving the dose. The soreness and pressure got progressively worse over the course of two days. It wasn't unbearable, just uncomfortable. The second day after the vaccine I had stretched my arm pretty good for minute, when I released the stretch I felt a rush of something for from my arm into my torso. I got really dizzy and passed out, my wife was in the room at the time and said I never closed my eyes; but I had completely blacked out. My wife had woken me up and I wasn't sure what had happened, it took me about 30 seconds to realize I had passed out after stretching that arm. My arm had felt better after waking up from passing out, and soreness had passed a couple days later. I didn't get checked out, after I woke up I started feeling fine. I'm honestly not sure if it's directly related to the vaccine or not, I just thought I should let someone know just in case.
1138906	3/26/2021	IN	65	M	3/18/2021	3/19/2021	Woke up for work at 3:45 am . Just didn't feel good. Went back to bed and then went down hill. Felt like I got hit by a freight train and a sever headache. Could not open my eyes it hurt so bad. Tried to sleep for the next 12 hours. Headache had let up some body felt sore. Was up for about 2 hours and went back to bed till the next morning. Felt much better but was wore out from the day before. By the 2nd day evening felt back to normal.

1138202	3/26/2021	NV	65	M	3/11/2021	3/15/2021	Four days after my vaccine, my eyes were very water with a clear, thick discharge. They were itchy as well. I went to see my optometrist who told me I had some sort of allergic reaction. I do not know if the vaccine caused my allergic reaction. My optometrist prescribed eye drops. I had no soreness or pain to my left arm after my vaccine. Today I still have some clear, thick discharge that is present.
1138182	3/26/2021	IN	39	F	3/24/2021	3/24/2021	Approximately 45 after injection a migraine began with visual disturbance. Wavy lines across field of vision obscuring eyesight. This was accompanied by fatigue. That night racing thoughts throughout the night. I felt as if I was awake all night cataloging my daily life. The following day only sore muscles and muscle weakness in left arm.
1138175	3/26/2021		96	F	2/22/2021	2/24/2021	1. Double vision. Saw ophthalmologist. Diagnosed as Left 6th Nerve Palsy as a result of the vaccine. Started using eye patch. Condition unchanged. 2. Weakness in legs, difficulty controlling movement which started 48 hours after vaccination. Saw neurologist. Diagnosed as Ataxia. Condition worsened daily to a point. Presently neither improving nor worsening. Currently conditions have reached a plateau, neither improving nor worsening.
1138165	3/26/2021	CA	43	M	1/6/2021	1/6/2021	That evening had tachycardia symptoms and trichina symptoms (about 12 hours after vaccine). I had fatigue and headache the following morning. Severe myalgias - in the epigastric cisternal area and in the back of my shoulder blades. 36 hours later - low grade temperature. At 48 hours I felt normal. Eye - 10 days later (vaccine) - I noticed a visual deficit in the left eye along with a line and the following day - on the 17th, I saw my ophthalmologist - left branch retinal vein occlusion. Since then I've had an Forestine Angiogram: and a video of my retina - branch retina arterial occlusion - so they are having trouble telling the difference between the two. I still am being followed for my eye. They did a carotid ultrasound - my carotids are fine. I am due to get an echo cardiogram. I am taking baby aspirin mg for now - not sure if it's helping or not. It takes a year and a half to go away.

1138321	3/26/2021	NC	74	F	3/16/2021	3/17/2021	The day after the shot I began a flare-up of psoriasis, an ongoing condition. By evening it had escalated to the point that my eyes were swollen shut. I had a fierce itching and burning of my face. I asked my husband if he would take me to the emergency room. He then suggested that he remembered having prednisone tablets. Without them I know I would have gotten much worse. I couldn't get in to see my dermatologist until another day later. They gave me a 40ml steroid shot. It called everything down but took another week to subside. I've had a similar reaction to the Fluzone shot back in Sept, 2020.

1138484	3/26/2021	TX	76	F	12/30/2020	1/8/2021	I had a severe migraine - and I don't have headaches. My whole face hurt. (I have two optic aneurisms and I was afraid they were starting to bleed out.) My eye was running water even more at that point and I also had some mucus in my eye. I went to ER. January 8 and they did a CT scan - and they gave me something IV for pain. They told me to take extra strength Tylenol every four hours and that didn't help. After one hour, I was in severe pain again. At that point, both eyes were tearing. I went to the dentist (Monday) -and they did x-rays - ( to see if I had a tooth issue and I went to my ENT doctor (Tuesday)- and he said it didn't appear that I had a major infection. still in severe pain - she gave me a prescription to get rid of infection in my eyes. She gave me a steroid shot - which stopped the pain. The following week, I had an appt with an ophthalmologist- I was not in pain any more and my eyes had pretty much cleared up. He said I probably had a viral or bacterial infection prior and when I got the vaccine then that was why I got a migraine. 2nd vaccine - 30th of January (8:30) - I slept all that day - I was sleepy the whole day and the Sunday, I had flu like symptoms and after that I was fine. This week, I have the infection in my eyes again. I went back to the Dr yesterday to get an antibiotic because I was having the same kind of infections. This time - infection in my left eye, with tearing and mucus. They had me do the eye drops again and nasal spray I've been using.

number as requested for call back. I got a call back in another 2 minutes. When I press to receive a call it disconnected. So I had to start all over again. So it is been like 2 hours adventure. Firstly I need to say that someone I told to call a second number well disconnect me twice but I have something call a report number that the person I think it has same job title of you. I am not certain but her name is (Name) and she gave me report number. She asked me all the questions, I answered all the her questions including my 28Jan2021 Pfizer injection which was my first injection and I have question referring to my taking Warfarin and wanted to if there was interaction because I went to doctor today to see my blood was instead 2.5 to 3, it was 4.9 which is extremely high and the only thing I have taken, I have done differently was to have my Pfizer injection on 28Jan2021. Consumer stated, "It is already in your system because as I said before I have report number. Should I give the report number. The person I spoke a long time ago that with I have been phone said that she information from my card when you they gave that card for you come like second time for the second dose or booster as I told this call." When probed for if the consumer call the Drug safety earlier: Consumer stated, "That thing I am telling I spoke to someone by the name of (Name). She started asking by same question you did. That is why I am trying to tell you that person already asked me everything and give me report number. She wanted to transfer me because she says it is wrong department. I started here same information again. I have been on phone for far too long for this to be evening. The report number is 'number'. Consumer stated, "Concern is that I have Lupus and I take Warfarin. My INR report does part of what to do when you have lupus. You have blood measure monthly or whatever times that necessary. It is very high. It should be a range just listen to number 2.5 to 3. My report they showed me that I am 4.9, that is big number. It is like 2 margin over. I am trying to find out if the injection had interaction with warfarin that is medication I take. Blood thinner I take because I have lupus with antiphospholipid symptoms. I am trying to find out if the injection had any interaction with warfarin the blood thinner. That is the information I am trying to to get. When I go to a surgeon tomorrow because I have wound on my foot from surgery that I had and it is not healing, it

is just draining. I don't know if one has anything to do with other but I am very suspicious about it because my blood is too thin and my body me things don't heal the way they supposed to. The consumer has taken the Pfizer Covid Vaccine: Consumer stated, "That is the first thing I said. I told you and then I am telling about warfarin. I said I wanted to know if the Pfizer vaccine which I took on 28Jan2021 as I said that before if it had conflicting reactions with warfarin. I explained to you I have lupus and I also have antiphospholipid syndrome which cause me to take warfarin medication. I want to know if the Pfizer injection had any negative interaction with warfarin the blood thinner." When consumer informed about Medical Information: Consumer stated, "That person transfer to me before. It was drop. So can you connect me to number. She tried to transfer me and I got nowhere to call just died. If I call I am gonna be on waiting for all over again. I already had experience consumer stated, "I have already been answered all of your questions that is why I have a reference report number that I gave you. I have been answered whole time questions. I answered everything. I just wanna be connected to get somebody because I am tired of being on the phone." Is there a product complaint to report was no. Consumer was provided with the number of Medical Information number and was requested to select option 3, timings as and 8 am to 8 pm Monday to Sundays as per (EST). Investigation Assessment: Yes. She had the first dose of the Pfizer covid19 vaccine on 28Jan2021. She is nervous. She lives with lupus and antiphospholipid syndrome, which means her blood is too thick. She is on a blood thinner, she takes warfarin. She is asking if the vaccine could interfere with warfarin. Today she had her INR checked and it was was 4.9. States a stable reading is between 2 and 3. The only different thing she has had in her body is the vaccine. Reports she is nervous and scared. She had surgery on her feet and she has a wound where a thicker scab came off, states it is draining but not drying out. She was thinking maybe this was due to her her INR being high. She will see the surgeon tomorrow. She put a bandaid on her foot where the open wound on her foot is. The next morning she checked her foot and the bandaid was wet. She put some peroxide on it. She read peroxide is not good for open wounds because it kills good bacteria so she used gauze and

1136791	3/26/2021	PA	73	F	3/20/2021	3/24/2021	<p>placed it over the open wound with tape across it. Last month her warfarin dose was 6 mg 5 days a week and 3mg two days a week. As of today she is to take 3mg three days a week and 6mg four days a week. Warfarin is 6mg tablet that is perforated, clarifies it can be broken in half. She does not think her new regimen that she was given today will bring her INR back in the range between 2 and 3. States her INR has never been that high. She will go back to see the nurse in two weeks to get her INR checked. She sees her patient medical record number listed on the card. She says pardon her grunts and moans because she grunts and moans when she moves since she is 76. She feels weird and her eyes are extra dry in 2021. She is nervous about the area where she had surgery on her feet, she does not want it to get infected. She thinks she had surgery on 04Dec2020 to have arthritis in her toes corrected. Outcome of events was unknown.</p> <p>Initially very mild muscle aches and fatigue. 3 to 4 days later there was weight gain of 3 pounds and edema most obvious to the upper eyelids. This worsened with itching and pain to eyes. Additionally I had difficulty focusing my mind and a general feeling of being ?unwell?. Benadryl 60 mg reduced the eye discomfort. Contacted providers? office, but have not heard back.</p>

1135691	3/26/2021	CA	54	M	1/9/2021	1/11/2021	some lost of eye sight on left side; Headache; Fever; Throwing up; Nausea; A spontaneous report was received from a consumer concerning her husband who is a 54-year-old, male patient, who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced headache, fever, nausea, and loss of sight on the left side. The patient's medical history cataract surgery in summer 2020, current conditions were reported as high blood pressure and glaucoma. Concomitant medications were reported as benazepril for high blood pressure and unknown eye drops for glaucoma. On 09-JAN-2021, the patient received their first two planned doses of mRNA-1273 (Batch number: unknown) for the prophylaxis of COVID-19 infection. On 11-JAN-2021, the patient experienced headache the worse he ever had on left side, nausea and fever. She stated that he started to lose sight on the left side but can see some light which is assessed as medically significant. Treatment for the events included ibuprofen for headache, Lotensin and eye drops. Action taken with mRNA-1273 in response to the events was not reported. The outcome of events, headache, fever, nausea, loss of sight on the left side, were considered as unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Prior history of glaucoma may be contributory to the occurrence of the headache and unilateral vision lost.

1135736	3/26/2021	NC	78	F	1/27/2021	1/27/2021	she woke up dizzy; it was like everything was moving or shaking just a little bit, and it would drive someone crazy; her eyes felt like they were burning out of the sockets; she was tired the next morning; she felt like she was floating out of the room, her head tingled, she tingled from the top of her head to the bottom of feet; she was nauseated; temperature of 103; she broke out in a terrible sweat; she was weak as water; light headedness; high blood pressure; This is a spontaneous report from a contactable consumer via Medical information centre. A 78-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot Number: EL8982) via an unspecified route of administration on 27Jan2021 14:00 as single dose for covid-19 immunisation. Medical history and concomitant medications was not reported. On 27Jan2021 20:00 the patient experienced light headedness, she broke out in a terrible sweat, she was weak as water. On 27Jan2021 the patient experienced high blood pressure. On 28Jan2021 her eyes felt like they were burning out of the sockets, she was tired the next morning, she felt like she was floating out of the room, her head tingled, she tingled from the top of her head to the bottom of feet, she was nauseated, temperature of 103 (pyrexia). On 05Feb2021 she woke up dizzy and it was like everything was moving or shaking just a little bit, and it would drive someone crazy. The event high blood pressure was considered as serious (Medical significant). It was reported that she had the Pfizer COVID shot 2 weeks ago today. She had severe reaction to the shot, she didn't have it immediately she got the shot on 27Jan2021 and at 2 pm and at about 8 pm she was sweeping the floor and she broke out in a terrible sweat and after that she was weak as water and then started feeling lightheaded and her blood pressure was going up, she put cold rags on her head. She did not take temperature but she did take her blood pressure and it was like 198/something, she said she noted at 8:30 she took it again and it was 180/98 she started drinking water she thought she might be dehydrated and finally by 9:45 she got it down 148/58, she slept that night felt pretty good but she was tired the next morning, about 4 o'clock that afternoon the second day she felt wonderful she went to sleep at about 10 o'clock, but when the clock was striking midnight it woke her up and she felt like she

was floating out of the room, her head tingled, she tingled from the top of her head to the bottom of feet she was lightheaded her eyes felt like they were burning out of the sockets, she was nauseated when she stood up so she took Tums and that took care of the nausea. She came in and took her blood pressure and that is when it was 194/90 the second time, she has a Rely On arm band and it said 205/98 and then she took it again and it said 235/117. She called the medic and he told her he thought she had a false reading but her temperature was 103 and before he left her blood pressure come down 180/70. Her heart rate was 86 the medic got ready to go her temperature came down to 102.2. On 05Feb2021 which was last Friday she woke up dizzy and light headed and but it was like everything was moving or shaking just a little bit, and it would drive someone crazy .On Saturday she took 3 Motrin that morning and Amlodipine 5 mg and 20 gm Omeprazole and she also takes 1 24 HR Allegra with Fexafenadine and her temperature was normal that day, all day it has been normal. On Sunday at lunch time she got light headed and was floating again and she checked her blood pressure and it was 183/77. She stated that her doctor recommended to get the second dose if she have no more side effects She plan on getting the second dose next Wednesday. Therapeutic measures were taken as a result of high blood pressure, she was nauseated and temperature of 103. The outcome of the events was unknown.

1135767	3/26/2021	AR	67	F	3/1/2021	3/1/2021	<p>           Couldn't get warm- very cold, her skin was very cold; Nausea; Pretty severe headache; Generalized aching; Fibromyalgia flare up; No energy been very tired; No energy been very tired; Felt like she was going to faint; Dizziness; Vision blurred; Loss of appetite; Flu-like symptoms; Hands feel warm to touch, but she still feels cold; She cannot sit or stand without discomfort in her spine; She cannot sit or stand without discomfort in her spine; Sick; Her bones and muscles hurt; Her bones and muscles hurt; Wheezing; This is a spontaneous report from a contactable Other HCP, the patient. A 67-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot Number: EM9809; Expiration Date: 30Jun2021), intramuscularly, on 01Mar2021 at 13:45 (at the age of 67 years old) as a single dose in the left deltoid for COVID-19 immunization. Medical history included having become disabled in 2009, arrhythmia from 2014 and ongoing which was diagnosed after she took a Hep C treatment (Sovaldi, Ribavirin, Olysio). She had to take these medications for five months, where most people have to take it for three, ongoing allergic asthma - allergic to "everything." She has had this her whole life, diagnosed when she was 5. Started treatment with steroids at 16 , Hepatitis C from 1996 to 2014 diagnosed 4 years after blood transfusions Could have already gotten it as a nurse, was much more resistant than the average person 5 weeks to go negative, ongoing hepatic failure from 2013- she went into liver failure from Hep C. An event occurred- exposure of a deadly toxin that came from China, ongoing fibromyalgia from 1992 -Immediately after blood transfusions when her son was born- Gave her the correct blood but her body reacted. Flu shot in Early Oct2020 Fibromyalgia flare up, 4 times the dose (as reported)- Onset Age 66, Seizure disorder which was diagnosed in 2016 after disseminated shingles; after 2.5 months started having black outs where she did things and said things no memory of, the only way she knew it happened is if there were consequences. Doesn't know if she still has those, but she is getting an MRI and EEG. She lost vision in her right eye 2 years ago due to retina surgery macular pucker. She thinks her liver was stealing Vitamin A from her eye. Medical history also includes she ran over herself with her car, blood pressure abnormal, hepatic encephalopathy, autoimmune         </p>

thyroiditis, and anxiety all from unknown dates and unknown if ongoing. The patient has had cataracts since an unknown date prior to the vaccination. The patient was diagnosed with "Rocky Mountain" in 2009. She also mentioned that when she got the vaccine she did not tell them that she was on steroids and an antibiotic. She commented that she was not in good shape when she took the vaccine to begin with. She is immunosuppressed and thinks that she should not have received the vaccination. But she also stated that she took the vaccine because she is a severe asthmatic and does not have a strong immune system so if she got COVID, she would die. Concomitant medication included benazepril (BENAZEPRIL) for blood pressure abnormal from an unspecified start date and ongoing; amlodipine (AMLODIPINE) for arrhythmia from 2014 and ongoing; rifaximin (XIFAXAN) for hepatic encephalopathy from 2014 and ongoing; lactulose (LACTULOSE) for hepatic failure, ammonia abnormal from 2014 and ongoing; levothyroxine sodium (SYNTHROID) for autoimmune thyroiditis from 1984 and ongoing; omeprazole (PRILOSEC [OMEPRAZOLE]) for reflux gastritis, chronic gastritis from an unspecified start date and ongoing; alprazolam (XANAX) for anxiety, post-traumatic stress disorder from 2009 and ongoing; albuterol [salbutamol] (ALBUTEROL [SALBUTAMOL]) for asthma from an unspecified start date and ongoing; ranitidine (RANITIDINE) for an unspecified indication, start and stop date were not reported. The patient previously took flu vaccine vii, olysio for hepatitis c and experienced histamine level increased, lyrica and experienced weight increased. Ten minutes after the vaccine was administered the patient experienced generalized aching on 01Mar2021 at 13:55 with outcome of not recovered. After twenty minutes she developed a pretty severe headache on 01Mar2021 14:05 with outcome of recovering. After 30 minutes she started to feel nausea on 01Mar2021 at 14:15 with outcome of recovered. She stated that when she stood up to leave felt like started to feel dizzy on 01Mar2021 with outcome of unknown, and felt like she was going to faint on 01Mar2021 with outcome of unknown, her vision blurred on 01Mar2021 with outcome of not recovered and she had trouble getting into the elevator. She also experienced a loss of appetite on 01Mar2021 with outcome of recovering. The

----------	-------	-------	---------	-----	----------	------------	--------------

patient continued to describe her experiences noting that "things changed daily" and mentioning that she experienced fibromyalgia flare up on 01Mar2021 with outcome of not recovered, no energy been very tired on 01Mar2021 with outcome of not recovered, no energy been very tired on 01Mar2021 with outcome of not recovered, couldn't get warm- very cold, her skin was very cold on 02Mar2021 01:30 with outcome of not recovered, flu-like symptoms on 01Mar2021 with outcome of recovering, hands feel warm to touch, but she still feels cold on 01Mar2021 with outcome of unknown, she cannot sit or stand without discomfort in her spine on 01Mar2021 with outcome of unknown, she cannot sit or stand without discomfort in her spine on 01Mar2021 with outcome of unknown, sick in Mar2021 with outcome of unknown, her bones hurt in Mar2021 with outcome of unknown, her muscles hurt in Mar2021 with outcome of unknown, wheezing on an unspecified date in Mar2021 with outcome of unknown. Lab tests and procedures included cardiac output: over 50 percent, echocardiogram: her heart was good and clear, electroencephalogram with unknown results, magnetic resonance imaging with unknown results, all on unknown dates. Therapeutic measures were taken as a result of pretty severe headache; Sender's Comments: Based on the available information, the company considers that a causal relationship between generalized aching, severe headache, feel dizzy, going to faint, vision blurred, no energy been very tired, very cold, her skin was very cold, wheezing and bnt162b2 vaccine cannot be excluded due to plausible temporal association. The Company considers the reported event fibromyalgia flare up is unrelated to bnt162b2 vaccine but more likely due to underlying medical history of ongoing fibromyalgia. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1136304	3/26/2021	AZ	20	M	3/25/2021	3/25/2021	Approximately 10 minutes after receiving the Moderna vaccine, this writer was called to the patient room by other staff. The patient was extremely confused and not speaking to anyone. He was gazing to the left and not making eye contact with this writer, who was loudly talking to the patient. Multiple attempts were made to get the patient's attention with no success. The patient then began to involuntarily raise his bent left arm in front of his face and then back down to his side. In this writer's opinion, the patient was having a silent seizure. This writer sat with the patient, who became aware approximately 15 seconds later. He was able to answer questions and was quickly reoriented. At this point this writer had the staff call 911 for further evaluation. After answering basic questions appropriately., this writer gathered vital signs on the patient . The first set of vitals were: bp 88/48, pulse 60, respirations 14/min, oxygen saturation 93% on room air, temp 98.5. After small conversation with the patient, another set of vitals were taken: bp 94/70, pulse 68, respirations 15/min, oxygen saturation 95% on room air, temp 98.8. We then had the patient drink some water, then had him lie down in the patient room until EMS arrived. By the time they arrived, the patient was completed reoriented and laughing with office staff. EMS evaluated the patient and deemed him safe to go home with his friend driving. This writer walked the patient to the car to assess balance and coordination. This writer informed the patient and his friend to call 911 if symptoms returned. The patient agreed.

1136474	3/26/2021	KY	54	M	3/16/2021	3/23/2021	I experienced slight flu-like symptoms 3 days after the injection: headache, body aches, diarrhea. This lasted a couple of days then went away. I woke up Tues. March 23 at 6:30 am and noticed numbness on the left side of my face and paralysis on the right side. I'd never experienced this before in my lifetime. I contacted my physician and she advised that I go to a healthcare facility to get checked out. Once at the healthcare facility, the attending ER doctor said everything pointed to Bell's Palsy. However, she ordered a series of tests to rule out anything else. All tests came back good. Diagnosis was Bell's Palsy. I was prescribed Prednisone, an Anti-Viral and poly eye drops. When I awoke the next morning 3/24, the numbness on the left side had mostly gone away, but the paralysis on the right side was worse. Today is 3/26 - there has been no change or improvement since.

1132745	3/25/2021	IA	30	F	3/12/2021	3/17/2021	<p>Patient states on day of vaccination she took 400 mg of ibuprofen due to the pain in her left shoulder around the injection site. Patient then woke up the next day (03/13/2021) and noticed that all of her fingers were more swollen than normal. Throughout the day, the patient reports that her finger swelling resolved and did have some facial swelling. 4 days later on 03/17/2021 the patient developed 3 pustules on her left shoulder at the injection site and another on her right scapula. The following day (03/18/2021), the patient began to have swelling around her eyes and lips. She saw her PCP that same day and was prescribed prednisone, Zyrtec, and hydroxyzine; however, the patient continued to develop mild pustules throughout her body. She presented to the ED on 3/19/2021 for evaluation. The patient was given 10 mg of dexamethasone and recommended to switch to benadryl. After discharge from ED, patient reports that her rash has continued to worsen as it is spreading diffusely all throughout her body. Patient specifically states that her rash spread from her left arm into her chest, then to her back, groin, face, and lower extremities. On 03/21/2021, patient reports that her pustules advanced into target lesions around her face along with developing some lesions in her mouth, as well. Patient also notes that her skin "burns" whenever she itches it. Patient then went in to be evaluated by a dermatologist and was sent to the ED for admission to the hospital. Patient currently hospitalized and undergoing work-up/treatment. Current treatment includes oral anti-histamine, analgesics, topical steroid, and IV fluids.</p>

1133033	3/25/2021	OH	66	M	3/6/2021	3/6/2021	I have never passed out prior; 1 in. laceration above the right eye along; food is less flavorful and does not excite me; Feeling queasy; bruising to my upper arm, leg and back; don't feel right; About 10 hours after the second injection began to have chills and a low grade fever.; About 10 hours after the second injection began to have chills and a low grade fever.; This is a spontaneous report from a contactable consumer (patient). A 66 -year-old male patient received his second dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, lot number: EN6203), via an unspecified route of administration (on left arm) on 06Mar2021 12:00 (at the age of 66 -years-old), single dose for COVID-19 immunisation. Medical history included Diabetes Type 2 (Doctor stated that I really do not fit either profile. Concomitant medications included pioglitazone, metformin, lisinopril, ascorbic acid, tocopheryl acetate, xantofyl, zeaxanthin, zinc (AREDS). Patient stays away from all Opioids they make him very nauseous. Patient typically gets a low grade fever (100-101) and chills 4 hours after a Flu Vaccine that last almost exactly 24 hours. The patient had the first dose of covid vaccine on 11Feb2021 for covid-19 immunisation and experienced only minor soreness at the injection site with the first dose. Experience only minor soreness at the injection site with the first dose. About 10 hours after the second injection began to have chills and a low grade fever. Sunday morning 07Mar2021 started feeling queasy. Patient thought that if I took a shower that I might feel better. As Patient was getting toward the end of his shower Patient just thought, Patient don't feel right. The next thing Patient remember Patient was picking himself of the floor of the shower. Patient have never passed out prior to this episode. Patient received a 1 in. laceration above the right eye along with bruising to his upper arm, leg and back. Patient basically ate nothing the remainder of Sunday nor Monday. It is as if the food is different. Even though he is a Diabetic and keep his blood sugar under control. Patient knows that this may sound weird, but it is as if the food is less flavorful and does not excite him. As 09Mar2021, he still does not feel together. The outcome of the events was not recovered. No treatment for any adverse event. No Covid prior vaccination, not Covid tested post vaccination.

1133368	3/25/2021	CO	56	M	3/24/2021	3/24/2021	Patient called to say that he had severe insomnia (not due to pain in arm or other side effects from vaccine) and when he woke up this morning his eyes look "glazed over" and has "grey color in center of eye" - no affect on patients vision, but instructed patient to seek care, especially with worsening symptoms.
1133317	3/25/2021	AK	19	F	3/24/2021	3/24/2021	Our patient received her shot and stayed in the pharmacy area for 15 minutes and was released. Fifteen minutes late she returned to the pharmacy says she was dizzy and nauseated. We had her sit in the pharmacy for about 20 minutes at whichn time she said she felt better and was ready to go. We had one of our pharmacists walk her but she became dizzy and nauseated again and had to sit down. At this time she said she was hot and very light headed and her vision was starting to get blurry. A minute or so later that she sat up in her chair and stopped breathing and started to fall off. One of our pharmacists caught her and at point she went into convulsions and started gagging and could not breath. 911 was called at this time and an Epi pen was administered. The convulsions stopped 30 seconds afer the Epi and her breathing eazed. The EmT's arrived with in 10 minutes and took her to local emergency room. Our pharmacist called the emergency room about a hour later and they said that She wwas doing well.

1133023	3/25/2021		76	F	3/2/2021	3/2/2021	<p>Back hurt a tremendous amount; Lower back, hips, knees, neck pain; Lower back, hips, knees, neck pain; When she would go to move her eyes left or right or up or down it seemed like her eye sockets just hurt to move her eyes.; Very sore, uncomfortable stomach; Exhausted; Chills; Felt like she was having a heart attack; a bit congested; Aches; jaw pain; facial pain; Quite a bit of saliva in her mouth, it filled up quite a lot; sore on the injection site; Bit of a sore arm/left arm pain; This is a spontaneous report from a contactable consumer (patient). A 76-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in Right Arm on 02Mar2021 14:26 (Batch/Lot Number: EN619G) as single dose for vaccination. Medical history included joint replacements (specified as 1 hip done in 2007; right knee done in Jan2013; another knee was done in Feb2017; another knee was done in 1986); and in 2011, neck fracture. There were no concomitant medications. The patient had the 1st dose of the PFIZER-BIONTECH COVID-19 VACCINE and on 02Mar2021, she had sore on the injection site, experienced excess saliva production. On 05Mar2021, she experienced chills, feeling of heart attack: left arm pain, jaw pain, facial pain. She is worried to take the 2nd shot as she might have more symptoms on the 2nd dose. On an unspecified date, the patient had lower back, hips, knees, neck pain, eye socket hurts when rolling her eyes, sore stomach, and exhausted. It was also reported as follows: on 02Mar2021 after she got home from being administered the Pfizer-BioNTech COVID-19 Vaccine she had quite a bit of saliva in her mouth, it filled up quite a lot; and a bit of a sore arm for a couple of days but that was about it at that point. On Friday, 05Mar2021 she started getting chills and aches; and felt like she was having a heart attack: her left arm hurt and her left side of face hurt down in her jaw. She was afraid and considered going to the hospital but thought she was going to wait it out see what it is and it passed. She then once again got a lot of saliva in her mouth again. Over the next few days she developed aches that were primarily located in her joint replacements, it seemed like the aches attacked those areas of joint replacements in her hips, knees and where she had a neck fracture. She had a lot of pain and a lot of</p>

chills. She was never bedridden, but would lay down because she was exhausted. Her back hurt a tremendous amount. Another thing that happened is her eyes, when she would go to move her eyes left or right or up or down it seemed like her eye sockets just hurt to move her eyes; she did not have a headache; this whole indentation there with her eyes hurt to move them from one side to another. She also had a very sore, uncomfortable stomach; it was not an upset stomach; just seemed very sore, uncomfortable. At first that first part of 05Mar2021 she seemed a bit congested. She is very worried about second dose of Pfizer-BioNTech COVID-19 Vaccine because of the first dose creating all of these difficulties. She does not know what she should be doing. She is scheduled to get her second dose of the Pfizer-BioNTech COVID-19 Vaccine on 24Mar2021 because she is leaving by plane on 29Mar2021. That only gives her like 4-5 days before she leaves and she knows that the other symptoms after the first dose of the Pfizer-BioNTech COVID-19 Vaccine did not start until 3 days later. She is concerned about that, because she is flying to take care of her sister; she is worried about the second dose because she does not like what she experienced with the first dose because she heard that the second dose will be terrible; she is worried about leaving and experiencing those horrible things. She reported that there are no tests/investigations relative to this report to provide. The only thing recently done was having X-rays of her neck on 24Feb2021 because of her neck issues with the fractured neck she had in 2011. Outcome of the events was unknown.

1133544	3/25/2021	IN	56	F	3/23/2021	3/24/2021	Severe arm pain all night. Woke up around midnight with my entire left arm and hand numb and tingling like it had fallen asleep but I was not laying on it. I moved it around until it finally stopped. Pain continued all not. On 3/24/21 was very tired and foggy. On 3/25/21 have a headache and slight nausea. I had an ophthalmic event where I saw lighting flashes in my right eye so it could be this causing instead of the vaccine. I am fine just thought I should report these occurred. Thanks!
1133542	3/25/2021	CA	73	F	3/20/1921	3/21/2021	Shortness of breath, severe muscle aches, eyesight impacted, impacted thought processes. This shot is NOT SAFE!!!!

1133512	3/25/2021	OH	41	F	1/8/2021	1/8/2021	<p>Ringing in ears; Urinary incontinence; Urinary frequency; Flank pain; inability to control temperature; Sweating; she was having hot or cold; Wheezing; falling down stairs; Muscle weakness; Blurred vision; Double vision; Inability to work; Rash; Injection site pain; Runny nose; runny eyes; cough with taste of blood; Shortness of breath; Fatigue; Fever; Chills; Dizziness; This is a spontaneous report from a contactable Nurse. A 41-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot Number: EK9231), via an unspecified route of administration in left arm on 08Jan2021 at 08:00 AM (at the age of 41-years-old) at single dose for covid-19 immunisation. The patient received the first dose vaccine BNT162B2 (LOT: EK5730 and EXP: Mar2021) on 18Dec2020. The subject had a history of ongoing Migraine. Relevant concomitant medications were unknown. The patient stated that after her second dose on 08Jan2021, the reaction started at 06:00PM that night. She says she had a rash and injection site pain that went her arm to her shoulder and neck. She says she had a runny nose, runny eyes, cough with taste of blood, shortness of breath, fatigue, fever, chills, and dizziness that night. She says she did not do any treatment that night, she thought the fever would run its course. Caller says that the next day she had severe fatigue, shortness of breath, wheezing, runny nose and eyes, and she also started to fall down stairs and had muscle weakness. She says she had blurred and double vision, and ringing in her ears. She says she progressed from that in a week to having urinary incontinence, intermittent frequency at night, flank pain, and an inability to control her temperature. She says she was having hot or cold sweats and chills which continued quite a while. She also reported that she has gained back muscle control, though she still has days where she is extremely weak, and her dizziness comes and goes. She says that the ear ringing has stayed the same, and her shortness of breath has stayed the same. She says that as of Mar 2nd she has been diagnosed with severe asthma, and she has never had any type of asthma or breathing problems before. The reporter stated that that this was disabling, she hasn't been able to work since 08Jan2021. The reported events were inability to work (impaired work ability) on 08Jan2021, rash on 08Jan2021, injection site pain (vaccination site pain) on</p>

08Jan2021, runny nose (rhinorrhea) on 08Jan2021, runny eyes (eye discharge) on 08Jan2021, cough with taste of blood (haemoptysis) on 08Jan2021, shortness of breath (dyspnea) on 08Jan2021, fatigue on 08Jan2021, pyrexia on 08Jan2021, chills on 08Jan2021, dizziness on 08Jan2021, falling down stairs (fall) on 09Jan2021, muscular weakness on 09Jan2021, vision blurred on 09Jan2021, double vision (diplopia) on 09Jan2021, ringing in ears (tinnitus), urinary incontinence, urinary frequency (pollakiuria), flank pain, inability to control temperature (body temperature abnormal), sweating (hyperhidrosis), wheezing on 09Jan2021 and feeling of body temperature change. Clinical outcome of the event inability to work was not recovered, while clinical outcome of all other events was unknown. Laboratory data included pulmonary function test, result: 40%.; Sender's Comments: Based on the current available information, the event Inability to work is most likely related to an intercurrent or underlying condition which is not related to the suspected drug. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1133511	3/25/2021	WI	50	M	1/5/2021	1/6/2021	Severe sweating; fever; weakness; Worst headache of my life/daily headaches; searing eye pain; fatigue; This is a spontaneous report from a contactable physician (patient). A 50-year-old male patient received his second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EI1284), via an unspecified route of administration in left arm on 05Jan2021 16:00 as a single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient previously received his first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: Ek5730) in the right arm on 16Dec2020 12:00 PM. The patient had no other vaccine in four weeks. The patient had not been diagnosed with COVID prior vaccination. The patient experienced severe sweating, fever, weakness, "worst headache of my life," searing eye pain for the last 2 months, daily headaches and fatigue on 06Jan2021 12:00 AM (also reported as first 48 hours). The events resulted in disability or permanent damage. Treatment was administered for the reported events. Outcome of events was unknown. The patient underwent Covid nasal swab test post vaccination on 27Jan2021 with negative result.; Sender's Comments: Based on temporal association and known drug profile a contributory role of BNT162B2 to the reported events cannot be excluded. Case will be reassessed if additional information is received. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

and 160/97. She has been in and out of the hospital for her high BP. After the hospital, she called (Number) because her BP "was off the chart". Her cardiologist ruled out heart issues. She did an "echo, a stress test and EKG". On 01Feb2021 she was admitted to hospital with 200/103 blood pressure. Ruled out cardiovascular & placed on Amlodipine. Now 37 Days later with many visits to doctors, blood pressure remains high. Cardiologist ran stress test & echo with no heart issues. Placed on many Blood Pressure Medications that also created side-effects (urination, flushing, dizziness, extreme headaches); Amlodipine 5 mg, Metoprolol 25 mg, Alprazolam 0.25 mg as needed, Propranolol 20 mg. Today, picking up yet another (Hydralazine?) as last-ditch effort. BP daily spikes remain high (160/99 and 175/100). Racing Pulse & BP wakes me out of a dead sleep within 1-2 hours. So weak & constant neck pain that feels like someone is placing pressure around my neck. The blood pressure medication received are the following: Amlodipine from 1Feb2021 until 9Feb2021. She explained it work well to manage her BP but she "could not urinate and had red flashes in [her] face"; therefore, it was stopped by her cardiologist. She was off the BP medication from 9Feb2021 until 17Feb2021. Metoprolol from 18Feb2021 until 25Feb2021, but it didn't work. She explained it was stopped by her doctor because of side effects. Propranolol in combination with Alprazolam as needed for anxiety. She explained she "took 3" of the tablets for anxiety. Hydralazine 25mg which she started yesterday, after seeing her cardiologist. She explained she only got 3 hours of sleep last night. She woke up around 1:30am/2am" her heartrate was at "93" and she put heat and cold on her neck to settle the pain. She specified the headache and pain were so bad it lasted for 1.5 hours, and her BP was 150/93 at 3 am .She added she had a "red and flushed face" and therefore took a "Benadryl at 4am". She explained her BP was down to "125/78", after taking the Benadryl, but got up to "147/90" at 7 am when she attempted to call Pfizer. She explained she has "done [her] due diligence: she consulted HCP, did all the test, she attempted to go for walks and do activities she can tolerate, but her symptoms persist. She added she use to golf and cannot anymore. She explained her symptoms are persisting until this day and her body won't handle it

1133501	3/25/2021	MA	25	F	3/9/2021	3/9/2021	<p>Within minutes I became very dizzy and could not move my head or my eyes without feeling like I would faint or fall over.; blood pressure was checked and found to be 155/110; This is a spontaneous report from a contactable healthcare professional (patient). A 25-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 at the age of 25-year-old, via an unspecified route of administration, administered in left arm on 09Mar2021 15:45 (Lot Number: EN6206) as single dose for COVID-19 immunisation. Medical history included irritable bowel syndrome (IBS), atrial septal defect, obsessive-compulsive disorder (OCD), depression, post-traumatic stress disorder (PTSD), and was normally hypotensive with an average of about 100/50. The patient has no known allergies. No COVID prior vaccination and no COVID test post vaccination. The patient was not pregnant at the time of vaccination. Concomitant medications included fluvoxamine (FLUVOXAMIN), valaciclovir (VALACYCLOVIR), and hydroxyzine; all taken for an unspecified indication, start and stop date were not reported. On 09Mar2021 15:45 (also reported as within minutes), the patient became very dizzy and could not move her head or eyes without feeling like she would faint or fall over. Her blood pressure was checked and found to be 155/110, and she was normally hypotensive with an average of about 100/50. Her blood pressure dropped, and the dizziness went away within 1-2 hours. The patient received EMT treatment/monitoring for the events. The patient recovered from the events on an unspecified date.; Sender's Comments: Based on available information, a possible contributory role of BNT162B2 vaccine can not be excluded for the reported events of dizzy and blood pressure increased due to temporal relationship. Case will be re-assessed upon the additional information provided. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.</p>

This 45-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Lot number EN6205 and expiration date 30Jun2021 received on 03Mar2021 as a single dose (at the age of 45 years), unspecified route in left arm for COVID-19 immunisation. History included thyroid removed in 2014 and diabetes in 2019 (diagnosed about a year and a half ago), Cirrhosis liver, fatty liver. Concomitant medications include metformin for diabetes, glyburide for diabetes, levothyroxine sodium (TIROSINT) for thyroid disorder, cetirizine hydrochloride (ZYRTEC), omeprazole, ascorbic acid (VITAMIN C), zinc, ergocalciferol (VITAMIN D), bifidobacterium lactis (PROBIOTIC), fluticasone propionate (FLONASE), albuterol (SALBUTAMOL), and budesonide, formoterol fumarate (SYMBICORT). Following the vaccination on 03Mar2021, she came home at night with sore arm and started getting chills. She felt very nauseous. She could not open her eyes anymore. She went to sleep and woke up in the middle of the night. She felt like someone was controlling her memories. It felt like someone is taking away memories (Mar2021) and she was trying to hold on. Like something was messed up in her head. The next day she woke up with a sore arm and felt fine. She had a little nauseousness but it was controlled. On Friday (04Mar2021), the vaccine site became red, hot, hard, and had a white ring around it. The more red it became the more fever, nauseousness, and constipation she had. She couldn't keep her eyes open. She started coughing. She had to use her inhalers even more. Her inhalers are Albuterol and Symbicort and she doesn't have a lot number to provide for her inhalers. All day she felt that way. She felt like she was going to die, has body aches. It was awful. She also had dizziness at nighttime she took the ice pack and froze her arm because she couldn't take it anymore. Saturday, 05Mar2021 she woke and still</p>

1133492	3/25/2021	FL	72	M	2/5/2021	2/5/2021	Passed out; cardiac event; This is a spontaneous report from a contactable consumer from a Pfizer-sponsored program COVAX Support. A 72-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 2 via an unspecified route of administration, administered in left arm on 05Feb2021 15:30 (Batch/Lot Number: EL9269) as a single dose for COVID-19 immunisation. Medical history included defibrillator insertion from 2014 to an unknown date (has never had it go off), blood pressure abnormal, heart disorder, blood cholesterol increased (Lipitor indication: to lower cholesterol), and eye disorder. The patient previously received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Batch/lot number: EL3246), on 15Jan2021, at 15:30 PM in the left arm, for COVID-19 immunization. Concomitant medications included acetylsalicylic acid (ASPIRIN) taken for heart from 2010 and ongoing; carvedilol taken for heart from 2014 and ongoing; ubidecarenone (CO Q 10) helps with the statin for his heart from 2014 and ongoing; atorvastatin (LIPITOR) taken to lower cholesterol from 2014 and ongoing; lisinopril taken for blood pressure from 2014 and ongoing; xantofyl (LUTEIN) taken for eye from an unspecified start date and ongoing; and warfarin taken as blood thinner from 2010 and ongoing. The patient reported that 2 hours and 15 minutes after the second dose on 05Feb2021, he passed out and his defibrillator kicked in and he had a cardiac event but was not sure what kind of cardiac event. He stated it was probably unrelated, but the doctor said to call Pfizer to notify. He said he has had the defibrillator since 2014 and has never had it go off. He is having a stress test to check it all out. He added he felt great by about two hours after the defibrillator kicked in and went golfing. The outcome of the events was recovered on 05Feb2021.
1133631	3/25/2021	NE	64	M	2/5/2021	2/6/2021	Patient described yellowing of skin and eyes. This was not observed by provider. Lab work including bilirubin and LFTs were all normal. Patient then reported on 3-25-21 that since the day after 2nd vaccine, he has had intermittent paresthesia's in left cheek, left arm and left leg. No weakness.

1131887	3/25/2021	FL	52	F	3/23/2021	3/23/2021	I received the vaccine outdoors in my car at the local fairgrounds. Within 10 minutes of receiving the vaccine, I briefly experienced a rapid heartbeat. I could breathe and swallow fine but for several minutes (maybe 20 or so) my throat felt heavy. My most concerning symptom was blurred vision that would come and go. At times my near sighted vision was completely blurry but far sighted was fine, at times all my vision was so blurry I couldn't see anything and at one point all I saw was a bright white light, I think my vision was trying to adjust to the sunlight when this happened. All of these symptoms cleared shortly before my 30 minute waiting period was over. After that I just experienced symptoms that I have read about that is common for the vaccine.
1131824	3/25/2021	MN	43	F	3/24/2021	3/25/2021	Moderna Covid 19 Vaccine EUA I spiked a fever, felt nauseous and threw up, and I have arm pain as well as swollen lymph nodes. Also, my body feels very sore and weak. I couldn't sleep, and I have a raging headache behind my eyes.

1131812	3/25/2021	CA	27	M	3/25/2021	3/25/2021	The female medical employee, who was administering the vaccination. The Pfizer Vaccination. Opened a shot syringe. That had an empty vile. The syringe did not have the dosage of vaccine. The female medical employee, documented on my immunization card the sticker Lot number #EN6204, but the vaccine Lot Number (the syringe received) was not the Lot Number indicated on the immunization card. Why? The female medical employee, called over the military personnel whom was being the security for the vaccination site. The female military personnel was holding an open unit syringe vile dosage of the vaccine. The female medical employee showed the empty syringe vaccine to the military personnel. She said, "The dosage fell out." The female medical employee, took the open package, of the syringe vile, that contained a measured dose of the vaccine. Which is not considered the full dosage, or considered a safe dosage of the vaccine, because the package was opened. Not in front of the patient. And. Was open, when the military personnel, who was holding this vile, was walking, with the open package, around without proper medical gear. The medical employee. Quickly took out the syringe. Didn't explain which and what that syringe was, and just injected the dosage into my arm. I know, that practice was malpractice. I know I experienced malpractice. And. It's obvious the Government is going to do anything about it. This is not a petty situation. I don't know where that needle from. What has been introduced to that open syringe package. I did experience very bad side affects: headaches, muscle pains, tiredness, fatigue, weakness, low strength, dizziness, partial blindness, overwhelming stress, back pain, joint pain, spinal pain, chills, fever like symptoms, nausea, spontaneous pain, soreness in the arm, swelling throughout my body, difficulty breathing, short breaths.

1131756	3/25/2021	CA	69	F	2/15/2021	2/16/2021	First vaccine on 1/16/2021, I experienced some numbing of my limbs (arms and legs). It was random and typically didn't last too long (except one time in my left arm that was quite dramatic and I took Bayer aspirin immediately) but was definitely not a normal experience in my body. After the second vaccine on 2/15/2021, the next day, I had the expected fever (100.1 to 100.9) throughout the next 2-days, along with no appetite, energy, or strength. I expected it to dissipate but by day 3 & 4, I felt even weaker and more exhausted. As the days turned into weeks (5+ weeks now), I've experienced severe exhaustion needing to sleep most days 9-13 hours, consistent numbness in my arms (con't next page) and some w/legs, blurry vision, and very unbalanced. I went from walking several miles a day to barely being able to walk a few blocks due to unbalance, weakness and being out of breath. This has gone on for over 5-weeks now. It feels like I am a long-hauler but without having had Covid. I've always been sensitive to drugs, expected to have a reaction, but never imagined something like this would go on for so long. During this period, I had two Covid tests on March 1 and March 10. Both were negative. The week of March 8, I came down with a good old fashioned cold. PCP asked for the second Covid test and chest x-ray (all clear) on March 10. PCP did lab work on March 5. Everything showed as "unremarkable".

1132017	3/25/2021	MA	78	M	2/27/2021	3/8/2021	He received his vaccine, and immediately he could taste it in his mouth. About 5-6 days later his normal routine was to work outside and noticed that he had lost his energy issue, and had this issue in the past when his pacemaker was out of wack. As the month went on it got worse and worse. In March he was out cleaning up the yard and as he worked it got worse and worse. He would have to work for 5 and sit down for a minute. He has hyperventilation syndrome and diagnosed back in 1980 and has been under control, this is one thing that always happens, which seems to be an ongoing problem that he's having. His settings on his pacemaker seem to be OK. He was sitting on his couch and watching a race on 3/8/21 and got a shock coming up from the bottom part of his head, through his chest and out through his right eye, this was less than 2 seconds. This was an event, but not a hard "mule" kick event. He wasn't doing anything to get the shock. The defibrillator is connected to the bottom part of his heart. He has a logic system and had an episode of 190-200 BPM which was at the top part of his heart. He had all of his equipment checked out yesterday, but they could not give him an answer why he got a shock. He now has to set up an appointment with his cardiologist to see tomorrow. He has had the pacemaker for 6-7 years now and the device goes into the device clinic and he gets reports regarding this information. They device people said there was no registration that he had any event.

1131752	3/25/2021	CA	49	F	3/12/2021	3/12/2021	On Friday, March 12, I received the second dose of the Moderna vaccine. I experienced coughing, wheezing and tightness in the chest at 4:00 pm. I treated the symptoms with an inhaler and it went away. At 6:00 pm, I experienced headaches, redness and puffiness in the eyes and eyelids were warm. I began to sneeze and sinus congestion such as seasonal allergies. I also experienced a headache, which I treated with Tylenol. These other side effects lasted until Sunday, March 14 at about 7:00 pm. On Monday, March 15 at 4:45 am, I woke up with swollen fingers on both hands. On Tuesday, March 16 at 3:30 am, I experienced swollen fingers, numbness and tingly in the hand and fingers. On Wednesday, March 17, the symptoms were the same as Tuesday, March 16 in the morning, but numbness and tingly subsided. On Thursday, March 18, the swelling, numbness and tingly in the fingers and hands returned when I woke up at 4:00 am. I was unable to curl my fingers in both hands into a fist and could not use my hands to grip. I realized from trying to hold anything I had a weak grip. My symptoms have not changed throughout the day. On Friday, March 19 after midnight, I went to the emergency room regarding to the pain of swollen fingers and hands (entire palm), numbness and tingly feeling. I was prescribed with 4 mg of methylPrednisolone for 6 days and to taper down. As of today, there is no swelling in the hands and fingers, no numbness; however, there is tingly feeling in the fingertips of my index, middle, and ring finger in both hands.

1131267	3/25/2021	IL	71	F	3/5/2021	3/5/2021	<p>Delirium/had taken over her body and was the cause of her illness; Severe weakness (could not walk or get out of a chair); Severe weakness (could not walk or get out of a chair); Nausea; Diarrhea; Mild headache; Blurred vision; Significant swelling at injection site which spread to full upper arm; Significant swelling at injection site which spread to full upper arm; This is a spontaneous report from a contactable consumer (patient). A 71-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), via an unspecified route of administration, administered in left arm on 05Mar2021 08:00 (lot number: EN6199) as single dose for COVID-19 immunisation. Medical history included osteoporosis (not bothersome), known allergies to some antibiotics, and felt dehydrated. The patient was not pregnant at the time of vaccination. The patient was taking other medications like grapefruit juice. The patient previously received first dose of bnt162b2 on 12Feb2021 (dose number 1, lot number: EL9267, administration time: 08:00 AM, vaccine location: left arm). No other vaccines received four weeks prior to COVID vaccination. On 05Mar2021 12:30, the patient experienced severe weakness (could not walk or get out of a chair), delirium (was convinced that (name) had taken over her body and was the cause of her illness), nausea, diarrhea, mild headache, blurred vision, significant swelling at injection site which spread to full upper arm over next three days and remains troublesome. Other symptoms (unspecified) lessened within two to three days and are no longer of concern. The AEs resulted in doctor or other healthcare professional office/clinic visit. Event 'significant swelling at injection site which spread to full upper arm' were treated with application of steroid cream (for arm only). Outcome of the events was unknown. The patient was not diagnosed with COVID-19 prior to vaccination. The patient has not been tested for COVID-19 post vaccination.</p>

1131211	3/25/2021	CA	23	M	3/8/2021	3/8/2021	<p>Passed out /Lost all awareness; Light-headed; Hyperventilating; He caught his breath; Elevated heart rate; Tingling sensation; He was unable to form cohesive sentences; Muscles movements were impeded; This is a spontaneous report from a contactable consumer (patient). A 23-year-old male patient received the first dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine, Lot. EN6206) single dose, in the left arm, on 08Mar2021, at 11:45 AM, for COVID-19 immunisation. The patient had not received any other vaccines within 4 weeks prior to the BNT162B2 vaccine. The patient had not received any other medications within 2 weeks. Relevant medical history and concomitant medications were unknown. No known allergies were reported. The patient had not experienced COVID-19 prior vaccination. On 08Mar2021, at 12:00 PM, 5 minutes after vaccination, the patient became very light-headed. In a few seconds his vision went dark and he passed out. After an unknown amount of time, he became semiconscious and was hyperventilating. While hyperventilating, his eyes were open, but he could not see anything. Once he caught his breath, after about 15 seconds, his vision came back and he lost all awareness of where he was. After about 30 seconds, the patient realized he was in the observation area for the facility and alerted the medical professionals near his vehicle he was sitting in. Medical professionals checked his vitals, which were fine other than an elevated heart rate, and he had a tingling sensation over his body for the next two minutes. In this time, he was unable to form cohesive sentences, and his muscles movements were impeded. It took another 40 minutes to return to a relatively normal state. No treatment was received. The patient recovered from the adverse events. Post the vaccination, the patient has not been tested for COVID-19. No follow up attempts are possible. No further information is expected.</p>

1131188	3/25/2021	FL	73	F	1/16/2021	2/8/2021	Diagnosed with Afib; Couldn't breath/Gasping for air; Eyes yellow; Asthma flairup; Couldn't sleep; Shaking; A spontaneous report was received from a consumer concerning a 73-year old female patient, who experienced asthma flair up, couldn't sleep, couldn't breathe, gasping for air, shaking, eyes yellow, admitted to hospital, diagnosed with Afib . The patient's medical history mentions asthmatic since the age of 3 years old and Atrial fibrillation. Concomitant medications provided were steroids NOS and a zpack. On 16 Jan 2021, one month and 6 days prior to the onset of the events, the patient received the first of the two planned doses of mRNA-1273 (Batch number: 0281120A) for prophylaxis of COVID-19 infection. On 08 Feb 2021, patient reported having an asthmatic flair up that was bad. She took medication provided by her hcp and could not sleep, could not breathe, gasping for air, eyes yellow and shaking. She was admitted to the hospital on 11 Feb 2021 and was diagnosed with Atrial fibrillation. She missed her planned dose as she was hospitalized. The event atrial fibrillation was deemed medically significant and the patient was also hospitalized. Treatment information mentions Xanax. Lab tests were not provided. Action taken with respect to mRNA-1273 was not reported. The outcome of the events, atrial fibrillation was unknown. The outcome of the events asthma flair up, couldn't sleep, couldn't breathe, gasping for air, shaking, eyes yellow, admitted to hospital was resolved on 21 Feb 2021.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

Patient stated feeling like she going to pass out then asked nurse to hold her hand. EMT arrived checked vital signs all within normal limit per patient. Patient then states that everytime she is in a medical setting she pass out or has vision and hearing loss due to panick and anxiety attack. Stated everytime to gives blood she has this is sure. Patient also refused homecare.
1132119	3/25/2021	TX	43	M	3/22/2021	3/22/2021	03/22/2021 - 12:43PM: A 30mcg/0.3mL dose* of COVID-19 Pfizer BionTECH vaccine was drawn up into a 1mL syringe with a 23G 1? needle and prepared for administration in the left deltoid. This was the patient?s second dose of a 2 dose series. [*vaccine lot EN6207] After insertion of the needle into the left deltoid, the nurse was beginning to depress the plunger into the barrel of a needle-syringe combination, (to administer a 0.3mL dose of COVID-19 Pfizer BionTECH vaccine) when the needle and hub broke from the tip of the syringe. The needle hub effectively spooned the vaccine to splash in the reverse direction from that of the needle. The vaccine went into the nurses left eye and surrounding facial area(s). The needle and hub remained in the patient?s arm, but it was removed immediately with no adverse effect, bleeding, or leaking of the vaccine suspension. The nurse apologized to the patient who was to receive the vaccine. She told him that no vaccine was injected. She said she would immediately prepare another 0.3mL dose of COVID-19 Pfizer BionTECH vaccine and **repeat the administration. The man gave no vocal expression of refusal or display of guarding. Following the completed IM injection of a 0.3mL dose of COVID-19 Pfizer BionTECH vaccine, the patient was reported to express his wish that she make ?a note of what happened.? He was escorted to a post-immunization monitoring area for the recommended 15 minutes of observation. During this time he did not report any adverse effects, or other abnormal outcomes possibly associated with the vaccine administration.

1135512	3/25/2021	CA	37	F	3/25/2021	3/25/2021	On 3/25/21 at 1220 Pt received her first Pfzier vaccine to the left deltoid and was sitting in the post vaccine observation site under 15 min observation. Pt was witnessed slumping down in chair by nurse at 1225 and then became unconscious with eyes gazed and to the right with snoring respirations. Pt was assisted to the floor by two nurses without any trauma lying supine and legs elevated. VS were taken 122/60,59,20 and SPO2 87%. Pt woke while BP was being taken and started talking and was A&OX4. Pt was placed on oxygen at 10LPM with NRB mask. SPO2 increased to 99%, pt's skins were W/D with good color. Pt denied any SOB, itchy throat or difficulty swallowing, rash or hives. Pt was feeling a bit better and oxygen was taken off. Pt was then sat up with legs straight while on the floor to repeat VS at 1231 Pt's BP was 70 systolic, pluse of 58, SPO2 dropped again to 87% and pt became vere dizzy and vision blackening and was layed back down immediately with legs elevated and NRB mask at 10 LPM was placed back on with increased SPO2 of 99%. Pt had positive orthostates. Pt also c/o tingling hands. 911 was contacted at 1234. VS at 1241 were 106/60, 62, 20 and SPO2 of 100%. Pt's husband was at her side. 1247 engine co 54 arrived onscene and report was given to paramedic. AMR unit 460 arrived approx 2 min later. Pt was assessed and transported to closest ER.
1135498	3/25/2021	AZ	26	M	3/4/2021	3/5/2021	Pt. reports drooping of his left eye and left lip, which lasted a few hours, one day after receiving his first dose of the COVID-19 vaccine.
1135417	3/25/2021	OR	40	F	3/24/2021	3/24/2021	2.5 hours after vaccination, I was sitting watching tv when I had a sudden neurological event. It was like a seizure. I was unable to talk, my eyes rolled back, and my right shoulder and arm seized up. I was sputtering and unable to make it stop. Lasted for a minute or two then stopped for a minute and happened again. I felt disoriented, confused, scared. I was unable to walk straight or visually focus on anything. I contacted my primary care doctor and she recommended I be seen immediately but advised I call Providence and speak with a nurse. I did that and the nurse said to come in to the ER immediately. I did.

1136142	3/25/2021	UT	32	F	3/25/2021	3/25/2021	PATIENT REPORTED TO NURSE 15 MINUTES AFTER INJECTION THAT SHE FELT LIGHTEADED AND HAD AN ITCHY THROAT. SHE SAT DOWN ON THE GROUND AND ATE SOME PEANUT BUTTER CRACKERS AND SOME WATER. SHE REPORTED THAT THE ITCHINESS IN HER THROAT PAST, HOWEVER HER DIZZINESS INCREASED. BP 105/60, O2-100, HR- 108, RR- 12. SHE WAS ASKED TO LAY FLAT AND SHE REPORTED SHE HAD DIFFICULTY BREATHING WHEN FLAT. SHE SAT UP AND COMPLAINED OF CHEST TIGHTNESS, AND TUNNEL VISION. PATIENT WAS NOT IMPROVING AND 911 WAS CALLED AT 1827. PATIENT AGREED TO 911 BEING CALLED PLACED INTO A WHEELCHAIR. SHE WAS WEAK UPON STANDING. VITALS BEFORE SHE WAS TRANSPORTED WERE O2- 99-100%, RR- 14, BP 110-62, HR-83. TRANSPORTED VIA AMBULANCE. SHE REPORTED SHE HAS ASTHMA AND DID NOT HAVE HER INHALER. SYMPTOMS WERE "SIMILAR" TO WHEN SHE HAS AN ASTHMA ATTACK.
1134023	3/25/2021	NV	66	F	3/4/2021	3/6/2021	Vaccine 3/4/21. 2nd day extreme tiredness for 2 days; then weak, dizzyish, tremors, blurred vision right eye which is near legally blind, poor concentration, generally poor feeling. These symptoms went on for 2 weeks, until I had to do my routine lithium level on 3/18/21. I was toxic at 1.7. Have been on lithium 40 years and have never been toxic. My doctor sent me to ER, where they gave me fluids and potassium. When checked in ER, my BP was 214/87. I never have high BP - 120/80 is normal. On discharge, my BP was 194/79. Saw my doctor ASAP on advice of ER. My doctor put me on amlodipine for BP which I started today. He said I had essential hypertension and heart rate is irregular.
1136077	3/25/2021	WA	25	M	3/12/2021	3/12/2021	Experienced blurred vision and dizziness. Refused medical care. Medical Device recommended patient go to clinic. Symptoms resolved.

1135881	3/25/2021	TN	34	M	3/20/2021	3/20/2021	Almost immediately after I received my dose, I felt very dizzy and began sweating profusely. My vision became very blurry, and I had trouble breathing. No one came to check and see if I was ok. They just waved me out of the building, being terrified of what was going on and what wanting to leave the facility I drove out into the parking lot for the additional assessment. In the parking lot, I continued panting and sweating, feeling as though I was going to vomit. Again, no one checked on me, and I was too incapacitated to "honk my horn 3 times." After the additional 15 minutes, they waved everyone through to leave, so I left. There was no professional around to speak with at this point anyways. Covered in sweat and dizzy. I drove home to go to bed. When I got home about 10 minutes later, my arm where I received the vaccine was already very sore. I laid in bed and fell asleep and continued sleeping off and on for the rest of the day and night. My shoulder was still sore the following morning when I woke up. As the day progressed my fatigue increased (Sunday was not too bad.) Monday (3.22.21) I felt terrible, (headache, brain-fog, bad back pain, bad knee pain, bad hip pain.) My symptoms have persisted all week. I am unsure as to what to do. I do not have a doctor that I regular see. I am afraid to receive another dose and have even worse reactions/side-effects
1136053	3/25/2021	UT	69	F	3/15/2021	3/16/2021	Fever, muscle and joint aches, eyeball aches, loss of appetite, extreme fatigue. On the first day after the second dose (Tuesday, March 16, 2021), I slept 19 hours, sat up for 1 hour, and went back to bed and slept another 16 hours. Upon waking on the second day after the vaccination (Wednesday, March 17, 2021), the fever had broken and the aches were not as severe but still present. No food or drink were consumed as I slept the entire time. On the third day after the vaccination (Thursday, March 18, 2021), aches were gone, but I was so weak with little energy. In addition, I had lost 3.5 pounds since the day of the vaccination. I could not find a thermometer (as well as was too tired to look), so I cannot tell you what my temperature was, but my face/forehead was hot to the touch.

1136112	3/25/2021	MA	41	F	3/25/2021	3/25/2021	Within 15 minutes: Dizziness, light headed, seeing stars, blurred vision, racing heart rate. I thought at the time I was having a panic attack. I tried to slow my breathing and relax. It did not help any. I monitored my Heart rate on my watch. My EKG said my heart rate was high and marked 138 at one point while at rest when my average resting rate is 52. By the time I walked to my car I felt chest pain and pain in my neck. It was a tightening and burning. In my car, at 1:25 I took antihistamine in a 24 hr dose of Claritin and an inhalation of OTC Flonase. I felt my body calming slightly, but not 100% returning to normal. I alerted my Dr. and she agreed I should not have the second dose without first taking an otc antihistamine and also having an epi pen on hand. I stayed with a friend so I was not alone, and continued to rest. At 6:12 i tried to move around and my hear rate shot back up to 132. I sat back down. At 9:30 I still have pain like I?ve been punched really hard in the chest.

1136040	3/25/2021	CA	30	F	3/25/2021	3/25/2021	<p>Patient presents to the clinic at about 2:20pm for her 2nd dose of COVID vaccination. She was greeted and asked to fill out another consent form for the 2nd dose and was told it will be reviewed after she completes it. She states she has a history of seizure. State had one small seizure episode yesterday. States her doctor is aware and is running more tests and changing her medications around. States her doctor is aware about her COVID vaccination and made no mention that she should not get the vaccine. She states she is comfortable getting it. She states she received the first dose of the COVID vaccine and did ok. The only symptoms she had was fever for about a week. Again she states her doctor is aware and has not told her not to get the second dose of the COVID vaccine. Consent and history were reviewed and COVID vaccination was given at about 14:27 with LVN. She was told because of her medical history, she will need to be monitored for 30minutes instead of the 15 minutes; she agreed. After vaccination was given, patient sat with another co-worker talking and appeared in no distress. Co-worker left shortly after while she was still there for monitoring. At about 2:30ish pm notice that patient was starting to slide down her chair appearing to have a seizure. Immediately rushed over to her, guided her down to the carpet, supported her head, she was lying to her side. She was not conscious, eyes closed, teeth clenched, no foaming of the mouth were noted. +strong radial pulse. Can hear her loudly breathing through her nose. Pulse oxygen on room air, 92% and heart rate was 67. She was not turning blue. Arms and legs were mild jerking. Called out to have staff called 911 simultaneously while supporting and monitoring patient. About 5 minutes into this, patient started to slowing open her eyes, still altered, teeth still clenching and extremities stopped jerking. Slowly, she started to relax, asked her name and where she is at and why she was there, which she was able to answer slowly. Asked her if she wanted us to call her daughter, she said he because she is a minor. Asked her who she is with and she said her husband is outside. Paramedic arrived and took over care and she was told she will be transported to the ER. Her husband, came into the room. After patient's husband spoke to paramedic, I also introduced myself to him. Per her husband, patient has a history of seizure that has not been controlled. Per husband, he states she</p>

1136038	3/25/2021	FL	50	M	3/23/2021	3/24/2021	<p>had 5 episodes on Sunday, 3/21/2021. Her doctor is aware and is doing more testing and changing her medications around. Per patient's husband, he states she was doing an MRA yesterday to further evaluate the seizure and they were not able to complete it because she had 2 episodes. When asked if her doctor mention anything about getting the COVID vaccine, per patient's husband he states they did not say anything. Per husband, she did ok with the 1st dose of the COVID vaccine and only had fevers. Per patient's husband, there was no change in her underlying medical condition with the seizure with getting the vaccine.</p> <p>First, pain around the injection site; it appeared within a few hours after the injection, but it was bearable. Then, after about 23 hours after the injection, bad headache (especially around the eyes - which also caused light sensitivity) and general malaise. Shortly thereafter, low-grade fever (99.5 F) and significant muscle pain, all over the body. The most worrisome side effect was the last one, which appeared during the second night after the injection (about 32-33 hours after the injection): extremely fast heartbeat / racing heart. I did not use any treatments for these side effects.</p>

1136034	3/25/2021	KY	46	F	3/24/2021	3/24/2021	I immediately felt my right arm getting cold. It then started to feel heavy and weighed down. Soon after, I started getting a mild headache toward the front of my head which intensified towards my temple area. My eyes felt strained ( the back of my eyes ). The feeling was similar to a migraine/sinus pressure. I started getting cold and then my extremities were freezing. I got chills and was shivering ( it was cold in the building, but I wasn't that cold upon entering ). This was all in the first 15 minutes. I was told to stay for 30 minutes in the waiting area because of my allergy to erythromycin, just as a precaution. Around 20 minutes my mouth became very dry. I also had a metallic taste in my mouth. It became hard for me to swallow and I had to think to swallow because it wasn't happening naturally. At that time I alerted someone and asked if these reactions were normal. I was given a 25mg Benadryl and had people continuously check on me. It took some time before I was able to not feel the choking closed feeling from swallowing. Once I was able to swallow it felt as if I had something lodged in the back of my throat. Similar to the feeling of phlegm. I kept having to clear my throat because that phlegm feeling wouldn't wash down?. I felt light headed, but not dizzy. More of a foggy feeling. Once they felt it was safe for me to leave I came home and rested. The headache lessened, I was still cold, but not chilled. Into the evening I was very tired and foggy in thinking.

1135999	3/25/2021		74	M	3/23/2021	3/23/2021	vaccine side effect. Patient reports slurred speech, difficulty forming sentences, SOB, R arm tingling x 3 hours. Patient reports symptoms have improved but not resolved. J&J vaccine today at 1045. Denies chest pain, N/V/D, HA, vision changes. Patient is a 74 year old male who presents to ED following a 10 second episode of right arm tingling followed by a 90 minute episode of difficulty finding words. This happened tonight at 8:30pm after dinner when he was with his wife. His symptoms resolved upon arrival at the ED at 10pm. He denies any weakness, no syncope, no chest pain or shortness of breath, no new visual symptoms. He does have a history of CHF, MI in 2013 s/p stent placement, he takes Plavix. He takes a beta blocker for PVC's. He reports he had a J&J COVID shot this morning at 11am and is wondering if his symptoms are a reaction to the vaccine. He is followed closely at Ajou hospital for all his medical care.
1135992	3/25/2021	AL	59	F	3/25/2021	3/25/2021	Patient lost consciousness while sitting in her chair in the post vaccination waiting area. Her phone fell from her hand/lap, head tilted back, and eyes rolled to the back of her head out of focus. Only last for about 60 seconds. Patient was the conscious and coherent. She did feel clammy to the touch. She said she felt hot and accepted an ice pack and decided to lay down on the cool floor for a few minutes.
1135971	3/25/2021	AK	35	M	3/24/2021	3/24/2021	5 year old male member. He received his first dose of the Moderna vaccine (lot number 003B21A, expiration date 9/9/2021) around noon at the vaccine facility. About 2 1/2 hours later, the patient developed burning and itching of the eyes and rhinorrhea. The patient's co-workers and a medic looked at him and said that his eyes were red and puffy, and told him that he should report to the ER. He also experienced some throat itching, and said that his thinking was "cloudy". The patient said that he had eaten nothing in the previous several hours. He had not taken any medications that day. He is not aware of any known drug or food allergies, and he has not been sick in the past few weeks. He denies having had any vaccinations in the previous 2 weeks.

1134398	3/25/2021	NE	77	F	2/4/2021	2/5/2021	<p>She had been in her usual state of health until tonight. Assisted living facility staff called. He mentioned that the facility staff had earlier noticed that she was dragging her right foot and and has been needing more assistance with activities. The patient was walking and did not feel well. She was lowered to the ground and had a witnessed cardiac arrest. The ambulance was called and she was reportedly found to have pulseless electrical activity. She was given Epinephrine and Amiodarone with return of pulse. The patient was brought to the Emergency Room and was evaluated by ER physician. EKG showed atrial fibrillation, ventricular rate = 66, RBBB with Brugada pattern. She was emergently brought to the Cath Lab. Cardiac catheterization showed normal coronary arteries but EF 35-40%. Repeat EKG showed atrial fibrillation with rapid ventricular response = 110, RBBB. Therapeutic hypothermia was initiated. The patient was admitted to the ICU on mechanical ventilation with TV 350 RR 14 PEEP 5. She is sedated with Propofol and Fentanyl IV. She is on Levophed IV. ABG showed pH = 7.22, pCO2 = 53, pO2 = 66, O2 sat = 88%. Lactate level = 9.5. WBC 8.8, Hgb 13.4, Hct 46, Platelets 138. Na 138, K 3.2, Cl 102, bicarb 20, BUN 16, Crea 1.19, estimated GFR = 44 mL/minute. Magnesium 2.7. Glucose levels have ranged from 273-312. Pro-Calcitonin = 0.26. Albumin 3.7. SGOT 262, SGPT 294. Troponin elevated at 47. Pro-BNP = 600. Urinalysis showed large blood. Chest x-ray showed vague peripheral pneumonitis. Endotracheal tube is in place. COVID-19 test by PCR is negative (2/5/21). COURSE IN HOSPITAL The patient was admitted to the ICU and was followed by Pulmonary/Critical Care. Patient was maintained on mechanical ventilation, sedated with propofol and fentanyl IV. Vasopressors were administered (Levophed IV). She was managed with therapeutic hypothermia. She was followed by Cardiology. Foley catheter was inserted for close input/output monitoring. Neuro checks, vital signs, daily weights, pulse oximetry, cardiac telemetry and fingersticks were monitored. She was given sodium bicarbonate IV due to metabolic acidosis. She was also given insulin IV drip. Potassium chloride IV was administered due to hypokalemia. The patient was given amiodarone IV. Platelet count was noted to be low but stable. Glucose levels were within acceptable range.</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							Metabolic acidosis resolved. Hypokalemia resolved. Hypomagnesemia resolved. There were elevated LFTs which improved. Elevated CPK also improved. She was taken off hypothermia protocol. Sedation was decreased and she was able to open her eyes with verbal stimulus but unable to follow commands. Ammonia level was normal. Neurology evaluated the patient. EEG showed left periodic epileptiform discharges consistent with severe diffuse encephalopathy. Chest x-ray revealed right upper lung and left mid lung increasing opacity for which meropenem IV was started. Levophed was discontinued. Initially she had peripheral cyanosis, but this resolved upon discontinuation of vasopressors. Brain MRI was done demonstrating diffuse bilateral small and moderate-sized ischemic foci throughout the cerebellum and cerebellar region suggestive of embolism. There also was chronic marked atrophy and moderate small-vessel gliosis. CIRCUMSTANCES SURROUNDING DEMISE Based on neurologic evaluation, her prognosis for meaningful neurologic recovery was thought to be extremely poor. The patient was evaluated and followed by Palliative Care. She does not have family members and had designated her neighbor friends as her power of attorney. They have known the patient for a long time and they know that she does not want to live like this. A decision was therefore made for comfort care measures only. Compassionate extubation was performed on February 12, 2021. The patient passed away on February 12, 2021, at 6:39 p.m.
1134397	3/25/2021	NC	72	M	2/11/2021	2/13/2021	Vaccine #1 received on 2/11. On 2/13 experienced polyarthralgias (wrists, shoulders, knees, ankles, hips), headache, scalp tenderness, and swelling and pain of testes. These had resolved by 3/4, after receipt of ceftriaxone, azithromycin, doxycycline, and ibuprofen. But on 3/10 he developed loss of vision in his right eye and new frontal headache and was referred to Ophthalmology on 3/11 where he was diagnosed with Giant Cell arteritis (GCA) and prescribed corticosteroids. Within 1-2 days of receiving the latter, his headaches and vision loss had resolved.

1134374	3/25/2021	WA	76	F	1/31/2021	2/7/2021	I think I am having a bad reaction to my covid shots. The first shot was 1/31; a week later on 2/7 I started having headaches that travel around my head: some are behind my eyes and my teeth ache; some more like migraines that go up the back of my head; some more on the top of my head or on the side. My sense of taste changed. My second shot was 2/27. The day after I slept all day. The headaches continued (I have had a headache of one kind or another since 2/7). I had a tooth that broke off last June and was removed on March 8. I thought the tooth was infected and part of the headache problems, but since then I have been having really bad fibro pain and for the week of 3/8- 12 I ran a fever, had chills and more headaches. I was on amoxicillin from 3/8 to 3/14, but the tooth was not that badly infected and is healing well. The headaches do not seem to relate to the tooth. I have had a headache every day since 2/7 of various intensity and in different areas of my head. I am extremely fatigued and need to nap some days. My fibromyalgia symptoms are worse than they ever have been and some nights keep me awake. I also muscle stiffness and spasms in my neck occasionally. This is not normal for me. I saw a ARNP on 3/16 and she tested me for neurologic symptoms. Here are her notes: NEUROLOGIC: negative findings: speech normal, mental status intact, cranial nerves 2-12 intact, gait, including heel, toe, and tandem walking normal, Romberg negative, muscle tone normal, muscle strength normal, rapid alternating movements normal, finger to nose normal, reflexes normal and symmetric I have a video appointment with my primary care provider 3/26 to discuss this further

1134322	3/25/2021	MI	73	F	3/17/2021	3/20/2021	Woke up at 3:00 am drenched in cold sweat, unable to focus, loss of equilibrium, nausea. Feeling better by noon. ongoing waves of brain fog, pressure behind my eyes. I seek no treatment, hope it will improve with time. Would like to know if it is advisable to have the second dose. I do not want to repeat the previous experience. Are you able to advise? Thank you
1134318	3/25/2021	OH	43	F	3/10/2021	3/13/2021	Two days after receiving the Johnson & Johnson vaccine in my right arm, I woke up the next morning with a raised bump on my chest and a feeling that something was in my left eye (that could have been my allergies). However, I do still have a raised bump that is slowly going away.
1134474	3/25/2021	ID	84	F		3/25/2021	Morning after 2nd shot felt great deal of fatigue, to the point of returning to bed. Spent rest of day on couch with no strength. Beginning of front of head headache. This headache has continued to this day, also some visual blurring. Fuzzy head thinking feeling. These conditions are on going as of today 03/25/2021.
1134238	3/25/2021	CA	32	F	1/16/2021	1/17/2021	The day after the second dose I felt sweaty hot and nauseous. I was still really sleepy on the third day. My eye started hurting and I could hear a buzzing sound in both ears. It got worse and worse by day six and I was having trouble seeing out of my right eye. It was really painful underneath my eye on the inside corner with swelling on the top lid. The Steroids seemed to help the problem with my eye. The doctor suspected Bells Palsy. On week two I was prescribed steroids from Lymphadenopathy. I still have the ringing in my ears which is increasing after it had subsided for a little time. I also felt pressure in my ears which is very uncomfortable. Whenever I stop taking the Steroids the ringing in my ears returns like Tinnitus. I plan to reach out to a doctor again because the ringing in my ears has returned after it had improved but was still present after 10 weeks. I did not have any of the same symptoms after the same dose. I have seen a lot of professionals.

1134117	3/25/2021	NC	43	M	2/26/2021	2/26/2021	Symptom onset 10 -15 minutes after receipt. Symptoms included pruritis, shortness of breath, perhaps CP. HE does not recall urticaria, oral/facial/throat or tongue swelling, red/watery eyes, wheezing, n/v/d. He was treated with 50 mgs benadryl and observed for one hour. There was no recurrence. Event documentation is very consistent with his report and documents VS R 60-75 SPO2: 98-100 with metal status of A&Ox4.
1134197	3/25/2021	NM	65	F	3/24/2021	3/25/2021	In addition to a very sore arm, experienced chills, body aches, headache, blurred vision, lethargy.
1134172	3/25/2021	CT	43	M	3/23/2021	3/24/2021	Rapid onset of blurred vision and partial blindness, confusion, inability to form complete or coherent thoughts or sentences. Started with blurred vision around 5:45pm. I immediately sat down on the couch, and tried to explain to my wife what was going on. However, I was unable to complete the thoughts I was trying to form. Eventually I began confusing words (such as saying "king" when I wanted to say "kind" or "kite") and was unable to produce more than one word every 1-2 seconds with great difficulty. Then a headache came that was both extremely painful and somehow "painless," as if I was observing myself having the pain as a bystander. All of this happened within one minute of onset. I laid down and after about 10 minutes from onset the difficulty speaking subsided and I could make complete sentences, although with some difficulty. After around 20 minutes from onset my vision had fully returned. I called 911 out of concern for stroke-like symptoms. The dispatcher sent an ambulance, and I was taken to the Hospital Emergency Department for treatment. Around three hours after the onset of the incident I was diagnosed with a complex migraine and discharged.
1134166	3/25/2021	FL	52	F	3/25/2021	3/25/2021	Starting about 5 minutes after the shot, I started getting a little bit lightheaded. I left the pharmacy and went home. I then started to feel numbness all over the right side of my body, blurred vision and dizziness. I decided to rest. It's been 4 hours now since I got the vaccine. I'm still lightheaded and have numbness on my right side, but it is getting better.

1134095	3/25/2021	MA	36	F	3/21/2021	3/21/2021	Approximately 4 hours after the shot I had an intense burning sensation in my head. It felt like my brain was on fire. It lasted for about 15-20 minutes. After that I experienced tingling/numbness in the back of my neck. Now 4 days later I still have tingling/numbness in my hands and fingers and a slight twitch in my left eye.
1134048	3/25/2021	CT	56	F	3/18/2021	3/18/2021	Patient states that evening that her tongue and lips felt heavy like after going to the dentist, by morning the right eye and ear were also effected. Has not seen a physician, keeping eye lubricated with drops. Too late at time of reporting to us for steroid treatment.
1135308	3/25/2021	CT	68	F	2/18/2021	3/9/2021	Could not close eye and mouth would not move; A spontaneous report was sent by a consumer who was a 68-year old, female patient who received Modern's COVID-19 vaccine (mRNA-1273) and experienced an episode of "could not close eye and mouth " and was diagnosed with Bell's palsy. The patient's medical history is unknown. Concomitant medication include Metformin 500 twice in a day, Losartan 50 mg, Atorvastatin, valacyclovir 1000 mg thrice in a day, Hydrochloride 12.5 mg, Prednisone. On 18 Feb 2021, the patient received the first of two planned doses of mRNA-1273 (Lot number: 023M20A) intramuscularly for prophylaxis of COVID-19 infection. On 09 Mar 2021, the patient reported she noticed her eye would not close and her mouth would not move. She has no events prior to this date. The patient went to the emergency room and was prescribed valacyclovir 1000 milligrams and prednisone 60 milligrams. At the time of this report, the patient reported she was feeling fine and her speech was improving, but her eye still would not shut. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the event of Bell's palsy, was considered not resolved.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

1136145	3/25/2021	NY	39	F	3/24/2021	3/25/2021	The vision in my right was blurred for about 6 hours. When it started to get better it was inconsistent. I would close my left eye and at first my right eye would be blurry for about 2-3 seconds then would be able to focus. As of now 13 hours after first noticing the problem upon waking, my vision is almost 20/20 again from what I can tell not having a doctors visit.
1134285	3/25/2021	CA	31	F	2/23/2021	2/24/2021	Since the vaccine, I have experienced extreme paraesthesia throughout my left head and face. It is chronic and lasts from the moment I wake up to the moment I go to bed. I am also experiencing a watering, itchy left eye and tingling behind the eyeball. Extreme neuropathy in brain, it feels like electric shocks coursing through my head and crabs pinching at the brain tissue. I have also deal with temporarily facial paralysis on the left side of my face, though those symptoms have since abated. I am on Lyrica, prednisone, indomethacin, and xanax in an attempt to get some relief but there are very few doctors who seem to understand what is causing this debilitating adverse reaction.
1134840	3/25/2021	CA	32	F	3/25/2021	3/25/2021	Pt has history of anaphylaxis, carries Epi pen. Complained of feeling odd, similar to how she felt before previous anaphylactic reaction. Place pt on cot, code green called. Paramedics assessed BP 162/102, HR 106, GLUCOSE 114. Attempted to sit pt up had near syncopal episode, rapid eye fluttering BP 172/126. PT was transported to hospital.

1135300	3/25/2021	NY	79	F	2/25/2021		Stroke; Dizziness; Blurred Vision; Slurred speech; Felt numbness; Tiredness; A sponatenous report was received from a consumer concerning a 79 years old female patient who experienced dizziness, tiredness, slurred speech, numbness, blurred vision, stroke, very very lethargic and had tingling in face and fingers, lost speech, lost eyesight. The patient's medical history as reported by the reporter includes hypertensive, diabetic and had circulation problems. Concomitant medications taken by the patient was not provided. On 25 Feb2021, prior to the onset of the event, the patient received their first of two planned doses of mRNA-1273 (Lot number: 025A21A) through intramuscular route at unspecified site for prophylaxis of COVID-19 infection. On an unknown date, patient had dizziness, tiredness (which is very unusual for patient), slurred speech numbness and blurred vision and then patient was taken to the ER and diagnosed with having stroke. She was admitted and discharged when her condition improved. As per the follow up report received, the reporter reported that patient ended up in having a stroke which was a medically significant event and she was very very lethargic and had dizziness, felt numbness and tingling in face and fingers. Patient had also lost speech, lost eyesight which was a medically significant event. Patient went to the hospital where she was diagnosed. Patient was feeling better at the time of reporting and mostly recovered but feeling weak. Patient went to hospital and treatment activities for events was unknown. Action taken with mRNA-1273 in response to the events was unknown. The outcome of events, experienced dizziness, tiredness, slurred speech, numbness, blurred vision, stroke, very very lethargic and had tingling in face and fingers was recovering/resoving and lost speech, lost eyesight was unknown.; Reporter's Comments: There is not enough information to assess the causal association between the reported events and the administration of the mRNA-1273 vaccine. Critical details such as the onset date of the event is lacking. Event is also confounded by the patient's advanced age and underlying medical conditions of hypertensive, diabetic and had circulation problems.

1134824	3/25/2021	AL	60	M	3/25/2021	3/25/2021	<p>Patient received their vaccine and sat in a chair, within approx. two minutes the patient told another patient they felt hot, I was already walking to the patient to check on them,. The patient's eyes were glazed, Almost immediately the patients eyes rolled back in his head. I shook his arm and shouted to him , he was unresponsive with agonal breaths.. I shouted for help from the other nurses. RNs came immediately. We moved him to the floor, called for an epinephrine injection to be prepared, I began to prepare the site for epinephrine injection to his thigh, nurse checked for pulse... at this time the patient was still unresponsive with agonal breaths... no pulse was felt so compressions were commenced by RN. Nurse gave approx. 15 compressions to the patients chest , the patient spontaneously began to recover. Carotid and radial pulses were felt at this time. Breathing returned to normal. While this was occurring, we called a code blue and 911 was activated. By the time 911 responded the patient was fully conscious , alert and responsive. He could tell us his name and how he felt prior to this incident. The patient was transferred via a stretcher by EMS 911 and RN accompanied him to the ER to give a report. The timeframe for being pulseless and having agonal breaths lasted no more than 30-40 seconds. Patient denied any history of a seizure disorder. No epinephrine or IM Benadryl were administered at the incident site by the responding staff due to the spontaneous recovery.</p>

1134816	3/25/2021	TX	39	F	3/2/2021	3/4/2021	To whomsoever it may concern, I am writing to report a reaction to covid-19 Pfizer vaccine second dose. My first dose was administered on feb 10th at the community College at 11:30 AM. My second dose was administered on March 2nd at 11:30 am at the same facility. On March 4th evening a rash started developing near my throat and it became prominent on March 5th. Attached please find the pictures of the day the rash started developing and subsequent days of it getting worse. It has been 20 days and the rash has not subsided despite applying local corticosteroid cream. Furthermore, it has extended to my face (left eye). Additionally, I have not changed my food intake , or used any new facial creams. I also only use hypoallergenic creams. Worried I showed my rash to a doctor who suspects that this could be an allergic reaction to the vaccination and asked me to report it to you as this may be considered important information. Therefore the email. Please let me know if there is anything I can do to be of further help. Sincerely
1134810	3/25/2021	NY	37	M	3/16/2021	3/16/2021	Got the vaccine around 10:30am, felt ok until around 7:30pm, when I started feeling some nausea and dizziness and weakness. Then progressed to severe shaking chills, fevers, headaches, tingling/electric shock feeling in back of head/neck, muscle aches, mild joint pain, eye discomfort associated with the headaches, poor appetite at first, trouble sleeping, and fatigue; all of which required doses of Tylenol and ibuprofen and cold packs. Symptoms lasted all night and fever broke overnight after finally falling asleep. The next day (3/17) took some more Tylenol and ibuprofen, but the fever and chills subsided. The other symptoms mostly resolved except was still quite tired and felt weak. Also, had cold sweats all day on 3/17. By around 3/18 most all of the symptoms resolved. Also, had mild soreness at vaccination site throughout. I'm a physician. If I wasn't a physician I may have sought medical attention.

1134685	3/25/2021	CA	63	F	3/25/2021	3/25/2021	Pt presented today for 1st Pfizer mRNA COVID vaccine. She received the vaccine at 11:06am and proceeded to the check out area and scheduled her second appointment and checked out at 11:10am. She was sitting in the secondary seating area, she looked scared, then she indicated to the APP she felt dizzy, eyes fluttered back, and slumped back into the chair and into APP's arms. With the assistance of another RN, we laid her down on the ground and lifted her legs. She was arousable to sternal rub and complained of dizziness. She was able to report her name and that her husband was outside in the car waiting for her, however, she was slow to answer questions and still appeared distressed. We made several attempts to obtain a BP, however, it would not register on machine, O2 sat 100%, HR 42, manual HR 50 at pericordium. Her bilateral upper extremities were cool to touch and appeared mottled. We attempted to give her apple juice just she was only able to take a few sips. We placed her on 100% non-rebreather. Given low HR, unable to obtain BP, and semi-conscious state, we elected to call 911 at 11:30am. Her husband was retrieved and at patient side when EMS responded. He reported that she has fainted in the past with blood draws and has a past medical history of "leaky valve, low platelets" and later it discovered via her medical records that she has a history of seizures and was on vimpat and lisinoril. EMS arrived, assessed the patient, and moved her to stretcher and transported patient at 11:39am.
1134658	3/25/2021	CA	25	M	3/25/2021	3/25/2021	Pt. c/o of feeling lightheaded, full body tingling, vision changes and everything seem to be in slow motion. Pt. also stated he could not think straight. Paramedic and Dr. on scene. Assessed pt. and vital signs obtained. BP 131/79, HR 75, O2 Sat 100% on RA, RR 18. Pt. was advised to go to ED if symptoms worsen. Pt. stated improvement of symptoms after about 20 mins. Family member to pick patient up. Observed for 30 mins.

1134496	3/25/2021	UT	26	F	3/24/2021	3/24/2021	Stayed 30 minutes after vaccine at vaccination clinic to be safe in case of a reaction. About 5 minutes after leaving 11:30 I could taste the vaccine in my mouth. I immediately felt intense sharp tingling in my lower lip, it felt hot and swollen (upper lip never had a reaction). I instantly felt a lump in my throat and had a hard time swallowing. I started with chest pain that resolved itself in a minute or two. A few minutes later a family member noticed my face was red and flushed and said I looked like I had a sun burn. Swelling in throat resolved within an hour. Lip never visually looked swollen but I could feel the tightness, burning and tingling that resolved within the hour. Redness on face resolved within a couple hours. Had tiny blisters about 3 show up above upper lip I still have them the next day with a couple more but they aren't causing problems. My airway was never blocked I never had a hard time breathing. I did have a sore throat this morning March 25 day after vaccine. All other symptoms seem normal.
1134707	3/25/2021	MN	22	M	3/24/2021	3/24/2021	Symptoms similar to vasovagal reaction. Patient reported feeling dizzy and shut his eyes. He then slumped over in chair and was caught before he fell out of chair. Reported no other symptoms up to 30 minutes after event. When questioned, he said that he had not had anything to eat that day except an orange in the morning. He states he has felt sweating with previous vaccination and has had this reaction with tattooing.
1129727	3/24/2021	CA	39	F	3/3/2021	3/3/2021	Feeling tightness on the face for around 45 min. Blurred vision, very dizzy and unable to have good balance for 6 days.

1129592	3/24/2021	OH	80	F	3/2/2021	3/1/2021	<p>blood pressure went from normal to 190; feeling her chest tight; couldn't breathe; black spot in her eyes; just a tightness in her throat; sugar is very high; This is a spontaneous report from a contactable nurse (patient). An 80-year-old female patient received bnt162b2 (BNT162B2, Solution for injection), via an unspecified route of administration on 02Mar2021 (Batch/Lot Number: EN9809; Expiration Date: 30Jun2021) as a single dose for COVID-19 immunization. Medical history included diabetic, asthma, allergy, sugar, and thyroid (disorder). The patient also stated that she has a lot of allergies. She was allergic to bees and allergic to bunch of things and many more things. She had her thyroid removed. Concomitant medications included levothyroxine (LEVOTHYROXINE, 100 ug) taken for thyroid (disorder), start and stop date were not reported; metformin (METFORMIN, 100 mg) taken for her sugar, start and stop date were not reported; hydrochlorothiazide (HYDROCHLOROTHIAZIDE, 12.5 pill), taken as diuretic, start and stop date were not reported. The patient reported that she had a very bad reaction from the vaccine, which was 20 minutes her blood pressure went from normal to 190 and she started feeling her chest tight and couldn't breathe (all on 02Mar2021). She also had a black spot in her eyes (02Mar2021). The patient reported that the events started the minute after she got the shot. She was sent to the hospital on 02Mar2021. When she was in the hospital, her blood pressure went up to 244, it is the highest. Her chest was going to have an asthma attack but she didn't develop an asthma attack it was just a tightness in her throat (02Mar2021). She was a day and half in the hospital, trying to get her blood pressure down which went down somehow that she still have over 200 blood pressure. When paraphrased the above concern she stated, "Yeah absolutely want to know what kind of result or what kind of the side effect you are going to have." The patient also stated at the time of report, "I still have my blood pressure is still 200 and my sugar is very high too (unspecified date in Mar2021), is that part of the after effect of the vaccine because I didn't have that before." The patient was hospitalized from 02Mar2021 to 04Mar2021. Therapeutic measures were taken as a result of blood pressure went from normal to 190 (hypertension) and couldn't breathe. The patient stated</p>

----------	-------	-------	---------	-----	----------	------------	--------------

her doctor put her in the double medicine for the blood pressure. When probed for if patient was still experiencing issue, she stated "No, as soon as I came home I took Benadryl". The patient reported that her breathing improved as soon as she took Benadryl and her chest is probably clear now. As treatment, they gave her blood pressure pills. They gave her Pravastatin 20 mg. Outcome of the event blood pressure went from normal to 190 and sugar is very high was not recovered. Outcome of couldn't breathe was recovering. Outcome of the other events was unknown.; Sender's Comments: Based on the available information, the known safety profile and the temporal association of BNT162B2 administration to the events, a possible contribution of the drug to the events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

1129659	3/24/2021	NC	71	F	2/11/2021	2/28/2021	Fluid on the ear; Bells palsy; Jaw pain; A spontaneous report was received from a consumer who was a 71-years-old, female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and who experienced: Bells palsy(facial paralysis), jaw pain (pain in jaw), and fluid on ear (middle ear effusion). The patient did not provide any relevant or specific medical history. Concomitant product use was not provided/unknown by the reporter On 11 Feb 2021, the patient received her first of two planned doses of mRNA-1273 (Batch number 013M20A) intramuscularly for prophylaxis of COVID-19 infection. On 28 Feb 2021, the patient started to experience jawpain and went to see her doctor. The date of the doctor visit was not provided/unknown by the reporter. The patient was told by the doctor, "she had fluid on ear." Patient endorses, "she has had fluid on ear before and never had that type of pain." Patient reports she returned for medical care on 06 Mar 2021 and was seen by a nurse practioner. The nurse practioner said she had Bells palsy. Patient indicated "she had all signs on(of) Bells palsy." The patient expressed concern regarding her eyesight as nurse practioner said "she could get dust in eye because of inability to close eye." Patient also wanted a call back on whether or not to take the second dose. Treatment for the events included: "pregnisone" (presumed to be prednisone, reported as pregnisone 500mg/1000mg) and an anti-viral (reported as valacyclovir 1000mg) which was prescribed by the nurse practioner. Action taken with mRNA-1273 in response to the events was not reported. Outcome of the events of Bells palsy, jaw pain and fluid on ear was unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the onset date of the reported events, a causal relationship cannot be excluded.

1130249	3/24/2021	IN	55	M	3/23/2021	3/24/2021	After having slight headaches(normal side effects) with dull eye pain from 11pm thru overnight of March 23, at 10:30 I went out driving in car and my eyes were squinting. with heavy dark clouds(not bright) outside. I looked at my pupils and they were pinpoint to slightly bigger. My glasses are auto tint, but not so much behind car windows. When I got home I sat in a dim room(lights off, but sliding door blinds closed but some light coming in) for an hour eating lunch. I then checked my pupils and they were about a third the size of my iris. Mild headache, dull eye pain and squinting continued. I searched the internet and found no details about eye problems. I called, ask a nurse and was told they found no information about eye problems at CDC or internet related to vaccine, but perhaps it is headache causing eye problems. Seems like this should be listed somewhere! Or do I need to see my ophthalmologist? You should be complete in side effects that eye problems are possible. I had no problems prior to vaccine. Do with this what you will(likely ignore it as you are bidens cdc).
1130243	3/24/2021	KS	23	F	3/12/2021	3/19/2021	Numbness and a tingling sensation to the left side of face. Started to left jaw and moved to left ear and eye. No treatment.
1130229	3/24/2021	NC	71	F	3/16/2021	3/16/2021	Received my 2nd shot at 8:20 a. Around 6:30 pm I started feeling really bad. In my 71 years I have never felt so cold, and the shivers kept coming in waves. I was very feverish and so very cold at the same time. Could not get warm no matter how many blankets I had. Every fiber of my being ached. Felt somewhat nauseous but did not throw up. The next day I was no longer cold, by even my eyelids still hurt and I had no energy at all. Even though it took 36 -48 hours to fully recoup, I would still get the vaccine.
1130064	3/24/2021	OH	45	F	3/8/2021	3/8/2021	I had severe anxiety / panic attacks, high heart rate, severe dehydration (6 pounds lost within 10 hours of the injection), chills, headaches, body aches, dizziness, nausea, extreme fatigue. I developed an eye infection for which I had to go to the doctor. I am currently doing eye drop treatments for this as well as topical lid scrubs. The anxiety / panic continues. I had extreme fatigue for several weeks. Other symptoms lasted 48 hours.

1130197	3/24/2021		28	F	3/12/2021	3/16/2021	Extremely sharp head pains and nausea started Tuesday (4 days after receiving the Vaccine) at 0245 AM. Thursday night around 0930 PM I noticed the swollen lymph nodes in the shower. After further investigation I noticed there were three almond sized swollen nodes (largest and most painful was in the left Clavicle and the other two were in the jugular area. Unfortunately after palpitations the nodes became extremely agitated and pain radiated from the neck down into the fingers in the left arm. On Friday (19 Mar I went to the clinic where I was tested for COVID and was negative) Over the weekend approximately 10-15 more Nodes became enlarged, followed by blurred vision in right eye and more intense headaches. 22 March I was sent to the ER for Lab work (testing white blood cell count) and an ultrasound of the lymph nodes .
1129919	3/24/2021	TX	22	F	3/23/2021	3/24/2021	Pain where they administered the shot and fatigued the rest of the day and the next. At 3am the next day woke up with a fever of 102F, muscle pain, chills and a headache. 30 minutes later I vomited. Took Tylenol. Woke up at 10am with a fever of 100F, muscle pain, chills (not severe as earlier), headache (not as severe) and eye strain very severe. (I wear glasses but I've never had eye strain this severe)
1130104	3/24/2021	FL	70	F	3/10/2021	3/10/2021	Shortly after the first dose of Pfizer vaccine, my upper lip, upper gums ,nose, eyelids got swollen and the back of my tongue felt sore. At 11:00 pm same day , when I went to take my low dose aspirin and vitamin D gel caps with water, I had difficulty swallowing them. The side effects lasted until the following day by early evening. I left several ,messages with VAERS, to report these symptoms and never got a call back.
1130077	3/24/2021	FL	80	M	3/20/2021	3/21/2021	Pt presented to the ED with right-sided facial drooping and was diagnosed with Bell's Palsy. Pt was prescribed prednisone in the ED. Evaluated today at our office and was prescribed valtrex. Currently experiencing right eye dryness and irritation.

1130027	3/24/2021	MT	18	M	2/27/2021	2/28/2021	onset Nausea and vomiting at 3 am the following morning of vaccine. Had about 5 hours of this then fevers, body aches and fatigue. Noted the following day this his eyes looked yellow, more that usual, and came to the clinic on 3/1/21 for evaluation. was feeling better but due to acute jaundice had blood work that indicated markedly elevated bilirubin and low platelets. Further testing for hepatitis was negative. Was sent to the ER the following day as we were unable to get blood drawn and GI consult was desired. There he had a normal abdominal US and bilirubin had dropped and he has since been followed by GI and is currently being evaluated by Hematology for any underlying conditions that may be contributing.
1130013	3/24/2021	UT	31	F	3/5/2021	3/8/2021	1. A very sore feeling inside of my right nostril that developed into an actual wound about two days after the vaccine on 3/5/2021. It has only just started to heal and feel "normal" as of 3/24/2021. A strange cold sensation just to the right, lower side of my right eye. Every time my eyes well up, crying or just tearing up after yawning etc., I have a cold shooting sensation that begins at the corner of my eye and moves down my face about and inch. It's so cold and intense I always reach up to feel if I somehow have a tear on my skin already, but never do. This occurs whether tears actually leave my eye and move down my face, or even if I just tear up. It start occurring roughly two days after my first Covid-19 vaccine on 3/5/2021. My second shot is scheduled for 4/2/2021

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1130004	3/24/2021	AR	42	F	3/20/2021	3/22/2021	I have Moderna arm (starting about 8am on 3/22/2021), and a pinprick sensation on right forearm starting evening of 3/22/2021. It progressed to itchiness in V1 distribution of right-sided scalp. As of 3/24/2021 there is pruritis of V1 distribution of right scalp down to the eye. There is some mild redness to right eye and skin surrounding eye and forehead. Mild enough that I cannot decide if it is from rubbing and scratching it versus being present at baseline. It is helped by a concoction similar to Icy Hot (not applied near eye). I have had chickenpox as a child. There are no vesicles (so far). I am not immuno-compromised. If anything (given my allergy history) I have too robust of an immune response to everything I will definitely follow back up if this develops into shingles. I would be very shocked if it were shingles. I am wondering if the vaccine did not get my immune system so primed that it's attacking anything remotely foreign (varicella zoster dormant in my trigeminal nerve perhaps?) such that I would have itching and burning pain associated with shingles but no actual outbreak of shingles (let's hope there's no outbreak coming later...). Another tidbit of information that suggests robust immune response is that I took my regular allergy shots on Monday, 22 Mar 2021 and the spots (2 shots) whealed up higher than usual. Those went down by morning of 23 Mar 2021 but the Moderna arm has stayed and the V1 burning/itching sensation continues. I am a psychiatrist, so I know my symptoms are not currently worrisome enough to seek medical care. I will if symptoms worsen.
1129986	3/24/2021	GA	26	F	3/12/2021	3/13/2021	received her first dose on 03/12/2021 at 10:30 AM. Later that day, she only mentioned slight soreness at injection site. In the early morning hours on 03/13/2021 she became anxious and having very irrational and disjointed thinking. She got into the pool (unheated) by herself, unbeknownst to any other family members in her athletic clothes she was in and was then found across the street at a neighbors house (she did not know them), standing on their doorstep in wet clothes at 5:45 AM on 03/13/2021. Her confusion, irrational thought, anxiety and paranoia has increased to the point of having audio/visual hallucinations and sleep disturbances. Prior to the vaccination, she did not exhibit any of these behaviors or symptoms.

1129954	3/24/2021	KS	65	M	2/23/2021	3/14/2021	Developed bilateral uveitis, confirmed by ophthalmologist. Treated with Durezol (difluprednate) eye drops. Improving
1130226	3/24/2021	AK	62	F	3/16/2021	3/17/2021	Upon waking on 3/17/21 at 6:00 a.m. (the day after my second dose of the Moderna Covid-19 vaccine). I experienced floaters and blurred vision in my left eye. There was one larger black spot in my field of vision larger than the floaters. The large black spot has gone away in my left eye on the same day it occurred. The blurred vision and floaters continue (over a week later) in my left eye.
1128226	3/24/2021	PA	59	F	3/18/2021	3/19/2021	Chills and fever from 9 am to 5:30 pm on 3/18/21 - fever was at 101 degrees for 2 hours before breaking in the late afternoon. A headache was felt all day, becoming increasingly painful as the day continued. It was sharp, intense pain in temples, across the forehead that pounded. Intense pain behind the eyes for 2 hours before the fever broke. I had not taken any pain or fever reliever all day - wanting to let the vaccine run it's course, however at 3:30 I took one acetaminophen tablet. I could not take the headache anymore. By 4:30 the headache had eased up and the fever was at 100. By 5:30 the headache was gone, temperature was at 98. I then slept for the entire night. The next day - no fever or pains/aches, just tired. I felt like myself by the end of the day.
1128384	3/24/2021	NH	61	M	3/23/2021	3/23/2021	pt states that he developed a headache, sore arm, had fatigue along with body aches and pains. He was dizzy and eyes were very droopy. He woke up next day and his arm is very sore, he is very tired and has a flushed face. Pt feels like his symptoms are improving now.

1128167	3/24/2021	NV	64	F	3/3/2021	3/18/2021	Extreme (!), severe pain in LEFT jaw/remple/upper lower molars. Radiating to back of eye, ear/temple area, upper and lower molars. Started on 3/18 lasted 3-4 hours then went away. Another attack on morning of 3/19 - lasted several hours and went away. Another attack afternoon of 3/19 - even more sever. Went to E.R. at the hospital. Thought it was an abscessed tooth at first but later realized that the tooth itself was not really sensitive. Diagnosed as trigeminal neuralgia by a nurse practitioner. Prescribed Baclafen and Pennicillian (in case it was caused by tooth abscess). Baclafen was successful in moderating the pain to tolerable levels. Have had several smaller attacks since when eating (even though I am avoiding chewing on left side). Seems to be set off by hot or cold foods possibly(??). No noticeable swelling . The thing is that I have NEVER had this kind of nerve pain in my jaw or anywhere else at all (save for an attack of Shingles 2 yrs ago) . possibly this is just a coincidence but it seems odd that this occurs two weeks after the injection when my health has been fine thus far.
1130223	3/24/2021	TX	47	F	3/10/2021	3/18/2021	Subconjunctival hemorrhages (right eye), petechiae around eyes and on forehead, increased bruising (shins, thighs, face), nose bleed noted during first week. Sunburn-like rectangular rash and swelling/firmness appeared at injection site on 3/19/21.

1129252	3/24/2021	WI	68	F	2/26/2021	2/28/2021	<p>vitreous degeneration; laser flashes of light in right eye; This is a spontaneous report from a contactable other healthcare professional (patient). This 68-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration in the left arm on 26Feb2021 at 14:15 (at the age of 68-year-old) (Batch/Lot number was not reported) as single dose for COVID-19 immunisation. The patient was not pregnant. Relevant medical history included long QT syndrome, arthritis, back problems, colon polyp and digestion problems. Concomitant medication included hydrocodone bitartrate/paracetamol (HYDROCODONE/ACETAMINOPHEN) taken for an unspecified indication, start and stop date were not reported. On 28Feb2021, the patient experienced vitreous degeneration and laser flashes of light in right eye, considered serious as medically significant. The patient specified that she continued to see flashes of light in right eye one week since being vaccinated. Eye doctor diagnosed vitreous degeneration. The adverse events resulted in Doctor or other healthcare professional office/clinic visit. Corrective treatments received as a result of the events included "numbed eye and examination". Prior to vaccination, the patient was not diagnosed with COVID-19 and, since the vaccination the patient has not been tested for COVID-19. The outcome of the events was unknown. The information on the batch number has been requested.; Sender's Comments: Based solely on chronological connection to the vaccine a causal relationship between reported events Vitreous degeneration and Flashing vision and BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

1128863	3/24/2021	OR		F	1/28/2021		<p>feels like the back of brain is swollen, its like the back of her head is heavy and pulsing; Shingles; sharp shooting nerve pain down the right arm, on the right side of head and between breast; had a rash at the injection site which was bubbly, itchy; had a rash at the injection site which was bubbly, itchy; feels like the back of brain is swollen, its like the back of her head is heavy and pulsing; This is a spontaneous report from a contactable consumer. An elderly female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot number was not reported), via an unspecified route of administration on 28Jan2021 at 11:00 as a single dose for COVID-19 immunisation. Medical history included shingles in eyebrows from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. The patient stated that her first shot activated a virus. In trying to recall the name of the virus, she stated that she is almost 80 and forgot the word, it's the virus with awful rashes in the body, she has been waiting for a month to report it. It's shingles. She had no symptom in first 4-5 days but then she had sharp shooting nerve pain down the right arm, on the right side of head and between breast. It was sharp pain, like someone poking with a knife every 20 seconds to a minute. It went on for a few days till she took gabapentin which is strong stuff. Then 2.5 weeks later she had a rash at the injection site, which was bubbly, itchy, and then she started getting shingles. She has shingles on 2 sites in the body. She's had no attack in the body, and she is not stressed. She has the shingles in the back and the 2 days ago she experienced shingles in the right eyebrow. She knows the shingles lives in her trigeminal nerve, because this is not the first time, she has had it in her eyebrow. She is pretty sure the shot aggravated the virus. Since then, she wakes up in the night to what feels like the back of brain is swollen, it's like the back of her head is heavy and pulsing. She can't get the second dose, no one is scheduling her. She thinks she is past the time they recommend, but then again, she got the shingles. She is not happy right now. The outcome of the events was unknown. Information on the lot/batch number has been requested.</p>

1128856	3/24/2021	IL	50	F	2/25/2021	2/25/2021	diagnosed acute right eye scleritis; Rash on face, neck, chest, arms, hands; flushed in the face; itchy all over the body; hot all over within 45 minutes of the shot administration; This is a spontaneous report from a contactable consumer reported for herself. A 50-year-old non-pregnant female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose via an unspecified route of administration, administered in left arm on 25Feb2021 13:00 (Lot Number: EL9266, at age of 50-year-old) at single dose for covid-19 immunization. The COVID-19 vaccine was administered at facility of workplace clinic. Medical history included hashimotos thyroiditis, allergies to sulfa, penicillin, latex. The patient is not pregnant at the time of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. Concomitant medication with in 2 weeks of vaccination included thyroid (THYROID). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 25Feb2021 at 13:45, the patient experienced rash on face, neck, chest, arms, hands, flushed in the face, itchy all over the body, hot all over within 45 minutes of the shot administration. Diphenhydramine hydrochloride (BENADRYL) was required for 36 hours to mitigate the reaction. Then on 01Mar2021, right eye developed increased pressure, pain, inflamed blood vessels, severe photosensitivity. At emergent eye doctor appointment, the patient was diagnosed acute right eye scleritis. Treatment for the events included diphenhydramine hydrochloride, steroid eye drop, antiinflammation meds. The events were non-serious per reporter. The events result in doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care. The outcome of the events was unknown. Follow up attempts are needed. Further information has been requested.

A 48-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Lot number was not reported), dose 1 via an unspecified route of administration (reported left side) on an unspecified date as single dose for COVID-19 immunization. Medical history included felt a little hot prior to the COVID vaccine from an unknown date, neck pain, extreme GERD, extreme racing heartbeat, right eye proptosis, and immune issues from an unknown date. Concomitant medication(s) included oxymetazoline hydrochloride (CLARITIN ALLERGIC); levothyroxine sodium (SYNTHROID); liothyronine sodium; hydroxychloroquine sulfate (PLAQUENIL S); and famotidine (PEPCID), all taken for an unspecified indication, start and stop date were not reported. The patient previously took diphenhydramine hydrochloride (BENADRYL) and had a side effect. On an unspecified date, the patient reported having these feelings in both arms, more so a tingly feeling in the right side of the face, and hypersensitivity in the face. She had a pain that goes from the right side of the face to the back of the brain. Her blood pressure went up. She also had a lot of liquid, and felt dehydrated almost felt like her right side was going to drool. She wanted to know if this could be palsy or a nerve condition. She stated she's concerned about getting second dose because she was still having these feelings. The patient wanted to know if it would be safe to use the EpiPen her Doctor prescribed to her, since her blood pressure went up high, instead of going down, like</p>

VAERS\_ID RECVDDATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

it usually would happen in the severe cases of allergic reactions; for that and the tingly face, the doctor recommended that she receive the second dose in the hospital. She stated she received her first dose at a convention center and wanted to know if Pfizer could provide her with a letter saying she would need to receive her second dose in a hospital. She was supposed to get the second vaccine on Thursday (unspecified date). She was concerned because of a reaction she immediately had and has had since that timeframe. She felt a little hot prior to the COVID Vaccine. After she got the COVID Vaccine, she felt hot. She was sitting there waiting and felt a little hot on her forehead. She thought she had a little sweat. She also thought she was being crazy because she was hot before she got to the COVID vaccine location. Twenty-nine minutes in she started feeling extreme heat on her face. She was burning and tingling. She felt she was having a lot of congestion. She saw her face turned very red. She had to use a lot of ice because it felt like she was on fire. She was there for two hours being monitored. Her blood pressure was 153/92 when it normally was 100/70. Her blood pressure was checked three times and the lowest was 142/90. She stated she is not allergic to Benadryl, but when she was a little kid she had a side effect so she doesn't use Benadryl. She was given Pepcid immediately after COVID Vaccine. She had red flushness on her chest. She had a tingling feeling under her throat. Her face swelled up a little bit, but enough where she could feel it. She stated she had neck pain prior to the COVID vaccine. Fifteen minutes after the COVID vaccine, she felt pain rise from the right side of her neck to her head. She also felt numbness across her face. It didn't go away. After two and a half hours at the COVID vaccine facility, she was told to go home, and someone would call to check on her. She felt a slight itchiness on the right side of her face. Her face looked very red, specifically her cheeks and forehead. She was so fatigued, she felt like she was drugged. She took Claritin. She couldn't fall asleep. She has extreme GERD and would wake up with an extreme racing heartbeat. She also had this happen prior to the COVID vaccine. She stated she takes Omeprazole, basically the prescription version of Prilosec. She stated her GERD is inflammation-based and the COVID vaccine must have triggered the GERD.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

Eight hours after the COVID vaccine, she fell asleep for five minutes, woke up, looked in the mirror and there was a big, red rash area on the whole right eye area on the right side of her face above her eye, but not to the top of her forehead. She hasn't been diagnosed with the cause of what is going on with her right eye. She does have right eye proptosis prior to vaccine so maybe the whole right side of her face was targeted because she has immune issues on that side prior to vaccine. On the next four days, she got zero sleep and had a hard time sleeping. She went to her primary doctor on Monday (unspecified date) and her blood pressure was 140-something over 80-90. Five days after the COVID vaccine, her blood pressure returned back to normal. This whole time she was taking Claritin. She could feel tingling feeling through her arm. She almost feels like she had been shocked or electrocuted. She had that continually feeling in her face and arm since the COVID vaccine. She did see an allergist who stated caller should have been given an EpiPen immediately. She has never used an EpiPen before. She saw the allergist seven to eight days later. The allergist took blood to see if there was still a histamine response, but her results were normal. She was still feeling those weird feelings of being electrocuted or shocked. The right side of her face is hypersensitive. It comes and goes. She did see her endocrinologist who stated maybe it's a neurological response to the COVID vaccine. She stated the doctor had seen what happened to her before, but it didn't last long. This doctor saw the face would go away after thirty minutes and reporting the ones that come back for the second time, their high blood pressures lasted for twenty-four hours. Her high blood pressure lasted for 5 days. The past couple of days her blood pressure has been very low and then high. It is all over the place, which is not normal for her. The outcome of the event "blood pressure went up/blood pressure was 153/92/her blood pressure was checked three times and the lowest was 142/90" was recovered, and unknown outcome for the remaining events. Information on the lot/batch number has been requested.

1131100	3/24/2021	CA	57	F	3/22/2021	3/22/2021	Within 2 hours of receiving the vaccine injection in my left arm, i began to experience a numbing sensation on my left cheek and within another hour or so the numbing sensation was around my left eye. The next day the numbness was still there on my cheek, however it was no longer around my eye. The second day after the injection the numbness is almost completely gone, but is still slight and only about the size of my finger tip. I had a virtual video conference with my family doctor, and she has stated it appears that it was most likely an adverse side effect from the vaccine. She asked that i report this via the VAERS website.
1131086	3/24/2021	ID	66	F	2/24/2021	2/26/2021	Woke up at 630am on 2/26/21 with severe ice pick headache on right temple. Intense burning pain running along top of right brain lasting a few mins. This happened 3 mornings in a row. On 3/2/21 at 10pm I had a very severe ice pick headache. It felt like hot lava along top of right brain lasting 20 minutes. Took Advil. Called Clinic at 8am the next morning 3/3/21. I was able to get emergency appointment at 11am that day with Dr . He prescribed Gabapentin and Valtrex. Checked for Bells Palsy as right forehead was smooth. Medications helped. No more Ice Pick headaches but I?m still having headaches along the right brain. Pressure and pain behind my right eye. It has been almost a month now. I sadly had to cancel my second vaccine appointment.
1131085	3/24/2021	TX	44	F	3/23/2021	3/23/2021	Got very dizzy and cold sweats a few minutes after vaccine. Then I had a seizure and thankfully my husband was there and called the paramedics because he thought I was having a stroke and when they came I was waking up but I had very blurry vision and I was very very sleepy and my memory wasn't very good. The paramedics came and checked my vitals and my blood pressure was very very low but I got to feeling better and stayed there for more time. I was very very tired and my memory was kind of bad for the rest of the day. My husband said I was twitching and my eyes were rolled back when I was seizing and he was a little over a minute when I was seizing.

1131082	3/24/2021	IN	66	F	2/7/2021	3/24/2021	Today at about 11: 30 AM, I took an Amoxicillin for gingival irritation. I have taken this medicine before , but this was the first time since getting my Covid Vaccine. About one hour later, I began having intense itching of both hands, followed by diffuse flushing and pruritus and slight swelling around my face and eyes and a little feeling of throat irritation, but without SOB, wheezing or tongue swelling. My vital signs stayed stable, including a normal oximeter reading. I took a 180 mg Fexofenidine and used some OTC Hydrocortisone Cream on my hands when the first symptoms started. When the other symptoms progressed , I took 24 mg Methylprednisolone oral tablets and 25 mg liquid Diphenhydramine and my husband drove me to the ER, to be close in case I developed difficulty breathing. After about 30 minutes the symptoms stopped worsening and gradually resolved. I didn't go to ER

1131588	3/24/2021		52	M	3/13/2021	3/15/2021	Patient reported that he was administered the first dose of the Moderna vaccine on 13Mar2021. Patient reported 2-3 after the vaccination he began to experience floaters and flashes before his eyes for 2 days. He then stated that after that he has been seeing a black dot to the right of his lateral periphery. Patient did see the optometrist on the same day. Optometrist noted: No tears or detachments noted today, with extensive (extended) BIO + peripheral 90D. Pt states floater remains since Saturday (though not present per pt during exam) but denies flashes or curtain veiling. Query if complete PVD though difficult to appreciate on exam. Strict RD precautions given, STAT if symptoms arise. Pt expressed understanding. Will repeat DFE at scheduled f/u 5/4/21 @ 13:40, or sooner PRN.
1131572	3/24/2021	WA	66	F	2/26/2021	2/26/2021	Localized headache/eye pain in my right eye. The eye muscle was sore when I moved my eye, especially looking down. Sharp throbbing pain intermittently lasting approx. 2 seconds in right temple. Tylenol eased the pain some. Headache gone the next day but still right eye muscle discomfort the following day and then it was gone.
1131323	3/24/2021	WI	30	F	3/5/2021	3/6/2021	Head and ear pain on left side began on 3/6/2021. I took Tylenol and OTC ear drops but pain continued to get worse. 3/10- pain worsened, ear itched, hyperacusis began. 3/11- 8am Finally made an appointment in clinic due to the worsening ear pain and was prescribed ciprofloxacin/dexamethasone drops and told to contact clinic in 24 hours if symptoms didn't improve. 3/11- 8pm noticed weakness on left side of face (inability to close eye tightly), went to bed. 3/12-6:30am weakness on left side progressed- eye wouldn't blink/close, asymmetric smile...called clinic and was asked to come in. My primary saw me and sent me to the ER. They looked in my ear and Diagnosed me with Ramsay Hunt Syndrome (shingles outbreak in ear/ impacting facial nerves causing acute paralysis) on 3/12/2021 after initial symptoms began on 3/6/2021. I was put on 1000mg of valacyclovir 3x day and 60mg prednisone for 1 week each. Moderately-Severe Paralysis remains as of 3/24/2021.

1131337	3/24/2021	TX	70	F	1/15/2021	1/16/2021	The day after vaccination I had redness and swelling in my right eyelid. My eyelid was very red and almost swollen shut. I was told that the problems I was having had to do with the Vaccine by telehealth. After seven days because of the bruised look I consulted another doctor who told me that it was an infected Sty in my eye. I was prescribed an oral antibiotic Doxycycline. I have never had a Sty in my eye before and it is still a little red spot after two months.
1131449	3/24/2021	SC	68	F	2/23/2021	3/24/2021	fever of 100, eyes ached, fatigued- lasted for about 5 hours

1131445	3/24/2021	CA	45	F	1/20/2021	2/1/2021	<p>On 2/1 I started to feel rundown. On 2/3 I had no energy. On 2/4 I couldn't think straight. On 2/6 I got a covid test. Results negative. On 2/8 I saw a doctor who tested my electrolytes. Everything was good with labs. I was declining rapidly. I started to become very lightheaded and dizzy. I had blurred vision. I started to get migraines. On 2/11 I saw another doctor who did a bunch of tests like vertigo, said she could not figure it out. The migraines were severe and consistent. On 2/15 I went to the ER. They did a CT scan, EKG, more blood tests. She said she would diagnose me with migraines although I never had an issue with them before, and she was diagnosing me with it as a "diagnosis of exclusion". I was bedridden. I had spots in my vision and couldn't drive. I felt like I was driving drunk although completely sober so I stopped driving. I had severe brain fog. I couldn't remember what happened 2 minutes ago. They prescribed me propranolol and a triptan. I didn't take them because I felt that the diagnosis was wrong. Something was causing migraines, my whole body was experiencing something major. On 2/19 I went to another doctor for another set of eyes. I told him what I was feeling was systemic. I had been out of work for weeks. He tested me for B12 and Magnesium deficiencies. Everything was normal. I googled nonstop. I started feeling zaps like my body needed oxygen. My brain needed oxygen. The brain fog was so severe I felt like I had dementia. I kept googling... I came across iron... I started to take iron on 2/21. I went to the VA for more blood tests. The blood tests had some low markers like eGFR and slightly low MCHC. I was clearly very sick. The same day I could barely breathe well and I went to the ER. The doctor told me he "deals with strokes and heart attacks" and not what was happening to me. I asked him to please check my ferritin. He refused. I kept taking iron. On 2/22 I went to another ER with shortness of breath and all of the other symptoms. I felt like I was going to die. I had never been so sick. I am a very healthy person who eats healthy and exercises daily. This doctor refused to test my ferritin as well. She told me it was stress. I ordered my own labs using walkinlabs.com. I had read that ferritin can be falsely elevated if the body was inflamed and I'm pretty sure that's what happened because at the time my ferritin was normal at 48. I kept taking large doses of iron (within safe limits) because my</p>

----------	-------	-------	---------	-----	----------	------------	--------------

symptoms matched iron deficiency without anemia and the causes of it fit me. I read many many medical journals regarding our ferritin ranges and how ferritin should be 75+. I had never had an issue with it before. I swore it was iron. Every day 2-3 symptoms would go away. I saw another doctor shortly after who dismissed all of my symptoms again. It was the sickest I had ever been and 4 doctors, 3 ER's all dismissed me. I was beyond frustrated and lost faith in the medical community. Some mentioned it could be the vaccine but they did not question it too much. I went to a naturopathic doctor. She did a thorough test on 3/9. My ferritin came out as a 21 on this date (after 16 days of taking large amounts of iron). She thought maybe I was already iron deficient and that when I got the shot, maybe my immune system couldn't handle both. I left it at that. Meanwhile, another coworker, had also been out 3 weeks. He had deteriorated severely about the same amount of time after the Moderna Vaccine that I did. I didn't think much of it as he had diverticulitis. He is also a healthy eater and exerciser. Today he is still very ill. Today he told me that his Kidney doctor just found out that his Iron was completely depleted! His labs were off the charts low. Coincidence maybe, but too similar to not consider as an adverse reaction to the shot! And how many people may have the same symptoms who don't know? As of today I am still very weak and tired but I am able to work. I don't feel as sharp. Iron did fix a lot of the symptoms but iron deficiency usually comes on slower. In this case it is like I FELL OFF OF A CLIFF. I deteriorated so hard and fast and was terrified. My family was terrified.

1131404	3/24/2021	WI	30	F	3/24/2021	3/24/2021	After the first 10 minutes, vision blurry and anxious, felt like she was going to pass out. Pt unaware if she lost consciousness. then had emesis. Appears pale and dry in oral mucosa. 1910. Now with complaints of stomach cramps. Drinking water. Emergency team called and patient refused transport to ER.
1131399	3/24/2021	ND	84	M	3/12/2021	3/13/2021	Hospital Course: Patient was admitted 2 days after having received his COVID-19 vaccine and had SIRS including hypotension. Was believed to be a possible reaction to the vaccine. He was admitted to the ICU and briefly he needed vasopressors. The hypotension resolved and did not recur. An echocardiogram showed that he had a moderate pericardial effusion, cardiology saw him and does not believe that this contributed to the hypotension. He also thought his stools were dark however he has had quite dark stools for many years he told me, ever since he was started on iron pills. He could not confirm whether or not the stools might be a little darker than usual for him and he also had 1 out of 3 stool occult blood test that were positive. He has chronic anemia with the hemoglobin slightly lower than his baseline, so GI was consulted and an EGD was performed. He does have Barrett's esophagus and GI discussed with him how he will need follow-up EGDs, and I reminded him of that as well. Warning signs and alarm symptoms were discussed. He was placed back on his Eliquis however he will not be taking the Effient medication. This was based on recommendation from cardiology. He will have lab work done and see his primary care provider within several days. He will also have a video capsule test done and pick this up either today or tomorrow and follow-up in several days with GI. Discussed going back on his low-dose Eliquis with GI. Discussed with cardiology and GI and discussed with the patient the risks, benefits and alternatives. He will watch for any signs of bleeding and stick with a low dose of Eliquis.

1130492	3/24/2021	OH	57	F	3/14/2021	3/23/2021	Received injection on Sunday. Monday was nauseated and had chest pressure. Nausea and CP came in waves and occurred about 10 times. Then stopped. Felt "off" for 4 days. Felt fine on Friday and through Wed 3/23/21 until 9:10 PM. Developed visual changes in left peripheral bilat. Appeared like waves in an arc. Then began to not be able to breathe. I had to tell myself to breathe. Called squad, arrived 9:45pm. BP 170/110, HR 118. By 10pm, the visual changes disappeared BUT developed chest pressure in same area as the MONday after the vaccine. Then became extremely nauseated, almost vomiting. Nause came in waves for next 6 hours until it calmed down. Then returned Wed am for several hours, again in waves along with hollow chest feeling and pain. Continued with headache off and on with brain fog the remainder of Wednesday 3/23/21. Discussed with hospitalist at Hospital and was told to report it to the CDC as likely an adverse effect to the vaccine. Was still in the 14 day window. Thank you, RN, PhD, MSN, MS, BSN

1131652	3/24/2021	GA	44	F	3/1/2021	3/24/2021	Redness, pain, swelling and arm. It's also warm in that area. Watery burning eyes. Headache.
1130437	3/24/2021	PA	72	F	3/13/2021	3/13/2021	Got the vaccine, got very dizzy immediately after and kept her for 30 minutes and gave her water. Then driving home she started feeling itchy, and could feel little hives in each ear. She was then very lethargic that night and all the next day Sunday, and then first thing Monday morning was covered with a large hives and a rash. She was covered from one end of her body to the other and into her joints where she was not able to bend her joints. She tried to use cortisone, but that made it worse. Also tried Benadryl lotion and Calamine lotion, which also did not help. She then went to the doctor and he prescribed steroids. She has had pain as if somebody was sticking needles in her. In the past 2 days her lips are numb and swelled, and on the right cheek plus her two eyes there is a big swollen area and her eyes are burning. Now her entire body is peeling as if she had a bad sunburn. Now her blood sugar due to the steroids is from 250-475. The site of the vaccine itself was ok.
1130857	3/24/2021	OK	76	F	3/17/2021	3/18/2021	Pt states that she developed a dozen lumps underneath her right arm the day after her second shot of vaccine. She also developed an eye infection and a sore on her lip the day after as well.
1130900	3/24/2021	CA	33	M	3/12/2021	3/20/2021	1) Loud tinnitus in both ears beginning one week after vaccination, persisting 2) Right-sided headache occurring behind/around eye, beginning one week after vaccination, persisting 3) Blurred vision in right eye, beginning two days after vaccination, persisting
1130336	3/24/2021		78	F	3/24/2021	3/24/2021	After RN administered vaccine, when she removed the "needle retractable safety syringe with needle" the syringe detached from needle leaving needle with hub in arm. RN removed the needle from arm. Patient stated she felt a drop go into her eye.

1130875	3/24/2021	ME	83	F	2/24/2021	3/8/2021	83yo F w/ PMH significant for HTN, chronic thrombocythemia, and glaucoma followed by Heme-Onc without treatment who presented to ED 03/15/21 via EMS complaining of generalized weakness. She had felt well and had been in her usual state of health, and was able to cook and enjoy a turkey dinner with 5 individuals on 03/07/21, but on 03/08/21 she began to develop progressive generalized weakness up to the point where she remained in bed for several days. She could not support herself when attempting to rise from bed. She noted poor PO intake with nausea, no vomiting. Loose stools for several days, no noted stool blood. Did endorse waves of lightheadedness and had fallen backwards three times in the prior week, reportedly due to poor balance when standing. She was unable to elaborate regarding the falls but admitted to hitting her head at least once, unable to say if she lost consciousness or if she felt presyncopal symptoms before falling. She had initially presented on 03/12/21 to ED for evaluation, workup negative, labs and imaging normal. CT brain found no acute process. She was sent home with arrangements for home PT. She returned to ED 03/15/21 when symptoms had not improved. In the ED she was found to be afebrile, significantly hypertensive, mildly tachycardic, + orthostatic vital signs. Labs significant for heme occult positive stool, proBNP 397, WBC 10.1, H/H 13.4/39.9, PLT 493, UA neg for infection. COVID neg. CXR found slightly increased interstitial markings. MRI brain found no acute intracranial abnormality. She was evaluated by PT and found to be unsafe to DC home as she could not ambulate without leaning backward and to the right and needed 1-2 assist. She was admitted to HM service for further management. She has remained consistently afebrile. She continues to experience significant gait instability, cognitive slowing, and difficulty with finger-to-nose testing with noted dysmetria, no focal weakness.

1130681	3/24/2021	VA	63	F	3/18/2021	3/20/2021	Saturday morning I woke up feeling fine. About an hour later I had a bad headache and my body started to be achy. That was followed by bilateral eye pain so that the only comfortable thing to do was to put on eye shades. I was exhausted by the afternoon. I had absolutely zero energy to do anything but lie down. By Sunday morning every inch of my skin was sensitive, every joint was sore and every muscle group in my body was painful. The symptoms from the previous day remained; head and eye pain. I used both tylenol and advil a few times but without relief. Monday my body/joints were still achy and I was super tired but not like the previous 2 days. I became very depressed and fearful that it would not let up. Today is Wednesday and its the first day I feel like myself again although I did have to take a nap 3 hours after I woke up today. Body still aches but nothing like it was

1130555	3/24/2021	IL	62	F	2/25/2021	3/3/2021	HPI: 62 yo with a "bad gallbladder attack" 20 years ago. She was sick for 2 weeks but had no insurance and was treated conservatively. Her pain was principally in the R post. Flank. Since then she's has occasional mild attacks associated with the same flank pain and nausea. Two weeks ago last Friday while working at the post office, she became acutely ill with the same flank pain but this time also with epigastric and chest pain with nausea. She saw Dr. 4 days later and still felt lousy and then followed up on March 13. At that time the patient related the history as "The pain is described as aching, colicky, cramping and pressure-like, and is 5/10 in intensity. Pain is located in the RUQ, epigastric with radiation to right back. Onset was 4 days ago. Symptoms have been gradually worsening since. Aggravating factors: activity and eating. Alleviating factors: none. Associated symptoms: anorexia, belching, flatus and nausea. The patient denies fever, hematochezia, hematuria and melena." Subsequent blood work was normal including CBC, LFTs and lipase. US: A 1.9 cm shadowing gallstone is visualized. It is mobile. There is no gallbladder wall thickening or pericholecystic fluid. Patient reports right upper quadrant pain during the scanning. The common bile duct is normal in caliber measuring 2 mm. She remains fearful of eating. No CBD sx/signs. She's had one of two Covid vaccinations

1130633	3/24/2021	IN	74	F	1/21/2021	3/17/2021	Left eye began to droop on 3-17. By 3/20 the entire left side of my face had started to drop. Went to dr on Monday, 3/23 and was diagnosed with Bell's Palsy
1130659	3/24/2021	TX	68	F	1/13/2021	1/14/2021	Got the vaccine, and about 24 hours later she started to feel an ache in her front left tooth. She was wondering if this was due to the vaccine or not. She was unable to lift her arm as well. In a couple of hours it was real sore and she kept hitting it with her tooth. Her upper gum was then tender and could not touch it. She then could not chew on the front left tooth, and even hurt with touching of her tongue. As the night progressed more teeth were tender, and the lip was also more tender. She started to get a headache and then all of her joints were starting to hurt. The next morning, Friday morning she had no energy at all, just felt terrible. Her face was now swollen, as well as her upper lip. That night it was getting worse and worse and her gums were so itchy and all the teeth on the left side felt loose. It then reached her jaw and then the swelling went to her eye. She called her PCP, and put on antibiotics, to take an antihistamine and a steroid. Told her to go to the ER if it did not get better. It was horrible by Monday morning, she went to UC and had an abscess in her tooth. They put her on penicillin, told her not to take the other antibiotics. By Tuesday morning the swelling had gone down, and the swelling in the gums were also gone, and the teeth were also better. The abscess was also feeling better. She had no issues with her gums and teeth prior to this. By the time she finished the penicillin she was fine. She went to the dentist and they could not find anything wrong with her, and informed her that it was proof that the vaccine was doing it's job.

1126556	3/23/2021	CA	60	F	2/14/2021	2/14/2021	Swollen face; Swollen puffy eyelids and below eye; itchy rash on face,neck, and chest; This is a spontaneous report from a contactable consumer (patient). A 60-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not provided), via an unspecified route of administration in left arm on 14Feb2021 at 12:30 at single dose for COVID-19 immunization. Medical history included allergies to dust mites, dogs, and corn; Hashimoto's thyroid; and high blood pressure. Prior to vaccination, the patient was not diagnosed with COVID-19. She was not pregnant and did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Concomitant medications included fluvoxamine maleate (LUVOX), thyroid (ARMOUR THYROID), and amlodipine. The facility where the most recent COVID-19 vaccine was administered was reported as other. The patient experienced swollen face, swollen puffy eyelids and below the eye, and itchy rash on face, neck, and chest on 14Feb2021 at 17:30. The events resulted in doctor or other healthcare professional office/clinic visit. The patient was told to take ALLEGRA and PEPCID in the morning and CLARITIN AND PEPCID in the evening by the allergist. Since the vaccination, the patient has not been tested for COVID-19. The outcome of the events was not recovered. The events were assessed as non-serious. Information on the lot/batch number has been requested.

1126549	3/23/2021	CT	67	F	3/9/2021	3/9/2021	Under eyes feels like hives; No appetite; Left arm is stiff; Knees, legs and back all hurt; Having some chest pain; Left arm is swollen; Cheeks are puffy; Chills; Head hurts so bad can barley lift it off the pillow; Fainted after vaccine; High blood pressure; A spontaneous report was received from a consumer concerning a 67-year old female patient, who experienced fainting after vaccine (syncope), high blood pressure, head hurts so bad and can barley lift it off the pillow (headache), left arm is swollen (peripheral swelling), cheeks are puffy (swelling face), under eyes feel like hives (urticaria), left arm is stiff (limb discomfort), knees, legs and back hurt (pain), chills, no appetite(decreased appetite), and having some chest pain (chest pain). The patient's medical history included breast cancer, seasonal allergies, and asthma. Products known to have been used by the patient, within two weeks prior to the events, included chemotherapy unspecified (chemo pills for breast cancer). On 09 Mar 2021, prior to the onset of the events, the patient received the first of the two of their planned doses of mRNA-1273 (Lot number: 027A21A) for prophylaxis of COVID-19 infection. On 09 Mar 2021, the patient passed out at the facility right after her shot. The patient also reported that her blood pressure was very high, and she was rushed to the hospital for a few hours where vitals got down to stable, and she was sent home. On 10 Mar 2021, the patient reported that her head hurt so bad and she could barely lift her head off the pillow, her left arm is very swollen, her cheeks are puffy, under her eyes feels like hives, left arm is stiff, knees, legs and back all hurt. The patient also stated having chills, some chest pain, and no appetite. Treatment information for the events was unknown. Action taken with mRNA-1273 in response to the events was not provided. The events, fainting after vaccine (syncope) and high blood pressure were considered as recovered on 09 Mar 2021. The outcomes for the events of head hurts so bad and can barley lift it off the pillow (headache), left arm is swollen (peripheral swelling), cheeks are puffy (swelling face), under eyes feel like hives (urticaria), left arm is stiff (limb discomfort), knees, legs and back hurt (pain), chills, no appetite (decreased appetite), and having some chest pain (chest pain) were considered as not recovered.; Reporter's Comments: Based on the current available information and temporal association between the use of

1126467	3/23/2021	IN	32	F	3/23/2021	3/23/2021	Within several minutes of administration, patient expressed feeling lightheaded/"woozy", vision beginning to close off. Also tightness and tingling between her neck and left shoulder. She was assisted into a prone position with feet elevated. After some questioning, she was given 3 glucose tablets and also some water once she felt certain she was improving and unlikely to lose consciousness. She remained lying down for approximately 25 minutes, at which point she was feeling much better and wanted to try sitting up. She sat on the floor another 10 minutes or so, then moved to a chair where she was monitored approximately 15 more minutes. She stated at that time that she was feeling "fine", "back to normal". She chose to leave at that time, but on request, called the pharmacy within about 35 minutes to report that she arrived safely home and still felt fine. At 2pm, she was contacted to confirm information for this submission and again stated she felt fine.
1126410	3/23/2021	NC	88	F	2/20/2021	3/5/2021	She got the vaccine, everything was fine, they warned her about being sick. She did not have any reaction at all until she woke up 13 days later on 3/5/2021 and her left eye was blind. She had some sort of blob that changes colors and moves around. It sometimes is orange. She knew she did not have macular degeneration as it centers it. Sometimes it sparkles and has grain to it. He said that she had an arterial blood, and that leaked from the carotid artery into the eye has not completely sealed off. She can see out of the right eye perfectly, but she cannot see a little out of the left eye. If she's watching the TV she can see the top of the newscasters hair, but she cannot see anything below that. Her vision is upward either, can see out of either side, but cannot below horizontal down. He told her that it was basically a stroke that didn't reach her brain and went to her eye. He told her to return to see him (ophthalmologist) on 5/18/21 at 10:00 AM. She also is to see her PCP on 5/20/21.

1126399	3/23/2021	NC	57	F	3/21/2021	3/22/2021	Large red dot under left eye. Not itchy and not a pimple.
1126272	3/23/2021	MA	63	F	3/18/2021	3/19/2021	vertigo, double vision, headache, inability to stand. Went to ER, given meclizine and lorazepam. Symptoms improved over 6 hours but, other than headache, have never disappeared completely
1126365	3/23/2021		57	F	3/11/2021	3/12/2021	Felt fine, no pain in right arm where vaccine was injected. Next day around 2pm felt muscle pain in lower part of left arm and right leg, thought it was just muscle pain like the flu. My arm and leg started tingling and going numb, would wake me up at night. Had a Dr. appt. on March 18 when I mentioned I had numbness and tingling, but thought it was just side effect from the injection. Saturday, March 20 called 811 and nurse recommended I get it checked out. Monday, March 22 called my Dr. office, but no openings. Started noticed tingling and numbness in left leg as well. March 23 went to ER regarding my concerns. Dr. checked me and said to keep an eye on my symptoms; GBS was brought up and he said it could show in up to six weeks.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1126355	3/23/2021	IN	48	F	3/19/2021	3/19/2021	Vaccine was given and while scheduling second vaccine I noticed my tongue and gums itching then my throat (?? trachea) began to tighten. Not knowing if these symptoms were the vaccine, wearing of a face mask, or just slight anxiety, once I finished scheduling my next vaccine appointment, I took my seat and sat for the 15-minute observation time. The itching and tightness did not seem to get too much worse so when my 15-minute observation time was up, I left the building, called my mom, and headed back to work. Removing the mask and having a drink of water did not alleviate my symptoms, so my mom suggested I go back to the clinic at the fairgrounds and have them assess my symptoms. I was escorted to the back of the building where Dr was. After a brief examination and asking questions, Dr had me lie down on a cot and he monitored my blood pressure and oxygen while continuing to ask questions about how I feel and any new symptoms I may have. He said my oxygen and blood pressure were great. I was shaking/body tremor pretty much the whole time I was lying on the cot. Neither of the original symptoms, tongue and gum itching and tightening of throat, ever really subsided. I was thirsty and I began to feel nauseous, and on a couple of occasions thought I was going to vomit, but only had dry heaving. (Note: I am not aware of the time and how long it was from beginning to end, when I was given something to when ems arrived, to when I arrived at hospital.) Sometime later, my throat was a bit sore and I felt like something was tickling or in the back of my mouth. Dr examined the location, and upon looking, called for a nurse and the next thing I know, I now have a throbbing headache and Dr was administering an EpiPen Injection to my upper thigh. At this point, I was still nauseous, pounding on the right side of my head near eye socket, still having body tremors, and ready to fall asleep. Dr explained that my Uvula and soft palate had double in size and that I was having an allergic reaction and will need to go by ems to the local hospital for observation. I tried to refuse, but was told it was protocol. Several people looked inside my mouth. I was given a pill that dissolved on my tongue. My head stopped pounding and I was no longer nauseous once I was in the ems. I do not remember when the itching and tightness of my throat went away, but it was before I arrived at the hospital. Once I arrived at the hospital,

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							the only thing that hurt was my upper left thigh where Dr administered the EpiPen and I still had small body tremors. Two separate nurses tried to give me an IV, but both were only successful at blowing out my veins. I refused an IV after the second attempt. The nurse gave me, what she said was 3 steroid pills (Decadron??) and ½ of some other pill that will coat my stomach and protect it from steroid pills. They allowed me to walk on my own without observation to and from the bathroom down the hall. Sometime later in the emergency room, the itching of my tongue and gums came back and the tightness in my throat returned. The staff at the hospital did not feel concerned enough to even examine me after I mentioned the return of the symptoms. After about an hour, I was told I could go home, but they later came back and said I had not been there long enough and had to stay. It was around 7:30 pm when I was able to leave and go home. Saturday and Sunday, I was very fatigued. Monday and Tuesday my hips and legs feel very weak and wobbly and I have pain going from my right hip down past my knee on the outside of my leg.

1126376	3/23/2021	WA	71	M	3/9/2021	3/10/2021	Pt reports that he received his first covid vaccine on 3/9/21 and that he had a "bad reaction". Pt reports he developed severe HA, watery eyes, body aches and chills. Symptoms lasted for about 18 hours and then resolved. Pt was reading an article today that said if you have had covid in the past that you are more likely to have potential SE when you do get your first covid vaccine. Pt would like provider to report this to the Vaccine reporting system, since he did have covid in December. Pt did not do any reporting through V-Safe after getting his vaccine.
1126735	3/23/2021	VA	27	F	2/27/2021	2/27/2021	40 minutes post vaccination patient reported rash on cheeks, then became lightheaded, developed itchiness in eyes and forehead and feet swelling and rash on legs. Patient was given Benedryl and released to home.
1126866	3/23/2021	NY	35	F	2/9/2021	3/15/2021	Received positive COVID-19 PCR test result on 3/15/21 after exposure to someone with COVID-19. Symptoms included fatigue, headache, tightness in chest, and eye discomfort sporadically for 4 days.
1125687	3/23/2021	WA	39	F	3/20/2021	3/21/2021	itchy eyes, onset was approximately 10 hours post vaccine, by the next morning my face was dry and peeling
1126190	3/23/2021	IN	58	F	3/14/2021	3/22/2021	On March 22nd (8 days after the vaccination I noticed a red bump on my right eyebrow that itched. At first, I thought it was an insect bite. Today, March 22rd, I noticed a red rash on my face (similar to rosacea). My cheeks and ears feel warm to the touch, and I have a mild itch on the entire area. The rash is more prominent on the right side of the face. This has not happened to me before. I am planning on taking an OTC antiallergic to calm the symptoms.
1126855	3/23/2021	OH	30	M	3/18/2021	3/18/2021	Employee received 1st dose of COVID Pfizer vaccine on 3/18; had a viral eye infection for 2 months. One to two day post vaccination employee developed an immune reaction in his eye. He describes this reaction as pain, redness, swelling, and eye photophobia.

1126819	3/23/2021	OH	71	F	2/23/2021	2/27/2021	Severe headache, earaches, tinnitus, jaw pain, eye pain started 2/27/2021. Started taking 300 ml of ibuprofen & 500 ml acetaminophen 3 times daily. Went to PC doctor, on 3/3/2021 who prescribed antibiotics and later a CT sinus scan. Went to ER on 3/22/2021 where was given CT brain scan, injection of ketorolac and 60 mg prednisone for 6 days. Finished prednisone and symptoms returned. Again taking ibuprofen and acetaminophen for pain. Symptoms are still on a daily basis and did not go to receive the next vaccination. Have follow up with ENT doctor on 3/25/2021 and neurologist on 4/23/2021.
1126811	3/23/2021	NJ	63	F	3/17/2021	3/17/2021	Wednesday night I felt tired and cold. Woke up Thursday morning and couldn't lift up my head. Migraine was in all of top teeth, ears, behind eyes, all over head. Pain was so extreme I fainted in bed. Came to and pain was a bit better but quickly came back full force. Woke up at 1am Friday morning drenched from sweat through to the mattress but migraine was better. Ran fever up to 102 and down and up all day Friday. Saturday fever was only 100 but came back after each sweat. Sunday I had almost no fever and just a regular head ache. Monday exhausted but okay.
1126700	3/23/2021	VA	45	F	3/23/2021	3/23/2021	5 minutes post injection, client c/o of itching every where; redness noted on upper chest, extending to face - just below the eyes and redness noted on upper back. Client denied respiratory symptoms at this time. Epinephrine 1:1000 0.5mg given IM @ 9:55AM. EMS contacted. Client transported to ER.

1126716	3/23/2021	FL	67	F	1/13/2021	1/14/2021	Woke up the day after vaccine with right eye swollen, red, painful and draining Saw eye doctor who prescribed warm soaks to eye and Retaine eye drops 4 times a day Better in 5 days
1126689	3/23/2021	PA	43	F	2/15/2021	2/15/2021	After receiving the first shot, I had a taste of metal in my mouth. I sat down and in the next 30 minutes passed out. For the next three weeks, I had migraines more frequently than my usual migraines and a new pain behind my eye. After receiving my second doses, I felt extremely tired and within 3 hours of receiving got shooting pain on left side of my face. I was diagnosed with Trigeminal Neuralgia by Dr on March 22, 2021. This pain has been constant since receiving the second dose on March 8.
1126676	3/23/2021	TX	48	F	2/11/2021	2/15/2021	After the shot, I had the "typical" reaction - sore arm, a bit of a head ache, but nothing concerning. Then on the 4th night after my shot, I started feeling bad and got in bed. That night I couldn't sleep due to not feeling well. The next morning I was very dizzy, agitated, nauseous and had a weird head ache behind my eyes. I started feeling like I was going to throw up anytime I looked at anything for more than about a minute. (my phone, a book, a puzzle, the tv). I laid by the toilet most of the day with a wash cloth over my eyes. Around 6pm that night I started throwing up a TON, major headache, body aches, shivers, but no fever. These symptoms lasted for the next two days. (as a side note, this was during the freeze, so I was not able to call my doctor, etc...). I started feeling better on day 4 but I had a headache for about two week - that still lingers on most days. (headaches are unusual for me). This was, without a doubt, the sickest I have ever been in my life! I decided not to get the 2nd shot because I was afraid of feeling worse after the 2nd shot.
1126673	3/23/2021		77	F	3/20/2021	3/22/2021	Caller stated she got Moderna vaccine on Saturday and was fine. She stated yesterday she had a few side effects, ie fever, headache, fatigue, which she stated are gone. She stated when she woke up today she was fine but then noticed her eyes were a little bit swollen. She stated she has history of eyes swelling when she eats alot of salt. No Lot number available at the time of this notification.

1125747	3/23/2021	WA	57	F	3/14/2021	3/15/2021	I got the shot in my left arm and shortly after right above my right eye I could feel a reaction going on. Almost like something effected the muscle, I didn't say anything and went to the wait room I mentioned it before I left and they said it sounded like a migraine and I went home. When I raise my face on the right side of my eyebrow area feels like I have spasms. When I got home it moved to my cheek area as well and felt strange. I got a rash on my right cheek that evening and a super bad headache. I took a Benadryl and went to sleep. I didn't have a fever. By the morning the rash was gone, the only thing that bothered me was my eyebrow area ( muscle area) I went to the Dr the following day and she said it sounded like it was my sinuses. Prior to this I was having allergy / sinus issues.
1125651	3/23/2021	FL	70	F	3/11/2021	3/20/2021	Caller 'felt woozy' after her injection but was unable to quantify, that resolved the day before yesterday, then yesterday noticed her injection site was a bit itchy and she had an odd bull's eye type rash over the area, area is also red/tender, she is finding this quite bothersome. As patient was rather upset about the bull's eye rash and the redness/tenderness advised her to seek tx, not sure if she did actually go.

1125534	3/23/2021	FL	58	F	3/17/2021	3/17/2021	Got the vaccine, on the first day within the first hour she started feeling itchy, tingling sensation above her eyebrow over the left eye. Didn't stay long, but sensation of itching left her. Then noticed a pin dot of a little red spot on the left side of the eye, temple area, itchy and then it went away. That night the soreness started in the arm. The next day the whole arm was sore, but she kept exercising it and moving it. On the third day the arm was clearing up like she didn't get a shot. Then, the left thigh had some achiness. The right ankle was achy as well, didn't stay long. She is still waking up with a rapid heart beat. She has a FU APT for labs and revisit with her PCP in a month. On Saturday, 3/20/17 and woke up with heart palpitations, which they continued until she went to the ER around 4:00 AM. They checked her, did an EKG, ran labs and VS. The labs came back and told her that her potassium was depleted, and gave her something to calm her down. She went to the store on Sunday and got some potassium citrate to maintain herself until she could get to the Doctor on Monday. They did give her potassium while she was in the ER. She went to the doctor on Monday, and he started her on a prescription for potassium. She also made an appointment with her nephrologist to make sure she was okay before she gets the 2nd vaccine since she only has one kidney. She also has had a lot of bruising from the blood draws in the hospital.
1125499	3/23/2021		21	M	3/20/2021	3/20/2021	Following administration of vaccine client complained of blurry vision, a heavy arm and that he felt his heart rate was pounding out of his chest. EMS and Dr on site. Pulse 58, Blood pressure 104/65 and 100% O2 saturation. Client was reclined in his car seat until he started feeling better. He reported reactions to previous vaccines but no elaboration. Released by Dr and advised to seek medical attention later if needed. Client verbalized understanding.
1125443	3/23/2021	MI	62	F	3/13/2021	3/14/2021	The day after injection started to have right eye pain, similar to being bumped in the eye. One week later the eye has a sty. It is red with a bump under the lid. Confirmed diagnosis on 3/22/21 with health care professional: Hordeolum externum of right upper eyelid.

1126112	3/23/2021	PA	55	F	3/16/2021	3/16/2021	The evening after the shot, I began experienced headache, sore muscles neck and back, fatigue. The next day I had chills clogged sinuses and runny nose, cough, and fatigue , sore muscles and headache continued. These symptoms improved somewhat by Saturday (4 days after) but I am continuing to have a cough and runny nose as well as eye pain when moving eyes.
1126020	3/23/2021	WI	32	M	3/23/2021	3/23/2021	Patient received Pfizer COVID 19 vaccine at 8:42am. This was patient's first dose. He was observed in clinic for 18 minutes afterwards without concern and left approximately 9:00am. Patient returned to clinic at 9:28am with complaints of sweating, nausea and lightheadedness. RN took patient to private observation room and started assessment. VS 9:30am O2 100%, BP 147/78, HR 50. Patient is laid back on bed with head at 45 degrees and legs elevated. Patient was given 6oz of water and neurological assessment completed. Patient alert and oriented without changes. Patient denies SOB, scratchy or tight throat, hoarse voice, trouble swallowing or itching. VS 9:40am O2 100%, BP 151/77, HR 54. Patient given another 6 oz of water and continues to lie back with feet elevated. Patient took clonidine, sertraline, propranolol, Adderall and vraylar this AM. He ate breakfast. Is not a diabetic. Patient states his lightheadedness has subsided, still complains of sweating and nausea but states he is "feeling better and ready to go home". Patient has a ride and is going home to his parent's house where they will both stay with him all day. VS 9:45 O2 100%, BP 143/81, HR 61. Patient appears more comfortable, less anxious and HR has risen. States his nausea is lessening. Patient would like to leave. RN educated patient on emergency signs to seek 911 for and they include SOB, throat swelling, sudden emesis, increased lightheadedness or nausea, fainting, new dizziness or any other sudden change in condition. He voices understanding; plans to go home with parents, have toast for lunch, push fluids and rest. Patient escorted to the door and visualized entering vehicle with family.

1125946	3/23/2021	MN	32	M	3/10/2021	3/10/2021	Approximately 5 minutes after receiving the injection, I became dizzy and lightheaded. My eyesight became blurry and my hearing very "tinny". I felt nausea and thought I was going to throw up. I sat down in a chair and was given a granola bar and some water. After about 3 or 4 minutes the majority of these seemed to fade, but I still felt slightly "off". Approximately 9pm that evening I felt very fatigued, so I went to bed. At approximately midnight, I woke up shivering, extremely cold, and sweating. Around 2am I had a fever of 102.3. I took some Tylenol to try to bring my fever down, which seemed to help. Around 9am the next morning my fever was gone, though I still felt extremely fatigued. Later that evening, after several naps, I started to feel a little better. Most of these adverse events were resolved by 28 hours after injection. I had arm soreness at the injection sight that felt like having been punched in the arm for about a week after the injection.
1125934	3/23/2021	TX	43	F	3/1/2021	3/10/2021	Severe raised rash on upper chest. Severe rash on left side of face under eye. rash lighted up a bit by day 15. Moderate rash on backs of both arms, both legs. Still have mild rash on upper chest 23 days later. Rash was worse of left side of body in all areas. I did not have any noticeable breathing issues, fever, etc. Arm did hurt within 7 minutes of shot and hurt very badly for 7 days. called my Dr friend and he advised me not to get the second shot. Said I had a reaction.
1125897	3/23/2021	MD	35	M	2/27/2021	2/27/2021	Client received the Pfizer COVID-19 vaccine and during the post-vaccination wait time he complained of itching around the eyes and face, and felt that his face was swollen. He stated that he had an anaphylactic episode in the past involving peanuts and nut trees, and because of that, he carries an epipen. "911" was called and his vital signs were as follows: BP=173/117; Pulse=76. Engine 205 responded to the call and evaluated the client, but was not transported to the hospital. Client did not receive 2nd dose of the Pfizer vaccine.

1125841	3/23/2021	MI	58	F	3/5/2021	3/5/2021	faint; blurred vision; vomit; diarrhea; hot sweats; weakness; This is a spontaneous report from a contactable consumer (patient herself). A 58-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; batch/lot number and expiration date were unknown), via an unspecified route of administration, administered in the left arm on 05Mar2021 at 16:00 as a single dose for COVID-19 immunization. The vaccination facility type was reported as health clinic. Relevant medical history included overweight from an unknown date and unknown if ongoing. The patient had no known allergies. Concomitant medications included fluoxetine hydrochloride (PROZAC) and omeprazole (PRILOSEC); both were taken for an unspecified indication, start and stop date were not reported. The patient had no other vaccine in four weeks. The patient was not pregnant at the time of vaccination. The patient had no COVID prior vaccination. The patient was not tested for COVID post vaccination. On 05Mar2021 at 21:15, the patient experienced faint, blurred vision, vomit, diarrhea, hot sweats, and weakness. The patient did not receive any treatment for the adverse events (AE). The patient was recovering from all the events. Information on the batch/lot number has been requested.

1127336	3/23/2021	MN	37	F	3/1/2021	3/14/2021	The evening I received my 2nd vaccine, I experienced similar to flu like symptoms that were mild. Fatigued and cold. Slight head ache. I woke at at 4/5 am Sunday morning, and it hurt to open my eyes, head ache, my whole body hurt every where, breathing made my sides hurt. I had a mild fever on and off. I felt better by Monday late afternoon. Monday, my arm where I have the injection started to flare up, it was hot, red, was so itchy that I scabbed up from scratching it. This lasted for two days. The days following that it didn't itch as much, but on occasion the itching would flare up where I felt the need to scratch it intensely. I would say the itching subsided at around 5 days after the shot.
1127499	3/23/2021		52	F	3/23/2021	3/23/2021	After getting COVID vaccine, R eye vision was blurry and felt like she was hearing a loud fan. Denies SOB, chest pain, fever/cold, swelling in face/throat, itchiness. No rash. Sx resolved after 30min after vaccination.
1127824	3/23/2021	CO	59	F	3/11/2021	3/11/2021	15 minutes after vaccine was getting lightheaded and little dizzy. Then 30 minutes after ( now 45 minutes after vaccine) started getting nerve problems behind left eye that was bothering me. Then my face got nerve problems too. Then all my teeth on top and bottom row were hurting. my lips and tongue got numb with nerve problems like I had too much Novocain. Then my throat felt like it was swelling up. I called hot Line of vaccine to report side effects. They transferred me to a Covid 19 nurse that said go to emergency room right away sounds like yur getting Bell?s palsy. FYI my brother who lives in another state did not report his side effects. In February he got the second dose of Pfizer and he said four hours after he got nerve problems in his face and his right side of eye and mouth drooped and he was talking strange like someone with paralysis of mouth . Still has it but never went to doctor and won?t fill out info to report

1127856	3/23/2021	UT	46	F	1/12/2021	1/13/2021	Summary: Abdominal pain (similar to that experienced years previously, but not experienced approx. 2 years previous to Pfizer COVID-21 vaccination) recurred after first vaccination, worsened after second vaccination, leading to 2 ER admission and hospital admission. Ultimate cause still not determined or successfully treated; pain continues treated by opioids, gabapentin, anti-nausea medication. Patient has not been able to work since March 4th, 2021 (currently March 23rd, 2021). Details: The day after the first vaccination, abdominal pain similar to that the patient had previously experienced, but which had not presented severely for around a two years, recurred quite severely for 4-5 days. Missed 2 days of work. Pain reduced enough to resume work after 4-5 days. The day after the second vaccine dosage (2 Feb 2021), the abdominal pain worsened again, becoming more severe and more prolonged than after the first dosage. Missed four days of work (not consecutive). Pain worsened. 12 March 2021 visited PCP, who recommended immediate ER/hospital admittance. ER could not any definite cause of pain (though 8cm fibroid present, thought to be causing lower abdominal pain but not upper abdominal) and released patient. Abdominal pain became somewhat better but still continued. March 6th, abdominal pain greatly increased, leading to ER visit and hospital admittance March 6th-March 9th, 2021. CT scan 6 March 2021. Relevant results: Bowel: Multiple dilated loops of distal small bowel with fecalization of small bowel contents and a slow transition to normal caliber at the terminal ileum. The appendix is not visualized. The stomach is unremarkable. The colon is not dilated. Mesentery/Peritoneum: Small indeterminate density fluid adjacent to dilated loops of bowel in the right lower quadrant. Nodes: Scattered small abdominal nodes, none meeting CT criteria for pathologic enlargement. Pelvis: Large uterine leiomyoma. Uterine fibroid identified as probably source of pelvic and lower abdominal pain. Mid and upper abdominal pain thought not to be related, however, and may be related to dilated loops of distal small bowel and adjacent fluid. Pain treated with opioids, gabapentin, anti-nausea drugs, patient released 9 March 2021. Abdominal pain continues, partially controlled with pain medications. Lower pelvic pain has not recurred (birth control pills

1127852	3/23/2021	CA	27	F	3/23/2021	3/23/2021	Approximately 1031, client stated feeling light headed with blurred vision and stated her ears felt muffled. Client visibly pale. Client was immediately transferred from the chair down to the floor and her feet were elevated on a chair. Vital sign was taken BP 114/68, Pulse 73, Resp 20, Temp 97.9, SaO2 99%. Client was monitored closely. At 1040, client stated they were no longer feeling dizzy or feeling discomfort with cold compress given. Client was transferred from the floor to sitting on a chair. Client stated she felt better and wanted to leave because her aunt was waiting for her outside. Staff encouraged client to stay longer for observation but client declined. Risk and benefits to waiting longer in observation was explained but patient declined strongly. Vital sign was taken t 1050, BP 113/73, pulse 75, Resp 20, Temp 98.2, SaO2 99%. Patient was discharged and escorted to her car where her aunt was waiting to drive her home.

1127661	3/23/2021	CO	59	F	3/17/2021	3/18/2021	I was fine until 12 hours later when I woke up to use the potty and laid back down to sleep and started shaking uncontrollably. I felt extremely cold and tried to calm my body down. I shook for two hours until I got up the energy to get up and put more clothing on, including a hat to cover my head and eyes, socks sweats and many wool blankets. My head was aching immensely. I probably had a fever, but did not have the energy to check. I took 800 milligrams of IB and 10 milligrams of Diazepam to help me sleep. The next day I slept after every small activity, and felt poorly with headaches and extreme fatigue all day long. I took another 10mg diazepam to sleep that night and woke up feeling much, much better. I am very active and have suffered from fatigue and headaches all week. I do not have my usual energy back, as of yet. Body aches from the first night have continued. I had Covid in early December, and this felt more intense, but for a mere 24 hours. I also feel I have a few lasting effects from Covid in December. Basically fatigue and a bit of focusing problems. Feeling better every day, I hope!!
1127817	3/23/2021	IA	29	F	3/22/2021	3/22/2021	about 1 hour after the vaccine, I noticed my right ear felt full and dry mouth. after 1hr and 45 minute the right side of my mouth felt tight and tingly (kind of like after you get a numbed at the dentist but your not completely numb) my right thumb felt the same way, and as the night went on the tight, tingly, numb feeling grew across the right side of my face from my lips to my ear. the next morning it was still there, and as the day progressed that feeling grew up to my eye. that is when I was seen by a doctor , who confirmed that what I was experiencing was not a muscle reaction, but a nerve reaction. I can still move my lips and eyes, but it just feels very weird and tight, and almost like I have to work hard to make them move.
1127813	3/23/2021	MD	46	F	3/16/2021	3/17/2021	Bell's palsy symptoms. Droopy eye (right) and tingling in the ears.

1127781	3/23/2021		31	F	2/10/2021	2/10/2021	Lightheadedness, flushing, blurry vision, rash ( red blotching on face, neck, chest), and nausea 10 minutes after 2nd vaccination, followed by headache, fatigue, myalgias, and afebrile chills. Developed vertigo, status migrainosus, and diarrhea one week after. Now more than one month out with severe daily headache requiring multiple medication therapies, including injections, and specialist care.
1127757	3/23/2021	WI	28	M	3/20/2021	3/20/2021	Body Ache starting 9 hours after. Main concern, I fainted while walking from the bathroom and split my eyebrow open. Could've been much worse but is a bad side effect. This occurred about 16 hours after vaccine
1127755	3/23/2021	FL	87	M	3/9/2021	3/13/2021	total scalp area, ear to ear became sore to touch. Minor headache was infrequent. Several days later the tender scalp receded to the right side only. Unable to sleep but in one position. The soreness has now traveled to include my right eye socket. Dr unable to determine a fix.
1127747	3/23/2021	WV	65	F	3/1/2021	3/10/2021	I had been doing really well with my irritable bowel and stomach issues for several weeks, but, the rash on my neck was in a flair up. I had some flairing going on with my upper neck and back area and some burning in my upper legs. I had gone to sleep on Wednesday night and around 3 A.M., I was awakened by a horrible burning sensation in my upper stomach, back, face, neck, and arms. They felt like they were on fire inside! My left lower jawbone was hurting up around the front of my ear into my cheekbone underneath my left eye. I took a terribly burning diaherra, chilling, and aching all over. I could hardly stand to set straight up in a chair , let alone lay down. This was terribly bad until around 8 or 9 A.M. It eased up some and I slept for a couple of hours. It came back intermittantly for the next four days and nights..So much worse at night. Even though I have issues with burning sensations and diaherra, etc., I have never experienced anything of this magnitude before! I am afraid whatever was in a flair up within me was magnified times over!

1127642	3/23/2021	OH	42	F	2/25/2021	2/25/2021	Patient received dose at a clinic provided by store pharmacy at 9:30 AM on 2-25-2021. Patient stated she started to have anaphylactic reaction to the Pfizer - Biotech COVID vaccine around 7:00 PM that same day. Her eyes swelled up and her throat started to feel like it was closes so she went to the ED at Hospital. At the hospital, she received an Epipen and a shot of benadryl. The reaction was taken care of and she was able to return home later that night with no lingering effect of the reaction.
1127853	3/23/2021	OK	41	F	2/26/2021	2/26/2021	About 2 hours after receiving the vaccine, I started to have kinda like tunnel vision, my ears felt cloggd. Tachycardia, palpitations, nausea/vomitting, extreme Fatigue, weakness, headache, dizziness, and loss of memory. I had this type of episode 2-3 times over 5 days, lasting about 20-30 minutes, last one being at work, all of a sudden, same type of episode. Went to ER after Coworkers stated I was " in coherent " or in and out, my BP upon arrival to er was in the 160's/90's. They ran multiple lab tests, CT head, CXR and ECG. By the time I was discharged my BP was normal I believe it was 116/81. Some side effects like nausea lasted a week, I was given an antinuasea prescription
1126963	3/23/2021	FL	61	F	3/18/2021	3/18/2021	Immediately: headache, left eye pain, nausea, cold sensation and felt ?weird? but thought it was normal and thought I might feel flying for a bit but that it would wear off so I did not report feeling anything at the clinic. I left the clinic and got in the car to drive home and felt a weird feeling in my throat reminiscent of my esophageal spasm and then it felt like someone had their hand on my throat squeezing my throat and felt like I needed to take deep breaths to expand my lungs. Within a minute or two at most, my lips, tip of my tongue, tip of my nose and face beside my lips and under my cheeks started to tingle and go numb. My insides felt swollen. I had a doctors appointment and went there after picking my son up at home. I reported my feeling to my doctor who prescribed a steroid for 3 days and told me to also take Benadryl or Claritin, which I did. However, today is day 4 after my vaccine and today is the first day my insides don?t hurt.

1127058	3/23/2021	WA	73	F	3/15/2021	3/16/2021	After Moderna Dose #1 Within one day of vaccination the person experienced extreme fatigue, muscle weakness, joint achiness, headache, and nausea. She felt feverish and chilled but had no fever. She noted nightmares , hard to focus, eye sensitivity, abdominal pain and about 10days after vaccination had an episode of thick saliva and drainage so that she had to sleep upright. These symptoms progressed for about a week and then slowly resolve completely by about 3 weeks post vaccination. After Moderna Dose #2 - RN spoke with client 1 week after dose #2. Within one day of vaccination she experiences intense fatigue, headache on day 2, light sensitivity, body aches in joints and muscles, her arm felt hot, swelling of her breasts, no appetite, and abdominal pain, She did NOT experience any rashes or itching or difficulty breathing. Her symptoms were so incapacitating that she could not do any of her ADL's and could only relieve her pain by lying down in bed all day. As soon as she tried to move around the intense joint pains returned and she had to lie down. Normally she treats her arthritis with Colchicine as needed but received no relief. After a few days she did try one dose of Allegra (antihistamine) with some relief. Resting by lying down in bed for a week has been her only relief. She did not indicate any allergies to PEG.
1127040	3/23/2021	AZ	23	F	3/22/2021	3/22/2021	About 5 minutes after injection, began feeling faint and experienced loss of vision. I had ringing in my ears as well. My brother who received the injection with me experienced the same symptoms at the same time. Due to us being disoriented, we are unsure how long initial symptoms such as the vision loss lasted.

1127689	3/23/2021	NV	50	F	1/12/2021	1/16/2021	On the 16th, I had the right ear and head pain. That lasted Sat, Sun and Mon. I woke up Tuesday morning (18th), I had a small Shingles lesion along with those symptoms. . I went to the doctor's office and saw the NP, who diagnosed me with an ear infection--right Otis externa. On Wed (19th) my right eye was swollen and my scalp, right forehead and eye were covered in shingles. On the 20th, I was diagnosed with having Ocular Shingles. I was put on steroids and sent to an emergent appointment with ophthalmologist because they were concerned that I would lose my sight. He put me on Acyclovir 800mg, 5 times a day and increased my steroids to: 40mg a day for 2 days, 30mg for 3 days and 20mg for 3 days and 10mg for 4 days. Fortunately the branch that goes into my cornea was not affected. I was in bed the entire time. I still had lesions when I went back to see him, which is why he kept me off work until Feb 1st. I continued to have neuralgia (nerve pain) and then I started itching. I went back to quick care and put on Atarax. I took that every 4 hours for about a week. Then I tapered it down to about twice a day. It eventually got better, but I do itch sometimes. Looking back, I did have a little right ear pain after the 1st dose of the vaccine.
1126902	3/23/2021	CA	48	F	3/21/2021	3/21/2021	Patient experienced anaphylactic reaction which includes fainting, sudden increase in secretions from eyes and nose, weakness, numbness in upper extremity (fingertips) agitation, flushing dizziness, feeling something wrong, and extreme headache. The patient was treated with epipen and pharmacist called 911 and advised patient to go to the hospital. Patient recovered in approximately 30 minutes but refused to go to the hospital and called in a ride by the husband.

1127009	3/23/2021	MI	21	F	3/23/2021	3/23/2021	Patient was nervous before the vaccination. After vaccination she started to feel hot and cold. Her hearing started to fade in and out. She sought help and was directed to lay flat on the floor and breathe. She started feeling light headed and that her vision was tunneling. Her appearance was pale and her hands were clammy. Her blood pressure was taken via wrist and was normal for her (112/72). The medical professional tending to her had her continue talking, asked her to state her DOB, name, age, the date, etc. After about 5 minutes she started to feel better- she sat up and had some water and M&Ms. She then laid back down but continued to converse with us. This took place over about 10 minutes from first symptoms. She remained laying down for about 10 minutes after and then slowly sat up, and when she felt comfortable sitting she tried standing up. She then went home for the day (was an employee of the store).
1127263	3/23/2021	HI	29	M	3/17/2021	3/17/2021	Monitored for 30 minutes after injection, no symptoms, released back to housing (cell). Approximately one hour later, presented to Health Care Unit with c/o itching, nasal congestion, watery eyes, lightheadedness, nausea, "hard time breathing". Very anxious. Administered 50 mg Benadryl IM without any relief. Patient was sent to local emergency department as precaution. Given epi SQ and additional Benadryl in the emergency department
1127307	3/23/2021	CA	40	M	3/22/2021	3/22/2021	Approx 1255: Patient stated he was not feeling well, light-headed. Patient pale, sweating. He asked to lie down. Encouraged to take deep breaths. Patient asked to step outside of room, assisted to hallway chair for air. Wife at side, encouraging to take deep breaths. Patient stated he could not see us and slumped in chair with eyes open and glazed. Shallow breathing, unresponsive to sternal rub. Lips noted to turn purple-blue and then gray. Called for assistance and LVN at patient side obtaining VS, patient took deep breath and started to become responsive. VS at approx. 1303: BP 104/47, HR 57, O2 Sat 95%. Patient talking, continued pale and diaphoretic. 911 called and EMS arrived at approx. 1305 Transferred to hospital.
1127303	3/23/2021	SD	77	F	2/11/2021	2/11/2021	Started with headache and mental confusion within a hour of first injection. Right eye was becoming blurry by day 3 and loss of vision apx 6 days after first injection.

1127217	3/23/2021	OR	66	M	3/13/2021	3/17/2021	Approximately 4-5 days after vaccination, the skin of my face, scalf and around my eyes became itchy. I think there's very minor puffiness of my upper cheeks at either side of my nose. Now, ten days later, the itching persists.
1127210	3/23/2021	SD	56	F	3/23/2021	3/23/2021	Patient is a 56yr old female presented today for her 1st Moderna vaccination. Patient educated on side effects, need and to wait 15 min before she could leave the waiting area. Patient was on her way out the door when she started to feel a "wet sensation on the right side of her face" and pain like a needle in the back of her eye. Dr. came to evaluate her and did not think she was having an allergic reaction. She denied any shortness of breath, swelling of the lips, tongue, throat or eye. Patient felt like the pain was not high enough to warrant even taking tylenol and felt well enough to return to work. She is schedule for a wellness exam with medical provider tomorrow and will follow up with her.
1127209	3/23/2021	WI	41	M	3/18/2021	3/18/2021	Beyond tiredness, weak muscles, mild to painful headache behind both eyes going to the back of the head, still have cramping/stabbing pain in left shoulder.
1127195	3/23/2021	MA	68	F	3/22/2021	3/22/2021	Tingling from site of shot down arm. Tightness around wrist. Tingling and heaviness up left side of neck and face. Abated some but heaviness remains around left eye (especially between brow area and eye) and left side of head. Also feels warm in that area. I am worried some but just keeping an eye on it at home. Called my doctor?s office and nurse said go to pharmacy tomorrow and report it to them. I am concerned about getting the follow up shot.

1127194	3/23/2021	TX	71	M	3/2/2021	3/3/2021	Nothing until approx 11 hours later. Awoke with severe lower abdominal pain. Very weak. Son helped me get up and clear liquid (water?) came out of eyes, nose, and mouth. Passed out. Son helped me to car and I passed out again getting in the car. Son drove me to the emergency room at hospital. In severe pain and very weak. Test done- Fever, Blood, Urine, CT-Scan. After about 4 hours I was given something for pain through IV and felt much better in about 10 minutes but still weak. Outcome- Doctor said it was reaction to vaccine and that I have a gallstone but it was not causing any problems. Referred to a doctor for the gallbladder. Told to take 600mg of ibuprofen three times a day for three days. Was fi
1127274	3/23/2021	WA	29	F	1/28/2021	2/16/2021	Right eye lid/eyeball feels numb and it was slightly lazy (that has resolved). I noticed it first on 2/16/21 and my eye lid still feels "off" and kind of numb. It seems like the right eye lid doesn't open all the way unless I use extra effort.
1127169	3/23/2021	CO	67	M	3/17/2021	3/18/2021	Second dose of Moderna COVID vaccine 3/17/21, onset of swelling of conjunctiva and blurry vision in both eyes on 3/18 with progression of vision loss to no light perception in left eye by 3/19 AM. Sent to ED and admitted to hospital after outpatient ophthalmology exam and started treatment with 1g methylprednisolone IV daily x5 days on 3/20. As of 3/22 eye pain had subsided but no improvement in vision. Has been in hospital 4 days at this point with uncertain discharge date.

1122976	3/22/2021	CA	57	F	3/19/2021	3/19/2021	57y/o female presents with mild throat tightness ~15min after receiving Pfizer vaccine into the left arm. She states that it feels as though something small got stuck in her throat and is causing mild discomfort. She reports associated injection site pain, body cramps, and headache. She denies itching, difficulty breathing, shortness of breath, chest pain, palpitations, blurry vision, presyncope, difficulty swallowing water, or lip/tongue swelling. She reports no change in symptoms after 40min. post-injection. Physical Exam: Heart Rate 66bpm, Blood Pressure 115/74, Repeat Blood Pressure at 40min post-injection 120/80 Cardiac: regular rate and rhythm Lungs: unlabored breathing, clear to auscultation bilaterally Skin: no injection site erythema or swelling. No rash. No lip/tongue swelling or narrowing of oropharynx. Plan: Patient reports that her symptoms have improved at 1hr post-injection and would like to leave. I advised her that she should wait until all of her symptoms have resolved as throat tightness is a concerning adverse reaction. I provided her with options including contacting EMS right now to take her for observation at the hospital, however, the patient declined and said she would not go in the ambulance. She insisted that she wanted to go home and that her husband was driving and would take her to the emergency room if her symptoms worsen. Patient was well-appearing when she left the vaccination site.
1122989	3/22/2021	NV	27	F	3/21/2021	3/21/2021	Headache, muscle pain, pain in the arm of the injection, chills, internal fever, nasal congestion, eyes pain.
1122995	3/22/2021	ID	39	F	3/20/2021	3/21/2021	Approx 12 after shot I woke up feeling very ill and nauseous. As I walked to the restroom to vomit I lost 100% of my vision, I became very disoriented and had the loudest screeching in both ears. I screamed for my husband and I caught me as I was taken to the floor with no mobility. The episode last several minutes before he was able to move me back to bed. I had severe sweating and ear ringing. As I report this I still have a lingering brain fog and ear ringing. I reported it to my physician and told to go to the ER if any reoccurrence of reaction.

1123061	3/22/2021	KS	68	F	3/19/2021	3/21/2021	Sunday morning woke up with swollen cheeks (cheekbone areas) in the same areas as having received Juvaderma Voluma fillers on June 16, 2020. The right cheekbone was more swollen than the left but there was also a pocket of fluid under the right eye. The areas were very tender to the touch. Iced the areas for several minutes and called both Dr.'s office and the pharmacist and both told me to take Benedryl, which I did. Has not helped. Swelling remains as of Monday morning and the fluid under the right eye feels hard like a knot. Seeing Dr. this afternoon.
1123013	3/22/2021	TX	65	F	3/16/2021	3/17/2021	Patient reported that she experienced blurry vision one day after receiving the Janssen COVID-19 vaccine, around 2:00 pm on 3/17/2021. She expressed concern that this might be related to the COVID-19 vaccine. She said it feels like there's something in her eye that's irritating it. I asked if she has seasonal allergies, and she said yes. She does not take anything for allergies. I advised her to try Visine eye drops. After consulting with Dr, I also advised her to take an over the counter antihistamine like Zyrtec, Allegra, or Claritin. Patient is diabetic, so we asked her to check her blood glucose as well. Patient reports that the Visine helped. Her blood sugar was 189. She reported chills and a mild fever. She took Tylenol and it brought her temperature down to of 99.6 F. I advised her to call me if any of her symptoms get worse or do not improve.
1123036	3/22/2021	AZ	40	M	3/19/2021	3/21/2021	Within a day and a half swelling of the face, especially around eyes. Rashes on face at brow and cheeks with flaking skin, in addition to hive on forearms. The following morning, today, it has become much more severe.
1122951	3/22/2021	NH	60	F	3/22/2021	3/22/2021	pain from vaccine site up back of neck, tingling lips and glassy eyes
1123009	3/22/2021	NY	60	F	3/20/2021	3/20/2021	Vaccine 1 - all arm pain for 6 days Vaccine 2 - severe all body pain for 20 hours, fever, headache caused blindness in one eye, dizzy, weak, ringing in ears. 48 hours after vaccine - pain and fever gone but dizziness and ear ringing still ongoing.

1122719	3/22/2021	AK	35	F	2/13/2021	2/16/2021	I had itching on my neck at the base of my hairline and then behind my ears; hives on torso that spread to my wrist, then inner elbow, inner thigh and eyelids; This is a spontaneous report from a contactable consumer reporting for herself. A 35-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) (lot number EM9810/expiration date: not provided), via an unspecified route of administration, on 13Feb2021 at 13:00 (at the age of 35 years old) as a single dose in the left arm for COVID-19 IMMUNIZATION. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) (lot number: FL3246/expiration date: not provided), via an unspecified route of administration, on 23Jan2021 at 13:00 (at the age of 35 years old) as a single dose in the left arm for COVID-19 IMMUNIZATION. Relevant medical history was not reported. It was unknown if the patient had any allergies. The patient was not pregnant at the time of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant was reported as none. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 16Feb2021 at 12:45, the patient experienced itching and hives. The clinical course was as follows: "I had itching on my neck at the base of my hairline and then behind my ears and then noticed hives on torso that spread to my wrist, then inner elbow, inner thigh and eyelid". It was reported whether treatment was received for the events was unknown. The outcome of the events itching and hives was recovering. Since the vaccination, the patient had not been tested for COVID-19.
1122648	3/22/2021	LA	76	F	2/6/2021	2/9/2021	Took the Pfizer vaccine and within two days, swollen eyes and face. My face has been swollen since then I look like I have chipmunk cheeks, how long will this take before it goes away. It is over a month The eyes are sometimes swollen , but not as much, just bags under my eyes Is there any other suggestions besides ice on face and taking allegra, and benedryl, that will make the swelling go down permantly

1123110	3/22/2021	CA	26	F	2/19/2021	2/19/2021	tingling in her mouth and lips; lump in throat; dizziness; tunnel vision; shaking; headache; anaphylaxis; A spontaneous report was received from a physician concerning a 26-year-old female patient who received Moderna (mRNA-1273) vaccine and experienced Anaphylactic reaction, having tingling in patient's mouth and lips and a lump in their throat, very bad headache, dizziness, tunnel vision and shakiness. The patient's medical history included: allergy to azithromycin and penicillin. Concomitant product use was not provided by the reporter. On 19 Feb 2021, approximately four minutes prior to the onset of the symptoms, the patient received their second of two planned doses of mRNA-1273 (Batch number: 031L20A) for prophylaxis of COVID-19 infection. On 19 Feb 2021 at 14.09, the patient had tingling in their mouth and lips and a lump in their throat. The patient's heart rate noted was 130s. The patient also reported very bad headache dizziness and tunnel vision. The patient developed shakiness which was noted on exam. The reporter reported for an anaphylaxis reaction. The patient's Blood pressure reported was 156/80. At 14.29, the patient's Blood pressure reported was 176/87. Treatment information provided included EpiPen (0.3mg) given Intramuscularly to right thigh at 14.22 and supplemental O2 provided. The reporter stated ambulance was called, husband of the patient was called. Reports were given to ambulance services. The systolic BP upon transport was 168. Action taken with mRNA-1273 in response to the event(s) was Not applicable. On 19 Feb 2021, the outcome of the events, having tingling in patient's mouth and lips and a lump in their throat, very bad headache, dizziness and tunnel vision were considered resolved and the outcome of the event, shakiness was considered not resolved. On an unknown date, the outcome of the event, Anaphylactic reaction was considered unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the se events, a causal relationship cannot be excluded.

1123140	3/22/2021	CO	70	M	2/11/2021	2/1/2021	visual blurriness/visual disturbances; headaches; tiredness; muscle/joint aches; muscle/joint aches; dizziness; panic attacks; depression got worse; nausea; fell once, almost fell at least 5 times; visual hallucination; My blood pressure has been elevated; This is a spontaneous report from a contactable consumer (patient). A 70-year-old male patient received the second dose of BNT162B2 (lot number: EM9810), via an unspecified route of administration, administered in right arm on 11Feb2021 15:00 (at the age of 70-year-old) at single dose for COVID-19 immunization. Medical history included depression, diabetes, arterial sclerosis, panic attacks, high cholesterol/ blood pressure, and enlarged prostate. The patient had no known allergies. Concomitant medications included clopidogrel bisulfate (CLOPIDROGEL SANDOZ); clonazepam; tamsulosin; and ramipril. The patient previously received the first dose of BNT162B2 (lot number: EL3247) via an unspecified route of administration administered in right arm on 21Jan2021 at 4:00 PM (at the age of 70-year-old) at single dose for COVID-19 immunization. The patient had no other vaccine in four weeks. Soon after the 2nd shot in Feb2021, the patient started having headaches, tiredness, muscle/joint aches. Three (3) days after it on unspecified date in Feb2021, he started having dizziness, panic attacks, visual blurriness, and his depression got worse. This last week on unspecified date in Feb2021, the dizziness with nausea, the visual disturbances increased to the point where the patient fell once, almost fell at least 5 times but caught himself, panic attacks increased, and on unspecified date in 2021 (also reported as yesterday) the patient had what was almost like a visual hallucination while riding in the car. Still dizzy today. His blood pressure has been elevated on unspecified date in 2021- most likely due to the worry about all of this. He does not know if these are related to the shot or something different is going on. There was no treatment for the adverse events. The events required physician office visit. No COVID prior vaccination and was not tested with COVID post vaccination. The outcome of the events was not recovered.

1123118	3/22/2021	WI	18	F	3/9/2021	3/9/2021	Difficulty swallowing; Shortness of breath; Big rash; A spontaneous report was received from a consumer concerning a 18-year old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced events shortness of breath, difficulty breathing, tightness on the throat, difficulty swallowing, big rash in forehead and under her eyes. The patient's medical history was not provided. Concomitant medications reported were birth control pill for drug use for unknown indication. On 9 Mar 2021, prior to the onset of the events the patient received their first of two planned doses of mRNA-1273 (lot/batch: unknown) intramuscularly for prophylaxis of COVID-19 infection. On 9 Mar 2021, the patient experienced the event shortness of breath, difficulty breathing, tightness on the throat, difficulty swallowing, big rash in forehead and under her eyes. Treatment details included went to the emergency room (ER), epinephrine, diphenhydramine, and dexamethasone.. Action taken with mRNA-1273 in response to the events was not reported. The outcome of event, shortness of breath, difficulty breathing, tightness on the throat, difficulty swallowing, big rash in forehead and under her eyes was unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.
1123323	3/22/2021	FL	65	F	3/5/2021	3/11/2021	Day 7 post-dose (first Moderna vaccine dose), woke up with swelling of both eyes, more severe around left eye (injection given in left arm), became more severe upper and lower both eyes, with redness and itching. Also some redness and itching both ears and scalp. This progressed to jaw pain on both sides. Had bruise around injection site with a bit of pain, but on Day 10 had grapefruit-sized red swelling distal to injection site. Began taking OTC antihistamine on Day 7 for eye swelling but swelling became more severe so went to Urgent Care center on Day 10. They recommended starting RX Prednisone 40 mg QD and RX Hydroxyzine 25 mg BID, to be started in a.m. on Day 11. Eye swelling improved but is still present, with some itching, as of Day 18. Redness and bruise on arm has resolved.

1121603	3/22/2021			F		2/25/2021	<p>they said was she is COVID positive; could not wake patient up; it is like she is drunk; This is a spontaneous report from a contactable consumer reporting on mother. A 93-year-old female patient received dose 1 of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Lot number EL9267 via unspecified route on 25Feb2021 as a single dose for COVID-19 immunisation. Reporter stated vaccine was given to her mother last Thursday, a week ago today (7 days ago). Reporter stated that the vaccine card was handwritten, and she doesn't see NDC/EXP on it. Medical history and concomitant medications were not reported. Reporter stated that before she was doing laundry, her mom was alert and was opening and closing her eyes, and she gave her Gatorade, and she had someone take her blood pressure and it was okay. She says she gave her ice chips, and water and it was like pulling teeth, she can't wake her up, it was unbelievable, it was like she is drunk. They had to rush her mom to emergency room; ambulance came, and they kept her over 24 hours, she was admitted and they did observed her and released her the next day, and said she was COVID positive, and to make sure she got tested until it was negative, which she says was very surprising so she feels her mom got a false positive. Outcome of event COVID positive was unknown, could not wake patient up, was unknown and it is like she is drunk was unknown.</p>

1121726	3/22/2021	AZ	69	M	2/21/2021	3/11/2021	First vaccination uneventful. Second vaccination uneventful except for expected arm soreness and mild fatigue the following day. However, approximately 2.5 weeks post 2nd vaccination I began to experience peripheral neuropathic symptoms on the dorsal surfaces of bilateral hands (C6-7 dermatomes). It felt as if I were in a shower with a fine mist hitting both hands - even though the hands themselves were completely dry!. Only occurred while outdoors walking. No pain/numbness/weakness. Lasted roughly 10 days, starting to abate over last 48 hours! Coincidentally, had my first haircut (professional) in a year 3 days ago. I mentioned that it felt good to get out now that I was fully vaccinated. Without suggestion, the hair cutter mentioned that her 81-82 year old mother had had a 2nd vaccination and started feeling ?bugs crawling on the backs of her hands.? My eyes were like saucers because this was a totally-unsolicited remark which closely mimicked the symptoms I was experiencing. Fortunately, they seem to be resolving....!

1121709	3/22/2021	CA	34	F	3/19/2021	3/19/2021	Within 10 minutes of injection, patient started to say her eyes were moving by themselves behind her eye sockets and she was feeling alot of "snapping" in her body. Her blood pressure and pulse were higher than normal and she could not keep her eyes open well. She was observed by nurses for approx 30 minutes and those symptoms seemed to subside although she was not steady walking. Midway into our 30 minute drive home it all started again, this time she said she felt heaviness in her chest but was pointing to her throat. I immediately drove her directly to the ER. Was monitored for 4 hours and was release to go home, be observed and follow up with Neurologist when possible. Throughout the night, she continued to say she was shaking alot on the inside and her eyes were still moving involuntarily. 3/20/19 at 8:30 am I called her Neurologist to inform her patients symptoms were continuing. I waited 8 hours and called back only to have her tell her service I was to call patients Primary Physician. Which I did. Dr. was on call and quickly prescribed medication to help calm patients symptoms. She prescribed Valium 2mg q 6 hours. 3/21/19: Patient is still experiencing shakiness, involuntary eye movement and fatigue. She does not have arm pain at injection site.
1121707	3/22/2021	OR	46	F	1/29/2021	2/10/2021	Within a week of COVID-19 vaccine I had an outbreak of shingles in my left eye.
1121688	3/22/2021	TN	33	F	3/3/2021	3/3/2021	I started experiencing inappropriate affect and lost control of emotions. I would cry innappropriately or laugh at things innappropriately. I began experiencing brain fog and memory loss. Then i began experiencing vertigo that impaired my spacial reasoning. On Tuesday 3/9 I lost the ability to see objects far away. on 3/10 I woke up and was unable to read close up, or distinguish letters. The vision and vertigo has continued. I have to shut my eyes completely to walk without becoming sick. I can not be in a busy room with movement or my eyes will hurt. I can not read anything with font smaller then size 18. I can not watch TV because i can no longer see far away. I can not drive a car due to the motion., and i cant see the objects as they move.

1121860	3/22/2021	VA		F	3/3/2021	3/1/2021	<p>she was mostly clawing at her neck, it was an internal reaction, allergies; she was figuratively knocked on the ground; felt like she had been beat to death; eyes puffy and swollen; eyes puffy and swollen; Headache; Tiredness; cold/ she was freezing to death; lymph node swelling; congestion; Fever; Rash; Chills; Cough; ears and throat hurting; detect red across her chest or stuff; her ear canals and lymph nodes in her throat hurt and she was aching/ her ears and throat were hurting; her ear canals and lymph nodes in her throat hurt and she was aching; her eyes are tired right now and glassy; her knees are aching; scratching/ itching; This is a spontaneous report from a contactable consumer. A 58-year-old female patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration, administered in right arm on 03Mar2021 as single dose for COVID-19 immunisation. Medical history included asthmatic, stage 2, multiple allergies, allergies to shellfish and egg. Concomitant medications were not reported. Historical vaccine included first dose of BNT162B2 on 03Feb2021 (lot number: EL9269) for Covid-19 immunization. In Mar2021, the patient stated that her eyes were puffy and swollen like she was extremely sick, and she had a slight headache and was real tired, however when she went to bed she tossed and turned. She says she woke up at 04:00AM scratching her neck and chest and under her breasts, but she was mostly clawing at her neck, it was an internal reaction, allergies, so she looked in the mirror to see if she had hives or a rash and only could detect red across her chest or stuff. She says it was unknown if this was because she was scratching stuff, she took her temperature and it was a half degree above normal, and she laid back down. She says after she got up with the itching that night, 2.5 hours later she had no welts or anything, it was internal itching like what she had experienced when she had eaten something with a form of iodine content in it, where it causes a red streaky itching underneath. She says on Thursday she got up and felt like she had been beat to death, and she went to work and it got worse as the day went on, she was more tired. She says by 11:00AM she was freezing to death so she checked her temperature and it was still just a half degree different, so she used a space heater. She says that at 03:15PM she had a nurse</p>

check her temperature and it was still 97.5 degrees Fahrenheit, and she was so cold when she came home she took her temperature by mouth and then it was 100 degrees Fahrenheit she was figuratively knocked on the ground. She says if there was a difference, she doesn't know. She says she went to bed freezing to death so she put flannels on. She says 2 hours later she had taken Tylenol since her temperature was up almost to 101 degrees Fahrenheit. She says yesterday evening her ear canals and lymph nodes in her throat hurt and she was aching. She says that she didn't experience a cough until today, she is congested a little, which is not abnormal for her because of her allergies. She says her temperature was better today. She says for the Tylenol she took 625mg yesterday morning at 08:30AM, she never took more because she was never running a fever and she is not one to pop pills. She says she didn't take another until 05:30PM-06:00PM because she had heard that she was going to have chills but not a fever so she thought that was what she was experiencing and it wasn't until she got home and used her mouth thermometer and her ears and throat were hurting that she thought she had better check it and it was 2.5 degrees above normal so she took more. She says that she gets allergy shots, and she was supposed to go today but she doesn't know if she should because she feels tired, her eyes are tired right now and glassy, and her knees are aching, and her right ear is stopped up. She says she doesn't think that she needs to deal with allergy shots while she feels this way now. She says she usually gets her allergy shot twice a week, and her allergist said to have a day separation so she got her dose on Monday of the allergy shot, then got her COVID shot on Wednesday and she doesn't want to do her second shot this week, she couldn't go in today, it clearly knocked her on the ground, she didn't know it was 04:00AM when she got up. The outcome of the events was unknown.

1122166	3/22/2021	PA	87	F	3/20/2021	3/20/2021	Patient was AAOx3, ambulating independently prior to obtaining vaccine. Medical Assistant gave patient vaccine in Left Deltoid. Patient ambulated to observation area and sat in a chair. Five minutes into her observation, patient reported not feeling well. Medical Assistant notified Nurse Practitioner. Upon exam, patient was pallor, eyes intermittently rolling back, lethargic and unable to keep her head upright, nauseous and dry heaving, developed rigors, unable to verbally communicate but did nod her head yes to having difficulty breathing. No hives or rash noted. Epinephrine 0.3mg Pen (Lot # 0FM406, Exp Feb 2022) was administered in Right Deltoid. 911 was called by the Vaccine Clinic Supervisor. Vitals: Temp 97.7, HR 77, BP 134/76 (sitting), Pox 96% Room Air. After Epi administration, patient continued to be lethargic and the only thing she stated was "I do not feel well" but was able to communicate with head nods. EMS arrived and patient was taken to a Hospital.
1122375	3/22/2021	LA	67	F	3/11/2021	3/11/2021	Patient received vaccine on March 11, and reports that she began experiencing arm soreness immediately afterwards. She was reporting soreness with pulsating pain for the first 2 to 3 days, now reports a constant dull and achy pain that is worse with activity and movement. She has been using Tylenol, which she reports does help reduce pain symptoms. She denies any reduction in her range of motion, but states pain symptoms are more prominent with movement. She is also reporting daily headaches that occurred starting the day after getting the vaccine. Patient reports headache is bilateral in nature with a dull, aching quality. She states headache starts within 10 to 20 minutes of waking up. She takes Tylenol to help with headache symptoms, which does seem to relieve the headache. Some days, she reports headache comes back in the afternoon or evening. She denies any nasal congestion, vision problems, tinnitus, postnasal drip or sinus pressure. No balance, near syncopal, or syncopal problems. Denies any sensory or motor impairment accompanying the headaches.

1122373	3/22/2021	MA	55	F	1/13/2021	1/15/2021	I did have a hard red lump at the site of the injection. The main reason I went for medical treatment, I woke up I believe the second day and had double vision. I went to urgent care, and they thought maybe it was an eye infection and gave me medication. I had the medication and did that for a few days and then I went to see an Optometrist and told me to take eye drops. I did that and it got better. The I got the second shot and it happened it happened all over again. My doctor ran blood work and has extremely low white blood count.
1122360	3/22/2021	VA	67	M	3/7/2021	3/9/2021	No immediate adverse reaction. No fever. Day 2 post vaccination fatigue, blurred vision, confusion, weakness, lethargy, inability to concentrate, loss of balance, anxiety feeling weird. Symptoms would come- had to lay down- last ~2 hours-feel okay. Again, same symptoms would start; 4-5 times a day every day. By day 7 post vaccination symptoms were severe; activities of daily living severely compromised. Blood pressure elevated 180's/100's (no history of hypertension). Emergency room visit was unremarkable. Next morning, 03/15/2021, EMS called to home. Blood pressure 217/112 finger stick 178 (no history diabetes). Transported to ER. B/P remained elevated. Cardiac negative. Head CT negative. Medications given in ER: Labetalol 10mg IV. Monitored and released to home. Diagnosis: Hypertensive Encephalopathy with TIA's. New onset hypertension. Meds: Lisinopril 10 mg daily. Seen by primary care on 03/17/2021. Elevated blood pressure continued 150/100's.
1122326	3/22/2021	OK	61	F	3/5/2021	3/6/2021	Horrible Headache. I couldn't hold my eyes open for 36 hours. Generally feeling lousy.
1122319	3/22/2021	NJ	56	F	1/2/2021	1/4/2021	A few days post vaccine #1 I noticed small rash on lower extremities, which progressed to hives all over body. Saw dermatologist and started taking Allegra 4x/day. Symptoms seemed to subside. Received vaccine #2 on Jan 30th, and hives increased severely. Went to ER on Jan 9th with swollen lips and eyes, and hives over entire body. Received IV Solumedrol, IV Benadryl. Followed up with Allergist who said I was having a reaction to the vaccine. Am currently taking Doxepin 3 tabs/ nightly, Zyrtec 2x/day and Singulair. I am on week # 12 with hives with no relief.

1122283	3/22/2021	IL	73	F	3/17/2021	3/18/2021	Evening of administered dose sore and itchy arm. Woke up the morning after injection (3/18/2021) had tired feeling of eyes, white of left eye appeared to have bleeding across entire bottom area as well as up both sides, top area remained white in appearance or bleeding was unresolved in three weeks AS
1122280	3/22/2021	FL	53	F	3/13/2021	3/20/2021	The day of the first injection and the following day, I had a sore arm only. On day 8 after the Moderna vaccine, my left arm at the site of injection started itching. I also developed a bright red spot about 2 inches in diameter around the site of injections and it was warm to the touch. My left eye was also itchy on the lower left lid, but I honestly don't know if that can be attributed to the vaccine or the fact that we were painting the inside of our house. It might have been the paint. On day 8, I did have a little bit of a rapid heartbeat, but noticed this before I noticed my arm itching and being red. Not sure if that was related to reaction or not.
1121952	3/22/2021	KY	87	F	3/4/2021	3/8/2021	Received call from patient's nephew. He reports approximately 4 days after receiving vaccine, patient's nose and around her eyes began peeling like she had a bad sunburn. Reports they have been peeling ever since. No other problems. Patient denies any changes to her normal skin care regimen. Advised if continues, to see her medical doctor.
1122198	3/22/2021	AZ	77	F	3/11/2021	3/11/2021	Slurred speech, extreme confusion and disorientation, headache, blurred vision. Symptoms of mild Demetia increased to meditate to severe dementia in a matter of hours.

1121995	3/22/2021	MA	68	F	3/17/2021	3/18/2021	Got the vaccine, and had no problems as she was busy in the house, cleaning. Later during the day when she went to check a note without her glasses was not able to see, which she was able to do before she got the vaccine. She cannot read anything close up right now without looking through her bifocals, which she did not have any blurry vision before the vaccine. She now cannot read anything far away without blurry vision, mainly distance reading, but again was able to do that before. Before her vaccine she used glasses for close up reading only. Her arm was sore for a day and a night and has no problems with the injection site itself. She does have an appointment with an Ophthalmologist is tomorrow.
1122143	3/22/2021	OH	62	M	3/10/2021	3/17/2021	Serious Dizziness / Vertigo when moving from a laying down position to sitting or standing, and when moving from sitting or standing to laying down. Visual "room spinning" and some nausea as well. Symptoms began 3/17/2021. Still ongoing.
1122133	3/22/2021	FL	72	F	3/4/2021	3/18/2021	pt states that a couple of weeks after taking the vax she ended up in the Hospital ER on 3/18/2021 for symptoms of having a stroke and blurred vision. On 3/18/2021 Pt was transferred to Hospital in. They ran ECHO, EKG, CT and MRI. Blood Work. No findings of clogged arteries. DX was w/ TIA possible cause due to AFIB. Pt states that she no longer has any symptoms.
1122101	3/22/2021	IL	47	F	1/7/2021	1/7/2021	Blurred vision, "seeing spots" throughout the day after the vaccination
1122062	3/22/2021	TX	49	F	3/13/2021	3/13/2021	Developed increased left eye lacrimation the morning of 3/13. Then received Moderna vaccine at 11:30 AM. Then developed facial droop, loss of nasolabial fold, increased lacrimation of left side. Was evaluated on 3/18/2021 with diagnosis of Bell palsy.
1122054	3/22/2021	IL	40	F	1/29/2021	1/29/2021	With both doses, eyes became swollen. Saw primary care provider and was prescribed eye drops and oral antibiotics which cleared the infection. PCP stated the "eye infection and sty" was caused by the vaccine.
1122049	3/22/2021	NC	46	F	3/18/2021	3/19/2021	Eye twitching beginning about 12 hours after vaccination

1122391	3/22/2021	NE	79	F	3/17/2021	3/19/2021	Pt. presented to ER on 3/19/2021. Family reports that pt. received her Covid vaccination on 3/17/2021. Since then her stomach started hurting and pt. is lethargic. Pt. did not open eyes when asked questions and was quite pale. Son reports increased confusion last day or two. Pt. reports that she started feeling ill immediately after receiving the injection. Complains of generalized weakness and fatigue. Denies dizziness or lightheaded. C/o abd. pain. Denies nausea, vomiting, but admits to diarrhea. Denies fevers, cough congestion. She is alert to place and name, but unsure of date at time seen in ER. When seen in ER she was afebrile, but hypoxic and hypotensive. Initial saturations were in mid 80's, but dropped to low 60's. With a non-rebreather mask she maintained at 90%. BP 60's systolic but with fluids increased to 90's. No rectal bleed or hematemeis. Diagnosis of septic shock, anemia, elevated LFT's, pneumonia, and UTI.
1122200	3/22/2021	FL	75	M	3/18/2021	3/19/2021	Extreme headache left side of head and left eye. Vaccine was given on Thursday March 18th and the headache started on Friday the 19th and got worse of Saturday the 20th and Sunday morning got better Sunday evening. A rash developed on the left side of my forehead Sunday afternoon (looks like bloody pit marks). The left side of my head hurts, and my left eye continues to throb.
1124344	3/22/2021	AR	85	F	2/4/2021	2/9/2021	after vaccine my body got little circles on it, not exactly a spot but I had dark circles on the edges of the spots, my joints got stiff but there was no pain or aches, and seems like I slept more than usual. On the 4th day it seemed like I'd been drained and dry, by the 4th week my skin seemed dry and I tried to drink water, my eyes seemed a little deeper set. I went to my PCP and he sent me to a dermatologist. The dermatologist and he gave me something to bathe in, and I didn't see any difference. The spots are not like a rash, but the discoloration seems to be under the skin, its not a rash on top of the skin but underneath.

1124555	3/22/2021	MO	61	F	3/10/2021	3/19/2021	Nine days after receiving the vaccine, my vaccine site on my arm started itching really bad, and when I went to scratch it, I felt a very large (~size of a tennis ball) bump on my arm that was also very hard and very red. Initially, I thought it must be a spider bite, though I haven't noticed any spiders in my home, and I simply watched it for any sign of infection (which never happened). The next day I also noticed an unusually high degree of fatigue which limited my ability to do much of anything for three days, thus far! Throughout the day and night, without warning, my eyes become really heavy, and I feel like I'm going to immediately drop off to sleep. My eyes also begin to burn, and when I close them I simply fall asleep for about a half hour. This has been happening off and on all day for three days, so far. I have no idea if there's any connection to the vaccine or to the sudden appearance of a hard, big, red, itchy bump at the vaccination site on my left arm.
1124331	3/22/2021	AK	48	F	3/9/2021	3/11/2021	extreme eye pain in the right eye for 2 days
1124329	3/22/2021	TX	51	F	3/19/2021	3/20/2021	Extremely sleepy and blurred vision. The blurred vision has continued now 3 days.

1124518	3/22/2021	OR	73	F	3/16/2021	3/22/2021	Woke up at 8:00 with a headache and face ache. Coughed a few times and discovered it was very painful to my rib cage. Had slight fever all day and now it's 4:00 p.m. I still have headache and slight fever. Slept a few hours today. Very sore neck muscles. Might have sinus pressure and eyes very sensitive to light.
1123642	3/22/2021	VA	27	U		3/18/2021	12 hours post-vaccine my heart rate was 115-125 beats per minute for over 5 hours and it was uncontrollable. No sleep, vomiting. The rapid heart rate that was so strong and persistent that it caused my brain to think my body was going to die. I had uncontrollable, racing and intrusive thoughts about the fact that I was about to die and I became incredibly scared and paranoid. I had minor "sleep" paralysis at times where I couldn't move my limbs and they felt incredibly heavy when I attempted to move (sleep in quotation marks because I did not sleep that night). The intrusive, racing thoughts were spiraling incredibly rapidly - roughly 3 thoughts per second for the entire 5 or so hours that my heart rate was uncontrollable. When attempting to re-direct my thoughts, I was unsuccessful. Scenes/moments from my life flashed before my eyes in shuffle mode (i.e., memories from different parts of my life in no particular order) and at some points there were dark figures/shadows in my imagination that made it seem like I was about to die. My extremities became icy cold as if blood was drained from the areas during this time. I couldn't decide if I would be found dead in my bed or if I should go to the ER. I ultimately stayed home and tried to overcome the side effects (which I did). Once my heart rate normalized the following morning, the racing and spiraling thoughts lessened, though there is an underlying fear of having these uncontrollable, intrusive, and racing thoughts return at any time.
1124527	3/22/2021	TX	76	M	3/11/2021	3/11/2021	He had his Vivid shot and awoke blind in left eye 4 hours later. Went to ER and then on Friday went to eye Dr. at clinic.

1124610	3/22/2021	VA	54	F	3/16/2021	3/18/2021	Starting at 5 p.m. on March 18th (two days post-vaccine), pain began in the lymph node area of the left side of the neck. It became increasingly painful on March 19 in the evening (especially after dinner) and overnight (around 3 a.m.) and more painful in the evening on March 20th after dinner. On March 20th, I took 800 mg ibuprofen (4 tablets) at 6 p.m. to relieve the pain. My husband is an Emergency Physician and indicated that is the dose I should take given the pain. At 1:00 p.m. on Sunday the lymphnodes on the left side of the neck began hurting again (excruciating pain) and I again took 800 mg of ibuprofen to relieve the pain. This occurred after having lunch (a burger) at noon. However, at 1:30 p.m. the left side of my face began to feel numb. I had little control of the left side of my mouth and could not close my left eyelid properly. The numbness lasted for about 20 min and then subsided. After 40 min (2:10 p.m.) it felt better and I had a few potato chips left over from my lunch. The numbness started again about 10 min later and lasted about 20 min. The face went numb again the evening of March 22nd for 20 min despite remaining on ibuprofen 3 times a day.
1124599	3/22/2021	PA	26	F	1/12/2021	1/13/2021	24 ours after, I developed a red bullseye- softball size - on right arm. Fever and back pain as well. And headache. The bullseye - lasted about 7-10 days. About three days into I went to the Urgent Care - they gave me a cream to put on it and Benadryl. The red bump was warm to the touch and it was painful. Those helped resolved the bulls eye bump within three days.

1124525	3/22/2021	GU	24	M	3/18/2021	3/18/2021	I kept a log of the events that occurred. Notes: 25mg amitriptyline taken nightly for the last month, 200mg motrin I've never taken pain killers before this, time is in military. Mar 18 1430 (1 hour 30 mins after my shot) i have a compressing headache toward the back of my head so i take 1 motrin. 1700 i head home, take 1 amitriptyline and head straight to sleep. ( i have no apatite so no dinner ) Mar 19 0100 The pain starts, it?s unbearable. I am sweating heavily and im also shivering cold. i have a high fever I have body aches which turns my shivering into shaking which keeps my wife up all night. In my dreams i feel pain. I talked to my deceased mother, i hold my deceased cat and i relive some of my most regrettable moments. 0700 I wake up, the bed is soaking wet. I take a motrin and get dressed. it takes me an hour longer to get ready for work because, the pain has sapped my energy. My supervisor sends me home seeing how horrible I look. 0900 I take an amitriptyline and lay down. I ask me wife to close to the storm shutters to darken the room. They are normally pretty quiet to close but, this time they are deafeningly loud. I struggled to get 1 hour of sleep. 1500 I wake up due to shaking so bad that i hit my head on the wall. I then take 2 motrin and about 30 mins later i notice theres a tightness in my chest. i take 1 tums. I know that my body is exhausted from the pain and my mind is clouded but i really wanted to do all of the tasks that i was planning on doing this weekend. All of the tasks end up failing. 2100 i try the tasks again and end up failing again. 20 Mar 0100. I eat a pear and 2 cheetos. i do not take a amitriptyline and i lay down. i have no pain or fever. (Dream start) The dream i had is of me watching myself get thrown around by a ghost. The ghost possesses my body for a short time. I grab some kittens (cats are a comfort to me so im guessing that my subconscious trying to reel me back in) I then wake my sleeping wife and tell her theres a ghost and we need to leave. We walk outside and im in an old neighborhood that i grew up in, everything darkens and im in pitch black feeling my way around a room. I open my eyes and im in a hotel. The front desk staff will not let me take the kittens up to my room so i leave them. When i walk into the room, it?s full of kittens (dream end) and i wake up 21 Mar 0900 I wake up and I have a sore throat and tightness in my chest. The soreness prevents me from going back to sleep and the tightness in my chest

							causing some anxiety. Once I calm myself down and convince myself that im not having a heart attack I take 2 motrin and some tums and the pain goes away from the day. These could be some withdrawals from not taking amitriptyline since 19 mar in the morning. This is still happening as I write this report. (23 March 2021)
1124737	3/22/2021	FL	37	F	3/21/2021	3/21/2021	Swelling at site of injection (Left arm-swollen, hard red arm with swelling approx. 6 inches in diameter). Progressed during the night to extend to swelling of all lymph nodes and swelling, hardness and redness from back left shoulder blade to finger tips (on left side only). This began to recede and improve after approx 24 hrs post vaccine and swelling is now contained to area approx 4- 5 inches in diameter from site of injection. Soreness is manageable. Fever present within 8 hours, ranging from 102.5 around midnight to temp of 103 during day on 3/22. Treating with Ibuprofen. Shortness of breath and increased arrhythmia/ rapid heartbeat started around 2 am. Treating difficulty breathing with rescue inhaler, this symptom has improved 24 hrs post vaccination. GI issues (vomiting and diarrhea) began within 2 hours of vaccine. Progressed throughout night but seems to be resolving a bit now, diarrhea has slowed down and now I am just nauseous and have stopped actively vomiting since approx 12 hours post vaccination. Pounding Headache started within 4 hours of vaccine, eyes ache when moved from side to side. Treating with Ibuprofen. Body aches, fatigue and muscle soreness. Treating with Ibuprofen.
1123732	3/22/2021	AZ	58	F	3/16/2021	3/16/2021	As I was driving home my face started to burn like a bad sunburn. When I got home my face was blotchy and my eyes started to swell. I took benedryl and applied a cool pack. Redness and swelling around mybeyes lasted for 2+ days. Still not feeling well and have scheduled a doctor appointment for tomorrow.
1123841	3/22/2021	NJ	65	F	2/1/2021	3/13/2021	On March 13, I developed double vision, dizziness and nystagmus. I was transferred by ambulance to a hospital due to stroke symptoms. Admitted overnight. Diagnosis: Transient Ischemic Attack. This occurred one month after second Covid injection.

1123816	3/22/2021	CT	75	M	1/15/2021	1/22/2021	hands swelling; right eye was involuntarily tearing; shaking; having a severe reaction, rash all over the body,extensive rash; red splashes all over their body except in their face and hands, smooth, not raised, not itchy,; fevers (102 °F); chills/ felt a slight chill/ a little bit of chills; A spontaneous report was received from a Healthcare Professional concerning a 75-year-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced a severe reaction, rash all over the body, chills, fevers (102 °f), red splashes all over his body except in his face and hands, smooth, not raised, not itchy, shaking, right eye was involuntarily tearing and hands swelling. The patient's medical history included temporal arteritis ((4 years ago) which got inflamed and did not know the cause of it. The concomitant medications reported were Amlodipine 5 mg a day, Rapaflo 8 mg a day, Eliquis 5 mg twice a day, Flecainide 100 mg twice a day, and Metoprolol 25 mg a day (drug used for unknown indication). On 15 Jan 2021 at about 10:45 am, prior to the onset of the events, the patient received his first of two planned doses of mRNA-1273 (lot batch: 012120A) via unknown for prophylaxis of COVID-19 infection. On 22 Jan 2021, the patient felt a slight chill. However On 23 Jan 2021, the patient had a severe reaction, rash all over the body, chills, fevers (102 °f) and suddenly about late afternoon 5 PM noticed an extensive rash, red splashes all over his body except in his face and hands, which were smooth, not raised, and not itchy. He started getting chills and fevers (temperature 102 °F). On 24 Jan 2021, the patient experienced shaking and, on 25 Jan 2021, the right eye was involuntarily tearing and noticed swelling of hands. On an unknown date the patient visited the dermatologist for rash, and his biopsy was done for the same. but the results were unknown. Relevant Lab data included, COVID test Negative for rapid and PCR. Blood and urine test were done on unknown date and blood test was normal. Treatment details included Tylenol and prednisone 40 mg. Action taken with mRNA-1273 in response to the events was Unknown. The outcome of events chills resolved. Other symptoms include rash all over the body, red splashes all over his body except in his face and hands, smooth, not raised, not itchy, and right eye was involuntarily tearing was Unknown. The reporter assessed the events as related to the vaccine

1123802	3/22/2021	CA	59	M	1/12/2021	1/19/2021	<p>drug.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.</p> <p>Bell's palsy; A spontaneous report was received from a consumer who was a 59-year-old, male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and developed Bell's palsy (facial paralysis). The patient's medical history was not provided. No relevant concomitant medications were reported. On 12 Jan 2021, approximately seven days prior to the onset of the symptoms, the patient received the first of two planned doses of mRNA-1273 (Batch number: unknown) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 19 Jan 2021, the patient developed Bell's palsy. As per patient, there was loss of taste, his eyeball was not moving, he had facial pain and he could not raise right side of his lips. The patient stated that his symptoms were still on going at the time of report. Both his PCP and neurologist can not confirm this is not related to vaccine. Treatment for the event included a seven-day course of Valtrex and Prednisone. Action taken with mRNA-1273 in response to the event was not provided. The event, Bell's palsy, was considered not recovered/not resolved.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.</p>
1123793	3/22/2021	GA	24	F	3/17/2021	3/20/2021	<p>My arm was swollen for a couple days after (which I expected) receiving the vaccine. Then on saturday night after dinner and dessert (all things I've eaten recently so nothing new) I began swelling in my lips and under my right eye. I took 6 doses of off-brand benadryl and it would only decrease the swelling by very small increments. My breathing was alright, but to this day as of 03/22/2021 my lips are still slightly puffy.</p>

Dr. consulted. 1615 - Patient ambulatory out of clinic and taken to ED, accompanied by Medical assistant and Dr. Patient stable and in no apparent distress.
1123720	3/22/2021	CA	57	F	1/14/2021	1/15/2021	One day after vaccine my eye felt slightly irritated. The next day I felt a little swelling in the corner of my left eye on the same side of vaccine. It became visible as an irritation on the outside corner of my eye. It was very painful and my lower eyelid was swollen. I was trying to massage but the pain seemed to be internal. There was a large red pimple like lesion inside my eyelid. I went to an eye doctor and was diagnosed with an internal sty on my eye. I have never had a Sty before. I was prescribed an antibiotic and it not not resolve so I was prescribed an antibiotic cream which helped. The lesion burst by then. I took two to three weeks to resolve. I since also received the second dose. I had a very strong immune response to the second dose. Chills, headaches and all over body ache. I was unable to work for two days. I was bed ridden for two days. My Asthma seemed very reactive during that time. My Asthma seemed worse for a few weeks and it is still a little worse than normal.

							<p>Mood and Affect: Mood normal. Behavior: Behavior normal. Thought Content: Thought content normal. Judgment: Judgment normal. Abnormal findings above improved after laying patient down flat. Pt feels better and was able to progressively sit up in the chair without reoccurrence of symptoms.</p> <p>Assessment/Plan Treatment included: water and rest Follow up response to treatment: excellent. Patient discharge: Stable to go home and follow up with PCP. Differential Diagnosis: Systemic reaction (hypoglycemia, hypotension, generalized rash) Resolution of symptoms, suspect vasovagal reaction. She is back to base line. Monitored in bay for approx 10 mintues. Pt able to ambulate w/o difficulty or w/ assistance. Pt with husband for discharge. He will drive home. Follow up with pcp as needed. Both patient and pt's husband express appreciation of care today.</p>
1124005	3/22/2021	IN	67	M	3/18/2021	3/18/2021	<p>Moderna COVID-19 Vaccine EUA That evening started with headache, muscle aches, nausea. About 4:30 am next morning I got up to use bathroom and passed out for unknown length of time. I tried to go back to bed and passed out two more times. The 3rd time my wife says my eyes rolled back in my head and she could not arouse me for 3 to 5 minutes. I went back to bed to sleep. Several hours later I was still to dizzy to stand and had a knot on the back of my head from the falls. We called 911 and I went to ER at Hospital for further evaluation.</p>
1123993	3/22/2021	KS	76	F	3/11/2021	3/12/2021	<p>The day following the 2nd injection I experienced visual disturbance (similar to prior to a Migraine headache) followed by a moderate headache and generally not feeling well, This has occurred once daily now for 11 days. Two Tylenol and resting alleviates the issue. I have also noted many episodes of the atrial tachycardia through out each day. No treatment other than rest/relaxation.</p>

1123899	3/22/2021	IN	45	F	3/20/2021	3/20/2021	MAY NOT BE CONSIDERED ADVERSE EVENT BUT WANTED TO REPORT IT: About 10 minutes after shot I experienced a sharp pain in my bottom right occipital lobe/base of skull. Later only about 1 min. Also experienced tingling sensation in my eyes and vision interference that lasted about 20 seconds tops. Immediately following, however, my vision appeared sharper. I also experienced sharp pain about a few hours later in bottom left occipital/base of skull that only lasted about 30 seconds. Other than that I feel great! Given the newness of the vaccine I felt it important that you know.
1123925	3/22/2021	MA	54	M	3/19/2021	3/19/2021	patient received first dose of COVID vaccine. while waiting in observation area patient felt dizzy with blurry vision. Began to feel a tingling sensation down both his legs. MD onsite assessed patient. . tingling sensation improved. Walked with with shoveling gait with assistance. Normally walks with cane since recent hospitalization. Not an allergic reaction. ER precautions reviewed client with patient then cleared to go home. Nurse called patient in pm, reports feeling better with mild soreness at injection site. Denies pain or tingling..Tingling sensation felt after vaccine has resolved, denies blurred vision and has his usually energy. BP again at home reported at 125/88 2 hours ago. No concerns at this time. Reminded of upcoming appointment and availability of on call providers eve and weekend if needed.

1120407	3/21/2021	TX	55	M	3/16/2021	3/20/2021	I received the first shot on March 16th and on March 20th around 4:00 pm I was feeling like my speech was a little slurry. I got home and about 5:30 pm I was resting against my boat cause I was feeling nausea and a headache. Also it felt like my food tasted different...I had ate some chips the day after the shot on March 17th and I had told my wife that they tasted different. Anyway, on March 20th around 8:30 pm I went to spit and realized I could only spit from the right side of my mouth. I called my daughter, who is an ICU RN, asked me to do a series of tests over facetime with her and she told me I should go in cause when I smiled it wasn't symmetrical. She came and picked me up and took me to hospital in. Immediately there they asked me to smile and to raise my eyebrows and they treated for "possible" stroke.
1120361	3/21/2021	PA	46	M	3/20/2021	3/20/2021	Within two minutes of receiving the shot, began to feel very nauseous. Inside of ears then felt very hot and body below neck felt very chilled. After five minutes these symptoms intensified, feeling hot flushed in face and vision darkened, feeling like a black out may occur. Pharmacist provided water. Symptoms began dissipating after 20 minutes after injection. After 30 minutes, symptoms ended.
1120131	3/21/2021	FL	55	F	3/17/2021	3/17/2021	I had awful nausea, loud ringing in the ears, I fainted. The medics provided help, gave me oxygen. I started having convulsions. After some time I felt like the lower part of my face went numb and it took tremendous effort to move my lips to talk. At that point, the medical called the ambulance and sent me to ER, where I was under supervision for some time. I was very weak and nauseated. After I was released, I was very weak could not keep the vertical position. The next day I was very nauseated, with awful tinnitus, lightheadedness, and weakness. Staying vertical for more than 15 minutes brought fainting symptoms. I was not able to get out of the house to work. The next day the fainting symptoms disappeared, everything else continued. Too weak to go to work. I started moving about only on the 4th day after the shot. During this event, I did not have any fever or muscle ache, no virus0tyle symptoms.

1120124	3/21/2021	GA	69	F	1/14/2021	1/29/2021	<p>Tested positive on 29Jan/she contracted Sars-Cov-2 infection before her second dose on 04Feb2021; tested positive on 29Jan/she contracted Sars-Cov-2 infection before her second dose on 04Feb2021; This is a spontaneous report from a contactable consumer (the patient) via the Pfizer Sponsored Program. A 69-year-old female patient started to receive the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot number: EL3302), via an unspecified route of administration on 14Jan2021 (at the age of 69-years) as a single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. On 29Jan2021 the patient tested positive/she contracted sars-cov-2 infection before her second dose on 04Feb2021. The patient inquired as to how long she needed to wait before receiving her second dose. The patient had lab tests and procedures which included sars-cov-2 test: positive on 29Jan2021. The clinical outcome of the patient tested positive/she contracted sars-cov-2 infection before her second dose on 04Feb2021 was unknown. On 23Feb2021, the investigation results was received from a company. The product is BNT162B2, Lot #: EL3302, Expiry: 31May 2021. Reasonably Suggest Device Malfunction was reported as No. Severity of Harm was N/A. Site Sample Status: Not Received. Confirmed Complaint Sample Defect Not Received. Summary of Investigation: The initial scope of the investigation was limited to the reported finished goods lot. The final scope was expanded to include the reported finished goods lot EL3302, fill lot EL3300, and the formulated drug product lot EL3299. Manufacturing and packaging batch records were reviewed for the reported complaint lot. The company did not receive photographs or a complaint sample for examination. The complaint was not confirmed. There were no planned or unplanned deviations recorded during the manufacture of the complaint lot and associated manufacturing lots that may have caused a complaint of this nature. A review of the manufacturing records confirmed processing steps were performed within pre-established parameters. All raw materials and amounts used in the manufacture of the batch were of the correct weight and identity. The drug product is stored at controlled refrigeration throughout the manufacturing process and a log is maintained</p>

VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

documenting the elapsed time out of refrigeration. A review of the logs confirmed that all times were within allowable limits. The product also requires storage in ultra-low temperature freezers following the packaging of the product. A review of the freezer temperature log for the reported batch confirmed that all freezer temperatures were within allowable limits. The results of all analytical tests performed at the time of lot release confirmed that the batch continues to meet potency specifications. Root Cause Analysis: a company could not indicate a probable root cause for the complaint to be related to the production process of the involved batch. Review of the manufacturing and packaging batch records and release test results confirmed that the batch continues to meet potency specifications. It is unknown how the product was handled, stored, or administered after it left the (name). Impact Analysis: Based on the results of this investigation, the manufacturing and packaging batches remain acceptable and the reported complaint is not representative of the lot. No regulatory notification is needed. Corrective/Preventive Action: There were no corrective actions as a result of this complaint investigation. The results of all tests, inspections, and in-process controls have been reviewed and all results met the established requirements prior to the release of the reported batch for distribution. Conclusion: The complaint for lack of effect of the PFIZER-BIONTECH COVID-19 VACCINE lot EL3302 as investigated. The investigation included a review of manufacturing and packaging batch records, deviation investigations, and an analysis of complaint history for the reported lot. The final scope included the reported finished goods lot EL3302, fill lot EL3300, and the formulated drug product lot EL3299. A complaint sample was not returned, and photographs were not received. No related quality issues were identified during the investigation. There is no impact to product quality. No root cause or corrective/preventative actions were identified as the complaint was not confirmed. All release testing performed prior to the release of the reported batch was within specifications. Scope of Complaint Investigation: The scope of this investigation included the reported finished goods lot EL3302, fill lot EL3300, and the bulk formulated drug product EL3299. Acceptable review of related documentation, including manufacturing

batch records and review of release test results at the time of lot release confirmed that there were no issues which may have resulted in a complaint of this nature. Manufacturing Batch Records: Complete - Acceptable. The bulk manufacturing batch record for the complaint batch was reviewed as part of this investigation and found to be acceptable. All processing steps were performed within pre-established parameters. The review of the manufacturing record confirmed that all in process checks, all line startup and end of batch challenges, and all line clearance and cleaning activities were completed satisfactorily. All raw materials used in the complaint batch were of the correct weight and identity. All the manufacturing temperatures mix speeds and mixing times were within acceptable ranges. In-process appearance and specific gravity test results were all within acceptable ranges. A review of the solution filtration documentation confirmed that all materials, filters and Water for Injection (WFI) were used within their expiration dates, and that all the filtration times, pH results, and pressure specifications were met. The manufacturing processes of raw material usage, solution formulation and filtration were all found to be acceptable. All manufacturing parameters met established requirements. A log is maintained throughout the manufacturing process of the amount of elapsed time that the product is out of refrigeration. A review of the elapsed time tracking logs confirmed that all times were within allowable limits. Packaging Batch Records: Complete - Acceptable: The review of the packaging record confirmed that all in process checks, all line startup and end of batch challenges, and all line clearance and cleaning activities were completed satisfactorily. Audits are performed on the finished packaged units by personnel at regular intervals throughout the final packaging process. This is done in order to ensure that all required labeling and packaging is present, complete, and meets all establishments requirements. During the audits, inspectors visually check the appearance of the finished product for defects. Reserve Sample Testing Result: A reserve sample was not sent to the lab to determine the amount of active ingredient since the complaint was received within six months of the release date of the involved batch. The results of all analytical tests performed at the time of lot

1120379	3/21/2021	AL	66	F	3/9/2021	3/15/2021	Pfizer COVID-19 shot was injected in my right arm on 3/9/2021. Five days later on 03/15/21 around 5am, my right eye was very sore and red, stinging/itching. The soreness continued on 3/16 and 3/17. My eye started to swell on 3/18 and continued to swell through 3/20. Started in the right corner of my eye. On 3/21 as I write this event, my right eye is still swollen. I have pictures of the swollen eye. I have a history of eye swelling from childhood thru adulthood after taking certain known medications(Aspirin, NSAIDS, penicillin, codeine, Feldene, steroids. There may be others that I am unaware of. Today 3/21 is the 4th day of swelling,

1119975	3/21/2021	MI	82	M	2/23/2021	2/1/2021	<p>~~very dark red, big, angry rash" on the back of both of his hands that is moving up his arms, which the caller describes as "erythema multiform"; This is a spontaneous report from contactable consumers (one is the caregiver). An 82-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot no. and expiry date were not reported), via an unspecified route of administration on 23Feb2021 (at the age of 82-year-old) at single dose for COVID-19 immunization. Medical history included cancer, stage 4 renal cancer with metastasis to the lung, kidney failure and being dialyzed, electrolyte imbalance, prostate infection, blood pressure abnormal. Concomitant medications included prednisone for kidney failure; sevelamer carbonate (RENVELA) to regulates his electrolytes; hydralazine (HYDRALAZINE) for blood pressure; candesartan for blood pressure; metoprolol succinate (TOPROL) for blood pressure; finasteride for prostate; and amlodipine. The patient developed a very dark red, big, angry rash on the back of both of his hands that is moving up his arms (reported as worsened), which the consumer describes as "erythema multiforme". Looks like erythema multiform is this rash associated with the product very dark red, big angry splotches very large. He was told he should get the vaccination, his oncologist and his nephrologist said he should get it so he got the vaccination last Tuesday and then he woke up either the next day or the day after that and her mother said he had a very severe rash on his hands and now it is climbing up his arms. It almost looks like erythema multiforme but it has no bulls eye, It is dark red and ugly looking it is rough, it is not really raised. They went to the oncologist and they took blood work to make sure his platelets were okay and they were normal so his doctors are baffled with this. She is calling from her husband's surgery office and they are disgusted with the healthcare he is receiving there but she wants to know if there is any data with cancer patients taking the vaccine or with people that have developed a rash like she is describing. His weight has dropped a lot since she last saw him he is 5'10", now he is probably about 150 or 160 lbs. That is an estimate. He developed the rash either 24Feb2021 or 25Feb2021, she is not sure which. It was ongoing and it is actually spreading up his arms so she would say it is worsened. He is on a slew of medications, but she</p>

1119893	3/21/2021		40	M	1/15/2021	1/26/2021	cough; nasal congestion; didn't sleep well/He has sleep apnea; blood pressure went up to 121/63; his temp and it went up; pulse rate was up; very tired; He had COVID test and it came back positive; He had COVID test and it came back positive; This is a spontaneous report from a contactable Nurse (patient's mother). Report 3 of 3. MI filed on report 1 of 3. A 40-year-old-male patient received first dose of BNT162B2 (COVID VACCINE, Pfizer product, Formulation: Solution for injection, Lot: Number: EL3302, NDC number: Unknown, Expiry Date: Unknown) via an unspecified route of administration on 15Jan2021 at single dose for covid-19 immunization. The patient's medical history included sleep apnea (he started with CPAP and technically it was a BIPAP machine), bipolar disease (took psychiatric medications), lost weight, blood pressure and liver enzymes. On 17Mar2020, he quit smoking. Concomitant medications were not reported. On 26Jan2021, the patient experienced nasal congestion and cough. He had COVID test and it came back positive. It was reported that, "they were vaccinated on 15Jan2021 with first dose. The Wednesday after which was about 5 days after the vaccine her husband got chills, sneezing, and fatigue. He did not call the doctor and did not get tested. About a week later her son had nasal congestion and cough. This was the third day for that. Called her son's doctor since this was the second person in the house to have symptoms. He had COVID test and it came back positive. Is the COVID vaccine enough to give a positive test. She had symptoms too, but she normally get sinusitis this time of year. No one had a fever. Her son was really congested. Maybe he will develop a fever down the line. She was at a quandary. She had to quarantine in case it was. Could the vaccination cause a positive COVID test result. She thought the symptoms should show up in 1 to 3 days. A week in between her husband and son and it was hard to believe. It should have been her to get it worse since she sleeps with her husband. Praise the Lord she had not. She and her husband had not been tested for COVID. Only her son was COVID tested. Wednesday morning he woke up and he was much more congested. He complained a little on Tuesday. He had sleep apnea and uses CPAP. He might have wanted cough medicine to help him sleep good. He said he did not sleep well. He was very tired and congested. On the evening of

26Jan2021 he was more congested than usual. He was tested yesterday and got positive results this morning. History and Investigations: he was in a lot better shape since living with them because he had lost over 100 pounds. He had sleep apnea. He started with CPAP and technically it was a BIPAP machine. They call it a CPAP. He was 355 pounds and now 228 pounds. Slowly losing weight. He had bipolar disease and took psychiatric medications. Since he had lost weight he has had to decrease his doses. He was having problems with blood pressure in October. He was starting to feel faint and the doctor stopped his blood pressure medications. He had issues with his liver enzymes and he was not out of the woods yet. He had been a smoker on and off. He quit smoking on 17Mar2020. Caller declined to provide information about her son's psychiatric medications and blood pressure medications for report. They bought a blood pressure cuff to keep track of his blood pressure. Since he got sick his blood pressure went up to 121/63. It was normally 110 to 114 over 63 to 70. She had also been keeping an eye on his temp and it went up about a degree. His pulse rate was up which you would expect. His pulse rate was usually between 55 and 68. That day it was 83. There was a product complaint. Caller was patient's mother. Vaccinated on 15Jan2021 with first dose. About a week later her son had nasal congestion and cough. This was the third day for that. Called her son's doctor since this was the second person in the house to have symptoms. He had COVID test and it came back positive. Is the COVID vaccine enough to give a positive test. Her son was really congested. Maybe he would develop a fever down the line. Could the vaccination cause a positive COVID test result. On the evening of 26Jan2021 he was more congested than usual. He was tested yesterday and got positive results this morning. Outcome of the events was unknown.

1121191	3/21/2021	GA	52	F	1/27/2021	1/28/2021	1 day after receiving the 2nd Moderna shot I began to experience severe nausea & vomiting precipitated by intense vertigo. The vertigo was so severe that I had visual disturbances, severe headaches, loss of balance, poor concentration including memory problems, and ringing in the ears that precluded these attacks. These events occurred 1-2 times a day. It has devastated my life. These episodes take 1-3 hours to overcome and their is no specific time of day they happen. I had to be hospitalized for 2 days exactly 1 week post vaccination. The healthcare providers can not agree that these events are directly caused by this vaccine. I've been told it's central nervous inflammation caused by my immune system over reacting from the vaccine. I have no history of vertigo or really migraine headaches. The neurologists say these symptoms are vestibular migraines or vestibular vertigo (positional). It's now almost 3 months and I'm still struggling with these symptoms but thankfully not as severe and debilitating. Shot 1/27/21, first day of symptoms 1/28 and hospitalized 2/3 to 2/5.
1121004	3/21/2021	MA	74	M	3/12/2021	3/20/2021	vertigo, double-vision, vomiting, sweating, high blood pressure (170/100)
1121036	3/21/2021	GA	58	M	3/5/2021	3/17/2021	Developed fever of 101-103, violent chills, uncontrolled shaking and extreme headache. Lasted 3 solid, then fever began to drop day 4, but headache persisted along with sweats and violent chill. No real appetite. Also experienced body ache, but not as bad as other symptoms. No, or little bowel movement during this time. On day five (today) urine output is dark, but went 18 hours without Tylenol. Plot to that i need 2 extra strength Tylenol every 5 hours for 4 days straight. No nausea or vomiting associated with any of this. I have extreme fatigue due the extreme headache pain keeping me awake. Headache on the left and right side of the head, not front or behine the eyes, more over the ears. Today I just feel wiped out by it all, but much improved. I have never had any reaction to any vaccines previously, including allergy, flu, shingles and pneumonia.
1121042	3/21/2021	AZ	32	F	3/20/2021	3/20/2021	Moderna COVID-19 Vaccine EUA 20-30 minutes after injection I felt faint and dizzy. Dizziness has yet to subside and have multiple times felt like I would faint. Room spins if I lay down or close my eyes.

1121061	3/21/2021	NY	54	F	3/20/2021	3/20/2021	At around 7pm, the symptoms started first with diarrhea. 10-20 minutes later, she started sneezing a lot. She took a Claritin, then took a shower. In the shower, she began feeling itchy everywhere, especially in the face. She developed hives around the body (3-4 small patches on underarm, legs). There was also a hive patch on her left eyelid, which started as a small bump, but worsened while she was in the shower. It grew bigger, taking up half of her eyelid. She came out of the shower 10-15 minutes after she began sneezing. 20 minutes after that, her body hives subsided but the eye hive worsened further. The hive took up her entire left eyelid and the eye was swollen nearly shut. Before going to bed (9:30pm), she took a Benadryl. The eye was still swollen in the morning but less so than the night before. Now, 24 hrs after the symptoms began, the eye hive has almost entirely subsided. She feels less severe symptoms now, like fatigue and scalp tenderness.
1121067	3/21/2021	NJ	66	F	3/17/2021	3/18/2021	One day after receipt of vaccine, had extreme pain in left arm (the injection arm) from top of shoulder to elbow. Pain felt like I was having a bursitis attack with a pain level of 7 out of 10. Took two days to get to a "2". Did not sleep for two nights. Extreme "fogginess" in head, numb feeling around nose, mouth and eyes. Fatigue, depression, sadness. Anxious feeling in the chest which is continuing as of this writing (3/21/21). I do not take any medications and do not have any history of depression or mental illness. This is all very unusual for me.
1121128	3/21/2021	FL	44	F	3/21/2021	3/21/2021	Janssen COVID-19 Vaccine EUA swelling of lips, itchiness of palate and eyes; occurred within 15 minutes of vaccine administration and took Benadryl Allergy Liqui-Gels at vaccine site medical station
1121635	3/21/2021		57	M	3/13/2021	3/17/2021	Swelling and itchiness in right eye. Marks on skin under the eye appeared. Eyelid swelled, eye got red, strange blemish formed under eye. Area around the eye became painful.
1120989	3/21/2021	NJ	39	U	3/18/2021	3/18/2021	After the vaccine I started feeling tingling in left face and in the left corner of the eye. It was mild and went away by 11.30 pm and in the morning next day it was all fine. I just wanted to mention to ensure if second dose is fine

1121179	3/21/2021		18	F	3/21/2021	3/21/2021	c/o visual disturbance - no change acuity- "bright white" everything; acting dazed & confused - turning head side to side though able to answer appropriately & follow commands; A&O x 3 (reported never doing well with "shots", anxious today as always - mask removed - car door opened- emotional support - waited 15 mins in observation X 1.5. symptoms resolved - driven home by parent.
1121134	3/21/2021	TX	70	F	3/18/2021	3/18/2021	The patient described that right after the vaccination she had black spots in front of her eyes, chest tightness, staggering to walk. She still had these symptoms while she was in the store and the following day. She plans to see her dr for her regular appointment on Thursday 3/25, but is going to discuss the adverse events with him. She reported to me on Saturday 3/20/21 that she was feeling better.
1121204	3/21/2021	NJ	34	F	3/16/2021	3/16/2021	Tired fell asleep afternoon starting at 5 PM on 3/16/2021. Woke up at 8 PM then went back to sleep around 11 woke up with a horrible migraine headache. Had to take medicine (Tylenol only had) but still lasted hours. On left side into eye and jaw felt like head was going to explode. Next day tired no migraine. Head still sore. Then morning of 3/19/2021 not sure time maybe 5/6 AM another migraine. Both on left side of head into eye and jaw. Took excedrin. I have not had a migraine since 2016 and before that only had a few in 2010 when I was on new progesterone only birth control (got off of it). Very nervous I had multiple migraines on shot 1. Don't know if they will come back or are now gone. I have had many vaccines as I traveled and lived in many countries. And other than occasionally feeling unwell some years with flu shots (but not every one) this is the worst side effects I have ever had for a vaccine.

1121215	3/21/2021	OH	44	F	3/18/2021	3/19/2021	Shot administered Thursday, March 18th 1. Today (Sunday, March 21) I am able to lift my arm again (see #2 for arm pain) and in the shower realized the lymph node in my left armpit close to the injection side is very swollen and dense. Right armpit lymph node is fine and difference is visually noticeable. If by morning it has not gone down I will call my doctor, I don't feel it's bad enough to go to an ER on a Sunday night. 2. Day after shot (Friday, March 19), waking up the injection site was incredibly sore, beyond a what a normal shot causes (with the exception of the tetanus shot, similar pain). I have been taking ibuprofen for pain, but having a hard time sleeping continuously, as waking up in pain. Today (Sunday, March 21), pain has gone from what was severe to mild-moderate. Still hurts if it gets touched, but I can now lift my arm without severe pain. 3. Headache since injection. Similar headache to when I had Covid in December, but probably 50% as bad, so able to deal. Still have headache, but not as bad as the day after the shot.
1121295	3/21/2021	CO	19	F	3/20/2021	3/21/2021	Conjunctivitis ? woke up the day after the vaccine (3/21/21) around 9:45 AM to notice eyelids swollen and pink. No pain associated.
1121314	3/21/2021	CA	53	F	3/13/2021	3/13/2021	Head ache, muscle aches, eyes were aching, chills, sweats, exhausted, tired, low grade temperature 100.4
1121632	3/21/2021	MI	37	F	3/17/2021	3/20/2021	At 3am, I awoke to use the restroom. Before opening my eyes, I turned my head and developed a severe case of vertigo. This has continued until the time of me filling out this form. I have menieres, so I had a dietetic (Dyazide) and antivert at home, which I began taking immediately. On Saturday evening, I evened a prescription for a Medrol dose pack and that was started immediately. I have vertigo, difficulty walking due to it. I vomited once on date 1 day due to the vertigo. I have continued vertigo and nausea.

1120586	3/21/2021	VA	39	F	3/13/2021	3/21/2021	I had arm soreness for about 36 hours after the initial shot that went away, but today (8 days after my 1st dose), my arm started itching, has some redness, and there's a hard/firm lump under my skin at the injection site. I looked it up and see online that others have reported this issue. <a href="https://www.health.com/condition/infectious-diseases/coronavirus/covid-arm-rash-moderna">https://www.health.com/condition/infectious-diseases/coronavirus/covid-arm-rash-moderna</a> I just took some Claritin and will keep an eye on it, but wanted to report this for the record.
1120933	3/21/2021	WA	29	F	3/19/2021	3/20/2021	Patient reported some ankle swelling in the left leg the morning after vaccination. no other events were reported. on seeing the ankle it was visually a little larger than the right ankle. pt was not too worried and had already contacted PCP with photo, I advised a follow up with a PCP and to go to urgent care if it got any worse.
1121655	3/21/2021	CA	34	F	1/21/2021	2/13/2021	Jan 21st 2021: Within 24 hours I had fever, red stinging eyes Within 2 weeks I had my first tinnitus attack February 13th approx noon: that caused me to loose the rest of my hearing in a sudden onset of tinnitus with some ear pressure. One week after taking presidone I regained some of my hearing however the severe tinnitus had not stopped and continues to increase anytime I try to use my hearing aid.
1121135	3/21/2021		67	F	3/20/2021	3/20/2021	Blurred vision
1120618	3/21/2021	SD	63	F	3/3/2021	3/8/2021	Four days after vaccination, I woke up with a lot of eye watering/ leakage that cakes/ goes on to under eye area. And this has been going since then (reporting date March 21, 2021). Did see an optometrist who used a slit lamp and determined an eye infection. Taking antibiotics and eye drops (antibiotics with steroid) but still having issues. Eyes not red but very leaky. This is not clearly a reaction to the vaccination but am reporting as it happened within four days after vaccination and is curious/ not usual at all for me and being ongoing. Drainage made skin on upper cheeks very red and angry.

1120589	3/21/2021	MN	65	F	3/18/2021	3/18/2021	Light sensitivity, eye discomfort, blurred and double vision, started immediately when I walked outside to go home. Very hard to focus on anything, everything blurred and doubled, hurt to have my eyes open. took a 30 min. nap so I could keep my eyes closed, symptoms totally disappeared about 10 min after waking up from nap, total time lasted was 4 hours.
1121153	3/21/2021	CA	49	F	3/3/2021	3/16/2021	I received my first Pfizer shot on March 3rd. No reactions at all. About 13 days later on Tuesday, March 15th, I noticed a small rash on my right side upper eye lid and the side of my eye but thought it may just be an allergic reaction to something. No pain or itching. I had a couple of similar spots on my scalp but didn't think much of it. On Thursday, I had a headache but I do get headaches now and then. When I woke up on Friday morning, March 19th, I found my eye lid completely swollen and saw the rash had turned to blisters, and there was a new one by the inner corner of my eye and a very faint rash on my forehead. Still no fever, pain or fatigue but had a lingering headache and a burning sensation on the rash. Saw my ophthalmologist right away who diagnosed it as shingles and did a complete eye exam. Luckily no shingles in the eye as that can lead to glaucoma or even blindness in severe cases. I was prescribed Valtrex (1000 mg x 7 days) and prednisone (60 mg x 5 days) by my PCP. Hoping that I was still in the 72 hour window when the antiviral med is effective, I started on the meds immediately. Today is the third day of treatment and the blisters seem to be crusting away and healing faster. Luckily, no new blisters as of now. The prednisone caused my eye area to swell up further so I am gradually tapering off the dosage from 60 mg prescribed to 40-30-20 mg. Keeping a watch for any complications such as ear pain or numbness in the face. Have a follow up appointment with ophthalmologist who will be dilating my eyes for further checks. I was glad to have found the Reddit board and see that there are over 50 cases of people reporting shingles after the first or second covid vaccine. I plan to delay or skip my second Pfizer vaccine for now.

1118306	3/20/2021	CA	64	F	2/17/2021	2/19/2021	2/18/2021 Developed fatigue, low grade fever and chills. 2/19/2021 Around 5:00PM noted new sudden onset of blurriness of vision on the left eye. 2/20/2021 Ophthalmologist evaluation noted cataract like changes on posterior lens capsule of left eye; no treatment recommended.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1118252	3/20/2021	IN	74	M	1/19/2021	1/21/2021	Received first vaccine at about 330 PM. on 1/19. On Thursday, my left eye got really red and I had some blurring of vision. I had a regularly scheduled eye doctor appointment the following Monday 1/25 and I waited until then to get checked out. My eye pressure in my right eye was 18, a few ticks above what it has been running. The eye pressure in my left eye was 45, extremely high. My eye doctor prescribed some steroids' and other eye pressure drops and he wanted to see me the next morning. By then I had three does of these new drops. The next morning my right eye pressure dropped to 16 and my left eye, the problem eye dropped to 10. We kept eye drop regiment for two weeks and set another appointment following my second vaccine shot to see if there was a reaction. It turns out that my left eye pressure was 11. Now we don't know if virus vaccine was responsible or not. However the vaccine shots were the only new events in my life, so it became highly suspicious.
1118345	3/20/2021	NJ	44	F	2/20/2021	2/20/2021	Sore arm, nausea, tummy cramps, headache, fever, eye pain
1118243	3/20/2021	MD	70	F	3/12/2021	3/13/2021	Severe nausea, dizziness, headache, weakness. Threw up all day 3/12 until the PMD ordered Zofran. As a result of vomiting while on Xarelto, both of my eyes became bruised and black and I had conjunctival hemorrhages in both eyes. I was checked by an ophthalmologist on March 15 who said there was no serious damage, just surface bleeding. Today is March 20, and I still have episodes of dizziness, headache and fatigue.
1118265	3/20/2021	NY	23	F	3/18/2021	3/18/2021	Swelling of the throat and difficulty breathing - 5 minutes after shot, used epipen and benadryl, did not seek medical attention. Rash on face but not on injection site 1 day later - notified my doctor and took benadryl, will also be seeing an allergist soon. Blurry vision - notified my doctor and will be seeing an ophthalmologist soon.

1118426	3/20/2021	NV	75	F	3/18/2021	3/19/2021	Chills for 30 minutes - fever 101.8 (not affected by Tylenol) - felt as though I weighed 500 pounds - limbs so heavy I could hardly lift them - Slept most of 36 hours - couldn't walk further than a few feet - didn't eat - standing was difficult - felt AWFUL - 8:00 a.m. 3/20/2021 - This morning I had a very sharp pain above my eyebrow/nose - the area is still tender to the touch. No clue what that is. No signs of stroke.
1118416	3/20/2021	MS	58	F	3/19/2021	3/19/2021	really sleepy can barely keep eyes open cold to the bone, rapid -pounding heart beat, and fever of 100.8
1118342	3/20/2021	MN	73	F	3/8/2021	3/20/2021	Presented to the ED for evaluation of hallucinations. Received the Johnson & Johnson COVID vaccine on 3/8. She had been feeling fine following it, until early this morning. She awoke and went to the bathroom when she noticed a "paisley pattern" that was "all over everything", noting that it was even present when her eyes were closed. While she was in the bathroom, the pattern began to move, causing her to feel nauseated and eventually vomit. She has never had a similar episode to this. All of her symptoms completely resolved after droperidol. Observed in the ED and was ambulating independently and returned to her baseline. She had no recurrence of any of her symptoms. She was comfortable going home and discharged with her sister.

1118236	3/20/2021	WA	64	F	3/17/2021	3/18/2021	Chills, body aches, redness in arms, shaking, some neurological issues appearing to be related to shock (shaking, rapid eye movements)
1118321	3/20/2021	MI	51	F	3/19/2021	3/19/2021	Within 15 min. Headache, eyes hurt (pressure) nose became stuffy, felt like I had a sudden sinus infection. I became shaky and tingly. My arm was sore and felt heavy. My face became dark red and was hot to the touch. All symptoms still continue now (27 hours later) however my face is not as dark red, just pink. About 10 hours after the vaccine my muscles in my neck and shoulders began to ache. I was very fatigued. My entire body felt weak and movement become a chore. Worst symptoms: Through the night I began to experience acid reflux. I have only experienced this a couple of times in my life and very mild. This was severe to the point that I couldn't sleep, my throat burned from the acid. Even drinking water was very painful and it would come back up. I located some Tums and ate 4. This was also a challenge as I couldn't hardly swallow due to the pain. After about 35 min. I began burping which help a little with the ability to keep some water down. Today I feel exhausted, my eyes still hurt, still have the headache and sinus pressure, and continue to have the acid reflux but not as severe as the night and early morning. I haven't tried to eat yet today.
1117831	3/20/2021	GA	54	M	3/11/2021	3/11/2021	stinging in the eyes, fever
1118501	3/20/2021	FL	67	F	3/5/2021	3/6/2021	I woke up, and could not get out of bed because I was sick. Aches and pain on entire body, tired, malaise, and sick. Then I got the chills, accompanied with a fever. My everyday temperature is 96.7 and I had a 99.7 fever. My eyes were glassy and grey. I was like this until the next day. I had COVID19 on 11/18/2020 - I did not have the above symptoms of aches and pains or a fever or the chills. My breathing and coughing finally was 99% better by February 2, 2021. My taste and smell is not back yet. Are there studies on how people react to vaccination if they had the COVID19? Is there research comparing prior COVID19 symptoms with adverseReactions symptoms?

1117809	3/20/2021	MD	46	F	2/25/2021	2/28/2021	Per doctor, I had increased activity of my auto immune condition, which means I have inflammation in the front of my eye. To me, it looks like decreased vision and presence of floaters. It happens overnight and then gets better during the day, then starts again. My doctor did imaging, like a CT scan for your eye. My eyes were dilated and a vision check, pressure check and exam was conducted.
1118187	3/20/2021	AR	68	F	3/19/2021	3/19/2021	Severe chills for 1.5 hr despite multiple heated blankets, comforter, etc.; high fever, severe headache (pain in ears and eyes as well as head), severe muscle and joint pain body-wide, skin painful to touch. Symptoms so severe that sleep was impossible for most of night. Headache severity lessened by 8a.m. 3/20, but is still present, and widespread joint pain, myalgia and fatigue continue up to the time of this report (24 hrs after injection).
1117645	3/20/2021	NY	45	F	3/17/2021	3/17/2021	Changes in vision and very fast heartbeat immediately following the injection. Subsided in 5-10 minutes and I felt heat wave through the body for the next 30-45 min and later at night. The next day - March 18th, My gums started bleeding suddenly and I had an upset stomach.
1117931	3/20/2021	AZ	52	M	3/17/2021	3/17/2021	Initial symptoms began with pain at the injection site and generalized fatigue. This developed into soft tissue pain in proximity of the large and small joints which could be elicited further on palpation. I had eye pain (left more severe than the right) which could be further elicited on palpation, headache, dizziness, chills, and an inability to feel warm. There was also significant skin sensitivity over the trunk, scalp, and upper extremities and more in the left arm than the right. The symptoms persisted over the second day albeit at less severity. Presently on the third day, I am experiencing continued eye pain, mainly in the left eye and mild dizziness.

1119137	3/20/2021	CA	42	F	2/11/2021	3/1/2021	<p>Jan 14: Shot #1 of Moderna at 7 am at Hospital o Very sore at injection site for 2-3 days o Retrospectively, I recognize a subtle shift in my mood after the first shot that has persisted. I felt inexplicably sad in the afternoons and continued until March 1st anxiety event. I also found myself crying more. o Sleep ? I woke up a handful of times with heart racing and then would fall back asleep. This is never had happened before February 11: Shot #2 of Moderna at 7 am at Hospital o Within 11 hours of the vaccine had fever, chills, aching and 103 fever. Next day my period started a week early. o Over the course of the next two weeks my anxiety levels heightened; o March 1st acute event that mimicked an anxiety attack (no previous history of anxiety or attacks); followed by my first night of many nights with no sleep. o Insomnia ? worsened each night. o Internal thermostat dysregulation ? I would get very cold and shake uncontrollably and then feel hot after the shaking episode; shaking would often happen in the afternoon and especially after meals. o High Blood pressure o Night sweats. o Muscle weakness; tingliness running through arms and legs. o My heart would skip a beat (several times a day). o My entire body would feel like it was pulsating uncontrollably but I wouldn't be visibly shaking. o Muscle stiffness. o Pain in lower right back region (ultrasound yielded nothing). o Extreme exhaustion. o Loss of appetite and dietary changes (no longer can eat rich foods; only bland small meals multiple times a day) o Weight loss (5-6 pounds) in one week (146-140) o Unable to focus; blurry vision. o Unable to partake in intense physical activity; can only walk. o Unable to participate in household work because of low energy. o Unable to participate in job duties due to inability to focus on screen for long periods of time. o. Second week, March 8th, muscles in upper back burn and intense pins and needles in my shoulders arms to finger tips. T This sensation woke me up from sleep on Friday March 12th. o Unable to focus; blurry vision. o Strange headaches- behind eyes, in temples, on one side of the head. (don't? have a history of headaches)</p>

1119195	3/20/2021	CO	68	F	3/4/2021	3/17/2021	I received my first CoVid vaccine March 4th, - exactly 2 weeks out. Last night, March 17, my arm was itching.... so I scratched... (due to the cataract removal/eye surgery, not the best vision last night everything still blurred), When I looked this morning, March 18 and it felt, warm to the touch, no lumps/bumps, itchy and red... I do not have a fever, temps for cataract eye surgery were fine yesterday and at this morning's post op F/U. Did not notice anything yesterday morning. Nor did anyone in the pre op area say anything (I had on short sleeves) and had to change in to a lovely patient gown. Today March 20, still red, no itching, smaller in size.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1119210	3/20/2021	UT	33	F	3/19/2021	3/19/2021	About a minute after I had the injection, my arm started hurting and it felt like hot water was coursing through my veins. I got an immediate headache that progressed into light headedness, my vision got blurry and I saw colors and then I started to lose my hearing, it felt like there was cotton in my ears. The nurses said I went pale and they called it a panic attack, but it was unlike any panic attack I have ever had in my life. I've had my TDAP updated a few years ago and got a flu shot and did not feel anything like this. I was rolled out of the room on a wheel chair because I was too dizzy to walk and then threw up several times into a bag and peed myself. It took about 20 minutes before I felt normal again. The following day my arm felt numb and incredibly sore, I couldn't raise it that far up without excruciating pain. I felt weak, fatigued and dizzy and was unable to use the bathroom. I had fever sweats and chills on and off. I was not able to sleep well, but I think that's because of the pain in my arm.
1119235	3/20/2021	WA	63	F	3/11/2021	3/11/2021	Within moments of injection: felt heat flush rushing from arm through chest to neck & face. Extreme itching in arm, felt anxious & lightheaded. Noticed eyesight blurred. Pharmacist told me my chest & face were bright red. I felt slightly nauseous & my mouth tasted like penny's. Pharmacist administered antihistamine. By this time I had a bad headache & feeling of pressure in chest & head. I was made to sit in lobby & wait 30 min. I continued feeling strangely unwell for 8 days. My b.p. went up & I felt anxious & exhausted. Arm hurt. No temp. On day 3 ( I believe..or day 4) arm became even more painful & A round rash appeared. My chest & neck were also red again . I took pictures of my arm, chest & neck.
1118510	3/20/2021		29	M	3/20/2021	3/20/2021	Patient reported fast heartbeat, sweating. Patient was pale, HR 112, O2Sat 96%, BP 108/60, reported feeling dizzy, vision changes, had brief moment of syncope, then aroused, Oxygen applied at 2l via NC, patient continued with sweating, HR now 78, EMS called, patient continued with sweating and feeling weak gradual improvement, EMS arrived, patient evaluated and did not want to go to ER for eval. Vitals rechecked and patient ambulated to private vehicle with no further difficulty.

1118566	3/20/2021	MT	63	M	3/16/2021	3/17/2021	Developed Bells Palsy, Right side 5th cranial nerve affecting the motor branch. No muscle movement from the top of head all down the right side of face. Numbness feeling all in cheek. Right eye does not open or close, cannot raise eyebrow, right side of mouth is drooping. No muscle movement at all - paralysis of right side of face from top of the head to the jaw.
1118873	3/20/2021	WI	49	F	3/16/2021	3/17/2021	18 hours post vaccine- severe muscle/joint pain and fatigue 28 hours post vaccine- several episodes of severe vertigo, nausea and vomiting By March 18th- muscle symptoms and fatigue have resolved. Severe vertigo episodes have stopped with only mild dizziness when moving my eyes and looking at computer screen, but I was able to work. Called my doctor and she recommended Dramamine. March 19th continued improvement with slight dizziness when watching computer screen. March 20 th. Felt great and I thought it had resolved but severe vertigo episode occurred when lying down. Lasted 20 seconds.
1118585	3/20/2021	PA	37	M	3/14/2021	3/16/2021	Patient received first dose of 2-dose Pfizer COVID-19 vaccine. Approximately 24 hours after injection, patient experienced headaches. Approximately 48-72 hours after injection, patient experienced left eye pain and developed a non-itch-inducing rash in left temple. Following after this period, eye pain worsened, as did the size of rash (stretching from temple to back of left ear - along the V1 nerve). Patient was diagnosed with Shingles and is now receiving treatment for that virus. It is theorized that the vaccine induced an immune response to attack the novel virus, and left its guard down for the dormant Herpes Zoster virus.

1115381	3/19/2021	TX	52	F	3/18/2021	3/18/2021	pt states about 5 minutes after taking the covid vax she started swelling on the left inside of her throat and then she noticed the swelling was moving up towards her face around her eyes and ears then back down towards her mouth. Vax administrator checked her vitals. Her BP 133/78 which is high for her. Her O2 level was good. About 20 minutes later she started feeling light headed and noticed some swelling in the right side of her throat and also experienced some discomfort on the right side of her body and had some chest tightening. She started having SOB and could feel her tongue swelling. Her blood pressure started going up. She was given 50cc Benadryl. Pt was transported by wheelchair to ER. Her BP 160/88, pulse was 79 and respiration was 18. Temp was 97.1. She had a normal EKG, normal Chest X-ray normal blood work. She was administered a steroid shot and given an IV. She was monitored and released to FU w/ PCP and advised not to take 2nd dose. Pt is waiting for her doctor to receive ER records to schedule FU appt. Pt still has some sensation on the left side of her face.
1115403	3/19/2021	WA	71	F	3/16/2021	3/16/2021	My reaction to the vaccine was: Complete and utter fatigue, going from the bed to the bathroom and back felt like I had run a marathon, I had brain fog, headache and a temperature. I ached all over and my vision was somewhat affected. The idea of eating took too much energy. No one I have talked to had a reaction like mine. I believe there is a connection between my reaction and the Valley Fever. I would like to know if other Valley Fever survivors had similar reactions. After 36 hours like that, I feel much better.
1115459	3/19/2021	GA	48	F	3/16/2021	3/17/2021	Woke up with severe chills around 3:45 AM the morning after my vaccine. Temp was low grade at first but then climbed, max was 102.2°F. All over body aches, no appetite, weakness, fatigue, headache, nasal congestion, burning eyes, ataxia, lightheadedness. Took my AM meds including hydrocodone-APAP which caused the fever to break but stayed low grade until the following afternoon around 2 PM. Helped with the body aches somewhat as well. Appetite started to return this morning, 3 days after the vaccine but the fatigue, weakness, muscular pain and a general unwell feeling continues.

1115167	3/19/2021	ME	64	F	3/11/2021	3/12/2021	Had COVID in mid-January 2021 Day 3: chills / upper back pain along spine Day 4: am - chills tapered off, significant less upper back pain along spine Day 0: March 10, Wednesday Took Daily Meds and Vit D in am / Copaxone & Clindamycin Phosphate Gel in PM 11am: Donated whole blood at a Church Day 1: March 11, Thursday Took Daily Meds in am / Applied THC/CBD cream to both legs, Clindamycin Phosphate Gel to face in PM 1pm: Received first dose of Moderna Church Medications: took 500mg of Tylenol and 400mg of Ibuprofen after shot PM: Sore arm, swelling and redness 9pm took 500mg of Tylenol and 400mg of Ibuprofen Day 2: March 12, Friday AM Medications: Daily Meds, applied Arnica homeopathic Roll-on to arm, took 400mmg ibuprofen Symptom: sore arm, swelling and redness, slight headache, upper back pain (stinging) along both sides of spine PM Medications: Copaxone & Clindamycin Phosphate Gel; applied Arnica homeopathic Roll-on to arm; applied THC/CBD cream to legs Symptoms: Same symptoms as AM but also had ?the chills? (flu ? like) (no fever) Day 3: March 13 ? Saturday AM Medications: Took Daily Meds , 400 mg Ibuprofen Symptoms: Same symptoms as Friday PM with additional ?jabbing? sensations in my joints as if someone was sticking needles in them (this also happened when I had Covid). Hand and leg cramping. PM Medications: Copaxone & Clindamycin Phosphate Gel and Zaleplon 5mg in PM; applied Arnica homeopathic Roll-on to arm, applied THC/CBD cream to legs Symptoms: Chills worsened by late afternoon. I was awoken at about 11pm by violent and uncontrollable shaking ( not minor shivering like with the flu - thought I was having a seizure) and sweating profusely. This lasted about 40 minutes. I was ?shaking /convulsing? to the point that I couldn?t even call for help. I was finally able to grab my phone and call my partner who was downstairs watching television. She tried to help me change out of my wet clothes, but I was unable to stop shaking. She covered me with blankets and held me down. After another 20-30 minutes the shaking subsided and I was able to change my clothes. A shorter episode occurred about 4 hours later (lasting about 20 minutes) Day 4: March 14 ?Sunday AM Medications: Took Daily Meds Symptoms: Chills, fatigue, upper back pain (stinging) along both sides of spine PM Medications:

1115110	3/19/2021	CT	56	F	3/18/2021	3/18/2021	tip and sides of tongue felt numb approximately 30 minutes after dose. left side upper and bottom lip gradually became numb as well over the course of the afternoon and evening. approx. 24 hours after dose, numbing sensation started presenting around left eye and eyelid.
1116019	3/19/2021	NV	59	F	3/17/2021	3/18/2021	(Note: Difficult to read handwriting on lot number, could also be DOV 6208 or DOV 6Z08) I woke up around 12 hours after having the vaccine and felt a strange sensation in my head, almost like a helmet of fog over my head, sort of a numb feeling, and I noticed that also my eyes and lips felt numb. I ate a grapefruit as I usually do (not sectioned by myself). I felt extremely lethargic, had joint pain and a weakness. I usually have tea and toast in the morning and as I was at the table buttering my toast, I had an overwhelming nausea come on. I then woke up on the floor. My companion told me I went unconscious and slipped off the chair. Perhaps the whole episode was a maximum of 20 seconds. My first words were "Where am I?" and my companion told me. I rest on the floor, directed my companion to read on the internet about stroke and we ascertained I was okay, so I was thinking completely clearly. In any case, I had the fog in my head the entire day, and also today, but I feel a little better and was able to eat after 4 hours of rest. I wasn't able to fall asleep but I rested the entire day and slept a couple of hours during the night, which is not like me. I usually don't have any problem sleeping.

The consumer reporter similar events for two patients. This is the second of two reports. A 68-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number: EN5318), via an unspecified route of administration, administered in left arm on 30Jan2021 15:00 as single dose for COVID-19 immunisation. The patient has no medical history and concomitant medications. The patient received her first dose of COVID-19 Vaccine on 30Jan2021. On 12Feb2021, the patient experienced symptoms of being tired and started with sore throat. The patient went to the doctor to get checked and she was tested for COVID-19 on the same day. The patient tested positive for COVID-19 on both the rapid test and PCR test on 12Feb2021. The patient developed other symptoms of cough with some mucus with it but not much. She has no fever and no body aches. She does not have a sense of smell or taste. The patient thinks she has pink eye in both eyes. When she wakes in the mornings she feels stronger but as the day goes on she gets a little bit more symptoms, a little bit of a headache. Nothing major. Has been taking oxygen levels which have all been in the high 90s. Body temperatures taken have all been within normal range. They cancelled her second dose which was scheduled for 20Feb2021. The patient was vaccinated on a racetrack. The events required a visit to the physician's office but was not hospitalized. The outcome of the events was reported as not recovered.; Sender's Comments: Linked Report(s) PFIZER INC-2021196167 same reporter and vaccine, similar events, different patient</p>

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1114311	3/19/2021	NE	39	F	1/25/2021		<p>Debilitating headache; nausea; vomiting; ringing in the ears; L eye drooping; numbness and tingling of lips; numbness and tingling of lips; trembling of R side of body; abnormal/change in gait; change in vision; hypertension; This is a spontaneous report from a contactable nurse (patient herself). A 39-year-old non-pregnant female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Batch/lot number and Expiration date was unknown), first dose via an unspecified route of administration on an unspecified date, second dose via intramuscularly in right arm on 16Jan2021 15:30; both at single dose for COVID-19 immunisation in workplace clinic. The patient's medical history included depression, MTHFR (methylenetetrahydrofolate reductase), latex allergy. Concomitant medications included venlafaxine, L-methylfolate; the patient received both the drugs within 2 weeks of vaccination. The patient previously took fluoxetine, citalopram and experienced known allergies for both the drugs. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. The patient has been tested for COVID-19 since the vaccination. The patient experienced debilitating headache, nausea, vomiting, ringing in the ears, L eye drooping, numbness and tingling of lips, trembling of R side of body, abnormal/change in gait, change in vision, hypertension on 25Jan2021 06:00. On 01Feb2021, the patient underwent lab test and procedure included nasal swab/ COVID-19 by PCR: Negative. The adverse events resulted in doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care. The patient was treated with IV Dexamethazone, Diphenhydramine, ketorolac, promethazine for all the events. The outcome of the events was not recovered. Information on the Lot/Batch number has been requested.; Sender's Comments: On the basis of the available information, the reported events debilitating headache, nausea, vomiting, ringing in the ears, L eye drooping, numbness and tingling of lips, trembling of R side of body, abnormal/change in gait, change in vision, hypertension would seem most likely related to intercurrent and/or underlying medical condition and concomitant medication, which is not related to bnt162b2. This case will be reassessed when</p>

A 67-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; Lot Number: EL267, expiry date 31May2021) via an unspecified route of administration, at the age of 67-year-old, on 24Feb2021, as SINGLE DOSE (0.3mi as reported) for COVID-19 immunisation. Medical history included type 2 diabetes mellitus and ongoing allergy to penicillin. There were no concomitant medications. The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; lot number EL9265, expiry date 31May2021) via an unspecified route of administration, on 03Feb2021, single dose for covid-19 immunisation wherein the patient had to go to Emergency room and it was found that her magnesium and potassium were low. The patient had a super bad reaction to the Pfizer vaccine. Patient's mind has not been normal ever since and she is so mean to everybody. The patient was fine until she got the vaccine. The reporter has had the ambulance and police up there to try and help but the caller wouldn't go out to the hospital. The patient had a normal mind before she got the shot. The patient has a bad headache that will not go away (8 days) and her eyes are hurting really bad/eye pain/ eyes hurt. She feels so tired and weak. The second COVID-19 Vaccine messed the patient up. She had the same symptoms for both first and second dose (unspecified symptoms), but the second dose has really messed up her mind. Patient probably won't have a mind. It was reported that the patient's mind was alright, but the second COVID-19 Vaccine did her in. Now patient is saying she won't get her mind back. It has messed up her mind. Clarified when caller states it messed up her

mind, he is referring to the patient being mean. Stated patient did have a headache, but wasn't hateful. Stated patient's mind is so bad, she is just mean. If patient doesn't get help soon she is going to tell herself good night. Patient stated in background "If I don't get my mind back I'm going to end up killing myself because he made me." At 11PM last Wednesday (24Feb2021), patient starting losing her mind. Confirmed with caller that patient is currently having suicidal thoughts. Patient used to be a real nice lady and blames this on the COVID-19 Vaccine. Patient is afraid she is not going to get her mind back. Advised caller to seek emergent medical attention for the patient. Patient is against everybody now because of the crazy COVID-19 Vaccine. Patient heard in the background stating the COVID-19 Vaccine screwed up her mind. Caller stated patient is quite upset with everybody. Patient is not acting normal. Patient doesn't think her mind will ever get straightened. The medicine was too much for her body. After getting the second dose, the patient lost her mind, she's lost her appetite/ No appetite and went 32 hours without eating, can't think straight, altered state of mental, mental fog, pain in head and stomach, change of mood, nightmares, her eyes felt like they were going to pop out. Her doctor said it was probably an overdose. The patient was not like this prior to second dose. Outcome of the event was unknown. The reporter believes her mental fog is due to second dose of vaccine.

1113644	3/19/2021	OK	72	F	3/18/2021	3/18/2021	With in 3 hours of the injection, I had severe pain in my eyes. When I examined them in a mirror, the whites of my left eyes was red within another hour it had crossed over to the right. The pain was severe. I had an eye antibiotic that I started on Friday morning. My eyes were swollen in the eyebrow area and face below the eye by Friday night. Had severe pain until I saw Dr. on Monday. He said my eyes were dry probably from swelling. I took the antibiotic thru Thursday as instructed. and used OTC eye drops every 2 hrs. for the week following the antibiotic.. The eyes are are more clear, but I still have some eye pain. It has been 2 weeks today since taking the covid vaccine.

1114308	3/19/2021	NJ	59	F	2/12/2021	2/12/2021	<p>Don't still feel good; with pain in side in my head; Slowed down; Extremely tired; Have a burst on energy for an hour or so; and then all of a sudden I can't even hold my head up; Eyes were swollen; Back to my head very weak; My whole body feels like it is bruised; This is a spontaneous report from a contactable consumer reporting for herself. A 59-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) (lot number EL9262/expiration date: not provided), via an unspecified route of administration, on 12Feb2021 at 17:30 (at the age of 59 years old) as a single dose for COVID-19 IMMUNIZATION. Relevant medical history included rheumatoid arthritis. Concomitant medication included methotrexate 2.5 mg (8 tablets, once weekly), hydroxychloroquine 200 mg, 2x/day and folic acid UNK, 1x/day(1 tablet). On 12Feb2021 (Friday night), the patient reported that she "don't still feel good". The clinical course was as follows: On 12Feb2021, an hour after the receiving the vaccination, the patient reported "it started with pain in side in my head and within minutes it was like I was jelly. I was felt like fall on to the floor. I slowed down and I was extremely tired. I even left work early. I was off Saturday and Sunday. Today I could not even get work. It is like I have a burst on energy for an hour or so. And then all of a sudden, I can't even hold my head up. My eyes were swollen and back to my head very weak. My whole body feels like it is bruised. Treatment received for the events included ibuprofen. The consumer stated, "I took 4 on Saturday and later on like midday about 4 or 5 O'Clock. That was 200 mg each. It was total of 800mg." The outcome of the events was unknown.</p>

1114895	3/19/2021		74	F	3/2/2021	3/2/2021	broken blood vessel in the right eye; not getting sleep; Achy; A spontaneous report ) was received from a consumer concerning a 74-years-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and was achy, not getting sleep and broken blood vessel in her right eye. The patient's medical history was not provided. No relevant concomitant medications were reported. On 02 Mar 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot/batch: 036A21A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. On 2 Mar 2021, the patient was achy and was not getting sleep. On 05 Mar 2021, she had a broken blood vessel in her right eye. She stated that she was better but her right eye was still red. No treatment information was provided. Action taken with mRNA-1273 in response to the events achy, not getting sleep and broken blood vessel in her right eye was unknown. The seriousness criterion for the event broken blood vessel in her right eye was medically significant. The outcome of the event, broken blood vessel in the right eye was not resolved, while the outcome of the events not getting sleep and achy was resolving.; Reporter's Comments: Very limited information regarding this event/s has been provided at this time. Further information has been requested.
1115090	3/19/2021	IN	61	F	2/17/2021	2/18/2021	One day after receiving first Moderna immunization, I awaken with diffuse, painful myalgias, dizzy, freezing, blurred vision, profound fatigue, loose stools, very thirsty, generalized weakness but afebrile. Never developed fever during this episode. Symptoms lasted from 02/18 to 02/21/2021. Diffuse weakness lasted for an additional 4 days. March 17 2021, I received my second Moderna immunization. Was fine the first day. The next morning, awaken unable to move due to diffuse muscle pain. This time, my knees hurt L> R (I have hx of L arthroscopy). Took mixture of Advil and Tylenol which helped markedly but about 7 hours later, pain/weakness, dizziness, thirst, profound fatigue began again. Today, it is day 3, and I feel better but weakness, fatigue continues.

A 51-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6200, expiry date: 21Feb2021), via an unspecified route of administration in the left arm, on 17Feb2021 15:40, as single dose, for COVID-19 immunisation. Medical history included type 2 diabetes mellitus from 2012 to (diagnosed with Type 2 Diabetes Mellitus almost 9 years ago), neuropathy in her feet/nerves and reported that she only turns pink if she gets overheated. There were no concomitant medications. The patient did not receive any prior vaccinations within 4 weeks. Historical vaccines included influenza vaccine (reported as flu vaccine) which she gets every year and pneumococcal vaccine (reported as pneumonia vaccine) which she gets every 5 years. The patient reported that she received her first Pfizer COVID-19 vaccine on 17Feb2021 and had an allergic reaction. She said she was at a podiatry appointment, and her podiatrist told her the pharmacy had an extra COVID-19 Vaccine available. She said the pharmacy staff came to her podiatrist's office to

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

administer her COVID-19 Vaccine. She said about 5 minutes after she received the COVID-19 Vaccine injection, on 17Feb2021 15:45, her left arm started feeling flushed, her left arm started getting hot, and the hot sensation traveled down her left arm to her left hand, and up to her left shoulder and neck. She said 20 minutes later, she walked from her podiatrist's office to a nurse's station to be monitored further. She said while she was at the nurse's station, a doctor came by twice to evaluate. She clarified the upper part of her left arm started turning pink, and then red. She said her podiatrist asked her if that was a normal reaction for her. She said she told her podiatrist she only turns pink if she gets overheated. She said her left hand got numb and tingly. She said the muscles in her left arm between the inside of her left elbow down to the inside of her left wrist were "twingey". She said her podiatrist and his nurse felt both her arms, and said her left arm was much warmer than her right arm. While she was at the nurse's station being monitored, she felt short of breath. She said she wasn't sure if she was short of breath because of her nerves. She said her oxygen level was checked and it was at 99%. She said her pulse was 101, her blood pressure was 118/76, and her blood glucose finger stick test was 128. She said she was told by the staff monitoring her, she should expect her blood glucose number to skyrocket because there is a steroid in the COVID-19 Vaccine shot. She said the staff also mentioned she can expect blood glucose spikes as the COVID-19 Vaccine's steroid goes through her system. Her fingers in her left hand became itchy while she was at the nurse's station being monitored. It was a deep down itch in her left hand fingers. She said she asked for an ice pack to put on her left hand because she uses ice packs for neuropathy in her feet, and she felt an ice pack would help with the itch and burning feeling in her left hand fingers. The doctor came to look at her again and wanted to give her IV Benadryl. Then the doctor decided against the IV Benadryl because she would be too sleepy to drive home but the doctor did eventually give her an intramuscular injection of Benadryl 25mg (clarified as Diphenhydramine 25mg in a syringe) in her upper right arm. Within 5 minutes the itching in her left hand fingers calmed down, and the redness in her left arm calmed down to a pink color. She said 20 minutes later her left arm was still pink

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

and warm. She said she was told by the doctor if her reaction moved out of the localized area of her left arm, to go to the Emergency Room, and to use an icepack, again, on her left hand. When she arrived home, her husband said she looked like she had hives and a rash going down her left arm. Her left arm was not itchy though. She clarified the blotchy red marks go in a line from the inside of her top left elbow down to her left wrist. She reported that while she was at her podiatrist's office her left arm was a solid pink. She then mentioned that when she goes out in the sun and gets overheated, she turns pink. She said from her left shoulder to left elbow was warm to the touch. She said by the COVID-19 Vaccine injection site there is a flush color around the vaccine injection site, but not on the vaccine injection site. She said the COVID-19 Vaccine injection site is sore and her left shoulder is warm to the touch around her COVID-19 Vaccine injection site. She reported there were no blotchy, red marks on her left arm on 18Feb2021. She said her left arm is a pretty normal on 18Feb2021. The nurse who monitored her after the COVID-19 Vaccine shot said she needed to report her allergic reaction. She was told she needs to let the COVID-19 Vaccine staff know of her reaction before she gets her second COVID-19 Vaccine injection, so she can be monitored closely. She took no other treatment after she returned home from receiving her COVID-19 Vaccine. She reported she had a headache on 18Feb2021, clarifying her whole head hurts, and the headache has been persisting all day. She said she experienced tiredness, as well. She said the tiredness started on 17Feb2021 and can be partially attributed to the Diphenhydramine 25mg injection she was given. Her husband told her she looked completely wiped out, and pale when she got home after getting her COVID-19 Vaccine on 17Feb2021. She said she remembers being tired when she got home because her eyes were squinty. She reported feeling more tired on 18Feb2021 and her whole left arm and left hand are sore. She clarified her blood glucose was at 295 when she checked before bedtime of 17Feb2021, and at 185 before breakfast in the morning of 18Feb2021. The patient recovered from the events "her fingers in her left hand became itchy/it was a deep down itch in her left hand fingers" on 17Feb2021; from "upper part of her left arm started

about 10:20. Then at 4:45 AM she woke up because her eyes were very dry. Stated she has a humidifier in the apartment and usually has no trouble with her eyes, but they were very dry. She also noticed her ribs were hurting and it was noticeable on 11Feb2021. She was also more achy, but it the ribs hurting did not last real long. Then she noticed she was wheezing (11Feb2021). She knows she was wheezing because she has had pneumonia in the past and had wheezing then. The wheezing she had after the vaccine was not real bad. It stopped after about 10-15 minutes or so. She had laid down in bed for a while then got up around 5:30 AM. She felt better around then, but it took until like around 8AM before she felt fully okay as her arm was still aching. The outcome of the event arm started hurting and achy was recovered on 12Feb2021; eyes dry, ribs hurting and wheezing recovered on 11Feb2021; thirst and muscular weakness recovered on 10Feb2021, and unknown outcome for the remaining events.

1114902	3/19/2021	NC	85	F	1/13/2021	1/21/2021	shingles on her eye and forehead, it has persisted and is painful; This is a spontaneous report from a contactable consumer (patient). A 85-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot Number: EL0140, Expiration Date: 31Mar2021) via an unspecified route of administration, administered in right arm on 13Jan2021 11:10 am at 0.3 ml (SINGLE DOSE) for covid-19 immunisation. Medical history included shingles (Family history) as sister had shingles 10 years ago, grandson on back a couple years ago. History of all previous immunization with the Pfizer vaccine considered as suspect (or patient age at first and subsequent immunizations if dates of birth or immunizations are not available) was provided as N/A. Additional Administered Vaccines was administered on same date with the vaccine considered as suspect was none. Vaccinations within four weeks prior to the first administration date of the suspect vaccine(s) was none. AE(s) following prior vaccinations was none. There were no concomitant medications. The patient experienced shingles on her eye and forehead, it has persisted and is painful (herpes zoster) (non-serious) on 21Jan2021. Caller mentioned that she received the 1st shot on 13Jan2021 and developed Shingles 10 days after (date mentioned was 21Jan2021). She is scheduled to take the 2nd dose on 03Feb2021 and is asking if she should hold off for a week or so for her 2nd shot because of the shingles being still there. If so, she is also asking whether she should she restart the vaccine if she goes over the 21 days. Caller is a consumer, states she had her first Covid vaccine on 13Jan2021, states ten days later developed shingles on her eye and forehead. States she is supposed to take second shot on 03Feb2021, next Wednesday, caller states she is concerned if she does not take it, wants to know if can she put it off for a week or two and if she needs to will she have to restart with the first dose again. Caller asks if there is any kind of special diet along with the shingles that we know of. Caller states she actually developed the shingles on 21Jan2021, states it has persisted and is painful, states she is treating the shingles with an antiviral medication. Caller states the ophthalmologist says she has no blisters on eye or anything. Vaccination Facility Type included Other. Vaccine was not Administered at Facility. The

							outcome of event was not recovered.
1114556	3/19/2021	NY	57	F	3/15/2021	3/16/2021	pt stated she woke up next day after taking her vax with chills, headache, pain behind the eyes, running nose, muscle pain, joint pain and loss of appetite. Most of these symptoms lasted about 3 days but still has pain behind her eyes, headache and joint pain so she will contact her PCP today regarding this. She has taken Tylenol to help with pain.
1114896	3/19/2021	CA	85	M	2/8/2021	2/11/2021	one side of his face was paralyzed/ had bell's palsy; A spontaneous report was received from a consumer concerning an 85-years-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and one side of his face was paralyzed (Bell's palsy). The patient's medical history as not reported. Concomitant use was not reported. On 08-Feb-2021, the patient received their first of two planned doses of mRNA-1273 (Lot number: 013M20A) intramuscularly in left arm for prophylaxis of COVID-19 infection. On 11-Feb -2021, three days after receiving vaccine, one side of his face was paralyzed. They called the nurse line and was unsure if he was having a stroke. They were instructed that he needed to go the emergency room and to call 911. After several hours in emergency department, the healthcare professionals said he had Bell's Palsy. He was given antiviral medication, prednisone, and eye drops as a treatment. Action taken with mrna-1273 in response to the event was not reported. The outcome of event was not reported.; Reporter's Comments: Based on the current available information which includes a temporal association between the use of the product and the start date of the reported events, and excluding any other etiology, a causal relationship with the event cannot be excluded.

1114840	3/19/2021	PA	63	F	3/17/2021	3/17/2021	She received the vaccine, and within 4 minutes she got a tingling feeling that swept through her whole body from her head to her toes. They called a doctor to stand by her, and spoke with her, and she was explaining what she had with reactions had a very warm sensation through her body. They have a medic station at the event center, and started taking her VS which her BP was high, and kept an eye on her, and kept talking to her. She still had the tingling feeling through her. She had this similar sensation from bee stings in the past. She then got very cold and started shaking all over and her went to 175/101. At that point she had probably been there for about 2 hours and she was then taken to Hospital. She was monitored at the hospital for her BP and did oxygen levels which were fine, and her heart rate was elevated, but then dropped down to 98-99. She asked for something to drink and something to eat, and they gave that to her, and was only at the hospital for about an hour. They told her that she was okay, and they did not give her any medications as the reaction had passed and her BP was down to 149/87, pulse rate 102, and her respiratory rate was good and they dismissed her. She did have fatigue since coming home from the hospital but is otherwise okay. She is scheduled to see her PCP on Monday, 3/22/21.

1117101	3/19/2021	IN	30	F	3/18/2021	3/18/2021	1022 - Patient received her 1st Pfizer vaccine by RN. She noted a history of vasovagal syncope to needles in the past (did not seem like it was complete syncope to all needle sticks per RN). RN offered for her to lie down, but she said she felt ok sitting. She did not endorse any history of severe allergies or reactions to injectables in the past; she was asked the necessary questions prior to vaccination. We later learned she has Crohn?s and is on immunosuppressant Imuran for this disorder. 1023ish ? walked to checkout area 1025 - While sitting at the checkout registering for her second shot she started to feel faint and checkout staff called for help 1026 - RNs were getting the BP cuff on her. She appeared obtunded and slouching in her chair- eyes closed. Gentle sternal rub and she was able to open her eyes and tell us what her name was and ask to call her dad. BP 90/58. Cold cloths placed on her neck. Continuous pulse ox monitor placed, showing 99%. 1030 - Still drowsy and diaphoretic. Able to tell us that "she passes out when she gets shots" C/O nausea and vomited. Still in and out of awareness. NP is site coordinator is now present and suggests taking patient by wheelchair to safer and more private area for evaluation in SR Room. Patient able to stand and transfer to wheelchair, which we did slowly and carefully. 1034 ? Now in safer and more private area SR room with NP and RN and Dr. Firemen are here and assessing the scene with medic assessing patient. Ambulance in route, about 5 - 10 minutes out per radio communication. Checking BP every 2 minutes. Now is 68/44. C/O nausea and vomited. Pulse ox won?t pick up. Patient with decreasing LOC, eyes rolling back in head, unable to maintain posture seated, and not able to describe symptoms to us (unknown if she felt itchy but no obvious cutaneous manifestations). Unable to visualize oropharynx. 1037- BP 57/40. NP administered Epi pen 0.3 mg dose to L lateral thigh due to s/s of systemic allergic reaction/anaphylaxis including 3 known body systems: hypotension (cardiovascular), vomiting (GI), and decreased LOC (neuro). No IV fluids immediately available but were preparing to obtain. Staff getting cot for patient to lie down. Provider spoke with her mom on the phone and informed her of event. Mom confirmed that she has often before passed out with vaccines and blood draws. Dad was on his way to center and rerouted to ER. 1038 - BP 68/45 Talking to medics and able to tell

1116997	3/19/2021	NY	66	M	2/5/2021	2/7/2021	Throbbing of tongue and tingling; Throbbing of tongue and tingling; Tingling around eye and nose; little dizzy; Stuffiness; This is a spontaneous report from a contactable 66-year-old male consumer (patient). A 66-years-old male patient received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) via an unspecified route of administration, administered in Arm Left on 05Feb2021 at 10:00 AM (at the age of 66 years old) as a single dose, for COVID-19 immunization. Medical history included HIV positive 31 years asymmetric high T-Cells undetectable viral load; Allergies to medications, food, Penicillin, sulfur drugs, Cypro and levofloxacin (LEVAQUIN); HIV positive, High blood pressure (HBP) and high cholesterol. Prior to vaccination, the patient was not diagnosed with COVID-19. Concomitant medications (received within 2 weeks of vaccination) included HIV medication, high blood pressure, high cholesterol. The patient did not receive any other vaccines within four weeks prior to vaccination. The patient experienced throbbing of tongue and tingling, tingling around eye and nose, stuffiness and a little dizzy, all on 07Feb2021 at 6:00pm. The patient went to the emergency room and was told it's probably a side effect to vaccine and they saw nothing serious. The patient reported that he called 911 a few days later and was told the same thing. This episode occurs at least 3-4 times per week and lasts for about an hour and then goes away. Treatment was not received for the events. The events of Throbbing of tongue and tingling, Tingling around eye and nose, little dizzy required Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. Since the vaccination, the patient was tested for COVID-19 (Antibody test as well as nasal swab) on 12Feb2021 with negative result. The clinical outcome of the events throbbing of tongue and tingling, tingling around eye and nose, little dizzy and Stuffiness was not recovered. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 mRNA VACCINE, were not provided and will be requested during follow up.

1117577	3/19/2021	TX	50	F	3/6/2021	3/7/2021	Got vaccine around 10:00 a.m. About 30 minutes after shot, I suddenly felt very exhausted, but it passed within another 30 minutes. A few hours later, pain in upper arm got pretty intense. Then around midnight, the pain in my upper arm had grown so severe that it was spreading into my shoulder and neck. By 2:00 a.m., I woke up in sever pain in my face, not able to open my mouth because my jaw hurt so much. I went back to sleepI was not able to open my mouth until I repeatedly coaxed it open, around 8:00 a.m. By 10:00 a.m., my eyes itched like crazy and were red. My jaw getting stuck shut and my eyes itching insanely are why I'm completing this form.

1117573	3/19/2021	AZ	75	F	3/17/2021	3/17/2021	6 hours after 2nd dose of vaccine I could feel my body starting to react. Aches and pains increased as the time went on. I went to bed and around 12 hours after the injection I got a headache that was unbearable. It felt like someone was hitting my head with an ax. The pain was excruciating. I went through the night with the pain feeling like my head would explode. In the morning I was totally exhausted and my body hurt all over. I took Tylenol and went back to bed. Put warm cloths on my head and face. My sinus hurt, my teeth hurt. my throat hurt. my eyes hurt. Awful!!! Spent the entire day in bed. I continued taking Tylenol every 6 hours. It did help a little. By Friday I was seeming to feel a little better. Still have mild headache and body aches and stomach upsets; but better than the first 24-36 hours. Hoping to continue to improve each day. Never expected any side effects as severe. Most people said sore arm and feeling tired. I do hope the worse is over.

1117485	3/19/2021	CA	77	M	2/12/2021	2/24/2021	At this point I am going to give you an account of my past 14 months health and how I know it is related to the covid virus. i am sure i have had long covid from december 2019 or january 2020 to the present based on symptoms i incurred on these dates. On my first night I ended up vomiting my guts out at 2:00 in the am. The following 2 weeks I had constant diarrhea. At the end of those 2 weeks, i ended up in emergency room. And this all happening when i haven't vomited in over 30 years. vital signs and blood work were good at the hospital and the drs were confused as to why i felt so bad. i returned home the next day where our permanent home is, and 3 months later the covid thing surfaced. at first being thought of as a respiratory disease. then in the past months it is surfacing that it may now be considered a gastrointestinal disease that progresses to a respiratory disease. after checking the five main symptoms of long covid i discovered that i have at least 3 of the 5 common symptoms for this. Those being extreme fatigue, joint pain, and cough. In addition to the long covid symptoms, I have encountered tasting issues on and off again. I have had many discussions with my primary care doctor, and no results or conclusive information came from my inquiries. Then on feb 12, 2021 I got my first moderna shot. About 2-3 weeks later I encountered a sharp pain in a muscle in my neck left side. Shortly thereafter I got very light headed. Then another week later while driving a motor home, I encountered a frightening experience with my eyes, and the neck pain and soreness was still there. My vision was very blurred and I was seeing double vision at different angles. I ended up at the medical center and was admitted for 4 days. Before I was admitted, I saw a local ophthalmologist here and he diagnosed me with a condition known as ?edema in optic nerve, inferior, consistent with optic nephropathy?. The symptom I had to get me to the doctor was I was losing eyesight in my left eye. After hd steroid treatment for 4 days, and a plethora of tests, including spinal tap, multiple mri?s, and probably over 20 blood tests (11 at one draw), I was released 3-18-2021 and still can?t see above the equator line of my left eye. And I also am extremely sensitive to light. I also have sensitivity inside my eye as best described as a soreness, especially when I try to look upwards. I have a follow up appt with the ophthalmologists that I first saw that advised me to get to

							the hospital. And that is on mar 26th 2021. to mention another point of interest, my granddaughters boyfriends mother is a charge nurse at the emergency ward at the hospital, and she has said that they also have recently encountered emergency patients, who have recently received moderna, and are also having issues with eye problems. What problems in particular, I haven't a clue at this time. This is at the very least, extremely alarming to me, and I have no idea whether I may completely lose all function of my left eye., or not. But I adamantly feel this should be investigated by the cdc and any and all other agencies that should be involved. I would be willing to have further discussions via phone or whatever to help you out with an investigation.
1117478	3/19/2021	CA	63	F	3/12/2021	3/13/2021	I was vaccinated on Friday morning. Everything seemed OK. On the next day Saturday, I felt some numbness on me left upper lip and right tooth. The numbness increased and changed to my left face paralysis. I could not chew or close my left eye totally. My husband brought me to the ER on Tuesday morning. They diagnosed that I had peripheral Bell's palsy and gave prescription to me with antiviral medicine, prednisone, eye ointment and eye drops, and shield to cover my left eye while I go to sleep. Today is Friday, one week after I got vaccinated. I also go to get acupuncture.
1117417	3/19/2021	MN	63	F	3/13/2021	3/13/2021	Moderna COVID-19 Vaccine EUA. About 5 hours after vaccination I noticed red lines across the tops of my eyelids. It looked like someone had scratched across the lids. My skin felt irritated and the lids of my eyes started to swell. The swelling was not enough that I couldn't open my eyes but my lids felt very heavy. I could feel the skin was raw and raised where I could see the red line. It took at least 4 days to the swelling to completely go away.

1117326	3/19/2021	WA	71	F	3/18/2021	3/19/2021	With the first vaccine I had a strong hypoglycemic episode 30 hours after the injection. The next day, about 24 hrs. later I became very dizzy but didn't develop shaking, diaphoresis, or black spots in my vision. (I've had hypoglycemic episodes rarely, maybe every several years, but I know well what they feel like. No further episodes since then. I wasn't prepared for the episode and didn't have candy or orange juice handy. It required I lay down for 10 minutes while I was very shaky and cold, clammy diaphoresis. Pita Chips helped---I presume. Yesterday I received the second dose and 29 hours later I started getting hypoglycemic again but quickly drank some concentrated sugary lime juice. I remained slightly shaken but never developed black spots or diaphoresis. I still felt too light and shaky so I had another half glass of juice and feel normal after about 10 minutes. When I reported this, my daughter, who is an ER doctor, was doubtful the first time it was vaccine related because of the 30 hour gap. Before receiving the second dose, the doctor there also didn't believe it was related for the same reason. But I find it very odd now that after both vaccines, at around the 30 hour mark, I had the same effects. Except for a slight migraine- like headache, no other real symptoms---- maybe some lethargy. I'm not diabetic, so I'm not on insulin or diabetic pills. I take a lower dose of blood pressure meds and have well-controlled hypertension. I can't even remember the last time (in years) I had hypoglycemia, but I've never had it as bad as I did the first time. Since I caught it this time with the juice and stopped the symptoms, I don't know if it would have reached the level of the first dose of vaccine.

1116423	3/19/2021	CO	22	M	3/17/2021	3/17/2021	Around 10pm, I was suddenly very tired and could not stop yawning. I typically am up until 12-1 most nights so this was out of the ordinary. While getting ready for bed I became very nauseous and almost threw up. I had waves of nausea for around 20 minutes. When I stood up I had chills throughout my body and my skin was covered in goosebumps. A little later, my vision started to go black and I felt dizzy and light-headed. I went to bed shortly after in hopes of sleeping it off (probably 10:45-11). Around 2 am the following morning, I woke up and had a hot flash (could have been a fever but I did not check my temperature). I was able to fall back asleep and felt normal when I woke up at 7:30 am.
1116417	3/19/2021	WA	89	F	3/12/2021	3/13/2021	patient reported 20 minutes of visual hallucinations about 15-17 hours after 2nd dose of COVID-19 vaccine and passed out for possibly 5 minutes. during fall she injured right low leg, but no evidence of DVT on exam today (6 days after fall).

1116722	3/19/2021	GA	30	F	3/12/2021	3/12/2021	<p>health) Electronically Signed 3/16/2021 3:23 PM</p> <p>Patient participated in a mass vaccine event with the local school system administered by local pharmacy. After the vaccine was administered the patient was instructed to wait 30 minutes so she could be observed by a school nurse. She said she noticed her lips were beginning to feel numb and looked in the mirror and noticed her face was beginning to turn red. The nurse came over to assess the patient when she noticed the patient was developing hives on her face and neck and her eyes were becoming swollen. The fire department with a paramedic unit was on site and came over to assess the patient. They did not administer any medications as their protocol did not call for medications if the patient was not having difficulty breathing. In the meantime 911 had been called and an ambulance arrived on site. The patient refused transport and the ambulance left the site. The nurse, pharmacist, and school staff would not allow the patient to leave the site until further evaluation for approximately 30 more minutes. The nurse and pharmacist insisted the patient receive 50mg of diphenhydramine orally, and she agreed to comply. The patient's friend was on site and agreed to drive the patient home and stay with her for at least four more hours. The friend was instructed to call 911 if any of the symptoms worsened. The patient was provided with an additional 2 x 25mg diphenhydramine capsules to take in case needed. The nurse called the patient at 1pm, and the patient indicated her symptoms were resolving. The nurse called the patient again at 3pm, and the patient indicated she felt much better. The pharmacist called the patient on 03/15/21 at 4:45pm for additional follow-up. The patient indicated she felt "wiped out" all day on 03/13/21 but felt much better by 03/14/21. The pharmacist instructed the patient that even though she did not have an anaphylactic reaction she should NOT take the second dose of the Moderna vaccine, and that she should not receive the Pfizer vaccine either.</p>

1116450	3/19/2021	DC	83	F	3/13/2021	3/14/2021	My mom lhad been up walking around for maybe an hour or so. She then laid down across the bed & when I looked at her, she was drenched with sweat, then she started hacking, almost like she was choking or couldn't breathe. She also started mumbling & called on Jesus. I tried sitting her up, her eyes then rolled back in her head, then this very gold colored stuff started coming out of her mouth (which scared me to death). Her body was so limp, she slid on the floor. I wiped her mouth & also put a cold rag on her forehead to try to cool her down. I dialed 911 & continued talking to her. She started to respond to me & along with my help we were able to sit her back on the bed. EMS arrived, took her vitals.

1116672	3/19/2021	TN	67	F	3/16/2021	3/16/2021	15-20 minutes after the injection, I started feeling a tightness in back of my throat; I broke out in cold sweat. I started getting dizzy and very woozy. I felt my vision starting to close in. I thought I was going to pass out. I got the attention of the person across me to get an attendant and they brought me a chair with wheels. Two people got me up (and I'm not a big person) - they were worried I was going down and I was taken to exam room. They said I was white as a sheet. She checked my eyes and throat a few times and checked my blood pressure. It was lower than normal but she didn't seem really concerned about it - 104 over 60 something which is low for me. She gave me water to sip. She gave me very cold compresses to put on my forehead. They watched me pretty good. She had the epi-pen ready. She watched me and I sat in there and nurse came in a quite a few times to check me for about an hour. About an hour later the tightness went away and I started feeling myself again. We went home. I went to sleep. I woke up at night to go to bathroom and I was still a little woozy but I didn't fall. Next day, I just didn't feel well. My left arm was starting to hurt - was no swelling; it was a little red at injection site. It hurt just a little. I was woozy. My eyes couldn't focus as well. I felt out of it. I drank a lot of water and took a nap. Yesterday, I felt pretty decent but still woozy somewhat. I tried to run errands with my husband - just wasn't quite right. Today, much better but I'm not quite myself yet. Just a little wooziness - weird feeling. Yesterday, I did feel a soreness in the back of my right calf muscle. It wasn't warm to the touch or swollen. I don't have it anymore, it went away. It could have been a muscle thing from the first day of the vaccine when I got home and I got up and almost fell down. I do still have some achiness in joints. Especially in my knees - which isn't normal because they are replaced.

1116564	3/19/2021	NY	25	F	3/17/2021	3/17/2021	A few minutes after receiving the shot I noticed extreme tiredness and light headedness. I got up to notify staff and my vision went and I began to feel nauseated. They helped me to a seat and I began sweating profusely and the nausea intensified. After several minutes the nausea and vision changes subsided and I continued to feel extremely tired and light headed. The staff put a heart rate monitor on me and I saw that my heart rate was sitting around 38-42. I felt like I just wanted to close my eyes but the staff kept asking me questions. After several more minutes a cop arrived. Later on an ambulance arrived and when they put the blood pressure cuff on I noticed tingling in my hand from it. I continued to feel light headed and extremely tired through arriving at the hospital via ambulance around 10:30am. These symptoms gradually subsided throughout the afternoon leaving me with light headedness only when walking or moving around. While at the hospital they did an EKG which showed inverted T waves (from what I remember of the PA's description) and so admitted me for observation and performed an echo which came back normal. I was discharged around 10pm on the same night.
1116520	3/19/2021	MA	36	F	3/14/2021	3/15/2021	Pfizer-BioNTech COVID-19 Vaccine EUA Red, itchy, watery eyes. It started when I woke up the next morning. It has gotten worse over the next few days. No other symptoms. Dr. prescribed prednisone, Benadryl, Claritin, eye drops.
1116470	3/19/2021	FL	70	F	1/10/2021	1/10/2021	Had the expected headache and tiredness that continued intermittently from first shot. Just a couple of days prior to second shot, upper teeth pain and some reaction to local high pollen count. Three days post second shot PCP started a course of antibiotics and decongestants thinking it was sinus related. Also had a couple of weeks of night sweats, headache and cheek pain strong enough to prevent sleep and cause difficulty eating. Pain became excessively strong about Mar 8. PCP ordered lab and sinus CT on Mar 11. Neither of which were significant. Night of Mar 12 had significant visual difficulties. March 13 morning the left temporal artery was tender and nodular with pain above left eye and left temple. March 13 suspicion of Giant cell Arteritis and administration of high dose steroids begun in afternoon.

The patient's medical history was not provided. Products known to have been used by the patient, within two weeks prior to the event, included blood pressure medicines. On 31 Dec 2020, approximately one day prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 [Lot number 039K20A] intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 01 Jan 2021, the patient reported sneezing and had vision issues. He was told that it appeared he had a stroke. Treatment for the event included eye drops. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the events stroke, lost vision in one eye and Sneezing were unknown.; Reporter's Comments: This case concerns a 75 year old, male patient, who experienced a serious unexpected event of blindness and cerebrovascular accident. Concomitant medication included blood pressure medication. Very limited information regarding this event has been provided at this time. Further information has been requested.

1111258	3/18/2021	FL		F	1/11/2021	1/11/2021	<p>Reports being tired; Eyes were very irritated; I had a little diarrhea; Had a sore on my arm, it was hard; Had a sore on my arm, it was hard; The injection leaked a bit of liquid from the injection site; The injection leaked a bit of liquid from the injection site; A spontaneous report was received from a consumer who was also a 69-year-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced being a little bit tired, a little diarrhea, the injection leaked a bit of liquid from the injection site, dry eye irritation, and injection site sore and hard. The patient's medical history included dry eyes. Products known to have been used by the patient were not provided. On 11 Jan 2021, prior to the onset of the events, the patient received one of two planned doses of mRNA-1273 (Lot number: unknown) for prophylaxis of COVID-19 infection. On 11 Jan 2021, as the mRNA-1273 vaccine was being given, the patient noted that the injection leaked a bit of liquid from the injection site. She denied a topical reaction. She reported that the side effects were mild, and she was fine that evening. On 12 Jan 2021, she reports having a sore on her arm that was hard. On 13 Jan 2021, she reported that she had a little diarrhea, and her eyes were very irritated, but she noted that she has dry eye to account for this. On 15 Jan 2021, the diarrhea was almost resolved. Treatment information was not provided. Action taken with mRNA-1273 was not reported. The outcome of the events, eye irritation and a little diarrhea, were resolving. The outcome of the events, being a little bit tired and injection site sore and hard, was not provided. The outcome of event, topical exposure at injection site, was resolved on 11 Jan 2021.; Reporter's Comments: The patient's medical history of dry eyes remains a contributor for the event of eye irritation. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.</p>

							<p>like really hard pressure was on her chest. The patient was hyperventilating with deep sweats, and said "it keeps coming on and off". The patient reported still getting clammy hands and clammy feet, and that her heart rate kept going up. Though she got vaccine on the left arm, the patient reported that her right arm had neurological tingles. At the ER, patient was given alprazolam; then she was asked to leave. Patient stated she was having waves where she had elevated heart rate about 140-160 and high intense heat along with optical nerve pain. Patient took diphenhydramine which she stated slowed down the heart rate and provided relief although patient was still experiencing waves coming back of chills, fever, sweating and elevated heart rate. On morning of 10 Feb 2021, the patient woke from sleep with extreme high heart rate and she broke out in a sweat. The patient experienced dizziness, diarrhea, and her occipital area behind the neck got extremely hot. She also reported that the rash came back on her chest, and her legs and outer extremities would shake. The patient stated "it doesn't feel right. I don't want to die after having this vaccine. The warm fuzzy reaction has just not gone from my body." Action taken with mRNA-1273 in response to the events was unknown. The outcomes of the events, increased heart rate, right arm had neurological tingles, got really hot, sweating, almost to the point of shortness of breath, lost sensation in face, eyes felt very bulged like a pressure, felt like really hard pressure on chest, hyperventilating, clammy hands and feet, and red rash on cheeks and chest were not reported.; Reporter's Comments: Very limited information regarding this events has been provided at this time. Further information has been requested.</p>
1110674	3/18/2021	PA	83	F	1/22/2021	1/23/2021	<p>I don't have all the info you want, but my Mother In Law, who resides at this senior assisted living center, had falls the day after her Moderna first and Moderna 2nd vaccine. Each landed her in the ER, suspected fainting episode. Lots of testing done, bruised eye and forehead each time. It may be noteworthy to report that she contracted covid 19 dec 30, about 3 wks prior to the first dose of vaccine.</p>

1111403	3/18/2021	IN	62	M	3/16/2021	3/17/2021	Had body aches, cold chills, thought processing was slow and some what scattered, eyes were dilated slightly, loud noises were painful
1110670	3/18/2021	NC	65	F	3/15/2021	3/17/2021	VIRAL PINK EYE Monday 3/15 AM I received the vaccine. That night I had some mild achiness and headache which continued the next day. Nothing exceptional. The next morning, Wednesday, when I woke up I was surprised that my right eye was a bit crusty. It was rather red but not painful. I thought it would go away ignored it but that night I realized it was still red. I did some research about pink eye and realized I fit the description for viral pink eye. But when I saw that 90% of all viral pink eye is caused by the Adenovirus - the same that is used in the vaccine I realized I should report the coincidence. I made an appointment with my doctor to confirm before submitting this report.
1110707	3/18/2021	ID	66	M	2/26/2021	3/4/2021	He received the vaccine, had fatigue, chills one day, but the arm was not terribly sore. Then 6 days later had itching bumps/hives that turn red, and just erupts on his hips, groin, arms in places, abdomen, most parts of his body including his scalp and has persisted. He had it for 4 days and she began giving him Benadryl, which has helped. He still has these areas and reaction. He has been having headaches since he's had these reactions. In Jan/Feb he was having some symptoms, COVID toe, hives, blood shot eye and intestinal problems all at the same time, which they believe he had the COVID virus due to articles that they had read about. He went to a podiatrist who did not know what he was looking at. These reactions are similar to the reaction he had when he believes he had the COVID virus. They live in a ski resort area and they have people coming from all over, and had a lot of friends who had "the flu". He tried to call his doctor twice to get some advice, and was never able to speak to her and the nurses misunderstood what he was calling for.

1111419	3/18/2021	CA	68	M	1/29/2021	2/25/2021	AT around 07:00 on Thursday, Feb. 25th I lifted my head from bed and whole room was spinning violently. Told my wife that something was seriously wrong. Tried to slowly move to side of bed but never made it before falling back into bed. Waited to see if would improve and when it didn't my son and wife put me into car and I was taken to an Emergency Center. I was hooked up for monitoring (pulse OX, cardiac monitoring, and an EKG was taken, Blood Work was done, and the Doctor said he was worried about a stroke/and or tumor because I looked so bad coming into their facility with help from their Nurses and sent me to get a head CT. When trying to get up from CT I fell backwards onto CT table. Whole room was not just spinning but was moving from floor to ceiling and then back to floor to ceiling. When I got back to room Doctor performed tests on moving my head and following his finger with eyes. He had to stop because I was spinning so much. He told me that I had Nystagmus.

1111295	3/18/2021	CA	44	F	1/7/2021	1/25/2021	every where she had had filler injections are swollen except the left eye, her left eye is not swollen; every where she had had filler injections are swollen except the left eye/her doctor believes she is having a reaction with her fillers/bump on her right eye; under her right eye there was a large bump that was swollen; This is a spontaneous report from a contactable nurse (patient). A 44-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK9231) via an unspecified route of administration in the left upper arm, on 07Jan2021 at single dose for COVID-19 immunisation. Relevant medical history included Hashimoto's disease from 2017 and ongoing, cosmetic filler injections got in her face within the last year and half or 2 years. Patient said that she knew that Allergan asked her doctor about her ongoing Hashimoto's as well. She takes medication for that. Patient also said that her white blood cell count runs low, like around 2 if they want to note that as an immune system thing and she confirmed that was an issue for her prior to receiving the COVID 19 vaccine. Family medical history included that her daughter has Hasimotos as well. Concomitant medications included unspecified medications for Hashimoto's disease. The patient previously received first dose of BNT162B2 (lot number: EI1685) via an unspecified route of administration in the left upper arm on 18Dec2020 at the year of 44 years at single dose for covid-19 immunisation. She said her doctor believes she is having a reaction with her fillers. She clarified fillers were like cosmetic injections got in her face. She thought the filler was called Allergan but she didn't have any other information about it. She did know her doctor did call Allergan and did a report with them. She thought it was like a big deal because it was not documented with Pfizer just with Moderna. She said the doctor was also going to call and report this as well. The doctor has not called yet but he said he was going to, she just left their office. Basically the places she had had filler injections within the last year and half or 2 years not have, under her right eye there was a large bump that was swollen and then the places that were called labial folds, the marionette lines where she had had filler there were all swollen and that was on the right side of her face and then on the left side the marionette lines were swollen as well so basically everywhere she had had filler

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

injections were swollen except the left eye, the left eye is not swollen. And the places were swollen and hard. She first noticed the swelling yesterday 25Jan2021. The bump on her right eye was yesterday around 15:00 and then this morning (26Jan2021) it was much worse under her eye and she noticed the bumps on the right side at about 6 am this morning and around 9 am she began feeling it on the left side and it progressively has gotten worse since it started in all of those areas (26Jan2021). This case reported as serious. Patient did not visit Emergency Room, but she has been to 2 different physicians in physician office. No other vaccines administered on the same day as either dose of the suspect product. Patient did not have prior vaccinations within 4 weeks. Outcome of the events was not recovered. Reporter assessed event everywhere she had had filler injections are swollen except the left eye, her left eye is not swollen as related to BNT162B2.; Sender's Comments: Based on available information a contributory role of BNT162B2 to reported events cannot be fully excluded. Consideration should also be given to the contribution from the cosmetic filler injections. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

1111431	3/18/2021	RI	30	F	3/18/2021	3/18/2021	Pt read through the list of questions and stated "I am short of breath at baseline, I am chronically anemic and tired, and I get sick for like 2 weeks after my flu shot." She denies having a flu shot over the last few years. Discussed at length the risks/benefits of vaccine and potential side effects, expected time frame and duration expected. Pt stated she had Lupus and consented to her first dose. Pt also stated she had an anaphylactic history to PCN, Amoxicillin, and Sulfa. Therefore she was instructed to stay for 30 minutes observation. Approximately 10 minutes post vaccine, pt stated she was "really hot and tired, like she couldn't keep her eyes open." She was given an ice pack and water. She denied any difficulty breathing, throat irritation, dizziness, or vision changes. She initially stated she did not think she could drive home and requested a work note so she did not have to return back to work. Requested pt have someone pick her up and she refused and stated "she was fine to drive." Of note, pt carried on an entire conversation for the one hour she was observed in the lobby here Hospital, laughing and acting appropriately. She denied the need to be seen at Urgent Care by a Provider for her c/o tiredness. Upon re-evaluation prior to d/c patient, she was asked by this RN, "do you feel you are able to drive home safely?" She responded with "I don't know, I still feel very tired and having trouble keeping my eyes open and I have not walked around." Explained to pt that if she was not able to drive home safely she needed to go to Urgent Care here for further monitoring and pt was lead to registration.

1110266	3/18/2021	OK	67	F	3/10/2021	3/10/2021	Following the vaccine went to the grocery store and had her mask on, when she got home she was itching around the mask area/mouth area. It then kept itching, and that night she went to rub it and it was full of blisters that popped and oozed and continued like that. Now her skin feels like elephant skin, burning and itching, and feels like she has somebody burning her with a cigarette and stabbing her with a needle at the same time, and this is everywhere and extremely painful that continues to keep spreading. She has it from the top of her head, in her head, in her ears, and down to her feet to the arch of her foot. She went to the UC the morning of 3/11/21, and she told her that she needed to go to the ER, which she did. They sent her home with Benadryl cream, Benadryl tablets and put on Prednisone, a Z-Pak and nothing has helped. She went back to the ER on 3/12/21, and was put on Hydroxyzine. Her eye is so swollen right now that she can only see a small slit through it and the left eye is swollen shut and cannot take the pain and is going to go back to the ER one more time.
1109977	3/18/2021	CA	31	F	3/17/2021	3/17/2021	Patient waiting in observation for 15 min. 10 minutes into waiting patient waves down field ops who caught patient in chair from falling. Observation nurse and charge notified. Vitals taken. 119/76, 98% o2, 76 pulse, 96.7 temp RR 20, lung sounds clear. Patient stated she felt sweaty and had blurry vision and decided to call for help. Patient asked to wait 30 min. Patient on floor, legs elevated, conscious and able to communicate. Mother came to assist. Patient sat up on floor and able to tolerate water. Vitals rechecked and stable. Vitals reassessed before leaving site 100/63, pulse 90, O2 97%, RR 18, temp 97.6. Patient states she feels much better and tolerates standing. Educated to seek medical attention if symptoms return or worsen. Patient accompanied by mother and nurse to car without incident at 4:05 pm.

1109966	3/18/2021	NE	33	F	3/13/2021	3/15/2021	Pain and swelling of the right eyelid. Started about 48 hours after the first dose was administered and had been getting progressively worse over the next 48 hours. Talked to my PCP and a nurse over the phone and through one chart. Treating the symptoms as a styne seem to be helping. Ibuprofen, eye drops, and a product called styne have been helping reduce the symptoms, especially the pain. A hot, wet washcloth is even more helpful. Used it for almost an hour this evening and the swelling is way down. My eyes themselves are actually starting to itch and look red tonight. This is the first time this has happened lately. I have seasonal allergies, but this whole thing experience has felt entirely different from that kind of swelling. I've never had swelling of this nature before. Or any adverse reactions to vaccines (aside from minimal soreness near the injection site).
1109963	3/18/2021	MN	29	F	3/16/2021	3/16/2021	Onset within minutes: dizziness, confusion, and facial numbness in both cheeks, eyes, nose, jaw and muscle stiffness in the face which lasted until the following day. Following morning, there was sharp pain at the injection site and I was unable to lift my arm at all. In the evening I can lift it half way. Still experiencing 32 hours later: headache and brain fog and dissociated feeling, fatigue, and body aches. Neck remains stiff. Never had any adverse or allergic reaction to anything before and didn't become fully aware that something wasn't right until after I left the facility yesterday.

1110468	3/18/2021	OH	33	F	3/13/2021	3/13/2021	33 year old female with no preexisting health conditions received her first Moderna vaccine on Saturday, March 13 at 9am in the left deltoid. Patient immediately felt weird after receiving the vaccine - tingling and accelerated heart but no intervention occurred. Patient started with the basic side effects headache, sore arm, shakes/chills and fatigue/weakness and brain fog. Starting around 24-36 hours after injection patient started to notice mild muscle spasms and tingling sensations. That has progressed to full paresthesia of the arms/hands and legs/feet. Patient also states paresthesia occurs in the face, neck, lips, torso and even occasionally in ears - but these seem less severe and wax and wane. The patient noticed vision changes and muscle fatigue described as muscles feeling like "jello." Due to weakness, patient also complains of continued brain fog. The patient is also occasionally getting twitching and pulsating muscles. The patient describes the neuropathy "like my limbs are defrosting." It was described as cold tingling but at times intense. Patient noticed that cold temperatures make it more pronounced and movement helps to temporarily make it seem a bit better.
1110604	3/18/2021	RI	30	M	3/18/2021	3/18/2021	Patient expressed fear of needles that he has had since an infant. Approximately 15-20 seconds after injection, client slumped his head, eyes dilated, diaphoretic. Rapid response called,, BP 90/49, ice packs applied, assistance provided as the client became alert and oriented , Verbalized that he would like some water. Still diaphoretic, second ice pack applied. Put in a wheelchair to transport to a stretcher.0741 EMT arrived. Blood sugar 135, O2 saturation 97 percent. BP109/50. 0745: BP 105/58 0750 BP 107/60, provided client with hydration. 12 ounces of water consumed. States he does not want to go to the hospital and declines to go to the hospital. Speaks with wife. She confirms that he "passes out after vaccinations" and has done this most of his life. States it did not happen with his last flu shot, so they thought this would be okay. 0810 States he feel fine and is not dizzy. BP 120/62

1110583	3/18/2021	ME	35	F	1/18/2021	1/19/2021	On 1/19/21- visual migraine, severe fatigue, difficulty concentrating. These symptoms continued along with blurry vision, dizziness, waking at night to ?buzzing? in head, hypoglycemic symptoms. Multiple doctors visits over the past two months, blood tests, BP and heart rate assessments - only to assume it?s a reaction to the vaccine. Extreme diet change, elimination of the two prescribed meds and detox- feeling much better however still experiencing hypoglycemic symptoms throughout the day and sometimes at night.
1110560	3/18/2021	IL	33	F	3/11/2021	3/15/2021	Day 4 - large warm red spot on left arm below injection site Days 5-6 - eyes swollen halfway shut, general face swelling, redness, itching and burning

1110540	3/18/2021	MA	32	F	3/13/2021	3/15/2021	<p>Saturday 3/13 - Moderna shot @10am on L arm. Onset of sx @6pm. Fatigue, irritability, mild body aches</p> <p>Sunday 3/14 - Upon waking Fatigue and severe body aches. Painful to walk, exert, lift a spoon. Required some assistance with activities of daily living. Nausea. Some improvement around 6pm. Monday 3/15 - Upon waking Decreased fatigue, body aches resolved, nausea resolved. Soreness and fatigue in carpal tunnel area, feeling as though I had held a heavy phone for too long. Adjusted by keeping off phone during the day. Hand/wrist pain increased in the evening. Noted wrist and hand swelling @8pm. After applying ice around 10:30pm pain became suddenly severe with movement. Suspected ice was somehow a mistake and applied heat. Pain became excruciating. Took tylenol XS to sleep. Tuesday 3/16 - Upon waking Moderate swelling and complete loss of mobility in both hands and wrists. Shooting pain that knocked the breath out of me. Unable to complete any activities of daily living independently (bathing, toileting, eating). Wore carpal tunnel braces all day. Some improvement in range of motion in the evening, able to open and rest hands semi-flat on an angled surface. R hand demonstrating faster improvement than L. Noted mild red bumps present on both wrists (more on L) and mild-moderate shooting pain from L thumb toward inner elbow, more severe in area closer to elbow. Upon rubbing the area close to elbow noted soreness and bumps under skin when applying mild pressure that aren't visible to the eye. Wednesday 3/17 - Upon waking Red bumps resolved. Some improvement in all areas. L hand improvements mildly lagging behind the R. Able to complete activities of daily living with supportive assistance. Increased range of motion and moderate pain. More improvement @5pm. Regained 90% range of motion, shooting pains were mild-moderate. Thursday 3/18 - Upon waking I have full range of motion. Mild-moderate pain with certain angled movements and levels of exertion. PCP telehealth appt @9am. Diagnosis: adverse reaction to moderna. Suspicion that there may be some connection with the complex migraine (though there was no numbness or tingling present) and to update my neurologist (you!). Recommendation was to report it and monitor sx. If sx not completely resolved in one week referral to othopedic.</p>

1110509	3/18/2021	AR	52	F	3/9/2021	3/10/2021	The day after my second shot, March 10, I experienced what I felt were normal side effects that a lot of people have experienced. But starting March 11, I have experienced dizziness, double vision, blurred vision, headaches, eye pain, and nausea. With regards to my eyes, it feels like they are out of sync. Severity varies on an hour to hour, daily basis. I have multiple sclerosis but have not had a relapse in almost 11 years. I was concerned about my right eye because my original MS diagnosis was via optic neuritis. I did see an ophthalmologist March 16 but was told there is no new nerve damage or inflammation. I have since been prescribed a steroid pack and I've been scheduled for updated MRIs (with and without contrast ) at the end of this month. I was 100% healthy and lived a normal life before the second shot. The first shot I had zero side effects except for soreness at the shot site.
