| 1081739 | 3/8/2021 | | 75 | F | 2/20/2021 | 2/20/2021 | Fainting; Aches; Extreme Nausea; Chills; A spontaneous report was received from a consumer, concerning a 75-year old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced extreme nausea, chills, aches and fainting. The patient's medical history, as provided by the reporter, included COVID-19 infection on last March. Concomitant medications reported included atorvastatin and levothyroxine sodium. On 20Feb2021, approximately 4 hours prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (batch number:015M20A) for prophylaxis of COVID-19 infection. On 20Feb2021, the patient experienced extreme nausea, chills, aches and fainting. Treatment for events included ondansetron and paracetamol. Action taken with mRNA-1273 in response to the events were unknown. The outcome of the events, extreme nausea, chills, aches were considered recovering/resolving. The outcome of the event, fainting, was considered recovered/resolved on an unknown date.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the onset date of the reported events, a causal relationship cannot be excluded. |

| 1081918 | 3/8/2021 | TX | 31 | M | 3/1/2021 | 3/1/2021 | I was called by COVID vaccine observation staff at approximately 11:57AM to respond to patient who was reported to be diaphoretic, pale, and retching 15-20 minutes after having received one dose of Moderna COVID vaccine. Vital signs before my arrival were: 11:55AM BP 97/52 HR 75 Patient states history of diabetes, hypertension, anxiety, panic attacks, and pulmonary embolism and is on Xanax prn, Xarelto, an ace-receptor antagonist and an insulin pump. States consumed about 12oz of water and a pop tart in the morning. Physical assessment: Alert oriented to person, place, time and situation. Gait normal Firm bilateral hand grips Radial pulse 2+ bilaterally EOMS intact and PERRLA Lung sounds clear in all lobes S1 and S2 auscultated. Advised patient to consume 2L of water before leaving clinic. Advised to stay additional 30 minutes for observation with blood pressure to be repeated at 5 minute intervals until blood pressure turns to normal range. 12:05PM BP 162/94 HR 95 12:10PM BP 134/51 HR 100 Gave emergency warnings to go to ER if experiences additional adverse reactions after returning home (shortness of breath, chest pain, etc.) Diagnosis: Vasovagal syncope in response to vaccine |
| 1081921 | 3/8/2021 | FL | 22 | F | 3/6/2021 | 3/6/2021 | Shortly after being given the vaccine the person had an episode of near-syncope where she felt light-headed and was not feeling well. She has had a history of this occurring in the past after an injection before (unknown if vaccination or other IM injection) and blood draws. She did not have any loss of consciousness, but she became pale and diaphoretic and felt like she could pass out if she would stand consistent with a vasovagal event. She initially had an elevated pulse at 113 which came down to 65 and her blood pressure was initially 110/60 and then 98/62 on recheck. Patient was placed supine on a cot and then her legs were elevated to help her symptoms. She did have some improvement in her symptoms prior to transport to the ER via EMS at her request. |
| 1081014 | 3/8/2021 | WI | 40 | F | 3/5/2021 | 3/5/2021 | Near syncope (multiple events); vomiting (multiple events); chills; headache Onset approx. 12 hours following vaccine. Rapid onset with little to no warning, lasting approx. 2-3 hours. |

| 1081746 | 3/8/2021 | OH | 70 | F | 2/12/2021 | 2/12/2021 | <p>began to pass out; because every time I tried to lift my head, I would start blacking out again; dizzy; diaphoresis; fell against the wall; violent high abdominal pain; n having multiple, large formed bowel movements; shaking; chills; nausea; fatigue; This is a spontaneous report from a contactable consumer. This 70-year-old female consumer (patient) received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, lot number EM9809) , via an unspecified route of administration on 12Feb2021 at 09:45 (at the age of 70years old) at single dose for covid-19 immunisation. Medical history included hypersensitive to latex, allergies to levaquin, ddavp, CT scan dye, codeine, fentanyl, primary immune deficiency, myasthenia gravis, Sjogren's, autonomic neuropathy, myelodysplastic syndrome, von Willebrand's, Barrett's esophagus on unknown date and unknown if ongoing and received Pfizer Covid vaccine (dose 1, Lot: EL9261) on 22Jan2021 at 2:45am on left arm. Prior to the vaccination, the patient was not diagnosed with COVID-19. Relevant concomitant medication was not provided. At approximately 9:50 AM on 12Feb2021, the patient received second Pfizer Covid-19 vaccine in left arm at Administration facility. The patient waited the 15 minutes post injection. At approximately 10:19AM, the patient left site & drove to her home without issues. At home approximately at 11:20am, she had violent high abdominal pain like she never had before. she proceeded to the commode and began having multiple, large formed bowel movements then began to pass out. She began to have diaphoresis and violent shaking and chills. She had passed out on commode and fell against the wall. She later managed to pull pants up and crawl with head hanging down stated that because every time she tried to lift her head, she would start blacking out again. This continued until after approximately 20 minutes. She managed to pull herself up to the couch and raise legs high above heart and head and let head hang off couch to restore blood pressure. The patient mentioned that shot triggered something with her autonomic nervous system. On 22Feb2021, she was still with nausea, fatigue and dizziness. The outcome of events was not recovered. No treatment was received for events. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Since the vaccination, the patient had not been tested for COVID-</p> |

| 1080526 | 3/8/2021 | OH | 35 | F | 2/8/2021 | 2/25/2021 | Initially tasted metal, numb mouth, flushing, later resulting in all flu like symptoms (severe chilling, fever, body aches, headaches and GI issues.) GI issues persisted for the next 3 weeks and on Thursday evening, 2/25/2021 at about 6:30 pm. I was sitting on floor with children and almost passed out. I felt very faint, dizzy, and instantly started chilling. I had a fever of 102.8 and could not get warm. My husband was going to call paramedics, but I encouraged him not to. Discovered my right breast was red and inflamed/ swollen as well as all of my lymph nodes in my right arm pit. I could not reach my right arm forward. I noticed around 12:06 AM after not being able to get warm or break fever. I messaged my primary care clinic when I noticed the breast swelling, redness, pain, and lymph node swelling. I continually felt like I was going to faint/pass out and was very dizzy all night long. I was also extremely fatigued. The did a telemedicine appointment the next morning and diagnosed me with mastitis and prescribed me antibiotics. I am a breastfeeding mother and all of these symptoms came on suddenly and severely on the same side that I got the vaccine shot. I have been breastfeeding for over 7 months and my supply has been dwindling to nothing so I have no problems with engorgement or blocked milk ducts. Before this baby I had just got done breastfeeding a baby for 11 months with no issues of the like. |

| 1080483 | 3/8/2021 | MI | 49 | F | 3/4/2021 | 3/5/2021 | <p>Pt came to ED on 3/6/21 with allergic reaction symptoms (diaphoresis, facial swelling, nausea, vomiting, urticarial rash, tachycardia) due to 2nd dose of Moderna COVID-19 vaccination. This Moderna COVID-19 vaccine 2nd dose was received on 3/4/21 at Health Dept (Lot# 030A21A). On 3/6/21, "a 49y/o F with a past medical history of migraines and hypothyroidism who presents to the emergency department for syncope. Patient states she believes she is having an allergic reaction to the moderna COVID-19 vaccine. She received the vaccine two days ago and last night began to notice a few hives on her body. This morning she woke up with more hives diffusely throughout the body and swelling to the face and lips. She presented to urgent care for this and while at the urgent care, she began to feel lightheaded, nauseated and had a syncopal episode while sitting in the chair. She denies hitting her head. After she woke up, she vomited after. Her mother states she was diaphoretic and pale during this episode. She was given benadryl and solumedrol at the urgent care. Paramedic was called and patient was brought in for evaluation of the syncopal episode. Patient denies any chest pain or difficulty breathing. She denies any throat swelling. She has had some diarrhea with this. No abdominal pain. She denies recent fevers or chills. She denies prior cardiac hx. No significant family history. Non-smoker. Labs are notable for mildly elevated liver enzymes. D-dimer is elevated so CTA chest was obtained and is negative for PE. Patient was given solumedrol and benadryl prior to arrival. Symptoms improved during ED stay. No uvular swelling or oral involvement. Airway is patent. Patient advised to follow up with her PCP for re-evaluation and repeat labs. Rx for prednisone and pepcid. Continue benadryl." Pt was given NS 1000 mL IV x1, diphenhydramine 25 mg IV x1, and famotidine 20 mg IV x1 while in SCH ED. Pt did already received diphenhydramine and methylprednisolone at the Urgent Care. Allergy added to patient chart for Covid-19 MRNA vaccine. Then, on 3/7/21, patient did return to ED with continuing reaction (new upper lip swelling). Dr noted: "Presentation c/w allergic reaction to Moderna vaccine. New upper lip swelling, but lower lip swelling and urticaria have resolved. No airway compromise or acute bronchospasm. Discussed option of switching from Benadryl to Zyrtec, if overly sedating. Continue</p> |

| 1080759 | 3/8/2021 | NY | 67 | F | 3/7/2021 | 3/7/2021 | About ten minutes after the shot, my heart suddenly started pounding, I was panting, and I got very hot. Then tingling went all over my body, even in my lips. At one point, I felt close to fainting. The pharmacist lady gave me cold water (I asked for it), and I just sat there for quite a while. Gradually my heart rate came down, and I got cold, but the tingling kept going, and I felt somewhat weak. Since I didn't want any epinephrine (it affects my heart), and I didn't think I was so bad that I needed an ambulance, after being there nearly an hour my husband drove me home. There I took some liquid Benadryl, and that seemed to help with the tingling. I just took it easy after that. Considering my reaction to the first dose, I will NOT be getting the second one. I don't need to consult with a doctor to decide that. It was somewhat frightening because I didn't know how bad it was going to get. |
| 1080763 | 3/8/2021 | KY | 73 | F | 3/2/2021 | 3/2/2021 | Pt developed vomiting, syncope, urinary incontinence the evening of 3-2-21 at 9:00pm. She continued to vomit through the night and had 1 syncope episode when trying to get up. on the morning of 3-3-21, pt was ambulating with assistance to the restroom and had a syncope episode, confusion and fell and hit her head on a chair. 911 was called and pt was transported to ER, pt was found to be dehydrated and had elevated blood sugar (< 300) per daughter.) admitted overnight for observation. |
| 1081948 | 3/8/2021 | NY | 20 | F | 3/8/2021 | 3/8/2021 | Pt states after receiving the vaccine she started feeling faint. Pt fainted and fell from a standing position. Pt was unconscious for approx. 30 seconds. Pt was seated in a wheelchair and moved to the observation area. Pt denies any head, neck, or back pain. Pt states she is feeling better and would like to leave. Pt didn't require transport to the hospital. |
| 1080459 | 3/8/2021 | NJ | 44 | F | 3/6/2021 | 3/6/2021 | At 11pm I started feeling chills and was having cold sweats. Around 1 am I went to the next room to check my temperature and almost fainted. I sat on the floor and started vomiting. I kept gagging nonstop for several minutes. During that time I urinated on myself, I felt strong stomach aches, headache, and my body felt extremely fatigued. I was dizzy and sweating. All these symptoms came back again a few minutes later. I do not remember how long everything lasted. I woke up the next day with a slightly upset stomach and headache. |

| 1083512 | 3/8/2021 | NY | 71 | F | 2/23/2021 | 2/23/2021 | For 2 days after vaccine occasionally felt dizzy with fluttering heart. On and off. Then subsided A week after got hot flashes. Then subsided During the second week I had an episode when I felt like fainting, Throughout the week I am increasingly tired to a level of total exhaustion and bewilderment. I have extreme reservations about taking the second shot as I never felt so extremely exhausted |
| 1083540 | 3/8/2021 | MD | 57 | F | 3/6/2021 | 3/7/2021 | Feels fatigue and like she's about to have a panic attack before fainting....has happened twice and had convulsions once. |
| 1081998 | 3/8/2021 | MO | 50 | F | 3/7/2021 | 3/8/2021 | Fainting, nausea, weakness, dizziness, headache, and chills |
| 1083314 | 3/8/2021 | CT | 50 | F | 3/6/2021 | 3/6/2021 | Vaso Vagal Syncope. Felt warm and dizzy. Previous episodes after vaccines, blood draws, family events. No itching, hives, SOB, tongue or mouth swelling, palpitations. Supine on floor for several minutes and symptoms resolved. Walked around with no return of symptoms. Released to go home. Advised to seek treatment if symptoms return. Lungs CTAB, no hives. BP WNL after resting. |
| 1082260 | 3/8/2021 | NH | 57 | F | 3/6/2021 | 3/6/2021 | Passed out within 10 minutes of getting the shot Went into a seizure An EpiPen was administered within a few minutes Transported to the hospital via ambulance and monitored at the hospital for about an hour after that. |
| 1082014 | 3/8/2021 | MN | 31 | F | 3/5/2021 | 3/6/2021 | Mild headache and nausea set in shortly after the injection on Friday, but went away after rest and eating/drinking. My arm was sore for the entire evening. I woke up around 2am Saturday morning and became dizzy. I fell to the floor and passed out for a short period of time. When I woke, I was extremely nauseous to the point of nearly vomiting. I had chills and fever. I could hardly move due to weakness - I needed help getting back into bed. When I woke the next morning, I had 100.3 fever, I had a headache and my entire body was sore. My fever went away late Saturday afternoon, but I still felt mildly nauseous. It is Monday and I still have mild nausea and light-headedness. My arm is only slightly sore. |

| 1082635 | 3/8/2021 | NJ | 57 | M | 3/7/2021 | 3/7/2021 | Patient received his first Moderna covid vaccine shot at about 4:00pm on 3/7/2021 and proceedd to the post-vaccination observation area for his 15 minute observation period. About 10 minutes after his shot, patient alerted the an observation staff member that he was starting to feel hot. Staff member alert the pharmacist who had given him his shot and the pharmacist came over. Patient told the pharmacist he feels like he is burning up. Pharmacist took hi temperature an it in the 98 rang (can't remember the exact temp but was 98. something) Patient then then told the pharmacist that he feels like he is getting an aura of a coming seizure. The pharmacist applied an intant ice pack to the back of the patient neck and provided a bottle of cold water. Pharmacist stayed next to him talking to him and asking how he was doing and kept a hand on him in case he had a full blown seizure. Patient was awake but looked pale and seemed like he was going to faint. Stayed like that for about 10 minutes. after about 10 minutes patient "came back". He looked back to normal and felt fine. During the process he called his wife to come get him and he was fine when she aroungs a few minutes later. Patient, wife, and pharmacist chatted for about 15 minutes before wife took him home. Patient said based on his history that it was a petit mal seizure. |
| 1082642 | 3/8/2021 | NC | 20 | F | 3/5/2021 | 3/5/2021 | Syncope or seizure 10 hours after vaccine, preceded about about 1 hour of aches, chills, and feverish feeling. Resulted in fall to floor, hitting head and injuring shoulder. EMTs reported hypertension, tachycardia, trembling, some EKG abnormality, and low-grade fever. Transported to emergency room where CT scan, CBC, and additional labs and monitoring were performed. Released when scans and labs were normal (after monitoring.) |

| 1082656 | 3/8/2021 | CA | 56 | F | 3/3/2021 | 3/4/2021 | Moderna COVID-19 Vaccine EUA In the midnight of my 2nd shot, my whole body felt freezing cold, and I was trembling, teeth were clinching, I almost passed out. I could not take shower. I turned on all heaters and 3 heat pads in my bed, and I put 4 comforters on top of me, wearing my down coat in my bed, and tried to sleep. I was afraid to not able to wake up in the morning if I fall into sleep, so I made myself wake up every 15-20 min, to get up and drink hot water. I woke up about 25 times in the whole night to go to the bathroom to pee and flush out medicine, and I kept drinking hot water each time. In the morning, I started to feel better. That is said, I also felt right head a kind of pain , it is around my ears, I say. It lasted about 5 days including today, still felt a little bit, but a lot of better than before. |
| 1082675 | 3/8/2021 | | 70 | F | 2/12/2021 | 2/18/2021 | Patient received first Pfizer COVID-19 vaccine on 1/20/2021 and second dose on 2/12/2021. Patient had minor symptoms such as body aches with both vaccine doses which resolved. Patient then stated she started to experience headache, nausea, and body aches, decreased oral intake, and chill starting on 2/18/2021. On 2/20/2021 patient had several loss of consciousness episodes. Patient presented to the Emergency Department on 2/21/2021 with a chief complaint of syncope, nausea, and vomiting and subsequently admitted to the hospital for potential sepsis, syncope, hyponatremia, dehydration, lactic acidosis. (Continued on second page) |
| 1082702 | 3/8/2021 | NY | 26 | F | 3/7/2021 | 3/8/2021 | I am feeling extremely dizzy, any time I move my head the room spins and my ears get hot. I feel achy all over my body and very very cold. As the day has gone on the dizziness has gotten worse. At times it feels like I?m going to faint. (I haven?t yet fainted) I have not tried any treatment yet hoping it doesn?t last longer then today. |

| 1079026 | 3/7/2021 | VA | 64 | F | 3/4/2021 | 3/4/2021 | swollen gland armpit night of 2nd vaccine, fatigue next day, chills and hot flashes evening, while sleeping tried? to get to bathroom directly connected to bedroom to splash cold water on face, couldn't locate faucet or light switch, woke up on the floor. I know I passed out as I have bruise on butt where I hit the night table. Do not know if I was dreaming, then tried to get up or I had fallen while getting up. |
| 1078992 | 3/7/2021 | WI | 24 | M | 3/7/2021 | 3/7/2021 | VAR form was reviewed with patient prior to vaccinating. It was noted that he has a history of syncopal episodes with vaccines. Patient was advised to sit for 15 minutes after receiving the vaccine so we could observe him. After receiving the vaccine, patient was escorted to observation chair. Immunizer advised registration technician that patient had a history of fainting, so to keep a watchful eye on him. Patient said I need to get some ice and stood up before we were able to advise him to sit and we would assist him. Upon standing, patient had syncopal episode. Patient did not have loss of consciousness and denied any injury from the fall. Patient was assisted back to the observation chair and monitored for the next 15 minutes. |
| 1078983 | 3/7/2021 | | 35 | F | 3/6/2021 | 3/6/2021 | Pounding headache about 10-11 hours after vaccine administration. Took 1000mg Tylenol Extra Strength which did not help. Chills about 12-13 hours after vaccine administration, lasting several hours. High fever (102.8) about 17 hours after vaccine administration (took additional 1000mg Tylenol at 2am) and fever was gone by 8am. Muscle/shoulder extreme tightness on right side (same arm receiving vaccine). Dizzy & light-headed 24 hours after vaccine administration (almost passed out). Headache remains 12+ hours since it began despite the multiple doses of Tylenol described. |

Fainting when standing to go to bathroom (fell on bed no injuries). Chills and temperature continued for next 12 hours. Stayed in bed the entire next day (3 March). Temperature subsided and was able to work on 4 March. |
| 1079482 | 3/7/2021 | NY | 102 | F | 2/8/2021 | 2/8/2021 | 102 female who is a COVID survivor.. had a mild case of COVID in May 2020. Received first dose of Moderna at assisted living facility on approximately January 20th and suffered no ill effects. Had second Moderna vaccination late afternoon of February 8th. Later that evening or in the early morning of February 9th tried to go to the bathroom and either fainted or fell onto the bathroom floor on her face. Lay on the bathroom floor face down until assisted living facility staff found her in the morning when they were passing out medications. Taken to ER at hospital on 2/9/2021. Was not admitted to hospital- all CT scans and x-rays and blood work were normal. Taken back to assisted living facility where she exhibited dramatic change in behavior- uncooperative, refusing to eat or take meds, refusing to get OOB. Mentally a decline in cognition. Transferred to different facility with higher level of care on February 15th and is improving somewhat. |

| 1077360 | 3/6/2021 | OR | 39 | F | 2/15/2021 | 2/16/2021 | 24 hours after the 2nd dose my temperature rose 4 degrees, full body aches and sweating for 24 hours. Followed by dizziness and headache. Within two days my body began having seizures accompanied with ongoing flushing/cold sensations in the occipital region/top of spine, with a feeling of fainting and dizziness, nausea, without loss of consciousness. Sudden jerking movements of the arms, legs and the head/neck range from 2-5 minutes in duration and continue in clusters for 8-20 hours per day. This seizure activity has not subsided since February 17th, and is ongoing to date. MRI confirms no new structural abnormalities in the brain. CBC and metabolic panels are all within normal range. EKG normal. I am not epileptic. No history of drug use. No alcohol use. |
| 1078149 | 3/6/2021 | WA | 52 | F | 2/28/2021 | 2/28/2021 | On 02/28/2021 @ 21:00 pm I felt chilly , hot and dizzy . When I got home and 24:30 am I took a shower, then I got freezing, chilly and body shaking, also I went to bathroom may time. The whole morning I felt so tired, then I went down to kitchen to have breakfast, but I reacted with my food smell. Then I went back to my room because I couldn?t eat. During I went back to my room, I fainted at the stair. I hit my head against the wall. I did not realized I fainted after the fact. Sometime it is tough to breath and body aches. On day 2, I had headache and could not work. From then the vaccination until now (March 6th) my heads feel heavy. |
| 1077934 | 3/6/2021 | TX | 16 | F | 3/5/2021 | 3/5/2021 | Site: Pain at Injection Site-Mild, Systemic: Fainting / Unresponsive-Severe |
| 1077752 | 3/6/2021 | AZ | 49 | F | 3/4/2021 | 3/4/2021 | Shot at 11AM, arm soreness within two hours. Went to bed with fever, back pain, chills and chattering teeth. At 2 AM, awoke to drink water and urinate. Fainted while sitting, was passed out for about a minute, and appeared to stop breathing for about 10 seconds (per husband). Vomited. Returned to bed, still with fever, stomach aches. Awoke tired, lethargic, with fever. Acquired thermometer, fever peaked at 103 late afternoon. Took tylenol with little effect then with advil the fever started dropping. Went to bed day 2 with 102 fever and more spirit. Woke up day 3 with fever of 100, but much more energy. Submitted form at this point. |

| 1077724 | 3/6/2021 | TX | 56 | M | 3/4/2021 | 3/4/2021 | Vasovagal syncope - lightheaded, did not faint |
| 1077595 | 3/6/2021 | NJ | 33 | M | 3/6/2021 | 3/6/2021 | History of syncope with injections in the past. 10 min after vaccine, felt dizzy, laid himself on the ground under. Bystander witnessed him lose consciousness for a few seconds. No seizure like activity seen. No confusion after the event and patient recalled when everything that happened. Also states he didn't eat today. Drank Gatorade, stayed recumbent for 30 min and felt better. Ekg sinus rhythm, vital signs stable. Declined to go to the ER. Went home with his fiancée who is a PA. |
| 1077556 | 3/6/2021 | WI | 45 | F | 3/3/2021 | 3/5/2021 | Felt feverish and achey starting 12 hours after injection, lasting a total of 54 hours. At 36 hours after injection I felt like I was going to faint. I sat down and put my head on the table. According to my husband, my eyes briefly rolled back into my head and I was convulsing for a brief period of time (5 seconds). I then sat straight up, sweating profusely, white a sheet and with a terrified look on my face started hyperventilating for a short period of time. My husband said I never actually fainted, but I don't have memory of this incident. After this episode passed I continued to feel feverish and achey. Temp about 100.7. Started to feel a little better 54 hours after injection. |
| 1077340 | 3/6/2021 | TX | 28 | F | 3/5/2021 | 3/5/2021 | Dizziness, fainting, difficulty breathing, pressure on chest, heart palpitations, high blood pressure, elevated heart rate, body temperature increasing. |
| 1078188 | 3/6/2021 | FL | 44 | M | 3/4/2021 | 3/4/2021 | I felt light headed, dizzy and I almost passed out approximately 20-25 minutes after the injection. I then took 1 tablet of Claritin in order to counter the reaction. I sat down outdoors, removed my mask and jacket so I could breathe better. I also ate a sandwich since I thought maybe I felt dizzy because I didn't eat a full breakfast. I stayed outdoors sitting down for 2 hours before getting up. I felt better after about 1 to 1.5 hours. However, as of March 6, 2021, sometimes I have a drowsy feeling like I'm on cold medication. However, I did not take any medication today. Also, for the 1st COVID vaccine I took on 11 Feb 2021, I took 1 tablet of Benadryl, which countered the allergic reaction which is why I did not have symptoms to report for the 1st dose. |

| 1077559 | 3/6/2021 | TX | 59 | F | 3/5/2021 | 3/6/2021 | I received the moderna COVID vaccine. 13 hours later I woke up with a leg cramp. While walking downstairs I became very dizzy and sweaty chills. I sat in a chair. My husband came down a minute later and I was passed out in the chair. He was saying my name and rubbing my arms to wake me. It took him about one minute to get me to open my eyes and then another minute before I could coherently respond. He said my chin was tucked into my neck and I was pale and making noises for less than a minute. He said then I relaxed and responded coherently. My temperature was 94-95 for about an hour while I had chills but also was drenched in sweat. I was also throwing up clear fluid for about two hours. I felt nauseous for about 3 more hours. After that I just felt tired. |

| 1078624 | 3/6/2021 | AZ | 30 | M | 3/6/2021 | 3/6/2021 | Patient received his 1 dose of Pfizer vaccine and was waiting in our lobby for the recommended 15 minutes. He fainted after about 10 minutes. He fell from the bench to the floor where he landed on his stomach. When I ran over to him, his eyes were open but his body was limp. I tapped his back and asked if he was ok, and he was startled as if I woke him up from sleep. He was alert and was able to speak, he asked for water and I gave it to him. I asked if he wanted me to call emergency services but he declined. He then vomited in the waiting room trash can. His sister was with him and began to rub his back and fan him. I asked again if he needed to go to the hospital and again he declined. I told them to please wait in the lobby at least another 15 minutes before leaving and he did. I called to patient around 8pm to check on him and he said he was fine and had no more symptoms. |
| 1078386 | 3/6/2021 | PA | 23 | F | 3/6/2021 | 3/6/2021 | Patient reports a history of syncope with any sort of injection or vaccine. Five minutes after receiving her vaccine, she felt lightheaded and lost consciousness for a few seconds. Prior to losing consciousness she asked for assistance and somebody held her up when she lost consciousness. She did not hit the ground or otherwise injure herself. Upon awakening, she was fully alert and oriented and denied any chest pain or shortness of breath. Drank Gatorade. Felt better with no recurrence after observation period. |
| 1078369 | 3/6/2021 | KY | 26 | F | 3/6/2021 | 3/6/2021 | PATIENT EXPERIENCED SYNCOPE IN OBSERVATION AREA AFTER VACCINATION. WAS TREATED BY EMS ON SITE BUT NOT TRANSPORTED |

| 1078300 | 3/6/2021 | IN | 80 | F | 2/1/2021 | 2/19/2021 | By afternoon I felt a little chilly and achy and took Tylenol. I woke at 2:00am the following morning to go to the restroom and my dog needed to go out. I felt light headed as soon as she was back in the house. I felt things going dark and I passed out in the hallway. I don't know how long I was out but when I came to, I felt like I couldn't move. I laid there for a while and finally crawled back to my bed. I was able to get back in bed. By then it was 3:00am. The next night I woke in the night and had an irregular heartbeat. I could not get back to sleep until it finally went away. For several days after the vaccination, I had very little energy. |
| 1078274 | 3/6/2021 | PA | 33 | M | 3/6/2021 | 3/6/2021 | Nausea, passed out, hands seizing/shaking |
| 1078510 | 3/6/2021 | | 29 | F | 2/27/2021 | 2/28/2021 | syncope episode with second vaccine dose. |
| 1075334 | 3/5/2021 | AZ | 37 | M | 3/5/2021 | 3/5/2021 | Felt dizzy immediately after vaccine and passed out. EMS stated low heart rate and blood pressure after waking up. |
| 1075360 | 3/5/2021 | WI | 71 | M | 1/30/2021 | 2/3/2021 | Vaccine on 1-30, developed dizziness and SOB 2-3, persisted intermittently until 2-5 when had syncopal episode with no LOC, symptoms gradually resolved over next few days with no further syncope |
| 1075372 | 3/5/2021 | TX | 49 | F | 3/4/2021 | 3/4/2021 | My arm became sore, and I was a little nauseated about 4 hours later which I expected. At 10pm I started feeling light headed and walked to the kitchen to get water. I began feeling weak and more dizzy and went back to my bedroom to lie down. I felt a rush to my head, passed out and woke up on the ground. I am unsure how long I lost consciousness: minutes/ seconds. I was able to get to my bed and called my husband for help. I broke into a hot, drenching sweat to the point I had to change my clothes. The dizziness eventually cleared. I have a headache and am still nauseated today but not dizzy. I have never had an experience like this before. |

| 1075744 | 3/5/2021 | IN | 52 | F | 3/5/2021 | 3/5/2021 | Patient rec'd vaccine at 1400. She went to wait her 15 minutes in the car and after about 10 minutes noticed eye sensitivity and headache. When symptoms did not pass after an additional 10 minutes she came back into the office. While waiting when her husband was checking her in, she "passed out." Episode lasted less than 1 minute. She was easily oriented to person, place and time. It was noted that she had some swelling to bilateral eyes. Patient was brought back to room, VS were checked and all were normal. She denied any chest pain, shortness of breath, wheezing, tongue swelling, itching, or tickling sensation to back of the throat. She was able to tolerate sips of water without difficulty. 50mg benadryl IM was given in the left deltoid. Approximately 5 minutes after IM injection patient again "passed out." She was seated at the time and slumped to her right, resting her head on her husband and did not fall from chair. She aroused after approx 2 minutes, and was a/ox4. VS were rechecked and were O2 99% on RA. HR 101, BP 124/88, RR20, temp 98.5/oral. Patient stayed at the clinic for an additional 45 minutes after which her eyesight was reported to be back to normal, her headache had improved and the lower eye edema had resolved. It should be noted that both the patient and the husband were not concerned with her "passing out." She states it happens because of pain and she was fearful of the injections. Patient also states that her neurologist told her that when "she is in too much pain, she will pass out.~~ |
| 1075800 | 3/5/2021 | KS | 35 | F | 3/4/2021 | 3/4/2021 | I got the shot at 6:30pm. Drove, went to the grocery store, came home, did chores. Around 9:45 started preparing for the next day (getting coffee pot ready, etc.) up until this moment I had no side effects except pain in my arm. Then at 9:45PM I began feeling light headed, ringing in my ears and fell unconscious. I woke up on my kitchen floor in a small pool of blood and disoriented. I do believe this reaction is related to the vaccine. I DO NOT have a history of fainting. I ate food and drank plenty of water throughout the day and after my vaccine injection. Everything about my day was typical except for the vaccination and losing consciousness. |
| 1075280 | 3/5/2021 | IN | 66 | F | 3/4/2021 | 3/5/2021 | Passed out. Low BP 83/42.Felt better after fluids. Also chills and achy flu symptoms lasting 12 hrs. This was 2nd dose; no reaction to first other than sore arm. |

| 1074471 | 3/5/2021 | FL | 39 | F | 3/2/2021 | 3/2/2021 | Evening of 2nd approximately 6pm diarrhea began with increasing frequency throughout the night. Lasted through the night several times an hour into the next morning. Around midnight dizziness,, faint and muscle weakness set in with feeling of extreme pressure on neck, especially right side where shot administered. Arms became tingly, tongue became tingly, hard to keep awake. After 12 hrs of extreme diarrhea, passed out for 12hrs straight. Awoke dehydrated, extreme muscle weakness unable to walk or stand, light headed, nauseous, dizzy, unable to grip or exert force. Felt like head was detached from body due to extreme pressure on neck. Rapid resting heart rate in 90s (usual testing HR in 50s). Constant rolling waves of abdominal cramps brought dizziness with each cramp, acid reflux, bloating and gas. These symptoms lasted through the evening of the 3rd into the 4th. Considered going to ER for help, as extreme dizziness and muscle weakness prevented walking. Fell asleep. 6am March 4th developed fever of 101. Continued extreme dizziness, pressure on neck, muscle weakness and feeling faint and extreme lethargy throughout day. Fever subsided to 99 by evening of 4th. Ate plain rice evening of 4th, 1st time eating in over 48hrs. Immediately passed out. March 5th still feeling weak, hard to stand, limited walking. Diarrhea has subsided, less pressure on neck and less dizziness. Feeling exhausted overall. Fall asleep easily and randomly. |

THEN PROGRESSED TO NAUSEA AND PLACED HEAD BETWEEN LEGS SAYING SHE FELT HOT. ICE PACKS WERE PLACED ON PATIENTS NECK. SHE SAID SHE NEEDED TO LAY DOWN AND TRIED TO TAKE HER TO MINUTE CLINIC BUT SHE WAS PLACED ON FLOOR BECAUSE SHE WAS UNSTABLE WALKING. SHE LOST CONTROL OF HER BOWELS AND HAD DIARRHEA ON HERSELF AND THE FLOOR. 911 WAS CALLED AND VITALS WERE TAKEN AND SHE WAS STABLE. SHE REFUSED TO GO TO ER BECAUSE SHE SAID SHE WAS BETTER. |
| 1074301 | 3/5/2021 | OH | 80 | F | 2/16/2021 | 2/17/2021 | Passed out; Felt tired; A spontaneous case report was received from a consumer concerning an 80 years-old female patient who experienced passed out (MedDRA PT: loss of consciousness) and felt tired (MedDRA PT: fatigue) The patient's medical history included cancer. Concomitant product use included chemotherapy and other medications (not specified). The patient received their first of two planned doses of mRNA-1273 (Lot # not provided) on an unknown date. On 16 Feb 2021, approximately one day prior to the onset of symptoms, the patient received their second of two planned doses of mRNA-1273 (Lot #011M20A) intramuscularly in an unspecified site for prophylaxis of COVID-19 infection. On 17 Feb 2021, one day after receiving the vaccination, the patient felt tired and passed out. The patient inquired if this was a normal side effect. Treatment information was not provided. The patient received both scheduled doses of mRNA-1273 prior to the events; therefore, action taken with the drug in response to the events is not applicable. The outcome of the events passed out and felt tired is unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Further information has been requested. |

| 1077119 | 3/5/2021 | AK | 84 | F | 3/5/2021 | 3/5/2021 | This is an 84 year old patient who presented for her initial dose of the Pfizer/BionTech COVID-19 vaccine. About 10-15 minutes after receiving the dose, she experienced a burning sensation in her upper mid-chest, felt dizzy, felt nauseous. She also said that she initially had dyspnea, but denied cough or wheezing (she denies a prior history of chronic respiratory disease, such as asthma). She said that her throat began to feel tight, and she was administered epinephrine at the immunization point of distribution (at the gym). She was then transferred via EMS to the ER for further evaluation. She denied experiencing cutaneous symptoms. She denied vomiting, diarrhea, syncope. She states that she has an allergy to sulfa drugs (she develops hives) and has an allergy to penicillin (she states that she passed out after receiving a penicillin shot as a teenager, but did not have any other systemic symptoms). |
| 1077117 | 3/5/2021 | OH | 70 | F | 3/2/2021 | 3/3/2021 | Patient reported waking up the morning after her second dose of the Moderna COVID-19 shot fine, but within 5 minutes of waking she began sweating profusely, vomited, and passed out. She reported that the sweating and nausea persisted for about a day and a half and that she is feeling mostly better today (2 days later) |
| 1077073 | 3/5/2021 | CA | 65 | F | 3/5/2021 | 3/5/2021 | Syncope, roused after roughly 4 minutes. Patient seen by MD, had juice, observed for 30 minutes, experienced dizziness, see again by MD, eventually DC to home @1100 with significant other. |

| 1076785 | 3/5/2021 | NH | 43 | F | 2/21/2021 | 2/22/2021 | 2am woke up with severe chills and a severe migraine. At 10am severe migraine progressed to skin on scalp feeling like it was pulled too tight. From there I began to feel an internal tremor in my head, almost like if you ran a jack hammer all day and then stopped, that shaky, off-kilter feeling. I used the bathroom that morning and had massive diarrhea, experience a vaso/syncope episode and passed out. All week I felt like this and experienced nausea, dizziness, heart palpitations, severe migraine, internal tremor, severe anxiety and severe thirst. By Friday, 2/26/21, it got so bad and my blood pressure dropped to 112/50, that I was taken via ambulance to the ER. They gave me IV fluids, ran labs, EKG, etc. Blood pressure went up to 137/91. Released to rehab at home. 2nd ER visit to Hospital on Sunday where they repeated labs, EKG, gave me fluids and treated symptoms. Both trips I was labeled Tachy. |
| 1076117 | 3/5/2021 | IL | 35 | F | 2/12/2021 | 2/13/2021 | intermittent episodes of subjective fever chills tachycardia nearly passing out headaches. Symptoms started approximately 9 days ago after having a second maternal vaccine. She states she is intermittently been feeling ill in terms of diffuse myalgias headaches today she had a racing heart rate and near syncope. Denies any chest pain shortness of breath abdominal pain nausea vomiting diarrhea. |
| 1076218 | 3/5/2021 | NY | 30 | M | 3/5/2021 | 3/5/2021 | Patient received dose of vaccine on right deltoid at 4:09PM at around 4:23PM developed symptoms. Symptoms described as: feeling "warmth, like if feels when you take NAICIN-flushing sensation but only minor". Other symptoms includes light rash in both arms, redness on face and arms. Excluding back, trunk and legs. Patient denies sore throat, swelling or tingling of tongue or mouth, lips. Denies drooling, no difficulty swallowing. Denies chest pain, SOB, palpitations, dizziness or light headed. No near syncope episodes. Patient refused Benadryl due to driving alone and also refused EMS to transport to ER. |

| 1072529 | 3/4/2021 | NY | 57 | F | 1/20/2021 | 2/17/2021 | Fainted; dizziness; All night she was sick; Chills; Aches; A spontaneous report was received from a consumer concerning a 57 years old, female patient who experienced chills, aches, dizziness, fainted and was sick all night. The patient's medical history was not provided. Concomitant products included cetirizine and an unspecified nasal spray for allergies. On 20-JAN-2021 the patient received their first of two planned doses of mRNA-1273 (Batch number: 012120A) on 20-JAN-2021. On 17-FEB-2021, approximately one day prior to the onset of the symptoms, the patient received their second of two planned doses of mRNA-1273 (Batch number 016M20A) for prophylaxis of COVID-19 infection. On 17-FEB-2021, the patient was sick for all night, on the same day patient experienced chills and aches. On 18-FEB-2021, the patient had dizziness and fainted. Treatment information was not provided/unknown. The patient received both scheduled doses of mRNA-1273 prior to the events; therefore, action taken with the drug in response to the events is not applicable. The events, chills, aches, dizziness, was sick all night were considered unknown. The event, fainting, was recovered on 18-FEB-2021.; Reporter's Comments: This case concerns a male of unknown age who experienced a serious unexpected event of SYNCOPES along with NS unexpected events of dizziness, illness, pain, and a NS expected event of chills. The events occurred 45 minutes after the first dose of mRNA-1273. Syncopal event reported as resolved, but other event outcomes unknown. Based on current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. |

| 1072895 | 3/4/2021 | MA | 55 | F | 1/31/2021 | 2/1/2021 | I received my second Moderna COVID vaccine on 1/31 (lot: 028L20A, exp 7/29/21) . The next day 2/1 I had a severe reaction with temps to 103, chills, rigors, nausea and vomiting. I was in the bathroom vomiting and passed out, and fell and hit my head on the tub. On 2/8 for two weeks and had residual fatigue but no other symptoms. 2/24 around 7 pm I had sudden onset of paraesthesias (pins and needles) in both feet, over 30 min it progressed up to my knees and my legs and feet were numb. The next morning I went to the ER and was admitted. |
| 1071384 | 3/4/2021 | TX | 56 | F | 2/26/2021 | 2/26/2021 | 56 year old female presents with symptoms after getting 2nd dose of Moderna Covid Vaccine. Received first covid vaccine 1/26/21, and 2nd dose 2/26/21 at 11am. 30 minutes after getting vaccine, started feeling dizzy, like room is spinning, still has dizziness constant. It is not as strong now. Denies nausea with the dizziness. 2/27 Saturday 2 am, started with vomiting and pain to the left arm where she had injection. Only had vomiting Saturday, pain to left arm stopped 8-9pm that night. Started with fever, body aches, headaches, back pain, and feeling tired since yesterday, 2/28 around 6 am. Felt dizzy and fainted yesterday when she had fever. Temp max was 101.5F. Check today 99.5F 4 hours after taking Tylenol. Today started with cough. Has no appetite. Has increased water intake. Has been taking Tylenol/ Theraflu/ ginger with lemon tea. Denies any residual swelling or redness to left arm. Denies diarrhea, loss of taste or smell, or SOB. |

| 1072900 | 3/4/2021 | CA | 77 | M | 2/10/2021 | 2/10/2021 | He received the vaccine and after 2 hours he went home and was paralyzed from the waist down. He tried to stand up and then he passed out on the floor for about 10-15 minutes. He went to sleep and woke up around 5 hours later. He then tried it again and urinated on himself and he fell down on the floor, passed out without getting up until the morning. He did call his doctor who was not available, spoke to the nurse and advised to go to the hospital. He is weak and cannot drive so he did not go to the hospital. He slept the rest of that day and the following day. Then when he saw his doctor about 2 days ago, he described his reaction and told to report the reaction and that he would report it himself. He was advised not to take the 2nd vaccination. He is no longer having the heavy reaction, his muscles are aching and his vision is blurred, especially on his back and the shoulder. His doctor did do blood work at the office visit. |

| 1071141 | 3/4/2021 | PA | 92 | F | 1/15/2021 | 1/16/2021 | <p>she had not been eating properly; she was found lying on floor of her house - likely having been there for 3 hours. Next morning found lying on the floor of the bathroom; On helping up she was confused but otherwise ok; she was found lying on floor of her house - likely having been there for 3 hours. Next morning found lying on the floor of the bathroom; This is a spontaneous report from a contactable consumer. A 92-year-old female patient received first dose of bnt162b2 (Formulation: Solution for injection, Lot number: EK1768), via an unspecified route of administration, on 15Jan2021 at single dose for COVID-19 immunisation. Medical history included t2diabetes, hypertension, arthritis, previous episodes of falling. The patient's concomitant medications included rampril, glimepiride, gabapentin, sitagliptin, atorvastatin, tolterodine l-tartrate (PREBLACON) all at unspecified doses. It was reported that on 16Jan2021 at around 6pm she was found lying on floor of her house - likely having been there for 3 hours. On helping up she was confused but otherwise ok (as reported). She remained ok for several hours before going to bed. Next morning found lying on the floor of the bathroom. It was reported that ambulance was called but did not go to hospital due to COVID risk and overcrowding. It was reported that blood sample was taken on an unknown date in 2021 and analysed. The doctor called and reported no abnormal findings in blood sample. Suggested possibility that she had not been eating properly. The outcome of the event she had not been eating properly was unknown, while for other events was recovering. The events occurred in a country different from that of the reporter. This may be a duplicate report if another reporter from the country where the event occurred has submitted the same information to his/her local agency; Sender's Comments: Based on the information currently available, a possible contributory role of the suspect drug in the reported event Syncope cannot be completely excluded given the known suspect drug profile and/or implied temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and</p> |

| 1071469 | 3/4/2021 | GA | 58 | M | 3/3/2021 | 3/3/2021 | Investigators, as appropriate. After developing soreness at the injection site about 6-8 hours post injection, I developed chills and thirst, at 4:30am I got up to go to urinate and afterward I was feeling light headed. I sat on the edge of the tub. After a couple of minutes I went to get up and fainted on the floor. My BP was 89/49 with a pulse of 86bpm. I was helped off the floor and back to bed where I lay with my feet elevated by a couple of pillows. No further issues at this time. |
| 1073852 | 3/4/2021 | MO | 66 | M | 3/4/2021 | 3/4/2021 | Customer had a vasovagal rx nearly immediately after receiving vaccine at approximately 1210. pulse of 50 when taken. Drooling, diaphoretic. unable to arouse when calling his name. did sternal rub, moved patient head to upright position and customer started to waken. asked for cold water and drank readily. started to ask coherent questions. sat with patient approximately 20-30 min before allowing him to leave.. He told us after the fact that he has passed out before when giving blood. Must lie down when giving blood or shots. He was not concerned because he has experience this same reaction . Pt left on his own accord at 1300. Did not tell staff of this problem before he got the vaccine. |
| 1073129 | 3/4/2021 | NY | 78 | M | 2/17/2021 | 2/27/2021 | Saturday 02/27 thru this morning: Low pains in upper left chest / Low pains in middle of left side of back Tuesday 03/02/2021: Headache and pain in left eye / Sitting watching tv on Tuesday 3/2/2021 and almost passed out Have never experienced anything like this before so think it may be vaccine related. Then saw the news report about women getting false positive mammogram results only on the same side they had their vaccine in and that seems to be the case with my events - all on left side. |

Blood pressure dipped down to 60/42 ...Ambulance came. EMT measured the blood pressure... 60/42 Was taking Tylenol 2 tablets of 500 mg. (max out) Fever will go down for an hour but would be back with extreme chills. Symptoms Fever, chills, body aches persisted for 30+ hours. |
| 1073427 | 3/4/2021 | NM | 41 | F | 3/4/2021 | 3/4/2021 | Pt was given shot and told to sit for 30 minutes since she put on information form that she has fainted or felt dizzy after shots. All of a sudden she just fell over and both ran out to help patient. We held her head and talked to her to see if coherent, then we took blood pressure which was 110/90 which was normal for pt according to husband. We monitored patient for several more minutes and she said she felt fine. Her and husband walked out after about 20min or so. |

| 1073431 | 3/4/2021 | NJ | 56 | M | 3/3/2021 | 3/4/2021 | <p>According to NJIIS registry, patient received Moderna dose 1 at "Rite Aid 00994" on 3/3/2021. Patient arrived in ED on 3/4/21 at approx 9AM via ambulance. ED physician note: "56-year-old male brought in by EMS intubated with CPR in progress. It was reported that he arrived to work and then passed out. CPR was initiated almost immediately. BLS determined that he was pulseless and AED was applied. He was defibrillated twice. He was then intubated by ALS and administered epinephrine twice with return of spontaneous circulation. He maintained a pulse for approximately 20 minutes when he again developed cardiac arrest. ACLS guidelines were again initiated and there was no return of pulse for approximately 20-25 minutes until he arrived in the emergency department. Emergency department CPR was continued and he was administered an additional epinephrine with return of a pulse. Is reported that he had no complaints prior to the event." Patient was intubated and ventilated, started on norepinephrine drip in ED. Twelve-lead EKG demonstrated right bundle branch block with left posterior fascicular block and diffuse QRS widening and diffuse repolarization abnormalities. Family consented to Cath Lab. Per Interventional Cardiologist note: "1. Angiography demonstrated proximal to mid LAD hazy 90-95% lesion likely culprit for cardiac arrest. 1 stent placed. 2. Diffuse distal right coronary disease that is likely nonculprit for cardiac arrest. 3. Left ventriculography demonstrated severe anterior wall hypokinesis with overall left ventricular ejection fraction of 40%. 4. Patient electrically and hemodynamically stable. Levophed has been stopped. Amiodarone bolus given in the Cath Lab for frequent ventricular ectopy. No drip was continued due to resolution of ectopy. 5. Dyslipidemia he will be on high-dose statin therapy. 6. Diabetic management as per primary team. 7. Quad-Lumen placed by me. Hypothermia protocol to be initiated in the ICU given GCS score less than 8 with no purposeful movements. Head CT scan completed before cardiac catheterization that demonstrated diffuse cerebral edema. 8. Prognosis guarded and likely poor. The next 24 to 40 hours will be critical. Family was updated in detail." Patient transferred to ICU post Cath Lab. Remains intubated, ventilated in ICU.</p> |

| 1073438 | 3/4/2021 | CA | 44 | F | 1/12/2021 | 1/13/2021 | I had Covid-19 in December 2020. On the following day of my first vaccine, in the middle of the night, I experienced chills, body aches. At 7am the next day I woke up feeling light headed and passed out. When I woke up I had thrown up on myself and started to hear a whooshing sound in my ears and I went back to bed. At 9am my symptoms started all over again. I live with my house maid and since I did not look well, she took me to urgent care. My BP had dropped and I was super dizzy. I got an IV drip for an hour, anti-nausea medication. My blood was also drawn and found to have underlying anemia. My urine test was negative. The pulse oximetry was fine and by the next day I slowly started to feel better. |

| 1073516 | 3/4/2021 | SC | 73 | F | 1/26/2021 | 1/26/2021 | <p>food poisoning; First got really sick; nausea/She got sick to her stomach; head colds/feels like coming down with a cold; Feeling unwell/she wasn't feeling well; Dry heaved for 40 minutes. Saliva in her stomach was coming up, not food. Felt like it lasted forever.; sinus problems.; vomiting; Pain injection site; Slight headache; Chills, feels like coming down with a cold; Tired; This is a spontaneous report from a contactable consumer (patient) via Medical Information Team. A 73-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: RL3249), via an unspecified route of administration at left arm on 26Jan2021 14:00 (also reported as 17Jan2021 - pending clarification) at SINGLE DOSE for COVID-19 immunisation. The patient had no prior vaccinations within 4 weeks. Medical history included diabetes, cancer (prior to receiving COVID-19 shot. Stated she was 14 years cancer free), allergy, shingles shot which hurt at the injection site, shrinks every year (Doesn't know exact number, but a little under 5 feet). The patient had no family medical history. Concomitant medication included mometasone furoate (FLONASE [MOMETASONE FUROATE]). On an unspecified date, the patient experienced she got sick to her stomach, food poisoning, "nausea/She got sick to her stomach," "head colds/feels like coming down with a cold," "feeling unwell/she wasn't feeling well," "dry heaved for 40 minutes. Saliva in her stomach was coming up, not food. Felt like it lasted forever," sinus problems, vomiting, and first got really sick. On 26Jan2021, the patient experienced tired, slight headache, chills feels like coming down with a cold, and pain injection site. The patient reported that she received the first dose of the Pfizer vaccine and experienced side effects including nausea, head colds, and sinus problems. She was concerned that this may be covid and if it will be safe for her to get the second dose of the vaccine as scheduled. The patient further reported that she first got really sick. Never had the flu and always gets head colds or food poisoning on an unspecified date. After reading material passed out, perhaps she was treating COVID and not a cold or allergy. The patient took first COVID-19 shot on 26Jan2021. Thought everything was fine. The patient was close to bedtime then noticed she wasn't feeling well. Looked at side effects and has</p> |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

like six of them at the same time. Right as she was going to rest, she got sick to her stomach. Never was sick to her stomach except when she was food poisoned. The patient had dry heaved for 40 minutes. Saliva in her stomach was coming up, not food. Felt like it lasted forever on an unspecified date. The patient asked that if she does have COVID, should she take the second shot? Wanted to get tested because Pfizer materials says exactly what her headache and sinus stuff was about. Now she was scared. The patient also reported that she wanted to take the second COVID-19 shot. If she does have COVID, thinks it's not the thing to do right now. It was confirmed she has not had a positive COVID test after receiving the first COVID-19 shot. Should have read material prior to and maybe wouldn't have taken the first COVID-19 shot. Confirmed symptoms she mentioned occurred after the COVID-19 shot. The patient came home from COVID-19 shot feeling fine. Didn't get sick until close to bedtime. Appointment for COVID-19 shot was 2:30PM. Clarified six symptoms previously mentioned: The patient had pain at injection site just two days and was gone. Began shortly after she got home from the COVID-19 shot. Went to lift arm up and it didn't feel good. Began an hour or two after COVID-19 shot. The patient was tired unusually early in the day. Felt like she didn't want to do anything. Couldn't use her left arm. Clarified left arm was injection arm. Tiredness has subsided and only lasted a couple of days. It was further reported that patient never gets headaches. It started after vomiting which didn't last long. It bothered her and then was gone by the time she went to sleep. The patient had chills, feels like coming down with a cold on an unspecified date which subsided right before dinner around 3PM-4PM. The patient had to put on a fluffy robe to keep warm. It was also reported that the patient did not have a fever. It was also reported that shingles shot hurt at injection site where pain lasted a week and a half. Temperature went from 98.6 degrees to 99 degrees. The patient was taking stuff now and monitoring to see if she can see any signs. The patient was feeling unwell on an unspecified date which has subsided except for allergies and she was concerned. The patient also experienced dry heaving: didn't have anything in her stomach on an unspecified date which subsided. Even after she ate yesterday, hasn't had any dry heaving except for night of

| 1069010 | 3/3/2021 | CA | 40 | F | 3/2/2021 | 3/2/2021 | At roughly 9:00pm I was scrolling through my phone when it became very difficult to focus and I felt nauseous. I got up to go to the bathroom and became extremely dizzy and my heart felt like it was going to beat out of my chest. I was having difficulty breathing and felt disorientated. I crawled up the stairs and when I reached the top I stood up to walk and promptly fainted/passed out. According to my husband I was out for roughly 30 seconds. He described my body as completely tense (formed fists, shaking). I don't have any recollection of passing out. When I came to I was overwhelmed with nausea and immediately vomited. I was sweating profusely and struggling to breath. After I vomited, within minutes (less than three) I felt fine. My heart rate returned to normal and I wasn't dizzy or nauseous. |

| 1069050 | 3/3/2021 | OH | | F | 1/28/2021 | 1/1/2021 | <p>passed out; almost delirious; couldn't lift leg; pain went all the way down left side of body; sweating; chills; felt heavy weight on chest; left leg hurting so bad like a charley horse; weak all over; allergic reaction; pain in left arm at injection site; felt extremely tired; A spontaneous report was received from a consumer, via notification from another manufacturer, concerning a 79 year-old female patient who experienced an allergic reaction (hypersensitivity); passed out (loss of consciousness); almost delirious (delirium); couldn't lift leg (femoral nerve injury); pain radiating down leg (pain); sweating (hyperhidrosis); chills; heavy weight on chest (chest discomfort); leg hurting like Charlie horse (muscle spasms); weak all over (asthenia); pain in left arm where she got the shot (injection site pain); felt extremely tired (fatigue). The patient's medical history included sinus issues and drug allergies to glycopyrrolate, sulfa, meloxicam, erythromycin and azithromycin. The patient stated that she had a long list of names and ingredients of things she is allergic to. Products known to have been used by the patient, within two weeks prior to the event, included Amiodipine. On 28 Jan 2021, approximately 12 hours prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number: 028120A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. The patient reported that she received the vaccine dose around 12:00 or 12:30 pm. The patient reported that she woke up with extreme pain in the left side and in the left arm where she got the shot. The pain went all the way down her body and she reported it as severe pain. She reported that the pain would not go away. The patient reported that she started sweating, had chills, and she felt heavy like a weight on her chest, but she was breathing okay. Her leg on the left side started hurting so bad that it was like a big Charley horse that would not go away. She got out of the bed and tried to see if she could stand on it, but she could not. She tried to rub it, but it did not help. She tried to walk on it, but by that time she was almost delirious. She was sweating so bad and she was weak all over. She had become extremely tired and she ended up laying on the floor because she could not get her leg to lift in order to get back in the bed so she just laid on the floor. By that point, she did not know if she had passed out or fallen asleep, but she does not</p> |

| 1069062 | 3/3/2021 | MS | 34 | F | 3/1/2021 | 3/1/2021 | <p>think she fell asleep because it was too much pain to sleep. When she woke up and came to, the pain in her leg was gone. However, she was still sweating. She could not get back in the bed. The following morning, she was extremely weak and tired. She still felt heavy on her chest like something had been pushed on her. She was hurting, weak, and tired, but the pain was not extreme like it had been that night. She clarified the time of onset for this event was around midnight, but she could not look at the clock to confirm the exact time. She reported the event either started the night of 28 Jan 2021 or early in the morning hours of 29 Jan 2021. She called her doctor, Moderna, and the pharmacist to ask about the ingredients of the vaccine. Treatment information was unknown. Action taken with mRNA-1273 in response to the events was withdrawn. The events, passed out and pain in left leg, was considered resolved the following day. The events of sweating, weakness, tiredness, and heavy chest was improved the following day. The outcome of the events, allergic reaction, delirious, pain in left arm, pain in left side of body, chills, couldn't lift leg, was unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.</p> <p>Patient fainted after receiving the vaccine and regained consciousness after 30 seconds. She was sitting and was laid down in the counseling room with her feet elevated for approximately 10 minutes. She was given food and water and moved to the sitting area where a ride came to pick her up.</p> |

| 1069304 | 3/3/2021 | CA | 65 | M | 3/3/2021 | 3/3/2021 | <p>Patient received his first Pfizer COVID vaccine on 3/3/21. Patient was conscious with no apparent issues after administration. Patient was asked to sit down for 15-minute observation afterwards. A few minutes later patient was swaying back and forth in his chair and saying he was feeling faint. I repeatedly addressed patient by his first name and asked if he could hear me and repeatedly asked if he was okay. Patient began slumping down in his chair but was still conscious. Patient was not responsive but made eye contact with me. Patient requested water. After giving patient water and observing him drink he began looking nauseous and threw up. Patient then passed out in his chair. I supported the patient upright in his chair and made sure he did not fall down or injure his head. I then immediately tapped him on both shoulders and repeatedly called his name. Patient then became responsive and 911 was called. While waiting patient said he was starting to feel better and was able to support himself in his chair. I did not observe any injuries due to fainting. When the ambulance came patient agreed to be taken to the hospital.</p> |

| 1069465 | 3/3/2021 | LA | 78 | M | 2/5/2021 | 2/24/2021 | <p>March 3, 2021 SUBJECT: Moderna COVID-19 Vaccine, Side Effects This letter/email is addressed to a number of individuals with a request that you seriously evaluate the below discussion, take action to alert medical staff of your respective agencies of these side effects, and work with the manufacturer, Moderna, to address them. As the recipient of them it has thus far been debilitating and interfered with my daily activities. It is my hope that the medical community can find ways to prevent or treat them such that daily activity can be unimpeded. I will first provide a chronology of my medical history and my Moderna vaccine experience. Then I will discuss my observations. My medical history: Age: 78 Gender: Male Pre-existing Conditions: Medications Hypertension: Blood pressure medication, 50 mg of Metoprolol Succinate ER daily Cholesterol: Atorvastatin, 40 mg daily Medical History 2018: Triple By-Pass Surgery 2019: Passed out, Hit head on falling, Brain bleed: Subdural Hematoma, Hospitalized: No surgery required and released. Subsequently, pacemaker installed. 2021: Moderna COVID-19 Vaccine administered. First Dose: Lot Number: 011J20A, Date: 01/08/2021, Clinic Site: Pharmacy Second Dose: Lot Number: 032L20A, Date: 02/05/2021, Clinic Site: Pharmacy Side Effects to Moderna Vaccine administration First Dose: Administration Site: Swelling, Site Redness and Fever. All dissipated within week after administration Second Dose: Fever and Chills day following administration. Lethargic for several days following administration. These symptoms disappeared. Observations February 24, 2021: Began to experience dizziness, symptoms progressed to mild vertigo. Based on history of presentation of these symptoms, assumed I had an inter-ear problem and began taking Zyrtec D, half a tablet. Experience with Zyrtec D has been that ear dries out and symptoms of dizziness and disorientation disappear. In this case the symptoms of vertigo progressed to the point of difficulty in walking and loss of balance. Stopped taking Zyrtec D on Friday, February 26th. February 26, 2021: Had more severe vomiting, walking difficulty and lose of balance. Used walker to stabilize walking. At approximately 7 to 7:30 PM, following consultation with wife and daughter, decided to go the emergency room of the Medical Center (MC). Was quickly seen by emergency room staff. Following questions on medical</p> |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

history, the ER doctor, based on head bleed history, I believe, had a CT conducted. I do not recall any questions about COVID-19, but do think we told them that both myself and my wife had been vaccinated for COVID-19. I specifically recall that prior to my transport, a nurse came in to do a nasal swab for COVID-19. I informed her that I had been vaccinated, but she said this was a requirement for admission to the location where I was being transported. Following the CT scan, the ER physician determined he believed there was a possibility of a small new brain bleed. At approximately 2 to 2:30 AM I was transported by ambulance to Health Center at approximately 5:00 AM. I am not certain about the exact times here. February 27, 2021: Health Center administered a number of tests including CT scan, EKG, and an echocardiogram. While there, physical therapists came to see me twice and exercised me to improve my balance and walking ability. The last one recommended exercises to help reset my vestibular system. Based on the administered CT scan there, the physicians saw no evidence of a new brain bleed and were prepared to release me. At the time of that discussion in my room, the attending nurse pointed out to the physician there that my blood pressure was elevated. He ordered a new EKG and deferred on releasing me until a cardiologist reviewed the results. Their concern was that I was experiencing episodes of atrial fibrillation (AFib). Subsequently, the cardiologist reviewed the new EKG and concluded the episodes were within the normal range, my understanding, but did note that my heart rate was elevated. At no time did the medical staff raise or question the possibility of COVID-19 side effects as being a possible explanation for my disorientation or heart rate problem. I was released later that day. February 28, 2021: While speaking to her sister, my wife shared with her my experience of dizziness and disorientation. Her sister related that her husband had and was experiencing a similar event. Further, her husband's sister had experienced a similar event. Additionally, the husband's sister had experienced vertigo. On further discussion it was determined all three of us had received the Moderna Vaccine, and approximately three to four weeks post second dose administration, developed these symptoms of vertigo. This prompted me to go to the internet for information on

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

vaccine side effects. The Food and Drug Administration Fact Sheet, revised 12/2020 in the Section Titled: What are the risks of the Moderna COVID-19 vaccine? speaks of severe allergic reactions including: a fast heartbeat and dizziness and weakness. I believe that I have suffered these two reactions. March 1, 2021: Called both hospitals to alert them to inform their respective staffs of the need to question the possibility of these side effects should other patients present in their emergency rooms. In my case, it may have helped to alleviate my concerns had I been informed of these possible side effects. At MC I left a voice mail for the Chief Medical Officer and at Health Center I spoke to the Nursing Supervisor. The nursing supervisor advised me to report my side effects and directed me to call the entity who had administered the vaccine doses. I called the Pharmacist and spoke to her. She said she would report my concerns through her reporting system. Further she informed me that there was a medication my primary care provider could prescribe. I called my primary care provider, and he has prescribed Meclizine, 25 mg tablets. I am currently taking ½ tablet, three times per day. A whole tablet made me drowsy. As of today, March 3, 2021, I am still experiencing disorientation. Hopefully this will subside and disappear. The above discussion is provided to assist medical professionals to further assess the side effects of the Moderna COVID-19 Vaccine. I am glad that I received it. I have no complaint about the care I received at the two medical facilities referenced. In fact, I think it was excellent. However, it would have helped me to have raised by either or both of them that my symptoms may have been COVID-19 Vaccine related. Further, it may have changed how they proceeded in assessing my situation. As an industrial hygienist with statistical training, it seems to me somewhat unusual to have three members of my extended family experiencing similar dizziness and weakness side effects, and for us all to have similar time periods following the administration of the second dose. Perhaps, if related to the vaccine, this cluster would suggest that this side effect may be more common than a ?remote chance.? Should any of you have further questions or wish to speak to me, please do not hesitate to call. Since I get a lot of calls from numbers I do not recognize, I do not always answer, but a voice mail left

| 1068364 | 3/3/2021 | WV | 63 | F | 2/12/2021 | 1/13/2021 | All hair has fallen out; Heartburn; Nausea feeling; Passed out; Wasn't feeling right after dose; Face was tingling; Burning feeling in head; A spontaneous report was received from a Consumer regarding a – 63Years-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced events like passed out, Wasn't feeling right after dose, face was tingling,bBurning feeling in head, devastated about hair loss after 1st dose, Heartburn and Nausea. The patient's medical history was not reported. Relevant concomitant medications were reported like amitriptyline, duloxetine, gabapentin, metformin, Nexium, hydrocodone, potassium, Proair, ropinrole, simvastatin, spironolactone, Topamax, vitamin d, vitamin b12. On 12-Feb-2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot/batch:030m20a) intramuscularly for prophylaxis of COVID-19 infection. On 12- Feb-2021, the patient experienced the event like Passed out. On an unknown, date the patient experienced events like Wasn't feeling right after dose, Face was tingling, Burning feeling in head, Devastated about hair loss after 1st dose, Heartburn nausea feeling and Nausea. Laboratory details not provided. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the events Passed out, Face was tingling is resolved. The outcome of the events Devastated about hair loss after 1st dose is Recovering/Resolving. The outcome of the events like Wasn't feeling right after dose, Burning feeling in head, Heartburn nausea feeling and Nausea are unknwn; Reporter's Comments: Based on the information provided which includes a strong temporal association, a causal association between the reported events and the administration of the mRNA-1273 cannot be excluded. Nausea is consistent with the known safety profile of the vaccine. |

| 1069632 | 3/3/2021 | MN | 55 | M | 3/2/2021 | 3/2/2021 | Presented to ED for evaluation of generalized lower extremity weakness, falls. The patient states that he carries a diagnosis of MS and typically is fully functioning without assistance of a cane or walker. The patient states that yesterday morning around 0900 he received the second dose of his Moderna COVID-19 vaccine and was otherwise feeling fine but by last night (12 hours after the vaccine) the patient states he tried to get out of bed and was transferring when he felt his bilateral legs give out, causing him to slide to the ground. His wife then came to help and states that the patient was completely weak in the legs, and was unable to even lift his legs up to get back into bed. They then tried to walk him again a short time later and he again stumbled with weakness in his legs. Since that time, the patient states he has been minimally ambulatory and has been using a cane, but still needs large assistance to get around his home. The patient states he has baseline foot drop but feels this is worse in his legs today. He went to clinic this morning for his symptoms where he was noted to have an elevated temperature and was diffusely weak in his lower extremities. Given this, the patient was referred to the ED for further evaluation. The patient denies any weakness in his upper extremities or facial asymmetry. He denies sensation change in his extremities nor any recent illness such as cough, shortness of breath, chest pain, sore throat, nausea, vomiting, urinary symptoms, or leg pain. He has no history of stroke. He denies any injuries or head injury, syncope from his falls. He was admitted to the hospital where he will receive further symptomatic treatment as necessary. No treatment provided in emergency department for weakness. |
| 1070910 | 3/3/2021 | IN | 19 | M | 3/2/2021 | 3/2/2021 | Vaccine was administered to patient. Within 10 minutes of administration, the patient had an episode of syncope and fell out of his chair. I immediately went out to help the patient and a technician called for EMS. The patient woke up within 2 minutes and reported feeling dizzy, tired, and numb. While waiting for EMS to arrive, the patient was situated in a sitting position and I continued talking to him to keep him awake. EMS assessed him and took him out to the ambulance to wait for a relative to come. It is unknown if the patient went to the emergency room or not. |

| 1065138 | 3/2/2021 | | | F | 2/11/2021 | 2/12/2021 | hard of hearing; rash; faint; being hot; short of breath; headache; was achy; extremely tired/extremely exhausted; This is a spontaneous report from a contactable nurse (reporting for mother). An 89-years-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection, lot number and expiry date not reported), via an unspecified route of administration on 11Feb2021 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The first dose of BNT162B2 as COVID-19 immunization was received on an unknown date. Reporter was calling regarding side effects of the Pfizer COVID vaccine. Reporter stated that her mother (patient) is 89 years old and her mother was hard of hearing since an unknown date. Her mother got the second dose of the product 11Feb2021 and she was fine that Thursday, and by Friday (12Feb2021) her mother had a headache, was achy, and extremely tired. On Saturday, her mother felt a little bit better. On Sunday (14Feb2021), her mother had an episode of being hot and faint, and short of breath and extremely exhausted. This morning (15Feb2021), her mother was experiencing shortness of breath, and a rash and was exhausted. Reporter wa wondering if shortness of breath could be a side effect of the product. The outcome of the events headache, achy, and "extremely tired/extremely exhausted" was recovering, while for events hard of hearing, being hot, faint, short of breath and rash was unknown. Information about lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported event syncope cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate. |

| 1066333 | 3/2/2021 | DC | 83 | F | 2/25/2021 | 2/26/2021 | Got the vaccine and was feeling tired, and her arm hurt, an all she wanted to do was lay in bed with her heating pad. The following day she woke up with a headache, some nausea but nothing came up. She also had diarrhea and her arm was sore. She felt weak, and since she had COVID she has had shortness of breath. She stayed in the bed all day unless she had to as her arm felt like it was made of metal and was extremely tired. She was moving around upstairs and somewhere around 8:00 PM she went to the bathroom, was sweating profusely and wiping herself with tissue, and apparently turned out the light and apparently passed out as she woke up on the floor in the hallway and could not get up right away. She could not use the left arm, was able to get herself up with the help of the door to stand on her feet. She walked into her room and sat on the bed, and did not lay back down and grateful that she did not fall down the steps. She went back to bed, but in the morning she was terrified and her family heard her talking to the doctor on call who told her to go to the ER. In the ER they told her that she had syncope, seen by Dr. at Health Care. She was admitted at 11:11 AM on 2/27/21. She was given IV, had a CAT scan of her head, told her that it did not reveal any blood. After several hours they discharged her. She called her doctor and she has an appointment tomorrow morning. She is feeling tired, not sleeping well. |
| 1066295 | 3/2/2021 | FL | 58 | F | 3/1/2021 | 3/1/2021 | 58 F with complicated medical history including urostomy, frequent UTI, fibromyalgia, seizures, presenting to the ED for presyncope/seizure following a COVID vaccination today. She reports that after getting the vaccine she felt dizzy. she is able to recount the events, no tongue biting. She was given diazepam via EMS en route. Has not missed any doses of medications. No other complaints. Symptoms started following the COVID vaccination and no other symptoms today. |

| 1066278 | 3/2/2021 | MO | 55 | F | 2/19/2021 | 2/19/2021 | Per patient's report: She received her first dose of Pfizer COVID-19 vaccine and developed soreness at localized injection site and felt sleepy, otherwise no adverse reaction signs or symptoms patient reported. On 2-19-21 at 2:30 PM she received her second dose of the Pfizer COVID-19 vaccine at a mall. She reports the lot number of the vaccine was EL9269. She was monitored for 15 minutes after receiving the second dose. She and her husband left and took the car to a car wash where she fell asleep on her way home and her husband woke her up when they got home. At about 320 or 3:25 PM, she noticed that her face felt puffy and she had a sensation that her face was sliding down, she developed tongue swelling, blurry vision, dizziness, and she reports that she was talking funny/slurring her words. Her husband got a flashlight and looked in her throat and said that her throat was swelling. She felt like falling asleep. Her husband used her EpiPen on her. The EpiPen worked right away to improve the symptoms. She took no other treatments at home. Her husband drove her to the hospital where she slept the entire way. She never developed rash, flushing, skin itching, wheezing, coughing, chest tightness, shortness of breath, nausea, vomiting, diarrhea, fevers, chills, or joint pains. She does not know if she passed out, she states it was hard to stay awake. She reports having some abdominal cramping and churning for the following 2 to 3 days afterwards. She was discharged from the hospital ED where she was never admitted. They gave her an albuterol inhaler to use every 4 hours for 6 days after she left the ED. She went home at about 10:00 PM and went to bed about 10:30 PM. She woke up at 3:00 AM crying and then fell back asleep and woke up again around 7:30 AM. She did not develop any local injection site reactions on her arm this time. |

| 1065918 | 3/2/2021 | TX | | F | 1/4/2021 | 1/1/2021 | Was found by her family after collapsing on 06Jan2021 /syncope; extreme fatigue; sleepiness; headache; vomiting; weakness /notes 3/5 strength; difficulty speaking /speech disorder /vocal weakness; difficulty walking /gait disturbance; lower extremity weakness /progressive lower extremity /Muscular Weakness; hyporeflexia; Vitamin B12 Decreased; difficulty speaking /speech disorder /vocal weakness; This is a spontaneous report from a non-contactable consumer (patient). A (age: 39; unit: unknown) female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot: EJ1686), intramuscularly at left arm on 04Jan2021 at single dose for covid-19 immunisation. Medical history included hypothyroidism, attention deficit hyperactivity disorder, shellfish allergy. Current illness was none. Concomitant medication included levothyroxine, lisdexamfetamine mesilate (VYVANSE). The patient previously took ceclor and experienced drug hypersensitivity, took first dose of bnt162b2 at single dose for covid-19 immunisation and experienced mild symptoms after the first vaccination, but no neurologic or vascular symptoms at that time. Patient experienced extreme fatigue and sleepiness the day following her second vaccination for Covid 19 and was found by her family after collapsing on 06Jan2021 at 05:30. Upon arousal, she experienced headache, vomiting, weakness, difficulty speaking and difficulty walking with lower extremity weakness. She was taken to urgent care and subsequently admitted for evaluation at hospital and found to have a normal chemistry, blood count, normal lumbar puncture and normal imaging of her neck and brain. Discharge summary notes 3/5 strength and hyporeflexia throughout. Patient had tele visit consult with Psychiatry and Neurology. She was subsequently to be discharged to a Facility without explanation for her sudden onset of progressive lower extremity and vocal weakness. Symptom: Asthenia, Blood Thyroid Stimulating Hormone Normal, Computerized Tomogram head, Computerized tomogram head normal, CSF cell count normal, CSF culture, CSF protein normal, fatigue, full blood count normal, gait disturbance, headache, Hyporeflexia, Lumbar Puncture Normal, Metabolic Function Test Normal, Muscular Weakness, somnolence, speech disorder, Spinal X-Ray Normal, syncope, Vitamin B12 Decreased, vomiting. |

| 1065142 | 3/2/2021 | MA | 29 | M | 2/10/2021 | 2/12/2021 | syncope; pleurisy; difficulty breathing; Flu-like symptoms; fever; chills; muscle and joint aches; muscle and joint aches; persistent headache; This is a spontaneous report from a contactable health care professional (patient). A 29-year-old male patient received the second dose of BNT162B2 (Pfizer-BioNTech COVID-19 vaccine, lot number: EK4176) in the hospital, via intramuscular route on 10Feb2021 at 10:30 at a single dose on the right arm for COVID-19 immunization. Medical history included Non-Hodgkin's lymphoma from 2010 to 2011 and allergies to penicillin on an unknown date and unknown if ongoing. Prior to vaccination, was the patient not diagnosed with COVID-19. The patient's concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not receive any other medications within 2 weeks of vaccination. The patient received the first dose of BNT162B2 (lot number: H9899) in the hospital, via intramuscular route at 01:15 PM on the left arm for COVID-19 immunization. Since the vaccination the patient has not been tested for COVID-19. It was reported that on 12Feb2021 at 08:00 PM (also reported as '3 days after injection') the patient experienced flu-like symptoms that included fever, chills, muscle and joint aches, and a persistent headache. On 13Feb2021 (also reported as 'on the 4th day', the patient developed pleurisy and difficulty breathing and had 2 syncope events the morning of 14Feb2021 (also reported as 'on the 5th day'). The patient was taken by ambulance and admitted to ER for further testing. It was determined that all symptoms likely related to the second dose of the COVID-19 vaccine recently received. Pleurisy persists one week following vaccine dose. The patient went to the emergency room/department or urgent care due to the events. As treatment for the event, the patient was monitored and given IV fluids over 12 hour stay in CDU. The outcome of the events was recovered with sequelae (reported as recovered with lasting effects). The events were reported as non-serious.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship and current known drug safety profile. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures |

| 1065380 | 3/2/2021 | NY | 82 | M | 2/13/2021 | 2/14/2021 | <p>Passed Out; Felt really bad and weak; Achy in his shoulders and neck; Chills; Temperature started at 99.6 then 100-101F; Burn really bad when he urinated; Traces of blood in urine; Threw up really bad; Fatigue; Joint Pain; Nausea; A spontaneous report received from a Consumer concerning, 82-year-old male patient who received first dose of the Moderna COVID-19 vaccine and experienced a lot of incidences. /MedDRA PT: [Incidences] The patient's medical history included Type 2 Diabetic. Patient's concomitant included Metformin 500mg daily. On 13FEB2021, the patient received their 1st dose of the two planned doses of mRNA-1273 in right arm (Batch #: 011M20A) intramuscularly for prophylaxis of COVID-19 infection. Patient friend stated he got the Moderna vaccine on 13FEB2021 at 2:30pm in the right arm. He urinated fine at church the next day on 14FEB2021. At 2:30pm, Patient friend stated he started feeling bad and weak and could barely unlace his shoes. Patient friend stated that he had achy in his shoulders and neck, and chills. Patient friend stated he is a type 2 diabetic and he thought his blood sugar was very high and took a 500mg metformin (usually takes it once a day). Patient checked blood sugar which was 99 (low for him). Patient friend stated that she gave him apple juice to bring it back to normal. Patient friend stated his temperature started at 99.6F and an hour later it was 100-101F. Patient was told by HCP to take Tylenol. Patient friend stated that he had burning and traces of blood in his urine. Patient friend stated that the second time he urinated; it was less burning. Patient friend stated that he had severe vomiting and passed out. Patient went to bed at 7PM and then at 8:45PM, without the Tylenol, temperature went back to 99.6F. Patient friend stated that he feels completely fine now. Patient friend stated that she only gave him only two 500mg Tylenols for the whole 24 hours of the reactions. Patient friend stated that he had other symptoms including fatigue, muscle pain, joint pain, chills, nausea, vomiting, and fever but no headache. Patient friend would like to know if the Moderna COVID-19 do something to his kidney or bladder? Patient friend would like to know if he should get the second Moderna COVID-19 vaccine. However, the patient still would like to get the second vaccine to be protected from COVID-19. Patient was treated with 1 500mg Metformin and 2 500mg Tylenols. Action taken</p> |

| 1067250 | 3/2/2021 | | 28 | M | 1/8/2021 | 1/8/2021 | <p>with mRNA-1273 in response to the event was not provided/unknown. The outcome of the event was unknown/not reported.; Reporter's Comments: This case concerns an 82-year-old male who experienced a serious unexpected event of Loss of consciousness along with NS unexpected feeling abnormal, dysuria, blood in urine, and NS expected fever, chills, myalgia, arthralgia, nausea, vomiting, fatigue. Event onset 1 day after the first dose of mRNA-1273. Treated with Tylenol. Based on current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.</p> <p>This is a 28 Years old Male presenting for initial allergy evaluation. Patient reports he received his first COVID vaccine (Moderna) on base on 8 Jan 2021. Was in his usual state of health. Waited 15 minutes without adverse reaction. About 35-40 minutes after vaccination while driving home, felt like his tongue was bigger inside his mouth. Patient's wife is a nurse, looked in his mouth, also felt the tongue and uvula were swollen. He did think his airway was compromised. Also had fever about 7 hours after the shot (~100F) resolved with Tylenol. Admits to soreness at injection site and generalized arthralgias for 2 days after injection. Denies associated lightheadedness, syncope, shortness of breath, wheezing, cough, urticaria, conjunctivitis, rhinitis, vomiting, abdominal pain or diarrhea. Swelling persisted 1.5-2 hours and spontaneously resolved. Did not seek medical attention. Presented to POD for second COVID vaccine dose (due 5 Feb 2021) and was turned away after mentioning his symptoms and was recommended to follow-up with the clinic. He has never experienced swelling before. Vaccines are otherwise up to date; has tolerated all other vaccines. Denies a history of anaphylaxis. Denies adverse reaction to any prior medications. Denies a history of adverse reaction to venom and latex. States gluten sensitive (bloating, diarrhea after ingestion). Denies a history of food allergies. Reports he is allergic to cats and has seasonal allergy symptoms controlled with Benadryl PRN. Denies a history of adverse reaction to polyethylene glycol (PEG), a polysorbate, or polyoxyl 35 castor oil containing injectable or vaccine. Takes an OTC stool softener PRN containing docusate and sennosides.</p> |

| 1066927 | 3/2/2021 | CA | 79 | F | 3/1/2021 | 3/2/2021 | After awakening at 11p.m., 1a.m. , and 3:00a.m. , I was off balance and found myself on the bathroom floor. I must have passed out but don't remember how. I had no injuries that I could see. I lay there for a while. I carefully got up and crawled back into my bed. I lay there until about 6:00 a.m. I again carefully arose, and I felt OK. |
| 1066952 | 3/2/2021 | MI | 39 | F | 3/2/2021 | 3/2/2021 | Patient got the vaccine and within minutes she became gray in color, limp, and her head went down. she then started to take deep breathes and her body stiffened right up and she stopped breathing for a second. we called 911 as soon as we noticed something was off with her. When she came to a few minutes later she knew she passed out but that was it. she did not go with the EMS, another staff member took her to the ER. |
| 1066997 | 3/2/2021 | IL | 33 | F | 2/11/2021 | 2/12/2021 | I received the vaccine at approximately 1245 on February 12, 2021. Approximately 12 hours later I got up in the night. I experienced ringing in the ears, sharp intense headache, blurred vision. Experienced confusion. Fainted. Asked my husband to get me Benadryl. Took 50 mg of Benadryl and slept for another 5 to 6 hours. I experienced body aches, chills, headache, heart palpitations, intermittent blurred vision for 4 to 5 days afterwards. |
| 1062713 | 3/1/2021 | IL | 44 | F | 2/26/2021 | 2/27/2021 | About 12 hours after the shot, I started running a fever and was very achy. It got progressively worse. Around 4:15 am I got up to use the restroom and I passed out. My husband was able to get me to regain consciousness. I then passed out again after about 10 minutes. We then went to the ER because I had a laceration on my eye, and head pain from hitting my night stand, wall, and floor. |

| 1062678 | 3/1/2021 | CT | 60 | F | 2/9/2021 | 2/9/2021 | <p>About an hour after receiving the vaccine my arm was very sore, it felt like someone punched me in my arm. That night I couldn't lift my arm. I took Tylenol and put on ice on it. The next morning, I was going to the bathroom and I almost passed out. I was able to catch myself before I passed out. I felt nauseous and dizzy, I felt like I was going to throw up but I couldn't. I had chills. I went downstairs to try and drink some orange juice, I sat here and was gasping to catch my breathe. I kept thinking it was just my anxiety and kept trying to catch my breathe. I kept drinking the orange juice and the dizziness seemed to go away. I went to work, I was tired, chills and this lasted for 2 days. on Friday the 12th the rash (the rash which I developed from the 1st dose) seemed to get worse, when I took a shower, the heat from the water seemed to make the rash redder. I continued Hydrocortisone cream and then switched to Lubiderm. Neither seemed to help much so I kept switching between the two, eventually the rash did get lighter, it went away under my breast area but it is still there on my stomach. I filed a VAERS report for the first dose as well. About 8 days after receiving the vaccine, I have a tattoo on my right thigh and a red bump appeared on my tattoo, it was hurt. It was a bump and the next day the bump burst, it was hard and crusty. Then a rash developed around the tattoo. I have also had on and off fluttering of my eyelid since receiving the vaccine. I had made a dermatology appointment but I canceled it because it seems like the rash is going away and my deductible is too high. 2/26/2021 My right arm from the shoulder from down to fingers, is numb and hurting. Yesterday 02/28/2021, I got up in the morning and felt like I was going to pass out, I came downstairs and I got some orange juice. I got dizzy and couldn't catch my breathe, I told my husband to call 911, because I thought I was having a stroke. My husband said I passed out, my eye and my mouth were open, he shook my shoulders and called my name no response this lasted for about 3-5 seconds, then I take a deep gasp and came back. I was sweating profusely and pale. EMS arrived, transported me to hospital. My blood pressure was high while I was sitting and it was low when I tried to stand. I went to hospital 02/28/2021. The ER diagnosed with my syncope and wanted me to follow with a cardiologist. They believe since it was 2 weeks out since the vaccine,</p> |

| 1063219 | 3/1/2021 | FL | 83 | M | 2/27/2021 | 2/27/2021 | <p>happens. States it is hard not think about it when her heart is having hiccups since that is what it feels like. She knows what it feels like because when her pacemaker goes off ventricularly she can feel it. She had arrhythmias before the vaccine but has not had issues with arrhythmias continuously. She was diagnosed with sick sinus syndrome and they do not know if it is cardiology or neurology, states it has been an issue for her for the last two years (2019). Lab data included weight of 284-286. She is asking if there is any data that supports her getting the second dose on 25Feb2021. She has read that some people tend to have more side effects with the second dose. The patient had no prior vaccinations (within 4 weeks).; Sender's Comments: Based on vaccine-event chronological association, a causal relationship between events worsening arrhythmia and pre-syncope and BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p> <p>swollen, tender left shoulder, nausea, vomiting, syncope referred to primary provider if symptoms worsen</p> |

| 1061978 | 3/1/2021 | TX | 61 | M | 1/22/2021 | 1/1/2021 | <p>he was not comfortable; allergic reaction; dizziness; feeling a lot of pressure in his head like his "brain wanted to pop out of his head"/ his brain wanted to swell up; felt like he was going to lose his mind / go crazy; fever; headache is recurring- worse at bedtime; almost passed out; This is a spontaneous report from a contactable consumer reporting for himself. A 61-years-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number: EL9621), intramuscular on the left arm on 22Jan2021 (reported as 07:45 to 08:00) at a SINGLE DOSE for prevent COVID, at 61 years old. Medical history included triple bypass surgery from an unknown date. There were no concomitant medications. The patient previously took morphine and experienced the same thing with his brain, almost identical to what he was experiencing after the COVID vaccine. He reported that the first time he received morphine it was fine and then he got a shot of morphine and he experienced the pressure on his brain after receiving morphine, about 5 or 6 years before reporting time. He stated it was almost the same reaction. He was given a shot of Demerol (he was not sure if it was Demerol) to counteract it. History of all previous immunization reported as none. No additional vaccines administered on the same date. No prior vaccinations within 4 weeks. The patient reported he experienced an "allergic reaction"/ bad reaction to his first dose of BNT162B2 on 22Jan2021. His symptoms included dizziness as soon as he got the vaccine, got dizzy right off the bat, still dizzy, very little; feeling a lot of pressure in his head like his "brain wanted to pop out of his head"/ his brain wanted to swell up; felt like he was going to lose his mind / go crazy; fever; headache is recurring- worse at bedtime. Symptoms (unspecified which) reported as recurring and are notably worse at bedtime. Patient is hesitant to receive the second dose. The patient stated he just went to sleep and prayed and then when he woke the next day, at night it did it again. At night it comes and goes, and he still has it happen but not like the first time. He tried to describe that he was washing his hands and he almost passed out like on an unspecified date in Jan2021, he was going to lose his mind. Last night he went to bed no problem, he felt a little pressure on his brain, stated it is hard to describe, it was not a good feeling. He was running a fever. Last night he</p> |

| 1061908 | 3/1/2021 | TX | 52 | M | 2/13/2021 | 2/13/2021 | Fainting twice; Low blood pressure; Sweating like hell; Dizziness; Significant chill; Body was feeling hot; A spontaneous report was received from a consumer, a 52 years-old male patient, unknown race and ethnicity, who was administered Moderna's COVID-19 vaccine, who experienced fainting twice (syncope), low blood pressure (hypotension), sweating like hell (hyperhidrosis), dizziness, significant chills (chill), and body was feeling hot (pyrexia). The patient's current conditions included epilepsy and slight cholesterol. Historical condition was not reported. Products known to have been used by the patient, within two weeks prior to the event, included eslicarbazepine acetate, simvastatin, atorvastatin, sertraline hydrochloride, acetylsalicylic acid, ubidecarenone, vitamins nos, fish oil and cyanocobalamin. On 13 Feb 2021, prior to the onset of symptoms, the patient received their second planned dose of mRNA-1273, (lot number: 030M20A), intramuscularly into right upper arm for prophylaxis of COVID-19 infection. On 13 Feb 2021, after administering the vaccine, patient stated that everything was normal. The patient stated that he went to bed at 9 pm and at 11 pm, he started feeling significant chill and body was feeling hot. On 14 Feb 2021, at 2 am, the patient woke up to go restroom because he was sweating like hell and felt dizziness. The patient's wife noticed that the patient had fainted, and she stood him up and fainted again. His wife made him sat down on the bed and called 911. Once the paramedics arrived, the patient underwent electrocardiogram (EKG) that was normal and checked his blood pressure (BP) that was at 95/82 (unknow units). The patient stated that his BP was usually normal at 120/80 or 85. The paramedics took him to hospital. In the ambulance, they performed another EKG and BG which came out to be normal. The patient was taken to the hospital and they performed multiple blood test that came out to be normal. The patient stated that the nurse gave him unspecified intravenous (IV) liquid as treatment medication for the events which he does not remember. The patient also informed that the doctors concluded that this may happen due to Moderna COVID-19 vaccine. The patient was discharge from the hospital at 4:14 am of 14 Feb 2021. The patient does have light dizziness but not heavy and no other symptoms. The outcome for the event(s), fainting twice, low blood pressure, sweating like |

| 1285022 | 3/1/2021 | PA | 67 | M | 2/5/2021 | 2/5/2021 | I received the Eli Lilly monoclonal antibody infusion on Feb. 12 after testing positive for COVID-19 on Feb. 10. I received the Pfizer vaccine on Feb. 5, and had muscle aches, chills and a cough. I passed out at home on the 10th, cut my forehead, and had to receive stitches. That is when I tested positive for COVID-19. I continued to be symptomatic and opted for the monoclonal infusion. About 5 hours after I received the infusion, I became completely disoriented. I was unable to stand and did not know where I was. My wife summoned an ambulance, and I was taken by ambulance to a local hospital. I received fluids intravenously. I was released from the emergency room about 6 hours later. |
| 1063949 | 3/1/2021 | LA | 61 | F | 2/18/2021 | 2/24/2021 | Intense dizziness to the point of almost fainting. It started the day before and culminated in almost fainting in the grocery store. I was quiet that night and it seemed to pass by the next morning, so altogether about 36 hours or so, with one substantial episode. |

| 1064312 | 3/1/2021 | MI | 77 | M | 2/26/2021 | 2/27/2021 | Reported via Nurse Triage / PCP: Fainted earlier, eyes rolled back, mouth was drooping. Nausea, weakness, and chills. BP was 107/75, HR in the 70s. Currently alert and resting. States that patient had his 2nd covid vaccine yesterday AM and then develop chills and clammy skin last night. Symptoms worsened today and patient became weak and fainted. Was unconscious for about 5 minutes and while unconscious, mouth was open and drooling and became incontinent and eyes rolled back in head. Is awake and alert now, but still weak and only able to take 1 or 2 steps. No chest pain or breathing difficulty and no fever. Feeling very nauseous. Caller requesting prescription for zofran. Yesterday AM 2nd vaccine. Last night chills. This AM feeling weak. Today at 11am he felt weak with ambulation. He fainted. Was unconscious for 5 min. Had drooping of the face. He was unresponsive during this time. Had incontinence of urine. Then became awake but very weak still. Only able to walk a few steps. He is communicating. No chest pain. No current fever. No shortness of breath. BP 107/75 with HR 70. He has been very nauseated. He is drinking only small sips of water. Does not seem like a usually COVID-19 vaccine reaction. Given the LOC with urinary incontinence and sustained weakness, I advised ER evaluation to rule out neurological issues. Pt's daughter in agreement. They will go to ER. From Emergency Department: Patient presenting with chief complaint of syncopal episode which was witnessed by his wife. He reported the got dizzy and lightheaded and then passed out while seated. The reported duration of his loss of consciousness was somewhat inconsistent, unclear how long he passed out for, there was however no postictal state. He was not noted have any shaking or seizure activity, he did have an episode of urinary incontinence. He has not been feeling well ever since receiving his 2nd COVID-19 vaccine. By the time of my exam patient states that he is completely asymptomatic, he states he is feeling much better after receiving IV fluids. His lab work is remarkable for a slightly low sodium, compared to his previous levels which were many months ago. Unclear of the acuity of this, although upon further discussion with the patient he has been drinking large amounts of water since his vaccine trying to stay hydrated. I advised him to substitute to some electrolyte balanced fluids and to have his sodium rechecked by his |

| 1063679 | 3/1/2021 | KS | 65 | F | 2/25/2021 | 2/26/2021 | The morning after receiving Covid-19 vaccination I fainted. I was sitting, working on an i-pad and got up to go to another room. I walked through the house to another room. I noticed my arms and legs felt kind of rubbery and that I didn't seem to have control of them. I fell to the bed and lost consciousness for 5-10 seconds. This was all observed by my spouse. I recovered quickly. The remainder of the day I had a slight headache and felt slightly nauseous. I took acetaminophen before going to bed and woke up the following morning with no complaints . |
| 1063750 | 3/1/2021 | TX | 69 | F | 2/27/2021 | 2/28/2021 | Moderate to severe pain and feeling of blacking out/fainting with nausea morning after. Fever the night of. Stayed in bed and rested.Fell good today just a little sore so do not have full use of arm without. |

| 1060596 | 2/28/2021 | IN | 70 | F | 2/24/2021 | 2/25/2021 | Woke up at my usual time the day after vaccine. Felt a little warm but not feverish and did not take my temperature. After walking to kitchen to let cat in from garage I stopped at the nearby kitchen sink and began to shake (I believe just my upper body). I had to grab onto sink to steady myself. Shaking was only seconds long. Then I must have fainted as I awoke (quickly) on the floor alongside the cupboards and sliding glass door. I laid there conscious about 15 minutes till I felt confident I could get up on my own. As result of fall I bit upper and lower lip on right (no blood just skin injured), must have clenched my teeth because my left posterior teeth were sensitive to cold and I injured my right ankle. After I got up and realized my ankle hurt with pressure I put on a support knee high to control swelling. Injury seemed to be focused on the ankle bone. I applied ice for recommended 20 on 20 off protocol for most of both 2/25 and 2/26, elevated and took OTC Aleve as directed on package. Bruising observed from heel, behind ankle bone and front of ankle. Called PCP, she recommended continue as I have and she will contact me tomorrow, March 1 |

| 1060871 | 2/28/2021 | ID | 68 | M | 2/25/2021 | 2/25/2021 | After about 3 hours (around noon) I began to feel like I was coming down with a cold and fever. By 4PM I had chills and body aches. By 8 pm I took my temperature and it was a low grade 99.8. Through the remainder of the night the chills worsened to the point where I was shaking uncontrollably and I could not get warm. I was also very dizzy. The next day (2/26/21) was more of the same along with a very painful headache and muscle aches especially in my shoulders and neck. That night all of those symptoms continued along with very sharp stabbing pains in my left leg above the knee cap. The dizziness also continued and I nearly passed out trying to get out of bed early in the morning. My fever had increased to 100.5 at the highest. I was also very weak by the end of the day on 2/26/21. On 2/27/21 I was beginning to feel a bit better but still had that low grade fever (now about 99.8) a headache and I remained very weak. The weakness was especially evident in my legs - it was very hard to stand up. It is now 2/28/21 and I am feeling nearly 100% myself again. From all I had read and understood I was expecting to have a reaction to the 2nd vaccine. I did not consider any of this life threatening nor necessary to call my PCP. Still, I wanted to report these reactions as it is my understanding the adverse reactions to the 2nd vaccination are common in people much younger than me. |
| 1060862 | 2/28/2021 | WA | 67 | M | 2/26/2021 | 2/27/2021 | Low grade fever and general body aches starting at 1:00 AM (12 hours after injection). At 9 AM, passed out in shower. When I awakened (about a minute later) I was unable to stand so I crawled to from the shower to bedside, but passed out again when I tried to pull myself up from the floor into bed. My wife called 911 and the local fire department responded. The EMT took my blood pressure while I was lying on the floor with my feet elevated and it was 78/34. The EMT called an aid car and I was transported to a local ER. At the ER, I received 2 liters of fluids over the next 4 hours. I had an EKG, chest X-ray, blood work, and urine analysis which all were clear. After 4 hrs, I was released and returned home. |
| 1061210 | 2/28/2021 | AL | 35 | F | 2/26/2021 | 2/27/2021 | Vasovagal syncope (4 times) between 4:00 and 4:30 a.m. |

| 1059525 | 2/27/2021 | CA | 41 | F | 2/26/2021 | 2/26/2021 | patient that fainted today. She reported on her screening questionnaire of passing out after receiving a injection. She was placed for 30 minute observation. The patient fainted several minutes after being seated. It was observed that she fell over from the chair and hit her head. Patient denied any symptoms other than her right toe being sore.. A + O x 4 medically stable. VS stable. EMS was dispatched due to patient hitting her head and c/o feeling dizzy still...however, patient declined services. She was with her husband and he agreed to drive her home. |
| 1059438 | 2/27/2021 | KY | 59 | F | 2/22/2021 | 2/23/2021 | Modern COVID-19 Vaccine EUA I received my COVID vaccine at 7:00pm on 2/22/2021. At 1:00 am 2/23/2021 I woke up to use the restroom. I fainted and cut my forehead in the fall. I was shaking uncontrollably following this. My husband bandaged my forehead and checked me for a concussion. Sometime after 2am I realized I was in atrial fibrillation. I have a Kardia app that confirmed this. I tried at home methods to go back in rhythm. At 8am I called my cardiologist. He advised me to go to the emergency room. At this time the Kardia app indicated I was no longer in Afib but still had a fast heartbeat. At the emergency room I had a normal EKG, CAT scan, blood work and chest X-ray and went home about 11am. |
| 1059366 | 2/27/2021 | NH | 66 | F | 2/22/2021 | 2/23/2021 | Woke up at midnight with fever, chills, thirst. Tossed and turned all night, cold and thirsty. Drank about 20 oz of Crystal Light Peach Tea over night. Got up at 5am to get more to drink and find another place to rest. went into my kitchen to fill container and passed out. Woke a few seconds later. Left side of my forehead was bruised and swollen above left eye. Over the last 4 days both eyes an cheeks are bruised. All day felt like I had the flu without the fever. I did not go to the hospital. |

| 1059732 | 2/27/2021 | NJ | 52 | F | 2/25/2021 | 2/26/2021 | Pain in arm, very tired and slight chills and achy at night. Mostly fine. Just wanted to report that I woke at 4:30am and was very nauseous and dizzy. I went to the bathroom and thought I would be sick, but I remember being so dizzy that I went to lay on the floor by the toilet but my husband said he heard a thud, and came to find me passed out. Then I was shaking (a vaso vagel response I guess) til I came to. The ems came, but everything was fine, so I elected to stay home. I threw up a 1/2 hour later and then felt better, and slept for a few hours. The rest of the day I was just exhausted. Today I woke up feeling fine! Just wanted to report the episode in case you track vomiting and dizziness and fainting. |

| 1057806 | 2/26/2021 | MN | 40 | M | 2/25/2021 | 2/25/2021 | <p>Within one minute of receiving vaccine, the patient became pale, stated that he felt dizzy and fainted. Patient regained consciousness within one minute. Upon regaining consciousness, patient reported feeling lightheaded and dizzy but was oriented to person, place and time. Skin was warm and dry but pale in color. After regaining consciousness, patient also stated that he has a history of fainting 5-6 years ago after receiving an influenza vaccination. (During screening questions, patient denied having any reactions to vaccines in the past) Patient independently moved from a chair to a laying down position on a cot and expressed an improvement in how he was feeling. Vital signs taken after event as recorded below. When asked patient stated that he does recall times when he thinks he may have been hypoglycemic in the past. Patient also states that he has been very nervous about receiving injections throughout his life. EMS called and assessed patient at the vaccination clinic site. Patient drank a 10 oz bottle of orange juice prior to EMS arriving and when EMS staff obtained his blood sugar the result was 97. EMS stated that patient was stable and all vital signs were stable. Patients skin color improved to pink. Patients wife was called by patient and she provided transportation home for patient. Prior to leaving the vaccination clinic, patient was walking around for several minutes and denied any feelings of being lightheaded or dizzy. VITALS SIGNS: 5:06pm: Heart rate: 50, Oxygen Saturation: 99% on room air 5:15 pm: Blood pressure: 100/78 ; Heart rate: 50; oxygen saturation 99% on room air. 5:20pm: Blood pressure 98/76 Heart rate:52; oxygen saturation 96% on room air. 5:34 pm: Blood pressure 92/68 Heart rate: 53 oxygen saturation 97% on room air. Vital signs taken by EMS staff were not recorded by public health nursing staff.</p> |

| 1056193 | 2/26/2021 | NC | 70 | F | 2/11/2021 | 2/12/2021 | fainted twice while visiting the bathroom; BP was 145/85; arm was sore; This is a spontaneous report from a contactable consumer reporting for herself. A 70-years-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot_number m000007217771.CSN20 447277212), via an unspecified route of administration in left arm on 11Feb2021 16:45 at single dose for covid-19 immunisation at Public Health Clinic/Veterans Administration facility. Medical history included hypertension, blood cholesterol increased, anxiety, allergies, allergies to penicillin, Sulfa drugs and Crustacea. The patient previously took tetracycline and experienced drug hypersensitivity. The patient was not pregnant at the time of vaccination. Concomitant medication included olmesartan medoxomil (unknown manufacturer), diltiazem hydrochloride (unknown manufacturer) and sertraline hydrochloride (SERT). On 12Feb2021 her arm was sore but she was not really feeling anything more. On 13Feb2021 morning at 04:45 the patient fainted twice while visiting the bathroom. Upon checking of the BP it was 121/75. Later in the day the BP was 145/85. The patient was completely normal before the shot. It seems that the vaccine affected my BP. The outcome of the events was recovered in Feb2021. No treatment was performed. The patient did not have COVID-19 prior to vaccination and was not covid tested post vaccination. |
| 1057775 | 2/26/2021 | PA | 27 | F | 2/24/2021 | 2/25/2021 | At around 11PM on 2/24/21, I had a severe headache, fatigue, chills, nausea, muscle and joint pain, and felt feverish. At around 2AM, I had vasovagal syncope (I lost consciousness and then woke up covered in sweat). Directly after I regained consciousness, I vomited several times over the next couple of minutes. I drank water and took Tylenol to try and alleviate symptoms. After that, I no longer vomited or lost consciousness but I continued to feel feverish, had a severe headache, fatigue, chills off and on, nausea, and muscle and joint pain until around 4PM on 2/24/21. |

| 1056646 | 2/26/2021 | FL | 71 | F | 1/21/2021 | 1/1/2021 | My arm hurt; I started to get little tired; I couldn't watch TV; My stomach suddenly did not feel well; Nauseous; I got cold; Sick; was very hot and so hot; was round up/she was feeling she would faint; waves of feeling like i would pass out; it was just being very hot, then being cold; Blood drained from my head, I just knew I was going to pass out; I took 0.2 rather than the 0.3ml of the first dose; very fast heart rate intermediately for many day; squeezing of chest; muscle hurting/Pain in my body in every muscles, my fingers, my hands, my calves, my feet, my back, neck, everything; digestive disorders; feeling gassy, uneasy; stomach abdomen was just tight; abdominal issue; feeling gassy, uneasy; stomach abdomen was just tight; This is a spontaneous report from a contactable consumer (patient). A 71-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; lot number: E18982), on 21Jan2021 (at the age of 71-year-old) at single dose for COVID-19 immunisation. The patient reported that based on her history of reactions to medications, the nurses giving injections "decided 0.2ml instead of 0.3ml", which is what they gave, so she got 0.2 that is two-third of the shot. The 2nd shot was for 8'oclock on 11Feb2021. She is very sensitive to shots, vaccines, and to all medications and injections and things like that. She has sensitives thanks to two concussions she had in her life. She never was before that she had two concussions. Second one had a crazy man hit her after that just noticed that just have reactions not adverse or dying but definitely take rest of everything. So she take less of a shot, like a dental shot or cortisone shot, which she had taken in the past. If she has dental shot she cannot take Novocain, had to take Carbocaine or Marcaine and they give her half. Also she had been taking cortisone shot for shoulder for rotator cuff injury. They also have to give her less. Or flu shot: she takes half one week and come back for the other half the next week. Just have reactions. She told to when arrive for medication and did have one anaphylactic reaction but that was to cat skin dye, was told to this two nurses who was administering the vaccine and said to them she was really afraid to take. It is just too much for her. She knows her body. She is sure have reaction but is really afraid and don't know what is the first one will do to her. They just did two nurses and she decided that she will be |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

taking 0.2 instead of 0.3ml which is what they gave. She got 0.2 so that two third of the shot and waited the half an hour, a nurse watched her card and 7 other cards. She did not have the anaphylactic reaction. She went home. Her arm hurt and started to get little tired. The events started the day that she got the shot. Like about 3 or 4 hours later. It is just few hours later she couldn't watch TV so went to laid down and an hour later she woke-up. She walked to her kitchen and blood drained from her head, she just knew she was going to pass out. Her stomach suddenly did not feel well. She tried to get back her bed but she was round up and as far as the bathroom. She got very nauseous, she laid down on bathroom floor. She thought she was sick but didn't round up having to use toilet of few times. Although while she was feeling she would faint. She was very hot and so hot. While lie down, she couldn't even pulling off her pajamas. So when she got cold so she was pulling a towel down and stop and she laid to for two hours, she finally got to her bed. It was a terrible experience. Next day she drank water and had potatoes prepared and went up eating back to later baked potatoes. Next day luckily she did not have repeat of the nausea. She didn't have that anymore of. She did have abdominal issue just not diarrhea or anything but just not feeling well, feeling gassy, so uneasy. This all lasted, that part lasted for 7 days. What concerned her was especially beside first day it was few days she got off again. She was just feel blood drain but not this first time she laid on floor. She couldn't sit on chair to watch TV for about 3 days. She mostly laid on bed but she would get very hot and then very cold during the day. She would get very fast heart beat not continue but really fast like heart was pounding her chest. She felt like someone has their hand inside her body squeezing her chest. She got afraid but didn't want to go hospital. She didn't think she was sick enough. She was concerned. So that was happened and this last was for about 7 days. Then the squeezing of chest part went away. She doesn't want to wind-up on the floor feeling that sick again, she felt so sick it felt like food poisoning. After that, it was just being very hot, then being cold, the fast heart rate, every muscle hurting. Those were the main things that continued for a week. And digestive disorders. It all lasted for about 13 days. She was concerned she had a very fast heart rate intermediately

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

for many days, for about a week. And that's considered an adverse reaction and also she was getting waves of feeling like she would pass out, everything would drain from her head. She experienced stomach ache, feeling hot then cold. She wants to do precautions before taking the second dose on 11Feb2021. She did take may be 3 days later two Tylenol but didn't take anything (clarification requested). She didn't even take vitamins during that time. She was afraid to take anything so she did not. At the same time also there was pain in her body in every muscles, fingers, hands, calves, feet, back, neck, everything. Her stomach abdomen was just tight. She was concerned that last for few days. In last few days she started feel herself and now she is going again tomorrow. So that how she reacted. She doesn't know how much of this shot she told them she could tolerate because everybody is saying second shot will give you more reactions. All she can take this more than that because that was lot. She wants to be herself, don't want laying on floor, don't want to have 105 temperature or anything. The patient was asking if she should take another 0.2ml another two-third of the shot. She just asked them for half that is 0.15 would that be a big difference. She needed to know by 8 o'clock tomorrow. I might be in a queue to get it. She stated: 'So, that's my concern. I'm all alone, I'm a senior, I have no family. I lost my mother to covid. I know I need this vaccine, but I just, I cant get that sick and I'm so afraid I'll wind up with a 105 something, fainting away and no one knowing'. She was asking if reactions after the 2nd dose are worse than the 1st dose, if she didn't have anaphylaxis after 1st one, she shouldn't have it a 2nd time, right. She said, "1st half of flu shot, I get sick, then the 2nd half nothing". She also asked if she can take medications after the vaccine, like Tylenol, or irritable bowel syndrome (IBS) medication she takes as needed. The events resolved, but the patient reported it took her like 13 days before she felt better.

| 1056638 | 2/26/2021 | IL | 47 | F | 1/11/2021 | 1/12/2021 | Rigors and severe back pain; Rigors and severe back pain; syncope; prolonged PT; Loss of work as a physician for 2.5 weeks; This is a spontaneous report from a contactable physician (patient) A 47-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in left arm on 11Jan2021 12:30 at single dose for COVID-19 immunisation. Medical history included gastrooesophageal reflux disease and allergies. The patient was not pregnant. Concomitant medication included lansoprazole (PREVACID). The patient experienced rigors and severe back pain, syncope, prolonged pt and loss of work as a physician for 2.5 weeks on 12Jan2021 with outcome of recovered with sequelae in Feb2021. The events resulted in Emergency room/department or urgent care, Hospitalization, Disability or permanent damage. The patient was hospitalized due to the events for 2 days. The patient received steroids, pain meds, muscle relaxers as treatment for the events. The patient did not have COVID-19 prior to vaccination and was not covid tested post vaccination. Information on the Lot/Batch number has been requested.; Sender's Comments: Based on a compatible temporal relationship and known product safety profile causality between event chills and syncope and BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), cannot be excluded. The events prolonged PT and loss of work as a physician for 2.5 weeks are attributed to intercurrent conditions that were unlikely related to BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE). The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate. |

| 1056513 | 2/26/2021 | | | F | | 1/1/2021 | <p>Passed out; Shakes so bad; So sick; Headache; Muscle pain; Temperature for five days (102.7F); A spontaneous report was received from a consumer, female patient of unknown age, with unknown race and ethnicity, who was administered Moderna's COVID-19 Vaccine (mRNA-1273) and experienced passed out (loss of consciousness), shakes so bad (tremor), so sick (malaise), headache, muscle pain (myalgia), and temperature for five days (102.7F) (pyrexia). The patient's medical history was not provided. No concomitant medications were reported. On an unknown date in JAN 2021, the patient received their first of planned doses of mRNA-1273 (batch number: unknown), intramuscularly for prophylaxis of COVID-19 infection. The patient reported that the difficulties which she experienced after the first Moderna vaccine were terrible and so bad. The patient had all the side effects, which includes headache, muscle pain, passed out, fever, and was so sick. The patient wanted to report the side effects and unsure if she should take the second vaccine or not. The patient doesn't think that she can handle the second vaccine. She had a temperature of 102.7 F and was shaking so bad. The patient second vaccine was due in 28 days in February. Upon callback, the patient had a hard of hearing and stated that the vaccine hit her hard and had a temperature for five days. She was concerned about getting the second dose. No treatment medication information was reported. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the events, passed out, shakes so bad, so sick, headache, muscle pain, and temperature for five days (102.7F), were not reported.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Further information has been requested.</p> |

| 1056497 | 2/26/2021 | | 22 | F | | | Severe anaphylaxis allergic reaction; Passed out on the ground; A spontaneous report was received from a consumer concerning a 22-year-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and passed out on the ground and had a severe anaphylaxis allergic reaction. The patient's medical history was not provided. Concomitant product use was not provided by the reporter. On an unknown date, prior to the onset of the events, the patient received their second of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. About 10 minutes after receiving the second dose of the Moderna vaccine, the patient passed out on the ground having a severe anaphylaxis allergic reaction. Treatment for the event included two doses of epinephrine IM in addition to diphenhydramine, ondansetron, and steroids to prevent a rebound reaction. 911 was called and after epinephrine and diphenhydramine were administered, the patient was immediately transported to the hospital where she stayed for 6 more hours for observation, fluids, and further medications. Action taken with mRNA-1273 in response to the events was not applicable. The events, passed out on the ground and severe anaphylaxis allergic reaction, were considered resolved; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Anaphylactic reaction is a listed event in CCDS. |

| 1056463 | 2/26/2021 | NE | 77 | M | 2/10/2021 | 2/10/2021 | felt like crap; became hot; left hand suddenly started jerking and left hand was having spasms; Vasovagal Syncope, Post Immunization Reaction; became cold; sweaty; sore arm; achy; A spontaneous report was received from a consumer concerning a 77-year-old, male patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced vasovagal syncope, post immunization reaction (syncope vasovagal). The patient's medical history, as provided by the reporter, included chronic cough, acid reflux, minor allergies, hypercholesterolemia and a penicillin allergy. Concomitant product use included esomeprazole, atorvastatin, famotidine, cetirizine, Montelukast, Vitamin D, zinc, fiber pills and antacids. On 10 Feb 2021, several hours prior to the onset of symptoms, the patient received their second of two planned doses of mRNA-1273 (Lot #:030M20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. After the injection in the evening on 10 Feb 2021, the patient reported experiencing a sore arm. During the night, he became cold, sweaty and achy. On 11 Feb 2021, the patient stated he "felt like crud" and was still achy and his left arm hurt more. The patient sat down at the table and again became "hot" and "sweaty." His left hand suddenly started jerking and having spasms, and the patient's head went back and then forward and he became unresponsive for approximately 2 to 3 minutes. After the episode, he went to a sofa chair and fell asleep for 1 to 1.5 hours. The patient's wife called a nurse at the Hospital to report the events, and the nurse suggested to take him to the emergency room (ER) immediately. At the ER, a series of tests/labs were performed including complete blood count (CBC) differential with platelets, COVID-19 test, cardiac panel-acute, comprehensive metabolic panel, electrocardiogram (EKG), and chest x-ray. All test results were normal. The patient's COVID-19 test was negative. Treatment for the event included IV fluids (sodium chloride IV). The patient was discharged from the ER 2 to 3 hours after treatment with a discharge diagnosis of "vasovagal syncope, post immunization reaction." The patient received both scheduled doses of mRNA-1273 prior to the event; therefore, action taken with the drug in response to the event is not applicable. The event, vasovagal syncope, post immunization reaction, was considered |

A 22-year-old female patient receive first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on the left arm on 06Feb2021 17:00 at a single dose for COVID-19 immunization. Medical history included asthma. The patient's concomitant medications were not reported. The patient is not pregnant. On 07Feb2021 09:15, the patient fainted 16 hours after getting the shot. The patient also experienced nausea, headache and slight fever. The events were assessed as serious (medically significant). No treatment was received for the events. The outcome of the events was recovered on an unspecified date. Information about batch/lot number has been requested. |
| 1059086 | 2/26/2021 | CA | 24 | M | 2/26/2021 | 2/26/2021 | On Friday morning 2/26/21, we had a 24 yo male patient who had an anaphylactic reaction after his first dose of Pfizer COVID vaccine. He was instructed to wait on the chair, but had stood up at some point but was still in the pharmacy waiting area. A team member noticed he had fainted and called for help. The pharmacist on duty and immunizing tech came immediately to help him to a chair. At that point, he was conscious and talking. Then within a few seconds he started convulsing on the chair and lost consciousness. His eyes were open and head tilted back. A team member immediately called 911 and pharmacist administered 0.3mg Epipen to the thigh. We removed his face mask to check his breathing and also to allow him to breathe more easily. We also adjusted his head more forward and he started coughing. After about 15 seconds, he regained consciousness and could answer questions. EMT arrived soon after and took over. Patient does not have allergies or any history of anaphylaxis/ severe reaction from vaccinations. He did express some fear of needles and did not eat breakfast yet. |

| 1058834 | 2/26/2021 | PA | 66 | F | 2/25/2021 | 2/25/2021 | Patient said she wasn't feeling well about 10 minutes after receiving her vaccine. She felt dizzy, thought she was going to faint. We gave her ice for the back of her neck. We checked her blood pressure, it was 230/130, pulse was within normal limits. Pulse ox was low. An ambulance was called. She removed her mask and stepped back so that she could breath better and her oxygen and coloring improved. She said that her lips felt numb, so we gave her some benadryl just in case. We did not give an epi pen due to her increased blood pressure. Her blood pressure did start improving but was still high when the ambulance came. They took her to the ER for evaluation and she will be following up with her pcp also. The hospital felt that it was just a fainting episode. |

| 1058526 | 2/26/2021 | MD | 44 | F | 2/26/2021 | 2/26/2021 | Pt given 0.5cc COVID #2 injection (Moderna), was waiting in patient area for 30 minutes due to h/o other reactions previously. 20 minutes after injection, pt remarked that she felt hot. Brought back to resp clinic, wasn't having any SOB or CP, didn't appear very flushed. Was shaking. Pulse ox applied, O2 stayed between 98 & 99% RA. HR was initially in high 80's (pt on 50mg metoprolol QD), climbed up to 109. BP (lg cuff, rt arm) was 144/91. Pt became nauseated, vomited phlegm. Did not feel presyncope. Ice applied to back of neck. No redness at injection site. Heart exam: no murmurs or irregular heartbeat; lungs CTA throughout, no stridor or wheezing. Pt remarked that the heart racing, shakiness & heat felt like previous times when she was given racemic epi for reactions. Was monitored for 30 minutes, HR stabilized in low 80's, sensation of heat dissipated. Was allowed to leave 50 minutes after vaccination given, and advised to call for EMT if symptoms came back. She expressed understanding, and was told to NOT drive herself home (family member was with her). |

| 1058613 | 2/26/2021 | AZ | 51 | F | 2/24/2021 | 2/25/2021 | I had the usual flu-like symptoms starting around 9 pm the day of the vaccination 24th) - headache, chills, lethargy, loss of appetite, injection site pain. I didn't notice anything else overnight, exception injection site pain increased. The next morning I got up around 6:45 am to feed my pets. I felt woozy walking about 25 m from the bedroom to the pet food location, and also very flushed and hot. I started sweating copiously while I was getting the food out, and then I fainted. I don't know how long I was unconscious but I suspect not more than a minute or two. I didn't seem to injure myself when I fell, other than a bruised elbow and hip I was able to finish feeding the pets, crawl to the bathroom (I had a strong accompanying urge to evacuate my bowels), and then get into bed. I went back to sleep at around 7:15 am and by 10:00 am I felt more normal, still with some chills and headache, general lethargy, and not much appetite. Those symptoms lasted through the evening until I went to bed at 9:00 pm, gradually decreasing. Today I feel mostly fine, although dehydrated. I did not record my temperature during the fever spike, nor receive medical attention. |

| 1058703 | 2/26/2021 | CT | 96 | F | 1/27/2021 | 1/28/2021 | Excerpt taken from patient's medical record notes. Recreational Therapist was in room with patient who was at baseline mentation at that time, and was getting patient a cup of tea. Rec Therapist observed patient to "all of a sudden slouch down toward left side" and became unresponsive. Therapist called for help, and Registered Nurse (RN) and Certified Nurse Aide (CNA) came into room. Patient was initially non-responsive and profusely sweating and hot to touch. Vitals were taken (see below). The patient then slowly became responsive after approximately 4 minutes and was visibly nauseous and appeared like she was going to vomit, but ultimately did not. Patient was assisted into bed, APRN was called, order for vital signs to be taken every 4 hours for 72 hours, and Electrocardiogram (EKG) to be performed. EKG results were abnormal, indicative of infarct; APRN ordered transport to Emergency Department. Patient returned from Hospital ED at approximately 10:45 PM same day (1/28/21), with transfer paperwork documenting a Hospital diagnosis of "Syncope" without any additional lab results or any new medication or treatment orders in the documentation. Follow up the next day (1/29/21) by RN at the Nursing Facility--RN logged into the Hospital medical Charting system, only to find that there was no record whatsoever of the patient being in the Emergency Department on 1/28/21--no notes, no labs, no summary from a practitioner. Patient recovered and has resumed close-to-baseline activity and functioning. |

| 1053668 | 2/25/2021 | WA | | F | 1/4/2021 | 1/5/2021 | swelling to head; swelling to left back knee; swelling to left hip; swelling to left foot; hit head; bump on back of the head; fainted; sleepiness; left arm pain; acute body aches; fatigue; flu like symptoms; A spontaneous report was received from a healthcare professional concerning a 65-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced flu like symptoms, acute body aches, sleepiness, fatigue, left arm pain, fainted, on blood thinner and worried about a cerebral bleed because she hit her head, bump on the back of the head, swelling to head, swelling to left back knee, swelling to left foot, and swelling to left hip. The patient's medical history was not provided. Concomitant medications included warfarin (5mg, 7.5mg). On 04 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot number: 041L20A) in the right arm for prophylaxis of COVID-19 infection. On 05 Jan 2021, the patient experienced flu like symptoms which lasted 8 hours. On 02 Feb 2021, the patient received their second of two planned doses of mRNA-1273 (Lot number: 013M20A) in the left arm for prophylaxis of COVID-19 infection. On 02 Feb 2021, the patient reported experiencing acute body aches, sleepiness, fatigue, and left arm pain. On 03 Feb 2021, approximately at 3am, the patient fainted and was out for 10-15 mins. She is on blood thinner and is concerned about a cerebral bleed because she hit her head. On an unspecified date, the patient was experiencing swelling of left back knee, swelling of left foot, swelling of left hip and swelling of head. Treatment included paracetamol and ondansetron. Action taken with mRNA-1273 was not applicable as the subject had already received both scheduled doses. The events flu like symptom was resolved on 05 Feb 2021. The outcome for the events, acute body aches, sleepiness, fatigue, left arm pain, fainted, on blood thinner and worried about a cerebral bleed because she hit her head, bump on the back of the head, swelling to head, swelling to left back knee, swelling to left foot, and swelling to left hip were unknown.; Reporter's Comments: Based on the information provided, a causal association between the reported event of swelling of the head and mRNA-1273 use ids assessed as not related as swelling was due to subject hitting her head. Based on temporal association between the other reported events and mRNA-1273 use, |

| 1054564 | 2/25/2021 | CA | 34 | M | 2/18/2021 | 2/19/2021 | Blacked out: I was attempting to put on a sweater to go to the bathroom. I had my arms up and felt a lot of pain in my arm, and blacked out and fainted. I don't recall the events for the next 60 seconds. My wife said that I fell on the bed, was unresponsive, saw foaming at the mouth, had seizure, and urinated in my pants. She adjusted the bed so that my head is up, and threw cold water at my face, mouth and teeth, which made me responsive, and then walked me to the bathroom. During the night, I had fever, Chill, pain at injection site, vomit, nausea, headache, light-headed. I didn't have appetite in the morning and had nausea and headache. I felt better ~3pm when I could finally eat rice, yogurt and chicken. I am feeling well now, but worry that the seizure had caused any long term damage. |
| 1055811 | 2/25/2021 | CA | 67 | F | 2/22/2021 | 2/23/2021 | I received this vaccine at a walk-in-clinic, called STAT Med. About 12 hours after receiving the vaccine I felt nauseated but finally managed to sleep. The next afternoon on February 23 I became very ill with vomiting and diarrhea all at the same time. I nearly passed out several times. First responders arrived and found my blood pressure to be about 70/30. Got in ambulance and given fluids. Arrived at hospital around 5:15 pm. Got more fluids and numerous blood tests, none of which were very remarkable. My WBC was 17 but nothing else was wrong. Left hospital at 9:00. Physician assumes Covid vaccine cause these side effects. |
| 1054557 | 2/25/2021 | HI | 38 | M | 2/23/2021 | 2/23/2021 | Flu like symptoms followed by two episodes of fainting and convulsions requiring ambulance 15 hours after vaccine. |

| 1055086 | 2/25/2021 | | 85 | F | 2/23/2021 | 2/23/2021 | ~~Patient with a PMH of HTN, Afib RVR (on Eliquis), nonischemic CMO, HFrEF (EF 25%), HLD, HLD, Fe deficiency anemia, Pulmonary HTN, rectus sheath hematoma presented to ED with LUE edema and pain that started a couple of hours after second dose of COVID vaccine administration. Patient had received COVID vaccine shortly after noon day prior to admit on RUE. She reports that she had been experiencing some nausea as well. She was admitted to the hospital for overnight observation secondary to transient alteration of awareness after she presented to the ED for arm swelling where experienced a syncopal episode lasting approximately 1 minute. She was monitored on cardiac tele which showed Afib with appropriate rate control overnight. For her left upper extremity swelling an U/S was done which was negative for thrombus, only a hematoma. Her arm pain was controlled and supportive with a compress. Patient had no further syncope, Afib rate controlled, and hemodynamically stable. Discharged home 2/24/21. |
| 1055062 | 2/25/2021 | CA | 27 | F | 2/24/2021 | 2/24/2021 | 10 minutes post 2nd vaccination patient passed out and had shortness of breath. Patient was administered Epi via EpiPen and transported to the hospital. |
| 1055021 | 2/25/2021 | IL | 77 | F | 2/24/2021 | 2/25/2021 | Fever, syncope. Pt has small rash to administration site. |
| 1054894 | 2/25/2021 | PA | 74 | F | 2/23/2021 | 2/23/2021 | About 6 hours after getting vaccine, I experienced extreme fatigue and passed out briefly on the bathroom floor. When I came to, I had no recollection of passing out. It was only for a minute or two. I felt better and not as tired. I felt okay the next couple of days. |
| 1054865 | 2/25/2021 | MD | 60 | M | 2/25/2021 | 2/25/2021 | RPh administered the vaccine, and the patient passed out 10 minutes afterwards and hit his head. Patient felt very faint even after sat up with feet up. Patient was given orange juice and he drank it all. Paramedics arrived and checked him out. 45 minutes after him passing out, patient felt fine and went back to work. He had gashed his head open on the fall. |

| 1054648 | 2/25/2021 | CA | 81 | M | 2/22/2021 | 2/23/2021 | Severe hives accompanied by shivering, significant itching, three fainting episodes close together about 8 hours after the onset of the hives and very low blood pressure following the fainting episode. At home treatment taken on phone advise from Doctorr with Benadryl and Fomantadine with no effect. Prednisone now prescribed. Doctor had suggested a visit to ER but this was taken as the patient was more stable at this time. Potential life threatening event due to the fainting and low blood pressure/heart rate. These symptoms have ocured on previous occassions as a result of virus and other infections. |
| 1336338 | 2/25/2021 | OH | 54 | M | 2/22/2021 | 2/23/2021 | Generalized not feeling well the day after vaccine administered then progressed to dizziness, nausea. Approx 20 hours after receiving his second dose of Moderna from Health Department he had a syncope episode with LOC of a few seconds. He sustained head injury that was treated and sutured. No further side effects after day 2 of vaccine. |
| 1055128 | 2/25/2021 | | 81 | M | 2/19/2021 | 2/20/2021 | Patient presented to ED due to AMS, syncope. Wife reported that he became confused with generalized weakness and dropped his food on the floor and became unresponsive with his eyes and mouth open. Patient was febrile to 103 on admission w/o leukocytosis. He was admitted to hospital medicine for acute encephalopathy with associated loss of consciousness. Neurosurgery consulted but no neurosurgical intervention needed. Patient improved & discharged home 2/24/21. |
| 1052124 | 2/24/2021 | OH | 22 | M | 2/23/2021 | 2/23/2021 | Conducting Covid Vaccine Clinic. Patient had already received his vaccination. At 2:74PM Staff yelled to nursing staff for help. Patient was passed out, hyper extended in chair. He jerked once and staff got him on the floor. He took 15 seconds to speak at which time he refused Epinephrine. Staff got him up into chair once he was alert and oriented. He was able to speak clearly, stating he felt tingling in his right arm and then throughout the rest of his body before passing out. Blood pressure was 118/82. At 3:05PM, he was up, walking around, alert and oriented x3. Staff drove him home and instructed him to contact his physician. Follow up today, 2/24/21 patient states injection site is sore but he is ok and has an appointment to speak with his physician. |

| 1052263 | 2/24/2021 | MA | 26 | F | 2/23/2021 | 2/23/2021 | I was given Moderna vaccine first dose in right arm. Sat down in observing area, within a few minutes I had a weird feeling, felt queezy. As soon as I felt queezy I passed out. I woke up they said within about 30 seconds and had full body sweats. Stomach ache, dizzy and head was tingly like I would pass out again. My calfs hurt like they had previously had muscle cramps. I went to ER, blood and urine tests were fine, heart and blood pressure was fine. Dr said he did not believe it was an allergic reaction, and that it was a stress response. I am not sure if it is because I had COVID in December. |
| 1052480 | 2/24/2021 | NM | 37 | F | 2/23/2021 | 2/23/2021 | Light headed immediately following vaccine (may not be related to vaccine, because I have long standing pre-syncope). Felt sluggish and tired the rest of the day. Overnight, I got a severe headache and throbbing in my arm where I received vaccine that kept me awake. Went to bed cold and then woke up several times very hot and sweaty, but don't know if this was related to vaccine, since this happens on occasion without the vaccine. |

| 1051341 | 2/24/2021 | NC | 69 | F | 1/24/2021 | 1/24/2021 | <p>The itching was located just below the injection site at a spot where the skin was a little red; The itching was located just below the injection site at a spot where the skin was a little red; terrible itching in her left arm; out of balance, her balance was messed up; nervous; Sweaty; Feeling hot; felt like her heart was racing fast; felt dizzy/terrible lightheadedness; Feeling anxious; trouble sleeping; sharp pain in her muscle; This is a spontaneous report from a Pfizer-sponsored program. A contactable other health care professional reported that a 69-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot EL9263) via an unspecified route of administration at arm left on 24Jan2021 13:00 at single dose for covid-19 immunisation. Medical history included drug allergies, IV contrast reaction. The concomitant medication was not reported. It was reported patient got the Pfizer COVID 19 vaccine Sunday 24Jan2021 at 13: 00PM in the left arm. She was scheduled for the second dose of the vaccine 16Feb2021. she got the vaccine and was perfectly fine; she started the wait time of 45 minutes and about 10 minutes into it she got really hot and felt like her heart was racing fast; felt dizzy on 24Jan2021. A nurse practitioner and a doctor came over and sat with her; she got some water and she was okay. They thought it was anxiety related to coming into a crowd, but for the next 36 hours she continued to feel anxious and on edge; she felt like she had too much caffeine. That night she had trouble sleeping; she had sharp pain in her muscles on 24Jan2021, it would be in one of her thighs then the other one. This was about 12 hours after the vaccine. States she took some tylenol and it did help. Adds she just continued to feel anxious and she was sweaty. States she has never has anything like this before. Today she felt perfectly fine; all of her symptoms had resolved. Then today, when she was driving to a routine GYN exam and she experienced a terrible itching on her left arm on 24Jan2021. It was sudden and startled her. The itching was located just below the injection site at a spot where the skin was a little red, feathery red, just below the injection site. Now the itching has stopped but it is still red. she couldn't hardly feel it being injected, she doesn't usually have reactions to vaccines, she never had anything, but she has a few drug allergies, and she was separated out, she was flagged to wait 45 minutes</p> |

after, instead of the 15. She does have an IV contrast reaction, and some other things, nothing she knew was in the vaccine, she was fine and wasn't worried that she was aware of. She thinks she got too hot, she had on a coat, she was sitting and panning through stuff, reading on her phone, and all of a sudden she had terrible lightheadedness, she never fainted in her life, she is pretty sturdy, she didn't know what to think, she was lightheaded, and it was not vertigo, not like the room was flying, but she was like out of balance, her balance was messed up, and she sat there a minute, she was too hot, she got out of her coat, and it got worse, she could feel her heart racing, and she was talking to herself, she thinks she nervous, she could feel her heart pounding, and was instructed to raise her hand if she had issues, so she raised her hand, a nurse practitioner came over, she raised her hand, and the doctor making rounds came over and he said take off your mask off, she did, that helped somewhat, it was that blasted mask, she couldn't get enough air, he gave her water, she thinks she got too hot and perhaps got nervous and didn't think she was she said she's not been around people, and was suddenly in a huge crowd, everyone was appropriately distanced, it was an extreme presentation, after 5-6 minutes, she was good, it went away, but for 36 hours she didn't feel right, she could feel sometimes her balance wasn't right, she was just not herself, she could do her usual, she lives on a farm, she did usual farm stuff, but was not herself, and in the night, she woke several times, her heart was beating too fast, too much, but she went back to sleep, and she told her son, she said it felt like she had had 4-5 cups of really strong coffee. So the next day she was ok. Absolutely her normal, and then she didn't think anything about it, and was driving to a routine GYN exam, which was canceled last moment due to an emergency, she was driving and suddenly her arm started itching, this was Tuesday, so 48 hours after, not the site, it was distal, underneath it, maybe 2-3 inches under injection site. The site did nothing, she looked that night, no redness, lump, no raised area, no warmth, nothing, but then she had itching, intense itching like poison ivy, and she scratched and thought wait a minute, at her appointment she looked at her arm, this area was 3-4inches under the site, that was red, feathery looking and flat, macular, not

A 79-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL9262, NDC number of COVID Vaccine: 59267-1000-1; Expiry Date of COVID Vaccine: 31May2021), intramuscularly at Left Deltoid on 08Feb2021 10:30 (either 10:30AM or within that hour or prior) at single dose for COVID-19 immunization. Medical history included anxiety, panic disorder, asthma, obstructive sleep apnea, additional Information for Other Conditions: She was oxygen Dependent, coeliac disease, allergy, Additional Information for Other Conditions: She had Medication, Environmental, and Food Allergies, central neuro hearing loss, vertigo, Allergic rhinitis, gastroesophageal reflux disease (GERD), Additional Information for Other Conditions: Esophageal Reflux, osteopenia, impaired glucose tolerance, hypothyroidism, claustrophobia, rheumatoid arthritis (she had arthritis for which she took Orencia for), history of coronary heart disease, diabetes, she would be a targeting patient, as she was an oncology patient with large granular lymphocytic leukemia she met criteria for the pandemic, as well as they put down that she was due for immunization. She had anaphylaxis to bees. With adhesive tapes she got dermatitis. With shellfish she got hives. She had a gluten sensitivity and with mango her mouth gets fuzzy. Family Medical History Relevant to AE(s): her sisters had a few cancer. There were no concomitant medications. The patient previously received levofloxacin she had hives, with quinolones drug class she had hives, with thiopental she had hives and needed IV Decadron for it, with sertraline she has syncope, with Revatio she had an adverse event of joint and muscle pain, with ciprofloxacin she had tachycardia, with Enbrel it caused a drug induced pulmonary fibrosis granulomatosis, with Montelukast she had a headache and muscle pain, nitrofurantoin she had headache, with Symbicort it gave her hoarseness, she took Orencia for arthritis, she got the flu Vaccine in Sep2020. That was most recent. The patient had a grade 2 allergic reaction |

2/20/2021

on 08Feb2021. The patient was watched after administering the vaccine on 08Feb2021 as she had background of multiple allergies and asthma. She was watched for 30 minutes in the oncology unit infusion suite. The reaction happened within 5 minutes of administration. Seriousness Criteria: Caller explained that this reaction was mild to moderate, there was a grade to intervene but at no point was she unstable, she did have a significant anxiety disorder, and so she was nervous about getting the vaccine. She was short of breathe, odd and flushed. She was physically stable, her vitals were stable and there was no angioedema. Reporter seriousness for grade 2 allergic reaction: Medically significant. The patient recovered, as a treatment they gave her IV Benadryl 50mg and IV fluids, she also had her own albuterol inhaler. In the pandemic, they are not doing nebulizers. The outcome of events allergic reaction, shortness of breath and flushed was recovered on 08Feb2021. Relatedness of drug to reaction(s)/event(s). Reaction assessed: Grade 2 allergic reaction; Source of assessment: Primary Source Reporter. Method of assessment: Global Introspection. Drug result: Related. Causality: reporter stated that she did think the patient's base line anxiety played into the reaction she experienced, the reaction was aggravated by it.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of grade 2 allergic reaction, short of breathe and flushed due to temporal relationship and current known drug safety profile. The patient's underlying allergic physique also predisposed the patient to developing the event. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

In under two minutes fainted. Believed to be Vasovagal syncope although patient has never fainted in the past and even with getting other vaccines.

| 1051718 | 2/24/2021 | MI | 80 | F | 2/11/2021 | 2/18/2021 | Vaccine administered on 2/11/21. Presented to emergency department on 2/18/21 following an episode of syncope and collapse at home. Patient reports becoming dizzy and diaphoretic at home and passed out in bathroom. Presented with left-side rib pain and headache attributed to hitting door and ground during fall. Was checked for COVID19 prior to transferring to observation unit and was found to be positive. Patient was discharged home in stable condition from observation on 2/19/21. |
| 1053311 | 2/24/2021 | LA | 69 | M | 2/18/2021 | 2/20/2021 | The patient was admitted for recurrent syncope that began on Friday evening 2/19. He fell twice and struck his head, knocking 2 teeth loose. He continued to feel lightheaded the next day and came to the ED and was admitted for syncope workup. His workup was negative. On discharge, patient recalled that he received his 1st Covid vaccine. His symptoms resolved after admission. This event was likely related to his vaccination. |
| 1052607 | 2/24/2021 | NY | 38 | M | 2/23/2021 | 2/23/2021 | Patient reports approx. 5-10 min after receiving first dose of COVID vaccine, he became hypotensive (98/60), dizzy, diaphoretic and near syncope. States he was monitored by EMT for a short time after this happened, did not need to use his EpiPen, but did take Benadryl. Reports that after 5-10 min his symptoms improved/resolved, and he has felt fine since. States he is feeling great today. He was advised by PCP NOT to get the second dose of the vaccine, and if he would like a second opinion, will need to be referred to an allergist. Patient declined referral, leaning towards not getting the second dose. |
| 1052492 | 2/24/2021 | MD | 73 | F | 2/24/2021 | 2/24/2021 | Syncope, BP 88/67, P 59, R 20, Was assisted to chair, given apple juice, crackers, water VS after 15 minutes: BP 124/74, P 111, R 18, VS after 30 minutes 121/93, P 101, R 18 |
| 1279586 | 2/24/2021 | | 73 | M | 2/6/2021 | 2/6/2021 | Narrative: symptoms were present prior to vaccination, but syncope occurred after vaccination. Low likelihood that vaccine was causative in our estimation. |

| 1053072 | 2/24/2021 | TN | 33 | F | 2/24/2021 | 2/24/2021 | At about 1458 patient received first dose of Moderna COVID-19 vaccine Lot number 031L20A expire 07/22/2021 in Left Deltoid by RN at vaccine site. Pt was instructed to wait 15 minutes in personal vehicle in designated parking area for monitoring. At 1508 patient whom was sitting the passenger seat of personal vehicle c/o SOB, and chest tightness to LPN who was monitoring the parking lot. Nursing Supervisor was dispatched over to the patients vehicle. On assessment patient stated she had a "loss of senses, SOB, chest tightness and cold chills". Pt confirmed she has no allergies and never had any reactions to medications or vaccinations. When asked pt to elaborate on s/s pt explained tunnel vision and sweating and "throat itchiness". Pt was breathing slightly labored 12 respirations a minute pulse rapid and bounding pt pale and diaphoretic and cool to touch. 1510 called made to 911. 1510 bp 60/30 Diphenhydramine and Epinephrine drew up into syringe for precaution. While RN rechecked bp to confirm. Recheck was confirmed 60/30. At 1513 pt states "I think I am feeling better, my senses are starting to come back and breathing feels better" Pt reports she passed out once giving blood. EMS arrived at 1515. At 1515 recheck b/p was 80/40. It was determined that pt did not require Diphenhydramine and Epinephrine due to pt quickly feeling better and s/s improving pt was determined to have a vasovagal response. At 1520 b/p 106/62 normal respirations at 14 a minute. EMS left at 1522 gave pt a cold paper cloth and water to drink. Dr. was called at 1525 where he was made known of the situation. His instructions where to advise pt to get second dose of Moderna in a hospital setting for close monitoring and advise that pt do not drive home. Pt made aware of instructions from MD. Pt was not driving. At 1552 patient feeling better and requests to leave. Pt reported she has no feeling of SOB or tightness. Pt not as pale as she was at begging of the event. |

| 1048866 | 2/23/2021 | AL | 35 | F | 2/19/2021 | 2/19/2021 | I started having minor body aches about six hours post vaccine. I woke up that night nauseous and dizzy. I passed out on the way to the kitchen to get water. My husband somehow heard me and helped me back to the bedroom where I passed out again. I was eventually able to get back in bed without passing out, though I couldn't get warm and had severe body aches for most of the night. It was like having a very high fever, only there was no fever. I was clammy, but no fever. Around 4:30 a.m. the 'non-fever' broke and the chills and body aches stopped. I was extremely fatigued for the next two days and felt myself again by the third. The arm in which I received the shot hurt pretty bad Friday too but that was the least of my concerns. I did not seek medical treatment for these symptoms. |

| 1048683 | 2/23/2021 | VA | 82 | M | 1/25/2021 | 2/2/2021 | <p>passed out; light headed; This is a spontaneous report from a contactable consumer (patient's daughter). An 82-year-old male patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EK4176), via an unspecified route of administration on 25Jan2021 09:50 at single dose for covid-19 immunization. Medical history included visual problem. The patient's concomitant medications were not reported. The patient experienced passed out on 02Feb2021 and light headed in 2021. Clinical course: Consumer was calling regarding her dad who got the Pfizer COVID-19 vaccine. She said her dad had an event and she took him to his cardiologist who checked him out and suggest they call about it. She said that her dad passed out a week and a day after getting the vaccine and had been light headed. She said she was concerned that the second dose of the vaccine was supposed to be worse for effects, and she knew he was supposed to get it, but she wasn't sure that he should. She said her dad would say to call his daughter, because he had a visual problem, which he had since before the first dose of the COVID-19 vaccine. Caller said that NDC/EXP were not provided on the handwritten card. She said it said he got his first dose 25Jan2021. She said that the report she filed online asked what time he got the vaccine dose, and she put 09:45AM since it would not let her put 09:50AM, it was really at 09:50AM. Outcome of events were unknown.</p> |

A 73-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3249), via an unspecified route of administration at Left arm on 06Feb2021 07:45 at single dose for covid-19 immunization. The COVID-19 vaccine was administered at Hospital. Medical history included High blood pressure. Concomitant medications included losartan, atorvastatin calcium (LIPITOR) and vitamins. Patient was not pregnant. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient woke up 1:30 am 07Feb2021very dry mouth, used restroom, felt very lightheaded, went back to room, next thing she heard was glass breaking. She had passed out hitting a table bumped head and back. Her boyfriend was with she helped she up. Said her legs went out from under her. Thought maybe she may have been dehydrated though she had drunk water throughout the day and before bedtime. No treatment received for the events. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient was not been tested for COVID-19. The outcome of the events was recovered on an unknown date in Feb2021. |
| 1049717 | 2/23/2021 | CA | 90 | F | 1/26/2021 | 1/27/2021 | The next day, patient was found down by children (lives alone.) Was confused, had had fecal incontinence many hours earlier (dried) . Neither syncope nor fecal incontinence had occurred before. Previously managed to walk w walker or holding on, do her own basic ADLs (toilet, use microwave, eat.) Now bed bound and requires 24 hour care, unable to stand even with assistance/PT. Mental state has returned to baseline. Spent a week in rehab but could barely comply w PT instructions due to pain/dizziness. |

| 1048196 | 2/23/2021 | FL | 48 | F | 12/24/2020 | 12/24/2020 | <p>Passed out/ Status post syncopal episode; Double vision; Diagnosis of static vision; Hypothyroid; Diarrhea; Injection site pain; Headache; A spontaneous report was received from a healthcare professional concerning a 48-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced hypothyroidism, passed out/status post syncopal episode, diarrhea, injection site pain, headache, static vision/double vision. The patient's medical history was not provided. Concomitant medication history was not provided. The patient received their first of two planned doses of mRNA-1273 (batch number: unknown) on 24 DEC 2020. On 21 JAN 2021, the patient received their second of two planned doses of mRNA-1273 (batch number: 028L20A) intramuscularly for prophylaxis of COVID-19 infection. The patient developed injection site pain and diarrhea after the second dose. She continued to have the headache from the first dose that was administered. On 03 FEB 2021, the patient experienced double vision and dizziness while driving to work. The patient passed out at work and was admitted to the hospital. A CT of the brain showed no acute findings and her CT angiography was normal. The patient was discharged in less than 24 hours with the diagnosis of static vision, hypothyroid and status post syncopal episode. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the event passed out/status post syncopal episode and static vision/double vision were resolved. The outcome of the events hypothyroidism, diarrhea, injection site pain, and headache were unknown.; Reporter's Comments: Very limited information regarding this events has been provided at this time. | 1047831 | 2/23/2021 | WA | 65 | F | 2/4/2021 | 2/5/2021 | acute flu lasting 3 days followed by 1 day with lighter symptoms. The 3 days included acute pain,fatigues,sleepiness,chills, body aches . On day 2 about 28 hours after taking the vaccine I walked to the bathroom and fainted. I am 65 and have never fainted. |
| 1048208 | 2/23/2021 | VA | 82 | M | 1/25/2021 | 1/25/2021 | passed out; felt lightheaded; This is a spontaneous report from a contactable consumer (patient). An 82-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration at the right arm on 25Jan2021 09:45 at single dose for COVID-19 immunization. Medical history included hypertension, hypothyroidism, high cholesterol. The patient has no known allergies. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient received unspecified medications within 2 weeks of vaccination. On 25Jan2021, the patient felt lightheaded since vaccine. On 02Feb2021, the patient passed out. The patient has never passed out before. He went to the cardiologist on 04Feb2021 and had EKG and review of BP readings and HR readings etc., all checked out ok. Today was 08Feb2021 and still lightheaded. The cardiologist suggested we call you but cannot get through. We were extremely concerned about getting the 2nd vaccine because of reports of worse symptoms with that one. We cannot get through to you and do not know what to do. The 2nd vaccine was scheduled for 15Feb2021.The events resulted in doctor or other healthcare professional office/clinic visit. The patient has not recovered from the events. Treatment was received for the event passed out and ordered Exam-EKG-Holter Monitor. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient has not been tested for COVID-19. Information on the lot/batch number has been requested. |

| 1049678 | 2/23/2021 | OR | 63 | F | 2/21/2021 | 2/22/2021 | I was fine til about 2am when I was faint and light headed with flu-like symptoms, stuffy nose, body aches + terrible migraine headache. Was so sick that I was unable to find my migraine meds (prescribed by doctor). Have history of migraines but haven't had one in several month...I was dizzy and worried about thowing up and fainting. Note: usually never recieve the flu shot but not during 2020. |
| 1050464 | 2/23/2021 | | 23 | F | 2/23/2021 | 2/23/2021 | 10 minutes post vaccination during observation, patient fainted and did not rouse immediately. I administered ammonia inhalant was used within 1-2 minutes of her LOC, and patient gained consciousness but was diaphoretic and pale. Within 2 minutes of the ammonia inhalant, she began convulsing (full body convulsions, eyes rolled) For 30-45 seconds. She had continued LOC for 1-2 minutes, 15L O2 mask was administered, and patient slowly came in and out of consciousness for the next 5-10 minutes, bradycardic 35-45 bpm, BP 72/50, HR irregular, RR 16 BS clear. At the time of observed convulsions, 911 was called and arrived within 10-12 minutes. When EMS arrived, she remained pale but with some improved pallor, HR 45 bpm, and more alert. Transported by EMS to hospital for eval. |
| 1049722 | 2/23/2021 | MI | 22 | M | 2/22/2021 | 2/22/2021 | One minute following vaccination, patient hunched over and fainted. Nursing staff lowered patient off chair and onto floor, raised patient feet above heart level. Patient woke 15 sec later and sat up slowly. Patient given juice and granola bar. Patient observed for total of 50 minutes. Patient vitals remained within normal limits throughout observation period. Patient released after reporting feeling better and all symptoms diminished. No other severe symptoms or concerns noted during observation period noted. |

| 1050316 | 2/23/2021 | CA | 23 | F | 2/19/2021 | 2/19/2021 | From patient note: 2/19/21 Day of Vaccination - Morning of the vaccination had burning in arm at and around the injection site with severe soreness of arm developing over the day. After 5 hours faintness, sore neck/shoulders, trembling hands, "super shaky", also headache with stabbing pain in head and neck which continued for several days. Tight chest developing within 3 hours gradually turning into extreme difficulty breathing by 9pm. Around 9pm both arms from shoulders to fingertips went numb and tingly "like nerves were TV static". Throughout night drank about 1 bottle of water per hour, each time getting up and taking a few steps vision would start blacking out, would feel clammy, and would barely make it back to bed before fainting. Extreme muscle and joint pain made walking difficult for 3 days.. Fever of 99-101 for 3 days. Day 2 - extreme back pain accompanied by heartburn On 2/22/21 reports doing better but continuing to have soreness, night sweats, chills |
| 1050309 | 2/23/2021 | CA | 64 | F | 1/15/2021 | 1/16/2021 | I had my 2nd dose of covid vaccine on 1/15, around 5 pm. Next day when I got up about 7:20 I felt dizzy nausea and wanted to vomit. Then I passed out, I fell down and hit my face on the floor. My family called 911 paramedica. They ,measured d my blood pressure and it was too low. The area around my right eyebrow was swollen and my neck hurt as precaution I went to the hospital. I suspect the incident and its symptom are side effects of the vaccine given the timing. Later on I had headache off and on and brain fog. |

| 1050244 | 2/23/2021 | FL | 41 | F | 2/19/2021 | 2/22/2021 | Anaphylactic shock? Shortly after receiving the vaccine my arm was sore and I had a severe headache. Approximately 24-48 hours after I received the vaccine I started developing a red, hot, itchy raised rash on my ears and buttocks which became more prevalent and peaked around 80-90 hours later. Approximately 82 hours after I received the vaccine, I began to feel nauseous, dizzy, and fatigued so I stood up to get ready for bed early. While brushing my teeth, I went pale white and felt like I was going to vomit. I put the toothbrush down and got on floor. My pulse felt like it had stopped. I tried to check my pulse and I could only detect one beat every other second. I called for my spouse and by the time he got to bathroom I was passed out. I came back to after about 30 seconds and was convulsing from chills. He put a blanket on me and grabbed my Apple Watch to try to get my pulse which read in the 50s (so I assume it was much lower when I passed out). My hands and feet were tingly and I stayed on the floor until my pulse got back up. I then had diarrhea. At this point in time the rash was most prevalent and was present mostly on my buttocks but also on my ears, scalp, pointer finger on right hand, thighs, and hips. I went to doctor the following morning an my vitals, blood sugar, EKG, urine screen were stable and indicated no issues. 106 hours later I still have the rash on all areas mentioned and am dizzy, nauseous, and fatigued. |
| 1050226 | 2/23/2021 | NJ | 58 | F | 2/12/2021 | 2/20/2021 | Suddenly became dizzy, My family who consists of 3 nurses were with me at the time. Had a witnessed vasovagal syncope episode . Turned white, lost consciousness for about 90 seconds. No pulse was felt by my daughter who is APN. 3 chest compressions were done, then color in my skin began to return (per my family). I was then transported to the emergency room. Cardiac work up for heart attack was negative, vital signs were stable after initial episode. Was admitted to hospital for 18 hours for observation. I have no medical history and had no changes in my daily routine |

| 1050205 | 2/23/2021 | NJ | 48 | M | 2/8/2021 | 2/8/2021 | Started with tiredness, then arm got sore and was painful to lift. Later in the day, body and joint aches started. 12 hours after dose, started to get very cold and this turned into violent and uncontrollable shaking from chills. Then headache started 13 hours after dose (the headache lasted for 2 days and was the last symptom to go). Fever fluctuated between 101.5 and 102.1. Later felt very nauseous, felt like I had to vomit but didn?t. Went to the bathroom and there I got dizzy and almost passed out but didn?t. Fever up and down all day the next day. Could only eat a little Campbell?s chicken noodle soup and a small can of coke. By the next evening (day 2) I started to feel better just exhausted and a headache. Went to sleep early, next day (day 3) still had the headache and was exhausted. By Day 4 I was about 80 % back to normal and feeling much better. I didn?t take any fever reducers or other medications during this time. It was all worth it to be vaccinated, |

| 1050147 | 2/23/2021 | IN | 48 | F | 2/6/2021 | 2/16/2021 | The day of the injection, approx. 3-4 minutes after getting the injection, I almost passed out. I became hot, sweaty, dizzy and my head starting to buzz. The nurse on-site provided me a couple cold packs and after about 30 minutes, I felt better. The nurse described my response as a "vascular" reaction. Later that night, I got a headache and night sweats and bouts of nausea. They only lasted a day. Approx. 10 days after the injection, the injection site became red, swollen, itchy and uncomfortable to the touch. Then it traveled down my arm and created a large red, swollen, itchy area on my entire upper arm. I advised my doctor and she provided me a Rx for a topical steroid and oral steroid. After 5 days of treatment, it is 90% better. The injection site still hurts. |
| 1050166 | 2/23/2021 | IN | 30 | M | 2/23/2021 | 2/23/2021 | Patient experienced light headedness and symptoms consistent with syncope, as well as nausea. the syncope event occurred in the chair without a fall. per patient reporting patient had not eaten 8 hours prior to administration time and also experienced anxiety with vaccines. patient was given supportive care including assisting to the floor carefully with a pillow provided and feet elevated. patient was also provided with juice to support any potential low blood sugar. |

| 1045735 | 2/22/2021 | MA | 29 | F | 2/20/2021 | 2/20/2021 | Around 5:30 PM I began experiencing normal symptoms like headache and muscle ache. At 8:15 PM I began to feel light headed, nauseous, and short of breath. Around 8:20 I needed to lay on the floor to prevent myself from fainting. My eyes were rolling back because I was borderline unconscious. I felt like I had no control of my body and had to go to the bathroom. For around 15 minutes I was on the floor convulsing, shaking as if I had chills and my muscles were involuntarily tensing. My pulse was extremely low. After the convulsions stopped I remained on the floor an additional 15 minutes. Around 8:45 PM I was able to return into my bed with assistance. My nauseous remained and I began experiencing chills. I slept on an off the entire night. At about 1 AM what I suspect was a fever began to break and I was extremely sweaty. For the following day I experienced exhaustion and muscle soreness. I am still experiencing exhaustion. I recognize a bulk of my symptoms were normal but the convulsions, losing consciousness, and inability to control my body seemed worth reporting. |
| 1046278 | 2/22/2021 | MA | 80 | F | 2/11/2021 | 2/11/2021 | Chills, pain throughout body, fainting (30 hours after injection, general weakness for 40 hours |
| 1046129 | 2/22/2021 | OH | 70 | F | 2/12/2021 | 2/12/2021 | Approx. 1 hr. & 20 min. post injection, severe reaction: Severe upper abdominal pains, multiple, uncontrollable formed to diarrheal bm's triggered vagal response, passed out, severe diaphoresis, violent chilling loss of control of bowel movements. Lasted approx. 30-35 minutes. crawled with head hanging to floor to keep from passing out, to locate a phone for help. after several of agonizing attempts to try and climb up to couch to elevate legs high above head and laying there for approx. 20 or more min. blood pressure came up some. (Did not call emergency services) afraid of hospitalization due to all chronic health problems, (forgot to report earlier that I am Hypothyroid as well) previously hospitalized for a Thyroid Storm. This is day 10 from injection and still have nausea, dizziness & fatigue, (also have couple episodes of abdominal pain). (I want to add that I felt completely fine prior to receiving 2nd Pfizer Covid dose). I am contacting my doctor today to receive some IV fluids. |

| 1045871 | 2/22/2021 | MA | 42 | F | 2/5/2021 | 2/5/2021 | <p>Patient reports that she received dose one of the Pfizer COVID-19 mRNA vaccine last Friday, February 5, 2021 at 2:03 PM. She received this here at facility campus vaccine clinic. She felt a strange tingling sensation immediately upon receiving the injection that extended from the injection site across her upper back but otherwise tolerated the injection well. Because of her history of food allergy she was advised to remain at the vaccination clinic for 30 minutes. During that 30-minute wait period she felt generally well however began to develop pruritus at her back in the legs. She did not mention this to the staff at the vaccine clinic and did not look at her skin. The pruritus was not too bothersome and she left the vaccine area after 30 minutes and walked down to our clinic to return to work. Her pruritus intensified very quickly upon returning to her desk and within a few minutes of after her return she went into the bathroom to look at her back and had patches of red, raised, urticarial lesions across her back. She began to feel itchy all over her body. She remained at work and did not take any medication or seek any medical help. She did not look at her legs. The pruritus intensified and when she looked at her skin of her legs approximately 1 or 2 hours later she had developed urticaria essentially head to toe. She had large confluent patches of urticaria at bilateral thighs, urticaria at her face, trunk, arms, legs. At this point she felt otherwise well. She went home and took 10 mg of Claritin and applied a topical Benadryl cream to her skin. This was not helpful. She had severe pruritus of her eyes and eyelids. She took 50 mg of oral Benadryl which also was not particularly helpful. Sometime in the middle of the night that night she developed chills, felt feverish, and developed intense muscle and joint aches. She took an unknown dose of ibuprofen with minimal improvement in muscle and joint pain. She did have improvement in fever. Following day was Saturday, she spent the whole day in bed in extreme pain. She describes the pain at her wrists as feeling as though "somebody was breaking my bones" with any movement of her wrists. She had pain even laying flat in her bed and had severe pain at all of her joints with movement. She tried taking a flexeril with no improvement. She recalls a T-max of 102 sometime on Saturday or Sunday. At that time she had been taking ibuprofen around-the-clock. She also took 10 mg of</p> |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

Claritin approximately every 4 hours. Each night she also took 50 mg of Benadryl. She continued to experience urticarial skin rash and intense pruritus of the skin. The urticaria waxed and waned during this time. She also developed a fever blister at her lower lip. She spent most of Sunday in bed also. She was feeling a bit better by Monday however still had intense pruritus. Skin rash was much improved at most of her body however she still had mild urticaria at her face. She did not have a fever on Monday but was continuing to take ibuprofen around-the-clock. She discontinued ibuprofen yesterday and has not had fevers or chills since Sunday. At this point her urticaria has essentially resolved. She continues taking claritin 10mg BID to 3 times a day and also 50mg bendaryl at bedtime. She did not experience any bruising related to this rash however did have excoriation from scratching particularly at her face. Throughout the course of these days she did not have any episodes of angioedema of the lips, tongue. She denies difficulty breathing, cough, wheezing, shortness of breath, throat tightening, nausea, vomiting, diarrhea, dizziness, lightheadedness, syncope. She has a history of oral allergy syndrome with peanut. Promethazine has caused diplopia, weakness. Simvastatin caused muscle weakness. She has never had any issues with vaccines. She has been getting a flu shot yearly with no difficulty. Her most recent vaccine was October 8, 2020, quadrivalent influenza vaccine. No known history of allergy to polyethylene glycol. No history of chronic urticaria. She takes NSAIDs frequently without any difficulty. She has not taken any NSAIDs prior to receiving this injection or developing this urticaria. She had however taken 10 mg of Claritin prior to receiving this injection. She has no history of anaphylaxis. She has undergone surgery under general anesthesia on more than one occasion without issue. No history of reaction to stinging insect venom. She receives immunotherapy for inhaled environmental allergens here in our office and has done well with this. She denies any recent medication changes or new over-the-counter medications. She has not previously been diagnosed with COVID-19.

| 1045635 | 2/22/2021 | MO | 74 | M | 2/4/2021 | 2/9/2021 | Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times,

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

| 1045629 | 2/22/2021 | MA | 53 | F | 2/2/2021 | 2/1/2021 | <p> Syncope; headache; body aches; intermittent fevers with flushing/chills; intermittent fevers with flushing/chills; intermittent fevers with flushing/chills; nausea night of 2nd inj and next day; Severe fatigue; joint pain; I felt very ill; akin to the flu; This is a spontaneous report from a contactable nurse(patient). A 53-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not reported), via an unspecified route of administration on the left arm on 02Feb2021 11:45 AM at a single dose for COVID-19 immunization. Medical history included Crohns disease which is in remission (No immunosuppressants in 5 years) and shellfish sensitivity. The patient received the first dose of BNT162B2 on 15Jan2021 for covid-19 immunization and experienced syncope. The patient is not pregnant at the time of vaccination. Facility where the most recent COVID-19 vaccine was administered was hospital. The patient was not diagnosed with COVID-19 prior to vaccination. Since the vaccination, the patient was not tested for COVID-19. Concomitant medication included duloxetine hydrochloride (CYMBALTA), trazodone, buspirone hydrochloride (BUSPAR), lisdexamfetamine mesilate (VYVANSE) methylfolate and Ma. The patient experienced syncope after injection in Feb2021. A few episodes in 18 hrs, the patient experienced headache, body aches, intermittent fevers with flushing/chills, nausea night of 2nd injection and next day in Feb2021. The patient experienced severe fatigue, joint pain, felt very ill, akin to the flu in Feb2021.No treatment received for the adverse events. The patient underwent lab test included body temperature: intermittent fevers in Feb2021.The outcome of the events was recovering. Information on the lot/batch number has been requested.; Sender's Comments: A contribution from BNT162B2 to the event syncope is possible based on available information. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate </p> |

| 1047225 | 2/22/2021 | CA | 65 | F | 2/17/2021 | 2/17/2021 | <p>Feeling mostly normal but tired fell asleep at 11PM day of second vaccine. Woke up 1 hour later and got up to go to the bathroom but felt fine. Went out to the hall bathroom so as not to wake husband in Master bath. Urinated and got up slowly as I always do and walked out to the hallway to go back to bed. I lost consciousness and came to when my husband who heard a thud came and found me out having fallen down the stairs.. head on the landing and feet above the landing. I have no recollection of it once leaving the bathroom and i would have headed away from the stairs which was just to the left of the bathroom doorway. I didn't feel any pain. Later found a bump on my forehead of the right side of my face and a bruised lip. He said my back was wet with sweat and I took a couple minutes to come to. After returning to the bed.. i immediately had to empty bowels. Diarrhea.. then the rest of the night in Chills. No fever. Slept most of the next day and night. Headache and joint aches and swelled lymph nodes in neck.. Fatigue through 20th. Mostly better by the 21st. Still today on 22 I am being careful when going from prone to standing. I feel more head pressure getting up and maybe I notice a little nausea when rising. I may just be worried about fainting again. It has never happened to me before. I do have very good blood pressure on the lower side so I was always careful to get up slowly but never fainted. Neck is sore.. Not sure if lymph nodes or something to do with fall.</p> |

| 1047669 | 2/22/2021 | IL | 62 | F | 1/1/2021 | 1/23/2021 | 01/23 Hives began on thigh and progress to arms, torso, underarms and then both thighs. 01/25 Called dr and had a Telemed call with NP on Tues. 01/26. Predisone and Benadryl was prescribed. Thurs. 01/28 Call to let them know that it wasn't working. I went into the office for one shot of Solumedrol. This help and they were gone. They gave me second dose of Predisone to take in case it came back and to continue the Benadryl. 02/8 Second vaccine. Hives began that night: arms, torso, thighs, hair. Call the Dr. on 02/10 and suggested I go to an allergist. Went to allergist on 02/11 she said to only take one Predisone, Allegra one am and one at noon, then take zertek at nighttime. The Predisone created a major brain fog, I had to stop. Saw the allergist on 2/18, she agreed to get off the Predisone. 02/11 I passed out in the am and when I woke up with vomit running down my face. Still suffering with hives this entire time. 02/17 my face, lips, tongue started to swell and I had chest pain for 90 minutes. My feel swelled and I have hives so bad on my feet I could not walk or put on shoes. 02/20 Woke up with sweat on my chest. My hands were so swollen I had to have my wedding ring was cut off . 02/21 I went to the Urgent Care and received a shot of Solumedrol. They said this should last me for a few days. 02/21 woke up 3 time throughout the night soaked in sweat. |

| 1047043 | 2/22/2021 | FL | 66 | F | 2/20/2021 | 2/21/2021 | At 3 a.m. on the 21st, approximately 18 hours after vaccine, got up to go to the bathroom. Felt weak and passed out on bathroom floor. |
| 1046592 | 2/22/2021 | | 94 | F | 2/18/2021 | 2/19/2021 | Per patient's daughter, the patient told her that she "passed out" while she was on the toilet the day following vaccination. States she felt weak. Per daughter the patient is doing fine now. |
| 1047618 | 2/22/2021 | MI | 44 | F | 2/20/2021 | 2/20/2021 | Mild dizziness started within 5 minutes. Within 20 minutes my tongue started to swell, but only the front to middle part, not the back part. I was still able to breathe. After 25 minutes, I was unable to stand and nearly passed out twice trying to get to some place safe. I could not verbally communicate and was lacked strength to move. I started drinking as many fluids as possible with the assistance of family. Symptoms began to subside after 3 hrs. After 4 hrs, I regained strength and was not dizzy if I stayed in place. I continued to push fluids and rested. I needed to be careful not to drink anything too cold as i would develop the chills. The next day, there was no dizziness but I was very groggy. I continued to push fluids. I would develop a headache if I did not drink at 16 oz every hour. The following day, I was still groggy, but was functional and felt okay to drive. |
| 1046514 | 2/22/2021 | SC | 73 | F | 2/3/2021 | 2/8/2021 | Admitted with syncope and began to have pancytopenia |
| 1047107 | 2/22/2021 | NY | 76 | F | 2/1/2021 | 2/16/2021 | I received my 2nd vaccine at 12:15 at the facility on Tuesday, Feb. 16. At about 10:30 that night I began to feel a bit light headed. I went to bed around 11:30 and didn't sleep very well. On Wed. am after going to the bathroom, I felt woozy while washing my hands. When I thought I felt better, I made my way back to the bedroom and passed out. I fell on my right side, bruising the right side of my face, my right hip and my right thigh. I apparently had my left hand under me when I fell because I broke the knuckle under the pinkie of my left hand. |

| 1044051 | 2/21/2021 | TX | 28 | F | 2/20/2021 | 2/21/2021 | Felt tired and arm was heavy for a few hours right after then I went to bed around 11 pm and woke up at 1 am with my arm extremely itchy and swollen feeling like it does when I'm having an allergic reaction to my allergy shots (which I haven't had in two weeks) so I got up to go check it out in the bathroom and then it looked fine so I sat down to go to the bathroom then felt faint so I moved to the floor and passed out for approx 20 seconds according to my partner then came to with a giant gasp for air and then drank a sip of water and threw up and felt dizzy for a bit after that |
| 1044084 | 2/21/2021 | PA | 55 | M | 2/9/2021 | 2/10/2021 | injection site soreness, shoulder tightness increased to a shock along nerve to back of thumb within 24hrs. Arm began to pull up with pain through forearm and biceps increasing through 72 hrs. Began meloxicam again at 60 hrs. Woke up at 84hrs with severe arm pain, unable to move arm without pain. Cold sweat and nearly fainted. Pressure/pain in shoulder, biceps, elbow/forearm wrist. Called sibling who is physician and began treating shoulder with ice, tylenol and benedryl. Pain controlled to moderate through day 10 but lifting arm at shoulder or extending results in shock at back of thumb and pain through biceps and forearm. Back base of thumb completely numb. Went to urgent care facility 10 days after injection and |
| 1044238 | 2/21/2021 | GA | 68 | F | 2/14/2021 | 2/15/2021 | Patient received vaccine around 3:00 pm on 2/14/21. Around 7:00 am on 2/15/21 she went outside to walk her dogs and began to have "tunnel vision". She says she almost passed out. She proceeded to sit down on a chair nearby. Patient was feeling clammy and sweating. Husband came out to help her back into the house. He took her blood pressure reading and it was 79/50. He claims it came back up pretty quickly. Patient says she put wash cloth on face and relaxed for that half of the day. By 1:00 pm that afternoon she felt fine. |

| 1044622 | 2/21/2021 | CA | 72 | F | 1/29/2021 | 1/29/2021 | Approx 2 1/2 hours after my first vaccination I was sitting watching TV and got a very sudden and very intense metal taste in my mouth. I waited about 2 minutes to see if it would go away abd then got up to go get a drink of water to try to make the taste go away. As soon as I stood I nearly fell abd felt I was about to pass out. I told my husband I was not OK abd went a few feet out my front door to an outside chair for more air. I felt extremely lightheaded. After maybe 5 minutes the metal taste went away abd I felt a little less light headed. I went back inside abd sat again but almost instantly the metal taste came back. I sat outside until the metal taste went away again. My husband brought me water to drink. The light headed ness eased up but didn?t go away until 4 PM that afternoon. It was a terrifying feeling. I emailed my doctor mg d also called ER to see if I should go to the hospital. I had an online appointment with an ER doctor who had not heard about those side effects before abd was only interested in whether I was having trouble breathing. I was not having trouble breathing. My Dr. emailed back stating I should go for my second shot, which I have not had yet, and take Benedryl. I?m scared about having these side effects again. I nearly passed out and if the second one is worse as I?ve heard I just don?t know if I should have it. |

| 1042757 | 2/20/2021 | IL | 59 | F | 1/13/2021 | 1/16/2021 | On January 16th I started feeling very dizzy in my eyes got blurry very dry mouth and palpitations, and I almost passed out at home, my husband had to take me to Er. They wanted to keep me in the hospital but I told him I will follow up with my doctor on Monday, I did not want to stay on the floor with covid patients the test that they had ordered at the hospital were normal they did not order a CMP they only did a basic metabolic panel and that was normal, so I followed up with my doctor on Monday which was January 18th, and she ordered CMP and all the labs, when they threw my blood my liver enzymes were very elevated over the thousands LT ASG and the and others, then the doctor ordered a second set of blood works of CMP just to make sure it wasn't a fluke, they were even more elevated they were over 1,400. |
| 1043369 | 2/20/2021 | OH | 40 | F | 2/20/2021 | 2/20/2021 | Patient felt lightheaded and had already left observation area 10 minutes earlier than her 15 minute recommended timeframe. She sat herself down due to feeling of syncope and stayed with EMS to lay down for 20-25 minutes. |
| 1042868 | 2/20/2021 | CO | 52 | M | 2/15/2021 | 2/15/2021 | Systemic: Confusion-Medium, Systemic: Dizziness / Lightheadness-Severe, Systemic: Fainting / Unresponsive-Severe, Systemic: Flushed / Sweating-Medium, Systemic: Hypotension-Severe, Systemic: Seizure-Medium, Systemic: Shakiness-Severe, Additional Details: About 5 minutes after receiving vaccine, patient was seated in observation area and notified facility staff member who was in charge of observing patients that he felt faint. Staff member reported patient quickly turned extremely red and was showing seizure-like activity, unconscious. She alerted the pharmacists to come over I came over and patient appeared bright red, pupils extremely dilated and was not conscious, grabbed pt arm he woke up and then showed typical vasovagal symptoms thereafter. |

| 1043255 | 2/20/2021 | NC | 61 | F | 2/20/2021 | 2/20/2021 | <p>Patient presented for COVID vaccination today, first dose. Prior to receiving dose, she mentioned to RN that she has a history of vasovagal syncope following her shingles vaccine. She routinely has flu vaccines without any adverse reaction. RN requested I standby and observe while patient receives vaccine. Within minutes of receiving vaccine, patient endorses prodromal symptoms lightheadedness, hot flashes, then lost consciousness while seated in the chair. After approximately 1 minute, the patient did regain consciousness. She was given orange juice and crackers and felt well enough to ambulate to a chair in the observation area. Vital signs were WNL and she was monitored closely in the observing area. She continued to complain of "queasiness" often stating that she just feels that she would like to go lay down and nap in her car. Rechecked her blood pressure which dropped to 94/64, patient states she usually runs low but systolic within the low 100's. She was taken to a private hallway where she laid down on a stretcher. Blood sugar checked reading 121. She was given more water but she was uninterested in any more food, as she questions if the orange juice and the crackers were the cause of the queasiness. Blood pressure was rechecked and she was again WNL. Given her persistent fatigue and "queasiness", team lead contacted ED charge nurse to discuss case. The recommendation was to have the patient further evaluated. Discussed with team lead, and it was agreed upon that this was best course of action given her persistent symptoms. EMS was called. Per EMS report, patient's blood pressure did rise which patient attributed to excitement/anxiety surrounding the situation. Patient ultimately declined EMS transfer to ED. Her husband arrived to drive her home. Discussed the importance of monitoring symptoms for the next 48 hours. If she has any worsening "queasiness", weakness, fatigue, nausea/vomiting, throat swelling, wheezing, dyspnea then she is to call 911 immediately. Patient verbalizes understanding and is agreeable to emergency services should any of these problems occur.</p> |

| 1043427 | 2/20/2021 | | 62 | F | 2/20/2021 | 2/20/2021 | Pt assessed after receiving COVID-19 vaccination drive thru site. She reported onset of mild lightheadedness and a non-specific "funny feeling" in her head. No vertigo or presyncope. No other new neurologic changes such as vision changes or extremity weakness. No chest pain, palpitations, dyspnea. No other signs of allergie/anaphylaxis (ie rash, throat swelling, GI side-effects). She reports hx of high blood pressure and is on one BP medication but cannot recall the name. States she took it today. Reports eating breakfast this morning. Exam notable for BP 140/85, HR 60. Pt well-appearing, no acute distress, no obvious CNS or peripheral deficits. RRR, normal s1/s2, no m/r/g. Lungs CTAB. No obvious rash or facial swelling. During course of evaluation pt reported symptoms improved but did not quite resolve. Advised pt to continue monitoring at vaccination site for additional 15 minutes. Offered juice, crackers, fluids which she declined though did drink some of her own water. Upon reassessment pt reported continued improvement though symptoms had not completely resolved. Offered to have EMS come assess pt though she declined. Warning signs/symptoms discussed with pt for when to seek out care at ED. She is in agreement. |
| 1043457 | 2/20/2021 | SC | 68 | M | 2/20/2021 | 2/20/2021 | The patient became lightheaded and pale and said he felt like he was going to pass out. He then had a syncope episode where he was unresponsive for 15 to 20 seconds and then became responsive. It took him 15 to 20 minutes to recover and regain balance to stand up and walk. He rested with his head down as he was nauseas and tired from the event. He stood up once he was able and alert. |

| 1043339 | 2/20/2021 | TN | 30 | F | 2/18/2021 | 2/18/2021 | Fever of 102. Extreme fatigue. Headache. Feeling faint (nearly passed out multiple times). Chills. Body aches. Headache /overall bad feeling began about 30 min after shot. Continued to get worse. Following day, could not work or care for myself. Currently on the 3rd day and still have headache. |
| 1043273 | 2/20/2021 | CA | 72 | F | 2/15/2021 | 2/16/2021 | Tuesday am: I woke up the next morning after the shot, feeling fine. I went to have my hair done around 10am and then by 11am it hit me hard. It began with vomiting and then I passed out. The next thing I recall I was on my home couch around 8pm feeling very weak. I'm told my husband came to get me.- It wasn't until today, Saturday, that I am starting to feel somewhat better. Still a little weak, but able to take of myself. |
| 1041285 | 2/19/2021 | TN | 34 | F | 1/4/2021 | 1/11/2021 | I was shadowing another interpreter on Jan. 11, 2021 and started to feel warm, nausea. I sat down and the PA asked if I was ok and then I don't remember anything. I then fainted and my Heart rate was 30 and they called a code blue. They took me to the ER and ran test and gave me IV and everything came back normal. After that incident, there was at least two other times I had to sit down because I was getting all the same symptoms again and thought it would happen again. I did donate blood on January 8. I was feeling fine when prior and the following two days. |

| <u>VAERS_ID</u> | <u>RECVDATE</u> | <u>STATE</u> | <u>AGE_YRS</u> | <u>SEX</u> | <u>VAX_DATE</u> | <u>ONSET_DATE</u> | <u>SYMPTOM_TEXT</u> |
|-----------------|-----------------|--------------|----------------|------------|-----------------|-------------------|---|
| 1041235 | 2/19/2021 | MI | 77 | M | 2/11/2021 | 2/12/2021 | <p>Patient reports at least two falls following COVID vaccine. Requiring assistance to stand up. Legs reported as "giving out" resulting in falls. Reports being shaking within 24 hours following vaccination. Reports extreme weakness and needing to be lowered to the floor at least twice. This is new for him. Did not report feeling dizzy; blood sugar was reported as normal during the time. No confusion or feeling out of it reported at the time. Ended up with abrasions. Patient has been having bilateral leg weakness since Friday evening, patient had Covid-19 vaccine on Thursday. Wife called Sunday at 0130 after 2nd episode of leg weakness and fall (see previous note). His first fall was Friday evening around 2030. Saturday his wife reports that he was walking on his own without his walker but did have complaints of fatigue and decreased appetite, which she attributed to his Covid-19 vaccine. Sunday morning at 0130 was his second fall, an ambulance was called and patient refused ED after being assisted by EMS. Patient did not have any dizziness or syncope, just states that his legs were too weak and gave out. Wife states that patient has improved today, is using his walker and walking without difficulty. Yesterday she states that she pushed food and fluids due to decreased urine output. Urine output has returned to normal last night and today, appetite and fatigue have also improved. Assessment 1. Fall from standing, initial encounter 2. Multiple abrasions 3. Adverse effect of vaccine, initial encounter 4. Generalized weakness PT EVAL AND TREAT 5. Decreased strength, endurance, and mobility PT EVAL AND TREAT I suspect his falls and weakness are due to Covid-19 vaccine reaction. I think he has more baseline weakness than he realizes- recommended PHYSICAL THERAPY for strengthening and he agrees- already planning to see them for shoulder pain. Feeling better overall today. Recommended getting up every 2 hours to walk around, use walker for now. Call if more falls or continued extreme weakness.</p> |

| 1041106 | 2/19/2021 | AR | 54 | F | 2/12/2021 | 2/13/2021 | Saturday morning passed out twice, stayed in bed and slept most of the day to avoid hitting my head again from passing out; Saturday night around 11:30 pm woke up having difficulty breathing-my airway was swollen-took 50 mg of benadryl every 3-4 hours until Monday morning; I was only able to move my left arm about 2 inches away from my body Saturday and Sunday; Monday morning I woke to a bottom swollen lip (felt like the size of a truck); no new reactions the remaining part of the week; my throat was extremely tender as well as my lip |
| 1040748 | 2/19/2021 | WI | 87 | F | 1/29/2021 | 1/30/2021 | Patient reported dizziness and a fainting episode the morning after her immunization. She knew she was getting dizzy and she attempted to get into her recliner, but fell into her recliner and injured her rib and possibly her 'tailbone'. She went to the Emergency Department where she was examined and scans were taken of her ribs. She was determined to have 'bruised' ribs and sent home with advice to take ibuprofen and acetaminophen alternately every 4 hours for pain relief. She has been at home since this episode. We only found out about this adverse event this week when we called her to confirm her second immunization. She reported this fall to us and was reluctant to get the second shot. I reported the event to her provider, and now to you at VAERS. |
| 1040728 | 2/19/2021 | NJ | 31 | F | 2/15/2021 | 2/16/2021 | Syncopal episode with head injury, concussion, chin laceration. At 4AM when walking back from the bathroom, suddenly syncopized with head strike on the floor. Subsequently required 6 stitches in the emergency room for her chin. Required CT head/neck and MRI head as well as she was confused and had amnesia. |

| 1040673 | 2/19/2021 | OH | 79 | F | 1/28/2021 | 1/28/2021 | laid on the floor and does not know if passed out on the floor or fell asleep (thinks could not have fallen asleep with such a pain); horrible pain on left side (side of the injection); awful pain on left leg; could not raise leg; congestion in head, like a sinus infection; tiredness/fatigue; Headache; Chills; A spontaneous report was received from a consumer, a 79-year-old female patient, who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced laid on the floor and does not know if passed out on the floor or fell asleep (thinks could not have fallen asleep with such a pain), horrible pain on left side (side of the injection), headache, chills, tiredness/fatigue, awful pain in leg, could not raise leg, and congestion in head, like a sinus infection. The patient's medical history was not provided. Her allergies included sulfa, mycin, meloxicam and glycopyrrolate. Concomitant medications included blood pressure medication (name not reported). On 28 Jan 2021, approximately one day prior to the onset of events, the patient received her first of two planned doses of mRNA-1273 (Batch number: 028L20A) on the left side (anatomical location not reported) for prophylaxis of COVID-19 infection. On 28 Jan 2021, on the night of the vaccination, the patient woke up with a horrible pain on her left side (side of the injection), headache, chills, fatigue/tiredness, an awful pain on her leg, and congestion in her head, like a sinus infection. She got up thinking that walking would make the pain on her leg go away, but it did not. When the patient tried to go back to bed, she could not raise her leg so she laid on the floor and she did not know if she passed out on the floor or fell asleep (she thought she could not have fallen asleep with such pain). When the patient woke up, she could move her leg normally. Treatment information was not provided. Action taken in response to the events was unknown. The events, laid on the floor and does not know if passed out on the floor or fell asleep (thinks could not have fallen asleep with such a pain), horrible pain on left side (side of the injection), headache, chills, awful pain in leg, could not raise leg, and congestion in head, like a sinus infection were considered resolved on 29 Jan 2021. The event, fatigue/tiredness was considered not recovered/not resolved.; Reporter's Comments: This case concerns a 79 year old female subject, who experienced a serious unexpected event of loss of |

Further information has been requested. |
| | | | | | | | She is a nurse and received her vaccine outside at the Vaccine Site. She had an immediate reaction to her first dose of the Pfizer Covid vaccine with acute hives within 15 minutes on 12/26. She had hives on her neck, arms chest, headache arm pain and mild dizziness. Symptoms resolved with Benadryl. She received her second dose of the Covid vaccine 12/26 with immediate symptoms within 30 minutes of respiratory symptoms, shortness of breath, hives, dizziness, fainting with treatment of epinephrine on site at the Vaccine Site by ambulance to the ER. She reports she was hypoxic with O2 sat 70 to 75%. Went to hospital and received 3 doses of epinephrine, IV Benadryl, IV fluids, Pepcid, and 7 days of prednisone. 1/26: c/o chest tightness had video visit with primarily MD, continued diphenhydramine and refer to allergy. She does have a history of vaccine reaction in the past to Gardasiln (contains polysorbate 80) given at age 16 with delayed hives 24 hours later. Allergist assessment: Covid vaccine 19 mRNA anaphylaxis with 2nd dose and acute hives with 1st dose of Pfizer vaccine S/p repeated doses of epipen With ongoing asthma, dizziness, light headed , nausea and fast heart rate 1.5 weeks after anaphylaxis but normotensive With prior history of delayed hives with gardisil --may be sensitive to polysorbate 80 in both vaccines. Added COVID vaccine to allergy list |

A 16-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN5318) via intramuscular on left arm on 02Feb2021 03:45 PM, at age of 16 years old at single dose for Covid-19 immunization. Patient was not pregnant at the time of vaccination. Medical history reported as allergies to medications, food, or other products was reported as none known. Prior to vaccination, patient was not diagnosed with COVID-19. Other medications the patient received within 2 weeks of vaccination included multivitamin and melatonin gummies. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3248), via intramuscular at left arm on 12Jan2021 03:45 PM for Covid-19 immunization. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. It was reported morning after vaccine 03Feb2021 08:00 patient was felt dizzy and nauseous. Told her mom and her mom ran over as she was ghost white. Went to sit down and passed out. Patient experienced sweaty, nausea, sick feeling and bad headache. Patient went to the emergency room (ER), they gave fluids and blood work. No heart issues noted. Felt better around 3 hours after. Headache was bad and continued on 05Feb2021 (reported today). Also, still feel nauseous and had to lay down. All events occurred on 03Feb2021 08:00 AM. Patient was recovering. It was reported the adverse event result in emergency room/department or urgent care. The seriousness criteria were reported as not serious, no results in death, no life threatening, no caused/prolonged hospitalization, no disabling/incapacitating, no congenital anomaly/birth defect. Patient was received treatment for the adverse event included fluids and heart monitoring. The patient underwent lab tests and procedures which included blood work in Feb2021. Since the vaccination, patient had not been tested for COVID-19. Outcome of events bad headache and nauseous was not recovered, for felt dizzy, as she was ghost white, passed out, sweaty, sick feeling was recovering.; Sender's Comments: Based on the information provided and |

| 1040532 | 2/19/2021 | | | U | 1/28/2021 | 1/29/2021 | <p>Passed out and was unconscious for approximately 5 minutes; Nausea; Tightening or squeezing sensation of my chest; Tired; Vasovagal event; A spontaneous report was received from a healthcare professional who is the patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced tightening or squeezing sensation in my chest, passed out, unconscious for approximately 5 minutes, nausea, vasovagal event and tired. The patient's medical history was not provided. No concomitant product use was reported. On 28 Jan 2021, the patient received their second of two planned doses of mRNA-1273 (Lot number: not provided) for prophylaxis of COVID-19 infection. On 29 Jan 2021, at 01:30, the patient reported they started to feel a tightening or squeezing sensation in their chest. On 29 Jan 2021 at 02:30, the patient's symptoms worsened, they reported increased chest tightening and were nauseated. The patient went into their bathroom and "I passed out and ended up on the floor". The patient reported they were unconscious for approximately 5 minutes. The patient's wife called 911 due to chest pains and to rule out a mild heart attack. The patient stated, "all tests came back negative". The patient stated they had a vasovagal event while in the hospital with a blood pressure reading of 77/40. Patient feeling better now, but still tired". Treatment information was not provided. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the events, tightening or squeezing sensation in my chest, passed out, unconscious for approximately 5 minutes, nausea, vasovagal event and tired, were considered unknown.; Reporter's Comments: This spontaneous report from a healthcare professional of unknown gender who experienced the serious events of unconscious, passed out and tightening or squeezing sensation in my chest and non-serious events of nausea, vasovagal event and tired. The events occurred 1 day after the administration of mRNA-1273 vaccine (Lot number: unknown, expiration date: unknown). Treatment given was not provided and outcome is resolved. Based on the information provided which shows a temporal association a causal association, between the reported events and the administration of mRNA-1273 vaccine cannot be excluded. The events of nausea and fatigue are consistent with the known safety profile of mRNA -1273</p> |

| 1038763 | 2/18/2021 | FL | 66 | M | 2/18/2021 | 2/18/2021 | Patient became pale and felt faint while sitting in the observation area after receiving the vaccination. He was alert and talking but quickly reported the need to lay on the floor with dizziness and faintness. The patient began feeling better after laying down and wanted to then sit in the chair again. After sitting up a second time the patient fainted in the chair and was guided to the ground where he became alert again and waited until the medics arrived. After some time with the medics the patient began feeling better and declined to be taken for further medical treatment. |
| 1038488 | 2/18/2021 | WI | 60 | F | 2/12/2021 | 2/13/2021 | This 60 y.o. female with past medical history of CLL in clinical remission and depression was admitted to the hospital yesterday for observation after she had a syncopal episode during the night after her 2nd Moderna vaccination. Patient reported that she got her vaccine on 2/12 at 8am and by that night she was experiencing chills and nausea. She then went to get up in the middle of the night as she felt she needed to vomit and became lightheaded with syncope. |
| 1038493 | 2/18/2021 | NY | 84 | F | 2/11/2021 | 2/12/2021 | The morning after vaccination, she felt extremely and unusually fatigued. After getting up from bed and eating her usual breakfast, she was returning to her bedroom when she became dizzy and fainted, falling to the floor, hitting her head and suffering other effects, including rhabdomyolysis from being on the floor for a long time after the fall as she was unable to get up. She was transported to the ER and was admitted to the hospital for 3 days. She was treated with IV fluids, Tylenol and a short course of antibiotics. While hospitalized, she had a repeat of a rash/swelling at injection site that began about 48 hours after vaccination. The hospital treated the rash with some barrier cream and within 48, the redness, rash and swelling abated. |

| 1038368 | 2/18/2021 | MD | 45 | F | 2/14/2021 | 2/14/2021 | Got at the mass vaccination site, is a drive through site. Husband was driving. Pt herself was in passenger seat Reports she had her first covid vaccine 2/14/21 (pfizer) around 10:30am Placed in left upper arm about 10 min after the injection + pain at the site, and then felt tight in shoulder Then became nausea and her husband woke her up; and was about 15 seconds per her husbands report No seizure activity No rashes No throat swelling No swelling No n/v The vaccine staff then came over to her parked car Took her BP and reports was low, cannot recall how low Was starting to feel okay when the vaccine staff came over, reports was a national guard MD, who said he advised an epi pen due to her reaction, then to call 911. And then was given epinephrine and then called the ambulance Pt was feeling better when the EMT arrived, and was taken into the ambulance, she declined the ER Went home, husband drove home, and she rested on the couch the rest of the afternoon Has been feeling fine every since Feels well, eating drinking like normal, no syncope, no rash, no changes to skin, no arm pain |
| 1038343 | 2/18/2021 | NC | 69 | M | 2/17/2021 | 2/18/2021 | Extreme dizziness during the night, weakness and headache (took Tylenol 650 MG for headache). Around 6 AM got out of bed to use toilet. Wife heard a loud crash and found me in bathtub. I don't recall falling but shower curtain fell down and have minor neck and back discomfort at this time. Wife assisted me to crawl out of tub and she reported I "passed out" two more times for short durations as I crawled back into bed. Had profuse cold sweating episode for about 15 minutes. Much less weakness now at 10 am, no dizziness but still a mild headache. |

| 1038258 | 2/18/2021 | NC | | F | 1/28/2021 | | Woke up on the floor, not sure if passed out or was unconscious; Cramps in hand; Hands shook; Dry heaving; Voice kind of changed; Urine was very bright; Chills; A spontaneous report was received from a female (age unknown) consumer who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced cramps in hand, hands shook/shaking of hands, dry heaving/dry heaves, voice kind of changed/distorted voice, urine was very bright/urine color abnormal, chills and woke up on the floor, not sure if passed out or unconscious. The patient's medical history was not reported. No relevant concomitant medications were reported. On 28 Jan 2021 prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On unknown date, patient started to experience cramps in hand, shaking of hands, dry heaving, voice kind of changed, urine was very bright, chills and woke up on the floor, not sure if passed out or unconscious. Treatment for the events were not provided. Action taken with the second dose of mRNA-1273 in response to the event was not reported. The outcome for the events, cramps in hand, hands shook/shaking of hands, dry heaving/dry heaves, voice kind of changed/distorted voice, urine was very bright/urine color abnormal, chills and woke up on the floor, not sure if passed out or unconscious was Unknown.; Reporter's Comments: The events developed after first dose of mRNA-1372. Very limited information regarding this events has been provided at this time. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. |
| 1038229 | 2/18/2021 | NY | 75 | M | 2/16/2021 | 2/17/2021 | 26 hours after receiving the injection, I became very nauseous and had diarrhea. At one time I passed out and when I woke up I was covered in feces and vomit. The symptoms remained until about 3:00 a.m. on the 18th of this month. Today, the 18th, the vomiting and diarrhea subsided; but I remain very weak; and I have no appetite. |

| 1038035 | 2/18/2021 | FL | | M | 2/1/2021 | 2/1/2021 | blacked out, passed out; could not move any part of the body; hard time breathing; sweating; A spontaneous report was received regarding a 73-year-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced sweating, blacking out, passing out, inability to move any part of his body. The patient's medical history was not provided. Concomitant medications were not provided. On 01 Feb 2021, prior to the onset of the events, the patient received one of two planned doses of mRNA-1273 (Lot number: 007M20A) intramuscularly for prophylaxis of COVID-19 infection. The injection took place in his car in a drive-in vaccination location. On 01 Feb 2021, approximately four minutes after the mRNA-1273 vaccine was given, the patient experienced sweating, blacking out, passing out, inability to move any part of his body. The patient reports that when he woke up he was out of his car on the grass and the emergency crew was working on him. They had given him a shot of an Epi-Pen. He had a hard time breathing and could not move any part of his body. He was placed in a wheelchair and taken into the emergency room. There, an EKG was done which had normal results. He was released from the emergency room approximately two hours later. Action taken with mRNA-1273 was not reported. The outcome of the events, sweating, blacking out, passing out, inability to move any part of his body, was considered resolved on 01 Feb 2021.; Reporter's Comments: Based on the current available information which indicates a strong temporal association between the use of the product and the onset of the reported events a causal relationship cannot be excluded |
| 1039245 | 2/18/2021 | HI | | 46 F | 2/3/2021 | 2/3/2021 | After receiving first dose of COVID-19 vaccine patient began experiencing jaw numbness on both sides and numbness of the arm. Was brought into ED where she denied any slurred speech, headache, chest pain, or shortness of breath. Denied any hives or itchiness, dizziness, or syncope. Blood pressure in the ED was 186/99 30 minutes after shot. |

| 1037861 | 2/18/2021 | IL | 47 | M | 1/20/2021 | 1/23/2021 | I was dizzy all along and almost fainted; I was dizzy all along and almost fainted; migraine; This is a spontaneous report from a contactable consumer (patient). This 47-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at single dose on 20Jan2021 for COVID-19 immunization. Medical history included sleep apnea; high blood pressure; high cholesterol; borderline diabetes. Concomitant medications included losartan; alirocumab (PRALUENT, injection) on 20Jan2021. Since 23Jan2021, patient was dizzy all along and almost fainted and was still having symptoms of mild migraine and he don't know like some light sensitivity. Doctor believed it was from vaccine. Patient was wondering how long was this going to be last as he had second shot coming out. He didn't think it was an adverse reaction and he thought he should get the second shot. But this was continuing to me and it had already been two weeks and patient still having symptoms of mild migraine. Patient was worried about taking the second shot as a result. He had never had a migraine before and was told it was probably from the vaccine and that was not something he wanted to hear. Patient wanted to know if this was normal to still be having this side effect for this long. Patient was taking acetaminophen (for migraine), it was not a TYLENOL, it was from a different brand. Patient did liver and cholesterol test and blood test in Jan2021 at Cardiologist and they came back fine, nothing was found there. The outcome of event migraine was not resolved. The outcome of rest events was unknown. Information on the lot/batch number has been requested. |

| 1037842 | 2/18/2021 | FL | 79 | F | 1/22/2021 | 1/27/2021 | <p>may have had a mini stroke; Bell's Palsy/developed facial drooping/her eye was drooping; fell; This is a spontaneous report from a contactable consumer (patient). A 79-years-old female patient received bnt162b2 (BNT162B2, Pfizer COVID-19 Vaccine; Batch/lot number: EL9262), via an unspecified route of administration injection to right upper arm on 22Jan2021 14:00 at SINGLE DOSE for covid-19 immunisation. Medical history included ongoing she was a fainter (She was a fainter, she just faints so she has a hard time getting shots. Pfizer COVID-19 Vaccine administered to her by nurse while she was in her car seat. She just asked the nurse to let her lay down in the car seat when injection was administered so that if she fainted she would not fall far; she was still getting the wash cloth on her head preparing when the Nurse had already finished administering the injection.); ongoing depressed sometimes (she was depressed sometimes, was stressed. She was the primary caregiver for her 96 year old mother. She had seen something about stress and COVID and shots and everything); ongoing Very tired (She was almost 80 years old so she was very tired often. She was the primary caregiver for her 96 year old mother. By the time she comes home at night around 21:30 she was just wiped.); Obesity (She was really overweight but she did not like the term obesity.); thyroid disorder; hypertension; Cataract and glaucoma in left eye; family history of ongoing facial paralysis (Dad had Bell's palsy that might have been 30 years ago. He died at age 87 years.); diagnosed allergies, compromised immune status, respiratory illness, genetic / chromosomal abnormalities, endocrine abnormalities (including diabetes). Concomitant medication included Levothyroxine at 100mcg taken once daily in the morning early before she eats with Start date unknown, but at least 10-15 years ago for Thyroid. Enalapril at 10mg taken once daily (Caller initially reported product name as Vasotec, but clarified it is not Vasotec, it is drop for eye cataract and glaucoma) for High blood pressure. Brimonidine with Strength unknown, 1 drop in both eyes twice daily, started maybe 1 year ago. Specified cataract and glaucoma in left eye; but drop was administered to both eyes; and left eye was eye affected by Bell's palsy for Cataract and glaucoma in left eye. The patient previously took codeine and experienced allergy with</p> |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

onset maybe about 50 years ago, she was not sure; occurred during dental procedure; had bad headaches but no lasting effects so they assumed allergy to codeine; she did not know if still has allergy but says she does if asked. The patient experienced bell's palsy/developed facial drooping/her eye was drooping on 29Jan2021 with outcome of recovering, may have had a mini stroke on an unspecified date with outcome of unknown , fell on 27Jan2021 with outcome of unknown (reported date of end of reaction was 27Jan2021), she could not blink that eye on 29Jan2021 with outcome of not recovered. Five days later she fell and developed facial drooping. HCP suggested she may have had a mini stroke causing facial drooping and the fall. She went to the ER on 29Jan2021 and the ER believed it was Bell's Palsy. She was still experiencing facial symptoms but they are improving. This consumer was administered her first dose of Pfizer COVID-19 Vaccine 22Jan2021. She reported having fell 27Jan2021. She was diagnosed with Bell's palsy in 29Jan2021 after having been seen in the emergency room. She is supposed to have the second dose/booster of Pfizer COVID-19 Vaccine on 12Feb2021. She called to ask if she should or should not still get the second dose as scheduled; and if Bell's palsy could be a reaction to the Pfizer COVID-19 Vaccine. The emergency room staff did not know how she got Bell's palsy, but knew she had the Pfizer COVID-19 Vaccine and were kind of assuming the Bell's palsy was a reaction to the vaccine. She does not have Bell's palsy bad. The emergency room staff thought at first she had a stroke before diagnosing her with Bell's palsy. On Wednesday, 27Jan2021 she had a friend named (Name withheld) who came over for tea. Patient has an oriental rug, and around 15:00 patient fell face first on oriental rug. She was just fine after the fall initially. She wonders if her having fell has anything to do with the Bell's palsy. She thinks it was the night of 27Jan2021 or 28Jan2021 when she asked her son if her face looked funny, did she look ok, because her face felt a little funny. She was looking in the mirror and her smile was looking crooked, and her eye looked like it was drooping. When she got up Friday, 29Jan2021 she could see her eye was drooping, and she could not blink that eye. She called her Ophthalmologist who saw her the afternoon of 29Jan2021 around 13:30-13:55. The Ophthalmologist said yeah something is going on with

VAERS_ID RECVDDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

that eye. Her friend called his friend who is a Pediatric Neurologist that advised her to go to the emergency room. She was seen in the emergency room of (Hospital name withheld) around 17:00 on 29Jan2021. She was not admitted to the hospital at that time; but was evaluated and treated. She Bell's palsy outcome: she is doing so much better. She still has a hard time blinking her left eye, she still cannot blink her bad eye: left eye, without also closing her good eye: right eye. She is not drooling, she can drink without drooling. Her smile is still just a little crooked. She was given 2 prescriptions in the emergency room which were Prednisone and Valtrex. On 29Jan2021 in the emergency room they did tests including testing her heart with EKG; X-ray of her heart or lungs or something; took blood tests; and continuously took her blood pressure. There were no notable or abnormal results of any of those tests. They wanted her to go see her doctor last week but she did not have a chance to do so. She has an appointment with her primary doctor on Monday coming up. She has not yet seen her primary doctor about this. History of all previous immunization with the Pfizer vaccine considered as suspect (or patient age at first and subsequent immunizations if dates of birth or immunizations are not available) was None. The event Bell's palsy require a visit to Emergency Room, no to Physician Office. The patient was not hospitalized. No Prior Vaccinations within four weeks prior to the first administration date of the suspect vaccine. The patient underwent lab tests which included her heart with EKG; X-ray of her heart or lungs or something; took blood tests; and continuously took her blood pressure, all with no notable or abnormal results of any of those tests on 29Jan2021.

| 1039942 | 2/18/2021 | VA | 36 | F | 1/15/2021 | 1/21/2021 | Fainting like episodes; Blurred vision; Severe vertigo; Chest pain; Fatigue; This is a spontaneous report from a contactable other health professional reported for herself. A 36-year-old female patient received first dose BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE) Lot # EL8982, via an unspecified route of administration in right arm on 15Jan2021 12:00 at single dose for covid-19 immunisation. There were no relevant medical history or concomitant medications. The patient was not pregnant at the time of vaccination. The patient had no allergies to medications, food, or other products. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 21Jan2021, exactly "4 1/2 days" after vaccine the patient experienced fainting like episodes, blurred vision, severe vertigo, chest pain, fatigue. The patient has been out of work since the 20th and she still had blurred vision. The adverse event resulted in Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. No treatment was received. The patient was not recovered from the events. She has been to the ER, cardiologist for an echography, ultrasonography of thyroids, Magnetic resonance imaging (MRI) of her head, went to ENT dr and neurologist in 2021. All blood work in 2021 came back normal as well. The reporter considered the event as non-serious. The patient was not diagnosed with COVID-19 prior to vaccination. She had negative Nasal Swab Covid test post vaccination on 22Jan2021.; Sender's Comments: Considering the temporal association, a causal association between administration of BNT162B2 and the onset of fainting like episodes cannot be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate. |

They were not prepared for this to happen. All people that where were calling anyone to come and help me and finally and ICU doctor came and took over my care asking for benadryl from the pharmacy, a stretcher to take me to ER. Stretcher arrived was put on it and an IV was put in my right arm and the benadryl was administer in which I felt I was burning and turn real red. They then proceeded to take me to ER, where they administered more medicine through the IV. I was there for about 4 1/2 hours. When i was released my throat was still very tight, felt very fatigue, muscle ached, shortness of breath and dizzy. I was sent home with an EPI PEN, Allegra, and pepcid. I also had a referral to see the allergist doctor who could see me on Tuesday 1/19/2021 because Monday was a Holiday. |

| 1039939 | 2/18/2021 | CA | 87 | M | 1/21/2021 | 1/21/2021 | fainted; nauseated; vomited 4 times; dizzy; bad headache; extremely tired; This is a spontaneous report from a contactable consumer. An 87-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in Right arm (at age of 87-year-old) on 21Jan2021 at 12:00 PM as a single dose for COVID-19 immunisation, lot number: EL3247. Medical history was none. Patient had no allergies to medications, food, or other products. Concomitant medications within 2 weeks of vaccination included ibuprofen (ADVIL) and melatonin (minimal usage). Patient did not receive other vaccine in four weeks prior to the COVID vaccine. Prior to vaccination the patient was not diagnosed with COVID-19. It was reported that on 21Jan2021 at 02:45 PM (also reported as 2 1/2 hours after vaccine) patient became nauseated, he vomited four times, was dizzy, fainted, had bad headache and was extremely tired. Events resulted in Doctor or other healthcare professional office/clinic visit. Patient was treated for the events with nausea medications and ibuprofen (ADVIL). Since the vaccination patient had not been tested for COVID-19. Patient recovered with lasting effects from the events. |
| 1039315 | 2/18/2021 | AZ | 56 | F | 2/13/2021 | 2/13/2021 | From District Pharmacy Manager: Patient fainted after getting into the observation area (maybe about 3-5 minutes after receiving vaccine). Fire Dept was called. She did not go to hospital and did go home with her husband who was driving. |

| 1039524 | 2/18/2021 | AK | 27 | F | 2/13/2021 | 2/13/2021 | At 8 pm the day I had the shot I started having a headache and muscle aches on both hips. The following day I was nauseous, light-headed, had a headache, muscle aches around my hips, pain at injection site, and was weak. I passed out for an unknown amount of time around 11 am that Sunday. I was unable to eat more than two pieces of pilot bread, but I kept drinking water and was hydrated. I kept rolling around trying to get comfortable, but the muscle pains in my hips would not let me until I used a heating pd. The following day I was weak, but no longer as nauseous or have as bad a headache. On Tuesday, I was able to get up, but both arms felt very weak and it was a strain to carry my bag and computer. Wednesday I was still very tired, but more like myself. No symptoms today February 18. |
| 1039538 | 2/18/2021 | WA | 66 | F | 2/6/2021 | 2/6/2021 | per patient report: "103.5 fever with heart rate of 100-120s. Farmer's Lung activated with profound coughing. O2 sats went transiently low to 85 but mostly 91-92%. Became very unsteady on feet, requiring support of walls, furnishings and counters. Horrible chiari headache with bad nausea Neuropathy in BLE flared, legs were buzzing and I was getting intense spasms of bilateral feet and ankles that made it hard to use them. Visual decline Passed out twice cold in the bathroom [found myself in bathroom, when "I came to"] In bed for 3 days except to use the restroom and make tea. Could not attend to any other ADLs. Injection site red from shoulder to elbow, swollen and itchy with axillary lymph swelling". Symptoms |

| 1039908 | 2/18/2021 | MA | 53 | F | 1/15/2021 | 1/15/2021 | <p> Syncope; This is a spontaneous report from a contactable nurse. A 53-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not reported), via an unspecified route of administration on the right arm on 15Jan2021 12:00 at a single dose for COVID-19 immunization. Medical history included Crohns disease which is in remission (No immunosuppressants in 5 years) and shellfish sensitivity. The patient is not pregnant. Concomitant medication included duloxetine hydrochloride (CYMBALTA), trazodone, buspirone hydrochloride (BUSPAR), lisdexamfetamine mesilate (VYVANSE) and methylfolate. The patient experienced syncope on 15Jan2021. The event was assessed as serious (medically significant). The outcome of the event was recovering. Information on the lot/batch number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the event syncope cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate. </p> |

| 1039925 | 2/18/2021 | IL | 45 | M | 2/4/2021 | 2/6/2021 | fainted; nausea; left arm began to tingle; dizziness; Broke out in a cold sweat; chills; Lost control of my bladder.; This is a spontaneous report from a contactable consumer (patient). A 45-years-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL6269), via an unspecified route of administration in Left arm on 04Feb2021 15:00 (at the age of 45-years-old) at SINGLE DOSE for COVID-19 immunization. Medical history was reported as none. There were no concomitant medications. 51 hours after receiving the vaccine, the patient was sitting down watching a film. His left arm began to tingle, and he felt a wave of dizziness and nausea come over him. He stood up, walked a few steps and sat back down. He broke out in a cold sweat, chills, and saw stars. He leaned forward with his head in his hands, and apparently fainted for a moment and lost control of his bladder. All events started on 06Feb2021 06:00 PM. No treatment received for the events. The outcome of the events was recovered in Feb2021. No covid prior vaccination, no Covid tested post vaccination, no known allergies. |

| 1039926 | 2/18/2021 | IN | 45 | F | 2/6/2021 | 2/7/2021 | Nearly passed out; Postural Orthostatic Tachycardia Syndrome; icy like pulsation through my blood occurred; fell to the ground; This is a spontaneous report from a contactable consumer reported for herself. A 45-year-old female patient (not pregnant) received the first dose of bnt162b2 (Pfizer-Biontech Covid-19 Vaccine), Lot number: EL9261, via an unspecified route of administration on 06Feb2021 12:30 at single dose in Left arm for covid-19 immunisation. Facility type Vaccine was Hospital. Medical history included anaemia, no known allergies. Patient had COVID-19 starting on 06Jan2021 and persisting through 16Jan. Her COVID symptoms were crushing chest pain, no fever, blood oxygen level never dropped below 98%. The patient's concomitant medications were not reported. There were no other vaccine in four weeks. Patient was experiencing Postural Orthostatic Tachycardia Syndrome. Nearly passed out going to the toilet when she first awoke. An icy like pulsation through her blood occurred first thing this AM, day after the vaccine. She fell to the ground and called for her husband to help her. He gave her 500mg acetaminophen and aspirin. She slept. Same thing happened with pulse 140+, he measured, as she showered. They stopped the shower, she laid down and recovered. When she got up immediately the pulse rises to 120+. Adverse events started from 07Feb2021 08:30 AM. Therapeutic measures were taken in response to the events. The outcome of the events was not recovered. Covid was not tested post vaccination. |

| 1039927 | 2/18/2021 | CA | 71 | F | 2/5/2021 | 2/5/2021 | passed out; passed out when went into bathroom at 5 am, cut chin when fell; dehydrated; sweats; chills-shivers; Bad headache; Dizziness; Couldn't sleep; Neuropathy pain in hip/groin; This is a spontaneous report from a contactable consumer reporting for herself. A 71-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EM9809 and expiry date unknown) on 05Feb2021 08:30 at single does via an unspecified route of administration into her left arm for COVID-19 immunization. Medical history included known allergies to statins. The patient had received first dose of BNT162B2 (lot number EL3248) on 15Jan2021 16:00 for COVID-19 immunization (vaccine location=Left arm). The patient had not had COVID prior the vaccination, COVID not tested post the vaccination. Concomitant medication included gabapentin (GABAPENTIN), fish oil (FISH OIL), zinc (ZINC), cyanocobalamin (VITAMIN B 12), iron (IRON). No other vaccine received in four weeks. The patient experienced adverse events from 05Feb2021 at 20:30. She experienced chills-shivers, had bad head ache, dizziness, couldn't sleep, intense neuropathy pain in hip/groin when got out of bed and then passed out when went into bathroom at 5 am (06Feb2021), cut chin when fell. She felt dehydrated. Cold marble floor felt good as she had sweats, so she just layed there awhile. Her husband came to her rescue with water and cold compress for her head. She received lots of liquids and rest. She had good night's sleep on 06Feb2021. The outcome of the events was reported on 07Feb2021 as recovered. |

| 1039936 | 2/18/2021 | IL | | M | 2/7/2021 | 2/7/2021 | The man walked approximately 30 feet and collapsed/fainted; Extremely diaphoretic; This is a spontaneous report from a non-contactable consumer (volunteer at a vaccination clinic) reporting for a patient. A male adult in his 30's received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number and expiry date unknown) via an unspecified route of administration on 07Feb2021 around 15:00 at a single dose for COVID-19 immunization. No information about the patient's medical history and concomitant drugs was provided. After receiving the vaccine, the man walked approximately 30 feet and collapsed. The onsite supervisor from the institute indicated that he was extremely diaphoretic and had "fainted" before he could reach the post-vaccination observation area. EMS (Emergency Medical Services) was stationed onsite and assisted the man. The man was placed in a chair for approximately 15 minutes. An electrocardiogram (ECG) appeared to have been performed. The man was then transported to the hospital for further evaluation of concussion as it was believed that his head might have impacted a table and/or the floor when he collapsed. It was not specified if the patient was admitted to the hospital. The outcome of the events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained. |

| 1035883 | 2/17/2021 | IA | 45 | F | 12/18/2020 | 12/18/2020 | <p>Throat and mouth "feels funny" following injection of Covid vaccine approx 1717. Slight chest burning. Patient ambulated. Drinking water without difficulty. Patient states tongue "feels funny" after getting covid vaccine. Patient states within minutes after the injection her tongue began to feel funny. She denies oral/lip swelling, numbness/tingling, difficulty swallowing, drooling, headache, nausea/vomiting, chest pain, shortness of breath. She also states her chest was burning just after receiving the vaccination however that has since resolved. No palpitations or syncope. No recent illness. No history of adverse reaction to vaccines. No known food/medication allergies. Patient is sitting comfortably on the exam table drinking water without difficulty. Patient states at this time her mouth feels better but "does not feel normal." Patient states she has a history of mitochondrial myopathy and has some esophageal motility issues at baseline. 1808: patient was given diphenhydramine 25 mg PO x 1. She reports mild improvement in symptoms. No headache, dizziness, nausea, oral edema, difficulty swallowing, chest pain, shortness of breath. 1830: patient states symptoms have resolved. She is sitting comfortably in the chair. No signs of distress. She states she thinks she got too anxious. No headache, dizziness, nausea, oral edema, difficulty swallowing, chest pain, shortness of breath. Patient states she feels comfortable leaving at this time. Discussed ED precautions. Patient verbalized understanding. Advised patient to follow up with her PCP to discuss second dose of covid vaccine. 1/15/21: Pt received 2nd dose of vaccine. About 10 minutes after, pt developed a rash at injection site. Rash spread up chest and onto back. Pt was taken to convenient care for further evaluation. At convenient care, pt stated she had no difficulty breathing but that something just didn't feel right. Rash spread to right arm and started to itch. Pt endorsed experiencing throat/tongue swelling but did not think it was closing off or actually swelling. Pt received epinephrine 0.3 mg IM x 1 and diphenhydramine 25 mg IM x 1. After treatment and about 1.25 hours of monitoring, pt felt well enough to go home. Pt was prescribed epinephrine 0.3 mg IM 2-pak kit. 1/15/21: Pt received 2nd dose of COVID vaccine and developed rash. Pt received epinephrine 0.3 mg IM x 1 and diphenhydramine 25 mg IM x 1. Discharged to home</p> |

| 1035518 | 2/17/2021 | PA | 48 | M | 2/2/2021 | 2/2/2021 | passed out; terrible headache; still some body aches; general bad feeling all over; nausea/tremendous chills and nausea; tremendous chills and nausea; low grade fever 99.5; This is a spontaneous report from a contactable consumer (patient). A 48-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in Left arm (at age of 48-year-old) on 02Feb2021 at 10:30 AM as a single dose for COVID-19 immunisation, lot number: EL9262. Medical history included high cholesterol and allergies to some seaweeds. Patient received first vaccine dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 14Jan2021 via an unspecified route of administration in Left arm (at age of 48-year-old) for COVID-19 immunisation, lot number: EL3246. Concomitant medications in two weeks prior to the vaccination included atorvastatin and multi- vitamin. Patient did not receive other vaccine in four weeks prior to the COVID vaccine. Prior to vaccination the patient was not diagnosed with COVID-19. Patient started about 12 hours after getting vaccinated (reported as 02Feb2021 at 10:00 PM) with a general bad feeling all over, 15 hours after (03Feb2021 at 01:00 AM) patient got out of bed because of nausea and passed out, his wife found he on the floor. Patient had tremendous chills and nausea with a low grade fever 99.5 for several more hours, maybe 6 hours, (onset date 02Feb2021) the next morning patient had a terrible headache and still some body aches. Patient was treated with extra strength paracetamol (TYLENOL) and ondansetron (ZOFRAN). Since the vaccination patient had not been tested for COVID-19. Patient was recovering from the events, at the time of the report. |

| 1035514 | 2/17/2021 | | | U | | | <p>feelings of fainting; high blood pressure in the 160s, normally <120s systolic); severe headaches; dizziness; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received first dose of BNT162B2 (Lot number and expiry date not provided), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history concomitant medications were not reported. On an unspecified date, the patient developed severe headaches, dizziness, high blood pressure (in the 160s, normally <120s systolic), and feelings of fainting 5-10 minutes after receiving the first dose of the vaccine. This adverse event was reported already, but the pharmacist was wondering if it is still recommended to get the second dose after a reaction like this. Stated "This reaction doesn't meet your definition of anaphylaxis or allergic reaction which is why I am reaching out to see if you have any recommendations on this". The patient underwent lab tests and procedures which included blood pressure: high blood pressure (in the 160s, normally <120s systolic). The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.</p> |

| 1035507 | 2/17/2021 | WA | | F | 1/28/2021 | 1/28/2021 | 3 episodes of fainting; Flu like symptoms; Chest tightness; Sore and tender upon swallowing food; Muscle aches on right arm; fever; fatigue; A spontaneous report was received from a consumer concerning a 45-year old, female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced fatigue, fever, fainting, muscle aches, flu-like symptoms, chest tightness, and sore throat. The patient's medical history, as provided by the reporter, included childhood asthma and seasonal allergies. No relevant concomitant medications were reported. The patient received their first of two planned doses of mRNA-1273 on an unknown date. On 28 Jan 2021, the patient received their second of two planned doses of mRNA-1273 (042L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. On 28 Jan 2021, the patient had fatigue by the end of the day following vaccination. On 29 Jan 2021, the patient presented fever and 3 episodes of fainting. She had muscles aches on her right arm, flu-like symptoms, chest tightness, and sore/tender throat area upon swallowing food. No treatment information was provided. The patient received both scheduled doses of mRNA-1273 prior to the events, therefore action taken with the drug in response to the events is not applicable. The outcome of the events was not reported.; Reporter's Comments: Further information has been requested as there is limited information regarding the events, particularly the event of syncope and chest discomfort. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. |

| 1032920 | 2/16/2021 | MI | 73 | F | 1/22/2021 | 1/22/2021 | Heart rate at 107; Stomach issue; Nausea; Chills; Passed out; Dizzy; Temperature; Hands were shaking; Sweating profusely; A spontaneous report was received from a consumer who is a 73 year old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced chills, dizzy(dizziness), temperature(temperature abnormal), hands were shaking(tremors), passed out(loss of consciousness), sweating profusely(hyperhidrosis), nausea, heart rate at 107(heart rate increased) and stomach discomfort(abdominal discomfort). The patient's medical history, as provided by the reporter included breast cancer. No concomitant medications were reported. On 22 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 029L20A) intramuscularly for prophylaxis of COVID-19 infection. On 22 Jan 2021, the patient experienced chills, dizzy, temperature, hands were shaking, passed out and sweating profusely. The treatment for the events included paracetamol. On an unknown date, the patient experienced, nausea, heart rate at 107 heartbeats per minute and stomach discomfort. The treatment for the events included paracetamol. Action taken with mRNA-1273 in response to the events was not provided. The outcome for the events, chills, dizzy, temperature, hands were shaking, passed out, sweating profusely, nausea, heart rate at 107 and stomach discomfort was unknown.; Reporter's Comments: This case concerns a 73-year-old female patient, who experienced serious event of loss of consciousness and non-serious events of chills, dizziness, temperature abnormal, tremors, hyperhidrosis, nausea, heart rate increased, and abdominal discomfort. The reported events occurred on the same day after first dose of mRNA-1273, (lot # 029L20A) with the exception of nausea, heart rate increased, and abdominal discomfort which occurred at unknown date. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. |

| 1033950 | 2/16/2021 | MN | 46 | F | 2/10/2021 | 2/11/2021 | At 4:00 am on Thursday morning (12 hours after vaccination), I got up to use the bathroom and when I was finished, I fainted. My mom heard the loud noise and found me on the bathroom floor and could not arouse me. She called 911 and I came to when she was on the phone with them. She helped me up and I felt weak and flush. She gave me some cold towels and I felt better soon after. She then took me to ER because I had a gash on my chin and my jaw was very sore. I asked the ER doctor if my fainting could have something to do with the vaccine and he didn't think so. He did a CT scan to check my jaw and an EKG and they were both normal. I told him that I have been very busy at work the last week or so and I know that I haven't been eating or hydrating properly. |
| 1033724 | 2/16/2021 | NJ | 25 | M | 2/15/2021 | 2/15/2021 | Patient, who was staff member, passed out about 10 minutes after vaccination. Was administered oxygen and given water. Blood pressure was a little elevated. Oxygen saturation was normal. Refused to go to hospital. Was observed for 30 minutes then allowed to go home. |

| 1030614 | 2/15/2021 | CA | 34 | F | 2/12/2021 | 2/12/2021 | 11:40am - received 2nd Moderna vaccine at Vaccination Superstation 3:00pm - started to feel queasy (this was also felt with first vaccine) 5:00pm - ate dinner 11:00pm, 2:00am, and 6:00am - vomited 7:00am - tried a small piece of toast for breakfast 9:00am - vomited and immediately had to defecate, while on toilet started to feel dizzy, got up to walk to bed and collapsed on my way, blacked out for a few seconds and hit my face on the carpet. Husband was nearby, he helped me turn over onto my back, I laid there for about 30 minutes resting and then called nurse line who recommended I go to ER. Arrived at ER around 10am. While in waiting room at ER, began to feel dizzy, nurse immediately checked BP and it was low, brought me to room to lay down. Started IV fluids. Doctor consulted, suggested it was likely a vasovagal syncope episode. Ran EKG, CT scan, urinalysis, CBC, chest and finger radiographs- all normal. Received 2 bags of LRS fluids and was able to eat some crackers, discharged around 3pm. I was tired and nauseous the rest of the day but was able to eat small amounts of bland food. No further vomiting. The next day, 2/14, I was still tired and nauseous but ate small meals and rested a lot. Today, 2/15, feeling stronger but not 100%, still a little bit queasy but better than I've been the last few days. |

She sat in our waiting area under observation for 15 minutes (she reported no allergies, prior issues with vaccination such as fainting/anaphylaxis). Once she was home, she started feeling nauseous (and vomiting), severe joint and body pain, headache (reports feeling like, "her head is going to explode). These issues were worst over Friday/Saturday but improved over Sunday and today, Monday. Patient stayed home over the weekend and did not contact emergency services. Patient contacted her doctor on Monday to report the events of the weekend. At this time, her doctor has not recommended any treatments or issued prescriptions, and their plan is to have the patient follow up with the office should things worsen or change. |

| 1032024 | 2/15/2021 | OH | 54 | F | 2/6/2021 | 2/6/2021 | 1533 Lightheaded post shot pt passed out. BP 182/120, 1540 148/108 pt lying on the floor, responding to nurse. Son was called to meet her at Hospital. 1542 911 called and squad arrived. 1545 Sitting in chair with EMS present. Oriented x3. 1548 Pt ambulated to squad with EMTS. Pt agreed to go to ER. Pt states she passes out after shots. She was advised to inform her PCP. |
| 1031719 | 2/15/2021 | OH | 50 | F | 2/12/2021 | 2/12/2021 | - Got the vaccine in the afternoon and by evening her arm was sore for several hours, about 6-7 hours post her shot she was fatigued. -She then experienced light headedness and headache roughly 10 hours or so after the shot, she had chills but no fever. She went to sleep. - Pt went took Tylenol around 11pm for headache and joint pain. Woke up the next morning and took Tylenol again, she had some severe dizziness around 0730 next day that was made her feel like she was fainting and panicking, she took her BP and it was 76/40. She then took it 20mins later it was back to normal at 116/80. She spoke with her PCP over the phone and they advised her to continue to observe herself at home and go to hospital if it happens again. -On 2/14/2021 at 2pm, her joints are still aching and hands are swollen/itchy/red on the backs of her hands. Followed up later on 2/14/2021 Follow up attempt: Spoke with patient and she is doing better, symptoms are resolving. Ibuprofen taken recently, just managing joint pain and headache with OTC meds. Hand swelling resolved. Advised caller to call us back with further questions or concerns as needed, seek medical attention if dizziness or hypotension occurs |
| 1031739 | 2/15/2021 | FL | 76 | M | 2/12/2021 | 2/13/2021 | About 1:35 am I was experiencing acid reflux, I prepared some alka-seltzer. As I was beginning to drink it I started to feel faint, My legs started to give out, my glass dropped into the sink, and a was flat on my back on the floor. I got up and went to bed. As I lay there uncovered I began to perspire, but that soon stopped. After 10 minutes I pulled the sheet over me and 30 minutes later I pulled the blanket over me. At about 2:30 am I was feeling normal except for the reflux. I took a full dose of alka-seltzer and have had no more problems since then. I believe the acid reflux was from eating and drinking wine that evening. I don't know of the fainting was from the vaccine or a touch of flu for one hour. |

| 1028990 | 2/14/2021 | TX | 66 | F | 2/12/2021 | 2/13/2021 | After beginning to not feel well--upset stomach, nauseous, lethargic , about 6 hours after shot, I had trouble sleeping and felt bad during the night. I woke up about 6am and when I was brushing my teeth I felt nauseous and very weak, and then I passed out. I hit floor hard and have a good size bump on the back of my head. For the rest of the morning (day after my 1:30 second shot), I continued to feel weak and a little nauseous. I never had a fever. I'm sending this report the morning of the second day after my second dose, and I'm feeling much better--more energy and no nausea. ---But i was pretty sick annd passing out indicates a severe reaction. I'm small--only 4 ft 11 in and 95 pounds. For my retired friends and neighbors who have been vaccinated, the smaller ladies are having much worse side effects. |
| 1029033 | 2/14/2021 | MO | 73 | F | 2/12/2021 | 2/13/2021 | Day of vaccine headache, fatigue, soreness 2nd day 2/13/21 Had issues sleeping and felt uncomfortable. In early a.m. hours, felt dizzy, feeling of sick stomach, and fainted in the bathroom. Paramedics were called by my spouse and they worked with me, then was transported by Ambulance to emergency room where they ran tests and released me the same day. I was told by the doctor that apparently my blood pressure decreased too fast causing me to faint. |
| 1029052 | 2/14/2021 | NY | 54 | F | 2/10/2021 | 2/10/2021 | I got the second does of the Pfizer. I had a massive headache and chills overnight. I had a fever of 100.1 at 7.10am the next morning. I was leaving my ground floor bathroom and I woke up on my basement floor. I fainted and fell down a flight of stairs. I passed out again, when I tried to get back up the stairs. I crawled back up the stairs and phoned my husband to come home, He did and helped me into the bathroom to wash my teeth. I fainted again and he caught me and carried me back into the sofa. I spent the rest of the day in bed. I am bruised and scraped all over. I am sore all over. I went to Urgent Care on 2/13/21 and got x-rays done. I have a fracture in my right thumb and may have a dislocated left shoulder. I have to see more doctors tomorrow. I sill don't fell well and I have no appetite. I fell really weak. I have dizziness when lying down, that may be related to the fall. |

| 1029296 | 2/14/2021 | PA | 39 | M | 2/12/2021 | 2/12/2021 | THE PATIENT RECEIVED VACCINE. DISCUSSED SIDE EFFECTS AND APPOINTMENT FOR DOSE 2. EVERYTHING WAS FINE, PATIENT DIDN'T HAVE ANY OTHER QUESTIONS/CONCERNS. I SAID I WILL CHECK ON HIM IN A FEW MINUTES. WITHIN MAYBE 1-2 MINUTES, HIS WIFE CAME TO THE COUNTER AND SAID HE IS OUT, PASSED OUT. I WENT TO CHECK ON HIM. YELLED TO MY TECH TO CALL 911. PATIENT WAS SLUMPED OVER IN THE CHAIR. HE WAS BREATHING AND HAD A PULSE, BUT NOT AWAKE. TRIED TO AROUSE HIM BE CALLING HIS NAME AND SHAKING HIS ARM TO WAKE HIM. HIS WIFE THEN WAS TAPPING THE SIDE OF HIS FACE TO WAKE HIM UP. SKIN WAS GRAY IN COLOR. SHE STATED HE IS GOING TO VOMIT AS HE WAKES UP AND NEEDED A GARBAGE CAN. I WENT TO GRAB CAN FROM PHARMACY AND RETURNED. SHE PUT CAN IN BETWEEN HIS LEGS AS HE CAME TO AND IMMEDIATELY STARTED TO VOMIT. HE WAS AWAKE BUT OUT OF SORTS. AT THAT TIME THE EMT ARRIVED AND WENT TO WORK. PATIENT BP WAS LOW AND THEY STARTED IV FLUIDS. THE PATIENT WAS ABLE TO SPEAK TO EMT AND ANSWER THEIR QUESTIONS. THEY PREPPED HIM FOR TRANSPORT TO THE EMERGENCY DEPT FOR FURTHER EVALUATION. BY THE TIME THE PATIENT WAS BEING TRANSPORTED, HIS BP WAS BACK UP CLOSE TO NORMAL. I SPOKE TO BOTH THE PATIENT AND HIS WIFE AROUND 5PM THAT DAY. THEY WERE LEAVING THE HOSPITAL AT THAT TIME. THE PATIENT WAS FEELING MUCH BETTER. HIS BP WAS BACK TO NORMAL, HIS COLOR WAS BACK, AND HIS VOICE WAS STRONG. THEY BOTH PLAN ON RETURNING FOR THE COVID 19 DOSE #2. |
| 1029305 | 2/14/2021 | MD | 48 | F | 2/12/2021 | 2/12/2021 | Soon after my arm got painful into my fingers and in my armpit that subsided. Friday night I had a high fever with chills, soaking through my sheets. Saturday I got up to go to the bathroom and my daughter found me on the floor. I am not sure how long I was passed out for. Today I feel a lot better, sore from falling. I did not hit my head because I fell on laundry basket. I do have some numbness and tingling in both hands today and low energy. |

| 1028779 | 2/14/2021 | MI | 25 | F | 2/11/2021 | 2/12/2021 | Arm soreness began 7PM on 2/11. Vasovagal syncope episode at 2:25AM on 2/12; triggered by combination of arm soreness, body aches, and low-grade fever. Senses returned back to normal within 5-10 minutes. Consistent low-grade fever from 1AM on 2/12 until 6PM on 2/13. Treated with 1000mg liquid acetaminophen every 6 hours per manufacturer instructions. Notable ache in legs (akin to Restless Leg Syndrome) from 3AM on 2/12 until around 9AM on 2/13. Urge to move calmed by acetaminophen. Highest recorded fever: 99.5°F at 9AM on 2/12. Fever subsided as of 6PM on 2/13. |
| 1029731 | 2/14/2021 | OH | 64 | F | 2/10/2021 | 2/11/2021 | Fever, Headaches, nausea, bodyache. Became very weak, fainted and fell on the floor. lost all her memory about the incident. |
| 1029468 | 2/14/2021 | WI | 67 | F | 1/29/2021 | 1/29/2021 | One of our Greenfield patients called today (2/12/21) to discuss the adverse effects she experienced following her first dose of the COVID vaccine (received last Friday, January 29). The patient indicated that several hours after receiving her vaccine, she experienced pronounced dyspnea and tachycardia. She stated these symptoms lasted throughout the weekend and were severe enough to prevent her from conducting her daily activities. The patient mentioned that, at one point, she nearly passed out while showering from not being able to catch her breath. The patient reported that she contacted her PCP for guidance, who instructed her to visit the ER for a thorough workup; however, the patient stated she did not follow these orders due to concerns of having a high copay. When speaking with her today, the patient assured me that her symptoms have since resolved. |
| 1029783 | 2/14/2021 | DE | 90 | F | 1/21/2021 | 1/21/2021 | Shortly after receiving the Moderna COVID-19 vaccine, patient complained of chest and stomach pain, then became very sleepy and fainted. RN was unable to obtain a manual BP; Apical pulse 36. Pulse Ox in the 70s. She was placed in bed and eventually regained consciousness. Her pulse ox improved to the 90s. BP 92/55. Her only complaint was that her hands were cold. Medical Director believes it was vasovagal syncope due to receiving the vaccine. Patient died on 1/28/2021, due to progressive dementia. |

| 1028602 | 2/13/2021 | IL | 24 | F | 2/11/2021 | 2/11/2021 | Around 5 pm on 2/11 (day of vaccination) I began to notice a very sore arm and dry mouth/dehydration. Drank water and continued as normal. Around 2 am of 2/12 I woke up with chills and had been sleeping very restlessly. I had body aches in my arm, legs and back. Around 3am my temperature was 100.2. I also felt very faint when standing and thought I may pass out. 3 times when standing, I had to quickly sit down to avoid it. I do suffer from vasovagal syncope so this may be unrelated to vaccination. I took Tylenol and drank more water. Temp rose to about 100.6 before beginning to drop at around 4 am. I continued to take Tylenol every 4 hours and it helped keep temp below 100 but towards the end of the 4 hours, it would start to rise again. I ate normally and drank extra water due to feeling dehydrated still. Around 1 PM 2/12 I started to feel nauseous and had an upset stomach. I was still have a general body aches and elevated temperature around 99.5. My normal temp is usually about 98.0. Nausea led to diarrhea 1 time. Symptoms continued until approximately 8 pm when very quickly the body aches, nausea, fever and soreness in injection arm all went away. None of these symptoms have returned and it is now 2/13 at 8 pm. I did test positive for Covid-19 on December 28, 2020 but have been fully recovered with no symptoms since 1/8/2021. |

| 1031115 | 2/13/2021 | | 66 | M | 2/11/2021 | 2/11/2021 | syncope, c/o itchy throat Narrative: Patient was seen prior to administration of the Moderna COVID-19 vaccination. He has allergies to bees/egg and a h/o anaphylaxis 2/2 receiving an injection of penicillin in the past. Discussed that prior h/o anaphylaxis to PCN injection was not a contraindication to this vaccination, but is a precaution. Discussed risks of receiving the vaccination vs benefits of the vaccine, which patient states "I already had this discussion with Dr.!" He has multiple comorbidities which place him at a higher risk for more severe illness from COVID-19. Again received the risk vs benefit discussion. Patient stated understanding and desire to proceed with the vaccination. He will be monitored for at least 30 minutes in area where staff can directly observe him. Patient received the COVID vaccination at 13:00. At 45 minutes later, staff alerted that he was c/o palpitations. Due to confusion and weakness, we were unable to transport him to an examination room. Oxygen, water, and vitals machine were brought to him. He presented with SOB, confusion, lightheadedness. Exam demonstrated acute distress, speaking in staccato sentences. HR in 80s, with lungs CTAB and no stridor - despite increased RR to 20s. Vitals with HR in 70s, SpO2 remained 97% or greater on RA. BP was initially 140/72. A code blue was called and Drs. presented to the area. Patient c/o itchy throat and still p/w confusion/combativeness, loss of orientation, and SOB. No visible swelling noticed. At around 13:58, patient syncopized. HR and SpO2 remained 70-80s and >98% on room air respectively. Pulse remained palpable. At that time, an epipen was administered. Patient woke up. During the entire episode, he was able to recognize a staff member with whom he was previously familiar. EMS arrived, vitals remained stable. EMS transported patient to the ER for further monitoring and f/u. Concern for immediate allergic reaction 2/2 vaccination. After event, patient in need of referral to allergy provider for evaluation prior to consideration of 2nd dosage. |

| 1026254 | 2/12/2021 | VA | 54 | F | 1/27/2021 | 1/27/2021 | Received Moderna COVID-19 vaccine on 1/27/21 in the am. At 11:30 pm, pt started to feel sweaty and went to the bathroom. She passed out and fell to the floor. Woke up on the floor. Incontinent of stool. Had scratches on forehead and nose from the fall. Called her daughter who took her to emergency room. She was not admitted. She was not given any treatment. Stated they checked her vitals and drew some blood work. She stated that she was told it was due to her blood pressure dropping. Discharged home with no further problems. Reported this on 1/12/21. |
| 1026007 | 2/12/2021 | | | M | 1/17/2021 | | Had a syncopal event; A spontaneous report was received from a health care provider who is also the patient, a male of unreported age, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced a syncopal episode. The patient's medical history was not provided. No relevant concomitant medications were reported. On 17 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot number: unknown) intramuscularly for prophylaxis of COVID-19 infection. On 17 Jan 2021, after receiving the vaccine, the patient had a syncopal episode. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not reported. The outcome for the event, syncopal episode, was considered unknown.; Reporter's Comments: This case concerns a male patient of unknown age. The medical history is not provided. The patient experienced a medically significant and unexpected event of Syncope occurred one day (same day) after receiving their first of two planned doses of mRNA-1273 (Lot unknown). Based on the current available information and temporal association between the use of the product and the onset of the event, a causal relationship cannot be excluded and the event is considered possibly related to the vaccine. |

| 1026008 | 2/12/2021 | CT | 47 | F | 1/8/2021 | 1/8/2021 | New sensitives to face cleansers; Anaphylactic shock; A spontaneous report was received from a consumer, concerning herself, a 47-year-old female patient, who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced anaphylactic shock and "newsensitives to face cleansers". The patient's medical history was not provided. Concomitant product use included face cleansers. On 08-Jan-2021, the patient received the first of two planned doses of mRNA-1273 (lot number unknown) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 08-Jan-2021, approximately five minutes after receiving the vaccine, the patient experienced anaphylactic shock as evidenced by throat warm and tingling, arms was bright red and warm to touch, trouble breathing, felt like choking, and nausea. Hence, she was treated with "epinephrine quite a few times along with steroids and ranitidine". On 09-Jan-2021, the patient went to the hospital two more times for "breathing issues", however she was not admitted. On 10-Jan-2021, in the morning, the patient had "passed out" and was given another epinephrine injection as she went into anaphylaxis shock again. On-29 Jan-2021, the patient also reported her arm, legs and chest are "bright red" and "burns". The patient also experienced new sensitivities to the face cleansers she has used for over 12 years. Action taken with mRNA-1273 in response to the events were unknown. The events, anaphylactic shock, was considered newsensitives to face cleanser" were considered not resolved.; Reporter's Comments: This case concerns a 47-year-old female patient, who experienced serious event of anaphylactic shock and non-serious event of sensitive skin. The event of anaphylactic shock occurred on the same day and re-occurred again approximately 2 days after first dose of mRNA-1273, lot # unknown. Based on the current available information and temporal association between the use of the product and the onset date of the events, a causal relationship cannot be excluded. |

| 1026024 | 2/12/2021 | MO | 32 | F | 1/26/2021 | 1/26/2021 | passed out and almost broke her arm; started salivating really bad/it's lot of drool; Heart rate started pounding; This is a spontaneous report from a contactable consumer (patient). A 32-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL9261, expiration date May2021), via an unspecified route of administration on 26Jan2021 at single dose for COVID-19 immunisation. Medical history included: Allergy. Concomitant medication included drospirenone, ethinylestradiol (YASMIN) for Birth control, chlorphenamine maleate (PIRITON) for Allergy. The patient was perfectly fine up until about the 3 hours after the vaccine, she started salivating really bad, she was not throwing up or nauseas or anything, it's just that it's lot of drool, like she even had just go over sink as just salivating so much it was weird, and her heart rate started pounding and she passed out and almost broke her arm, so and then she kind of like blacked out and don't remember anything for rest of the evening. The events onset date was on 26Jan2021 08:30. No treatment was received. The outcome of events was recovered in Jan2021. |
| 1026060 | 2/12/2021 | GA | 65 | F | 2/10/2021 | 2/10/2021 | Severe flu like systems with nausea and cramping. Lightheaded, clammy, cold to the touch. No fever. Passed out 3 times - per my husband trying to go the bathroom. These systems lasted from 10.30 pm till 8.00am the next morning. Severe nausea continued and my doctor prescribe ondansetron. This is the sickest I can remember being in my life. I am very concerned about me passing out. |
| 1026126 | 2/12/2021 | PA | 24 | F | 1/6/2021 | 1/6/2021 | Around 12 hours post-vaccine experiences severe chills for a couple of hours. Woke up around 8AM with headache, took an advil, passed out for an hour and have been fine since. |

| 1025005 | 2/12/2021 | | | F | 1/27/2021 | 1/28/2021 | Fainted during the night; I had chills with a high fever; A spontaneous report was received from a female consumer, age not reported who experienced "chills with a high fever", and "fainted during the night" after receiving the second dose of mRNA-1273. The patient's medical history was not reported. Concomitant product use was not reported. On 27-Jan-2021 prior to the onset of symptoms, the patient received her second dose of mRNA-1273, route, site and Batch number not reported, for prophylaxis of Covid-19 infection. The patient reported a bad reaction approximately after ten or eleven hours after her immunization, she had chills with a high fever and then fainted during the night. She reported that she did come to a moment later. On 29-Jan-2021 she reported that she is feeling fine that day. The patient stated that she felt it was an unusual reaction that should be reported. Treatment for the event was not reported. Action taken with the study drug due to the events "chills with a high fever", and "fainted during the night" was not reported. The events "chills with a high fever", and "fainted during the night", were considered recovered/resolved on 29-Jan-2021.; Reporter's Comments: This case concerns a female patient, who experienced events of chills with a high fever, and fainted during the night. The events occurred 10-11 hours after the second and last dose of mRNA-1273 vaccine administration. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded and the events are assessed as possibly related. |

| 1025007 | 2/12/2021 | NJ | 21 | F | 2/2/2021 | 2/2/2021 | Rapid eye movement like "having a mini-seizure"; Fainted; Feeling warm; A spontaneous report (United States) was received from a pharmacist concerning a 21-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and fainted and experienced to have rapid eye movement like "having a mini-seizure" and feeling of warmth. The patient's medical history included historical seizures. Concomitant product use was not provided by the reporter. On 02 Feb 2021, the patient received their first of two planned doses of mRNA-1273 (Batch number:026L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 02 Feb 2021, a few minutes after the injection, the patient fainted then recovered but again fainted and was noted to have rapid eye movement like "having a mini-seizure". HCP managed her with ice pack as patient complained of feeling warm and she recovered in less than 30 minutes. Treatment information was not provided. The outcome for events fainted, rapid eye movement like "having a mini-seizure~~" and feeling warm were resolved.; Reporter's Comments: This spontaneous report concerns a 21-year-old, female patient with historical seizures. who received experienced the patient fainted then recovered but again fainted and was noted to have rapid eye movement like "having a mini-seizure." The event occurred a few minutes after the administration of mRNA-1273 vaccine (Batch number: 026L20A, expiration date: unknown). Treatment administered include Icepak and outcome is resolved. Based on the information provided which includes a strong temporal onset between the vaccine administration and the event, a causal association cannot be excluded. However, event is confounded by the subject's history of seizures. Feeling warm is consistent with the safety profile of the product. |

| 1027210 | 2/12/2021 | CA | 62 | F | 2/2/2021 | 2/3/2021 | At 2pm I was at work and packed my things like I was going home. A friend saw me and told me it wasn't time to go home. At this time she took me to my office and I realized I was confused. When I got home on the 3rd of February I had a fainting spell. I had headache on the left parietal and temporal lobe. The headache was the worst headache of my life. It lasted for 7 days. It was throbbing and pulling constantly. It felt better when I was sleeping. The left side of my head was warm. Upon waking up, my headache would return. On day 7 all symptoms resolved. I went to my physician (Via phone visit) and she has ordered me an MRA w/o contrast head which is now pending. |
| 1027201 | 2/12/2021 | NY | 71 | F | 2/12/2021 | 2/12/2021 | Patient called staff over and told him she was going to faint. staff got senior nurse to help assess. Other nurse which was at pt site. Patient leaning forward and then sat back head tilted backwards, eyes opened and non-responsive. Sternal rub performed and other noxious stimuli performed. Continued until pt became responsive. app less than a minute late patient became responsive. Alert and Oriented X 4, Vital signs obtained. encouraged Patient to drink water and take deep breaths. Patient stated incident of fainting occurred prior in dermatologist office. No follow-up care was given after the doctors visit. patient became nauseas and vomited. She was clammy and pale. Patient was encouraged to go to the hospital and would not let us call EMS. Said she would not take public transportation home. She will take a cab and call her PCP in the morning and follow-up care. Staff verbalized that it was unsafe for her to go home rather than the hospital. patient denied any further dizziness, nausea or respiratory distress. Stated she just felt unwell and needed to rest. Staff made her sign "Refusal of Immediate Care Against Medical Advice". Patient then called uber and staffed member escorted pt into cab at 7.12pm. We attempted to call patient multiple times between 7.23 pm - 7.30 pm. |

| 1027169 | 2/12/2021 | MN | 23 | F | 2/12/2021 | 2/12/2021 | Patient passed out and fell to the floor. She was very dizzy and nauseous. She may have also hit her head on the floor when she fell. She stayed laying down until she felt better and then sat up. She said her neck also her, and she used an ice pack. A nurse was with me, helping with paper work and she helped to monitor her. Patient called a friend to take her home once she was feeling better so she wasn't left alone. |
| 1027135 | 2/12/2021 | CA | 68 | F | 2/12/2021 | 2/12/2021 | Pt received vaccine @ 2:50 PM. Pt reported feeling dizzy, hot and sweaty. Pt has a history of anxiety/fainting when dealing with needle sticks. VS 122/80 HR: 72 O2: 94. Patient later reported feeling back to normal. Pt denied feeling dizzy, hot, and sweaty. Pt was d/c home with her husband. |
| 1027112 | 2/12/2021 | IN | 81 | F | 2/10/2021 | 2/11/2021 | Fever, chills, body aches, fatigue, fainting through first night. Body aches and fatigue next day and night. Still have some aching and fatigue on fri, second full day after vaccination |
| 1026575 | 2/12/2021 | WV | 72 | M | 2/9/2021 | 2/9/2021 | Patient came to the Health Department on afternoon of 2/12/21 to report incident. He received the vaccine approximately 4:20pm. According to the patient, he felt at his normal all evening. At 9:15pm, he reports he started having chills and was very cold. He rested with a blanket until he got up at 9:30pm to get a drink of water and check his temperature. Per the patient, he remembers checking his temperature, which was 97.6F, then awoke on the floor. He had passed out, believes he was "out" for no more than a minute. Patient reports he felt well when he awoke and has felt at his baseline ever since. He has abrasions to bilateral hands, as well as his chin. His upper lip was busted. He did not see his doctor in regards to this. He admittedly does not see a doctor often. Encouraged patient to follow up with is doctor, as he states he has a history of a stroke and heart attack. |
| 1026381 | 2/12/2021 | NY | 69 | M | 2/12/2021 | 2/12/2021 | Pt became faint 10 minutes or so after dosing of cv19 vaccine. Per EMS pt passed out for about 1 minute. Pt came to stated he felt ok. Decreased blood pressure 80/40. pt states he had not eaten anything since 0700 blood sugar 125, pt loaded on to stretcher and transported via EMS to local hospital St. Lukes for fluids and monitoring. |

| 1023365 | 2/11/2021 | | | U | 1/27/2021 | 1/27/2021 | When got up I passed out; blood pressure shoot up to 180 over 100; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date were not reported), via an unspecified route of administration on 27Jan2021 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that the patient took the covid dose yesterday and after he/she took it, he/she sat there for few minutes and then when he/she got up he/she just passed out. The patient mentioned that they called the code blue in the hospital, they tried to, they were going to, he/she doesn't know what they were going to do but they ended up taking the patient to the emergency room where they ran every test possible blood work they did chest X-ray, they did EKG. The patient stated that the only thing that was consistent was that after the vaccine his/her blood pressure shot up to 180 over 100 and they were trying to get it down, they gave the patient some fluid (unspecified) which stayed for over two hours. The patient added that he/she have never had any blood pressure issues, as he/she was not even on any medications. The patient mentioned that he/she was now afraid to take the second dose. The events occurred on 27Jan2021 with outcome of unknown. Unknown results for blood work, EKG and chest X-ray. The reporter considered the events serious per hospitalization on 27Jan2021. Information on the lot/ batch number has been requested. |

| 1021918 | 2/11/2021 | CA | 58 | F | 1/13/2021 | 1/21/2021 | Flushed; Body aches; Red rashy spot; Fatigued; The site on my left arm got to a baseball size; Headaches; Felt like I would throw up; Ended up fainting/ went down for a second time; Diarrhea; Light headed; Discombobulated; A spontaneous report was received from a 58 year old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced diarrhea, felt that she would throw up, light headed, fainted, discombobulated, site on her left arm got to a baseball size, and in the middle was a red rashy spot, flushed, fatigued, had body aches and headaches. The patient's medical history included high blood pressure. Relevant concomitant medications included unknown blood pressure medication. On 13 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot: 011J20A) intramuscularly in left arm for prophylaxis of COVID-19 infection. On 21 Jan 2021, around three, the patient experienced diarrhea, she thought it was food poisoning. While on the "pot" with diarrhea she felt that she would throw up. She mentioned that she became lightheaded but did not throw up and ended up fainting. She fell off the pot and decided to lay down in her bed. She got lightheaded again and went down for a second time. She stated she had a difficult time getting up; she crawled to the bed. When she attempted to stand up, she could feel she was lightheaded again. The patient mentioned that maybe she was down 45 minutes before getting to lay on her bed. She felt discombobulated. She felt very clumsy when trying to dial her sister's number; she left a message on the machine and was struggling to get her words together. The site on her left arm got to a baseball size, and in the middle was a red rashy spot. On Friday evening, 26 Jan 2021, the patient stated she started feeling better. She mentioned that she was flushed, fatigued and had body aches. The patient stated she hasn't tried any treatments but took paracetamol for headaches and tried to rest. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the events, diarrhea, felt that she would throw up, light headed, fainted, discombobulated, site on her left arm got to a baseball size, and in the middle was a red rashy spot, were resolving. The outcome of the events, headaches, flushed, fatigued and body aches, were unknown.; Reporter's Comments: This case concerns a 58 year old female patient with medical |

| 1023358 | 2/11/2021 | CA | | F | 12/19/2020 | 12/19/2020 | encephalitis-like symptoms; Hearing loss; memory loss; paresthesias; visual disturbances; taste disturbances; dizziness; L-sided chest pain; staggering; elevated SBP 190-200; severe L-sided chest tightness; pre-syncope; elevated BP; DDimer was elevated; fell; intermittent memory lapses; nausea episodes; cant smell that last 1-2 hrs; L neck /head pain; L neck /head pain; Left axilla lymphadenopathy; rhinitis; lightheaded/lightheadedness; had an episode of pain all over; SOB; This is a spontaneous report from a contactable physician (patient). A 46-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot/batch number and expiration date were unknown), via an unspecified route of administration from on 19Dec2020 at a single dose for COVID-19 immunization. Medical history included ovarian cancer at age 29, food allergy to clams and escargot, and allergy to sulfa. The patient's concomitant medications were not reported. The patient previously took bactrim and experienced allergies. On 19Dec2020, immediately after vaccine had rhinitis, lightheaded, given Zyrtec and water and observed for a duration of 30 min. Three hours postvaccination on 19Dec2020, at home had an episode of pain all over and SOB (shortness of breath). 3 days later (22Dec2020), patient had L (left) neck /head pain and left axilla lymphadenopathy. On 23Dec2020, she fell in the shower. On the same day (23Dec2020) the patient had intermittent memory lapses, lightheadedness, nausea episodes, can't smell that last 1-2 hours a few times a day. Symptoms worsened on 03Jan2021, with severe L-sided chest tightness, pre-syncope, was seen in the ER with elevated BP. DDimer was elevated, CT Scan of Chest/Abdomen showed L axilla lymphadenopathy, negative for PE. CBC, Electrolytes WNL (within normal limits), still on 03Jan2021. Observed in ER for 7 hrs. and then discharged home. Intermittent symptoms continued. On 08Jan2021, patient had another severe episode while at work. She was noted to be staggering, and again was complaining of left-sided chest pain. She was taken to the ER by her colleagues on 08Jan2021 and noted to have elevated SBP 190-200. On 08Jan2021, patient underwent CT head negative, MRI negative, w/u (workup) for pheochromocytoma negative and COVID negative. She was started on prednisone and Norvasc |

VAERS_ID RECVDDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

and discharged home. She continues to have intermittent episodes however they have decreased in intensity and last for about 1 hour. She described her symptoms as encephalitis-like symptoms. These include memory loss, paresthesia, visual disturbances, hearing loss, taste disturbances, and dizziness. These symptoms when severe have been incapacitating. She had been hospitalized for a neurological and infectious work up (including Brain MRI and multiple COVID tests) but no diagnosis has been yet identified. This symptom complex (unspecified) has persisted to now. She has not received the second dose of vaccine. She is asking how long mRNA, the lipid nanoparticles and the protein spike lasts in the body. Outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the limited information currently available, a possible contributory role of the suspect drug in the reported events cannot be completely excluded given the implied temporal association. However, underlying medical conditions may provide the alternate explanations. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

| 1023345 | 2/11/2021 | HI | 89 | F | 1/26/2021 | 1/26/2021 | Got sick; Headache; Shortness of breath; Passed out; Dizzy/ Dizziness; Tightness in her chest; This is a spontaneous report from a contactable consumer. An 89-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number and expiration date unknown, first dose, intramuscular on 26Jan2021 at single dose on right arm for COVID-19 immunization. Medical history included mastectomy, surgery for metaplastic carcinoma. She received 4 units of blood and reacted to the blood and itched from her head to toe and they treated her with prednisone for that. She said that the metaplastic carcinoma was 10 inches big and half of her front was removed. Other medical history and past drugs included allergic to Bactrim, Sulfa drugs, Cortisone, Zocor, Keflex, Macroclantin, Penicillin, Vicodin (took three times and thought she was going to die; coughed for a year and couldn't even sleep because she developed Pericarditis), Benazepril, Levaquin, Losartan, Niaspan (whole body turned red), Pravastatin. On 07Jan2021, she had an appointment with her doctor who first advised her not to take the vaccine because of all of her allergies but she said there is an antidote if she has a reaction so she said she could take it. She had the first dose of the vaccine on 26Jan2021 and had a bad reaction. She was very dizzy and got sick. They didn't catch it at the vaccination site because they only had the patients wait 15 minutes. Her drive home takes 10-15 minutes. She thought she couldn't drive home because of the dizziness. She got a tightness in her chest and started getting so dizzy that she ran into the living room and slept on the sofa because she couldn't handle it anymore. It was reported that she passed out from about 12:00-15:00. She was completely out. She took a Tylenol right after the shot for dizziness and sick because when she told her healthcare professional about the symptoms, she said to take a Tylenol. She also had shortness of breath on 27Jan2021. This morning (28Jan2021) she had a headache but she was feeling much better. The caller asked if she should get the second dose due to her reaction. The patient stated she has a whole list of allergies that she gave the other agent. The patient stated that she doesn't think she will take the second shot. She also stated she takes Tylenol after the Flu shot so she doesn't get so sick. The patient mentioned that her physician does not know about any of this and said |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

that she received the vaccine at a hospital. She said that she only contacted her doctor to notify her that she was dizzy. She was directed to take Tylenol. She said that she did take Tylenol as directed by the people administering the vaccines too and she did get sick. The patient said that it helped a little and she knows that it was not the Tylenol that caused this. She does not want to get the second shot if she gets sick like this. The patient said that the fact sheet said to call 911. The shot did not hurt her at all, and she did not know that she even received it. She said that the person who administered the vaccine was very good. The outcome of the event headache was recovering, dizziness, shortness of breath recovered on 27Jan2021, Tightness in her chest, passed out was recovered on 26Jan2021 and sick was unknown. Information about Lot/ Batch has been requested.

| 1023343 | 2/11/2021 | MN | 41 | F | 1/27/2021 | 1/27/2021 | Fainted; blacked out; This is a spontaneous report from a contactable nurse (patient). A 41-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EL1283), intramuscular on 27Jan2021 10:15 at a single dose on right arm for COVID-19 immunization. Medical history included low iron. The patient was not diagnosed with COVID-19 prior to vaccination. The patient was not pregnant at the time of vaccination. The patient had no allergies to medications, food or other products. Concomitant medications included ferrous sulfate, vitamin c [ascorbic acid] (VITAMIN C), chondroitin sulfate, glucosamine sulfate (GLUCOSAMINE CHONDROITIN SULFATE). The patient previously received first dose of BNT162B2 on 06Jan2021 for COVID-19 immunization (brand: Pfizer, lot number: EK9231, administration time: 04:30 PM, route: intramuscular, vaccine location: right arm, dose number: 1). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 27Jan2021 23:45, the patient fainted and blacked out. No treatment was given for the adverse events. The events resulted in doctor or other healthcare professional office/clinic and emergency room/department or urgent care visits. It was unknown if the patient has been tested for COVID-19 since the vaccination. The patient was recovering from the events.; Sender's Comments: Based on the compatible time association, the events fainted and blacked out are possibly related to suspect vaccine BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate. |

| 1022695 | 2/11/2021 | WV | 61 | F | 2/10/2021 | 2/11/2021 | The patient felt fine immediately after the vaccine which was at 3pm 2/10. She reports having difficulty sleeping and awoke with a headache. When she got out of bed, a few after getting up, she felt dizzy and decided to get back in bed however she fainted and fell onto the floor. She also reports nausea. |
| 1022391 | 2/11/2021 | IL | 42 | F | 2/10/2021 | 2/11/2021 | MODERNA COVID-19 vaccine EUA Received first shot yesterday (2/10/21 @ 2:42pm) had chills off and on overnight and sore arm. Got up at 6:30 am today (2/11/21), used the bathroom, felt very dizzy and lightheaded, started sweating profusely, tried to make it back to bed, took 4 steps and passed out, hitting my face on dresser. This has only happened one other time, 16 years ago when I was pregnant, flying on vacation and hadn't eaten, blood sugar dropped and I passed out momentarily. No history of fainting, not diabetic, no health issues whatsoever. Healthy weight, fit and in shape. |
| 1022389 | 2/11/2021 | MI | 77 | F | 1/21/2021 | 1/22/2021 | I was sleeping, then woke up and my whole body felt numb. I got up to go to the bathroom and fainted. I fell on the floor and got a bloody nose, cut lip and cut and bump on my head. I had stiff neck for a week afterward. |
| 1022047 | 2/11/2021 | WA | 62 | F | 1/26/2021 | 1/27/2021 | collapse and passed out; Woke up at midnight with severe leg cramps; I turned white as a ghost and sweats; I turned white as a ghost and sweats; Got the chills after sweating; This is a spontaneous report from a contactable 62-year-old female consumer reported for herself that she received 1st dose of bnt162b2 (BNT162B2; lot number EL9261) on 26Jan2021 04:30 PM at left arm for COVID-19 immunization in Public Health Clinic. Medical history and concomitant drugs was none. The patient woke up at midnight with severe leg cramps, tried walking it out, collapse and passed out (according to husband). He stated that the patient turned white as a ghost and sweats. After coming too, drank electrolytes and water. The patient got the chills after sweating. It took a while for her to warm up and go back to sleep. Event start time was reported as 27Jan2021. The outcome of the event was resolved. |
| 1021731 | 2/11/2021 | MO | 37 | M | 2/8/2021 | 2/9/2021 | Bloody nose, fainting spells, sore arm, insomnia. |

| 1023375 | 2/11/2021 | IA | 35 | F | 1/29/2021 | 1/29/2021 | Became unresponsive; Looked like having a seizure; Felt light headed; BP extremely low; Profusely sweating; Heart rate extremely low; A spontaneous report was received from a pharmacist, concerning a 35-year-old female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced felt light headed, became unresponsive, looked like having a seizure, BP extremely low, heart rate extremely low, and profusely sweating. The patient's medical history, as provided by the reporter, included high blood pressure. Products known to have been used by the patient, within two weeks prior to the event, included hydrochlorothiazide/lisinopril. On 29 Jan 2021, five minutes prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot Number: 025L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. On 29 Jan 2021, the patient felt light-headed five minutes after receiving the vaccine. He then became unresponsive but was breathing and had a pulse. The reporter stated it looked like the patient was having a seizure; his eyes rolled upward, his left arm shook, and he did not respond to touch or voice. It was reported that 911 was immediately called and responded within a couple of minutes. The patient's blood pressure and heart rate were extremely low, and he was profusely sweating. The reporter stated that the patient came to and still felt very light-headed. The patient was then taken to the emergency department. Medical tests and laboratory results were unknown, but the reporter stated that a magnetic resonance imaging (MRI) was possibly performed. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not provided. The outcome for the events, became unresponsive and looked like having a seizure, were resolved on 29 Jan 2021. The outcome for the events, felt light headed, BP extremely low, heart rate extremely low, and profusely sweating, was unknown.; Reporter's Comments: This case concerns a 35-year-old, female, with medical history of high blood pressure, who experienced a serious unexpected event of syncope, seizure, and non-serious unexpected events of dizziness, hypotension, hyperhidrosis, and heart rate decreased. The events occurred 1 day (5 min) after mRNA-1273 (Lot# 025L20A). Treatment information was not provided. |

| 1022037 | 2/11/2021 | TN | 50 | F | 1/25/2021 | 1/25/2021 | <p>Concomitant medications included: hydrochlorothiazide/lisinopril. Based on temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Additional information has been requested.</p> <p>felt near syncopal; very short of breath; heart was pounding hard; felt tachycardic; BP was 160/100; irregular HR with PVCs; HR 40; This is a spontaneous report from a contactable healthcare professional (patient). A 50-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; lot number EL1283) on 25Jan2021 08:15 given intramuscular (left arm) single dose for COVID-19 immunization. Medical history included was reported as none. The patient was not pregnant at the time of vaccination. Concomitant medication included estradiol, testosterone, lorazepam (ATIVAN). The patient previously received ultram/ Zofran ad experienced drug allergies, and first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number EL1284) on 04Jan2021 08:15 intramuscular single dose for COVID-19 immunization. The patient was not diagnosed with covid prior vaccination and the patient was not tested for covid post vaccination. On 25Jan2021 at 08:45 AM, 30 minutes after injection,-the patient felt horrible described as her heart was pounding hard and felt tachycardic. BP was 160/100 and HR 110 and felt near syncopal. Then PVCs started/ very short of breath, and HR went from 112, 69, 40, then 80. The patient went to ER. The patient was monitored and given was IVFs and O2, and labs checked. The patient was discharged 7 hours later and continued having irregular HR with PVCs. Outcome of the events was recovering at the time of the report.; Sender's Comments: Based on the available information, a possible contribution of the drug to the event syncope cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p> |

| 1022385 | 2/11/2021 | AR | 42 | F | 1/15/2021 | 1/15/2021 | 5 minutes after receiving vaccine became very dizzy, and flushed with fast heart rate , dropped to the floor near syncope. Laid down and took off mask for air. Was offered water and Benadryl. Drank some water then felt better.. Refused the Benadryl. 10 minutes after someone noticed a possible rash on my forehead. Went ahead and took some Benadryl. Later that night had same feelings.. fast heart rate and dizziness. The next day development flu like symptoms with fever up to 102.9. Took a half Tylenol. The next day just felt achy . The day after that had diarrhea. |
| 1024562 | 2/11/2021 | ID | 32 | F | 2/11/2021 | 2/11/2021 | Patient experienced likely vasovagal syncope. Felt "woozy, dizzy," then momentary syncopal episode, then slight nausea and dizziness. VS monitored Q 5 mins x 35 mins, incl orthostatics. Patient assisted to gurney with head raised, given bottle of H2O to drink. Pt states had eaten Taco Bell immed prior to vaccine appt and was well-hydrated. Pt states that she experienced a similar event in Oct 2020 after a blood draw. Pt felt back to normal within 10-15 minutes, this RN continued to monitor and provide support for an additional 20 mins. Pt reported feeling "completely normal" at discharge. Conversing and ambulating well. |
| 1023711 | 2/11/2021 | CA | 46 | F | 12/28/2020 | 12/28/2020 | Describe adverse reaction: vasovagal syncope several hours after vaccine. Sent to ED via ambulance. Vasovagal symptoms: dizziness; vertigo; lightheadedness; near syncope and weakness. Sent to ED via ambulance from work. ED gave IV fluids and mescaline. Studies performed: EKG; CBC; and BMP. From ED MD note DC instructions: You came to our ER with concerns of dizziness after getting your covid vaccine. We evaluated you with labs, and provided you with meclizine and fluids. The results of our evaluation were reassuring, and we believe that the causes of your symptoms are not immediately life threatening and safe to follow up with your clinic doctors. We've prescribed you meclizine, take it as needed for dizziness. Administration error: no Clinic called No; Transferred to Emergency Department from workplace several hours after vaccine was administered. |

| 1021917 | 2/11/2021 | NY | 90 | M | 1/26/2021 | 1/26/2021 | <p> Syncope; Shaking; Struggling to breathe; A spontaneous report was received from a consumer concerning a 90-year-old, male patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and developed syncope, shaking, and struggling to breathe. The patient's medical history was not provided. Concomitant medications reported included warfarin, ezetimibe, bupropion, finasteride, tamsulosin, furosemide, potassium chloride, rosuvastatin, and nitrofurantoin. On 26 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot # 032L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 26 Jan 2021, after vaccine administration, the patient stayed at the vaccination site for fifteen minutes to watch for any reaction, he had none, so he left. Later that night the patient began shaking and struggling to breathe, so 911 was called. At the hospital, the patient was diagnosed with syncope. He spent overnight in the hospital and had an echocardiogram the following day. No results were provided for the echo, but the patient was cleared to go home after a sixteen-hour hospital stay. No treatment information was provided. Action taken with mRNA-1273 in response to the event was unknown. The outcome of the events, syncope, shaking, and struggling to breathe, was resolved.; Reporter's Comments: This case concerns a 90 year-old, male patient, who experienced events of syncope, shaking, and struggling to breathe. The events occurred the same night after the first and last dose of mRNA-1273 vaccine administration. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded and the events are assessed as possibly related. </p> |

| 1024752 | 2/11/2021 | OR | 74 | F | 2/8/2021 | 2/9/2021 | Patient reports she got up out of bed early the next morning after receiving her COVID vaccine and took 2 of her morning pills and then had an episode where she passed out for a few minutes and spilled the water down her clothing. She felt weak and tired after this episode and so went back to bed for several hours. Later that day she had another episode of feeling lightheaded as if she might pass out, while sitting at a hair salon waiting for her appointment, but did not actually pass out, just felt a wave of heat and slight nausea, but did not faint. She had one further near syncopal episode at home later that night when she also noticed she was a little "jittery" and noted a strange smell that the rest of her family did not notice. She also reports that she has had near syncopal episodes in the past and thinks she may have been a little dehydrated the day these incidents occurred. |

| 1024457 | 2/11/2021 | NV | 24 | F | 2/9/2021 | 2/10/2021 | I had on-and-off insomnia starting around 10pm. I woke up every thirty minutes on the minute with a feeling like there was a fifty pound vest on my body. At 3:30, I felt nauseous. I walked from my bedroom to downstairs to the kitchen. My knees buckled several times en route. When I ate one bite of a protein bar, my nausea increased tenfold. I ask drank water at the time. I walked back upstairs to my room to sleep where remained awake until ~five am. I slept from ~five am until approximately 8:10am. I felt faint as I walked into the bathroom where I felt my faintness increase by the second. My knees buckled and I passed out on the bathroom floor tile for ~five - ten seconds. I layed there for a few minutes until I felt stable to stand. This morning, 45 hours after the injection and 22 hours after blacking out, I felt a goose egg on the back of my head. It has hurt all day at a level 4/10 on the pain scale. |

| 1019847 | 2/10/2021 | MA | 77 | M | 2/9/2021 | 2/9/2021 | I had my (Moderna) first dose yesterday. Within ~6 hour the soreness level of the shoulder joint (but not especially the site of the jab) zoomed up to intense. So much so, that simply lifting my arm slow-motion to the level of my eyes caused intense pain spasms. Last night and this morning were equally severe. Within the last hour or so, the pain level has diminished a bit. NOTE: I know how people rate pain is super subjective. In my case working as a geologist in a quarry a number of years ago, I was struck and pinned by a large boulder. The ER crew would not give me a pain killer, so that they could monitor how the Jaw of Life was working (it broke, the boulder was too heavy), so I not surprisingly passed out several times from the pain level before being extricated. Needless to say, this compound fracture of the tibia and fibula accident was a 10 of 10 pain level. Yesterday's CV-19 jab pain level was an 8-9 of 10. Nothing I read before yesterday's jab, Fauci et al, prepared me for this pain level. So, is this normal??? My POV is, I think, atypical in this matter of pain. Should I be concerned about a return to normalcy right now (today / tomorrow) as well as for the second dose?? I HOPE THAT A MEDICAL PERSON WILL RESPOND TO THIS EMAIL - NOT SOME BOILER PLATE WORDS. If you want more details, feel free to phone me |
| 1019664 | 2/10/2021 | CO | 75 | F | 2/5/2021 | 2/8/2021 | 75-year-old woman who presented to the emergency room 2 days after vaccination with chest tightness, fatigue and was found to have pericardial effusion without tamponade. It was noted that patient has had intermittent syncope since August of 2020 and clinical interpretation is likely that pericardial effusion pre dated vaccination. In her workup for dizziness and syncope she had not previously undergone EKG, chest x-ray or echocardiogram therefore pericardial effusion could have been missed. I elected to report the pericardial effusion to be on the side of caution. |

| 1018328 | 2/10/2021 | FL | | F | 1/11/2021 | 1/12/2021 | Headache; Collapsed on the floor; Left arm injection site red; Rash; A spontaneous report was received from a consumer, who was also a 80-year-old, female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced syncope, injection site redness, rash, and headache. The patient's medical history, as provided by the reporter, included high blood pressure. Concomitant product use reported included atenolol and atorvastatin. On 11 Jan 2021, one day prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Batch number: 039K20A) intramuscularly in the left arm for the prophylaxis of COVID-19 infection. On 12 Jan 2021, the patient noticed her left arm was getting redder and redder at the injection site. When she turned to look at the clock, the patient collapsed on the floor. She went to the medical center and was prescribed prednisone and diphenhydramine. On 21 Jan 2021, the patient reported she now had a headache that began on an unspecified date, and that her injection site redness and rash were still present, but getting better. Action taken with mRNA-1273 in response to the events was not reported. The outcome of event, syncope, was unknown. The events, injection site redness and rash, were considered resolving. The event, headache, was considered not resolved.; Reporter's Comments: This spontaneous report concerns an 80-year-old, female patient with medical history of high blood pressure who experienced serious event of syncope and non-serious events of injection site redness, rash and headache. The events of syncope rash and injection site redness occurred 1 day after administration of mRNA-1273 (Batch number: 039K20A, expiration date-unknown). On an unspecified date on the event of headache began. Treatment provided for the events included prednisone and diphenhydramine and the outcome is not resolved. injection site redness, rash and headache are consistent with the known safety profile of the mRNA-1273 Vaccine and hence, based on the temporal association between the events and the vaccine administration, a causal association cannot be excluded |

| 1021270 | 2/10/2021 | MO | 28 | M | 1/28/2021 | 1/28/2021 | Immediately after I administered the vaccine, the patient passed out. He fell onto the floor and we witnessed some oral seizure like type movement . The patient was unconscious for approximately 1.5-2 minutes. Our Chief Medical Officer was on site and walking into the room as the patient fell. We immediately placed him on his left side, protected his head, and stayed with him. We called 911 immediately due to the uncertainty of health issues. Once conscious, the patient explained to us that he experiences such every time he receives a vaccine. He was assessed by the CMO as well as the EMTs that arrived on scene. His vitals were taken. He was moved into a comfortable position and monitored. He was alert and orientated x 3. We requested he have someone pick him up instead of him driving himself home which he did. This gentleman is also an employee and we were able to see him and verify all was well in the following days. We also recommended he tell all vaccinators that he experiences LOC post vaccination. When he receives his second dose we plan to have him lying down and our CMO will be present. We recommended he follow-up with his PCP. |
| 1020778 | 2/10/2021 | MA | 22 | F | 2/10/2021 | 2/10/2021 | vagal response post vaccination while seating in post vaccine observation area. | 1016105 | 2/9/2021 | MD | 69 | F | 2/8/2021 | 2/9/2021 | Patient states she received the Moderna second vaccine around noon. Around 2 am she sent and drank some warm milk. As she walked up the stairs, she felt like vomiting and also felt like she could not move. Tried to crawl to the bathroom when she passed out. woke up with clothes full of vomit. Feeling better today. |
| 1016938 | 2/9/2021 | OR | 28 | F | 1/31/2021 | 2/1/2021 | 02-01-2021 patient syncope x 2 with loss of consciousness. Chest heaviness, dizziness, lightheaded, increasing fatigue. Went to ED - diagnosed with new onset Right Bundle Branch Block and hypophosphatemia. Elevated D-Dimer. |
| 1016686 | 2/9/2021 | CT | 41 | F | 1/21/2021 | 1/21/2021 | As I was leaving the clinic, roughly 20 minutes after receiving the vaccine, I became very nauseous and returned to tell the nurse I didn't feel well. I then had an episode of syncope and was unconscious for around 40 seconds. I was transported to the hospital via ambulance. In the ambulance I had a second syncopal episode while the EKG monitored that my HR dropped to 30 bpm. I was unconscious the 2nd time for around 1 minute. Upon arrival to the ER I vomited uncontrollably for a few minutes. For the last 3 weeks following the vaccine I've had a fever of 99.8, headaches, mild diarrhea and nausea. For 10 days following the vaccine I had trouble with thinking clearly and "brain fog". Beginning 2 days post-vaccination my left supraclavicular lymph nodes became very swollen and hard and have remained that way since. |

| 1016622 | 2/9/2021 | VA | 45 | F | 1/15/2021 | 1/15/2021 | faint; feeling off; feel dizzy/light headed; dry mouth; hard to swallow; They took my BP upon arrival and it was 141/93; chills; low grade fever 100 degrees; This is a spontaneous report from a contactable 45-year-old female other health professional reported for herself that she received 1st dose of bnt162b2 (lot number EL8982) on 15Jan2021 08:00 AM at left arm for Covid-19 immunization. Medical history included hereditary angioedema from unknown date (last episode 2015). The patient had not received other vaccines within 4 weeks prior to COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. Concomitant drug included caffeine, paracetamol (ACETAMINOPHEN AND CAFFEINE). The patient reported that after waiting the 15 minutes, she walked to her car, and started feeling off. She thought about sitting in the hospital parking lot, but started to drive home. She started to feel dizzy, light headed, faint, dry mouth, hard to swallow so she drove herself to the fire station. They took her blood pressure (BP) upon arrival and it was 141/93 and blood sugar was 90 on 15Jan2021. She was 120 pounds and her normal BP was 116/63. The event onset time was reported as 15Jan2021 08:30 AM. Later on 15Jan2021, the patient had chills and low grade fever 100 degrees. Treatment was received for the events. The events were resolved on unknown date. Events were reported non-serious. Since the vaccination, the patient has not been tested for COVID-19.; Sender's Comments: Based on temporal association, the causal relationship between bnt162b2 and the event syncope cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate. |

| 1016617 | 2/9/2021 | NY | 70 | M | 1/22/2021 | 1/1/2021 | <p>He almost passed out a couple times; Fever; weak; Awful shakes; Sweating; Chills; Stomach like on fire; Diarrhea; He lost about 4 pounds; has autoimmune disease, lupus; has autoimmune disease, lupus; he thinks he was almost dehydrated; This is a spontaneous report from a contactable consumer (patient). A 70-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; lot number and expiry date not reported) via an unspecified route of administration at right arm, on 22Jan2021 14:30, at SINGLE DOSE for COVID-19 immunization. Medical history included autoimmune disease, systemic lupus erythematosus diagnosed in 2018 (over 3 years ago). Concomitant medication included baricitinib taken in a clinical trial, a study, unknown if 2 or 4mg plus placebo for lupus. On 25Jan2021, at 14:30 in the afternoon, the patient was sweating and it was awful shakes and chills, and it lasted over three hours, and on 26Jan2021 he was weak. The patient lost about 4 pounds on 25Jan2021, with all the water running out of of him. The sweating and shakes happened so suddenly and stomach felt like it was on fire on 25Jan2021. The stomach feeling like it is on fire has gone away, he almost passed out a couple times on an unspecified date, he had diarrhea on 25Jan2021, it was unbelievable. The sweats with awful shakes has gone away on 25Jan2021, but it was horrible, he has recovered with a lasting effect, he is a little weak, but he can move he had to take his dog to the beautician. Diarrhea: the is not eating (had no breakfast this morning) however it was also reported that the patient had a little slice of roast beef and blackberries not many, and he has been drinking, he thinks he was almost dehydrated in Jan2021, he drank about a quart of water so far today. On an unspecified date, the patient had fever. His doctor called the day before and said it was alright; his rheumatologist said it was ok. Outcome of the events he almost passed out a couple times, fever, chills, weak, Diarrhea, He lost about 4 pounds, he thinks he was almost dehydrated was unknown; the events sweating, awful shakes recovered on 25Jan2021 with sequaleae, while Stomach like on fire recovered in 2021. Information on the lot/batch number has been requested.</p> |

| 1016598 | 2/9/2021 | NC | | M | 1/27/2021 | 1/27/2021 | Vasovagal syncope; I suffered incontinence; Blood pressure dropped; A spontaneous report was received from a 29-year-old male patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced vasovagal syncope, blood pressure dropped, and incontinence. The patient's medical history was not provided. Products known to have been used by the patient, within two weeks prior to the event, included multivitamin and fish oil. On 27 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly in the left arm for prophylaxis of COVID-19 infection. Approximately five minutes after receiving the vaccine, the patient experienced vasovagal syncope. The patient reported his blood pressure dropped too much and he passed out for about ten seconds. He also suffered incontinence. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not reported. On 27 Jan 2021, the outcome of the events, experienced vasovagal syncope, blood pressure dropped, and incontinence, were considered resolved.; Reporter's Comments: This case concerns 29-year-old male patient, who experienced non serious unexpected events of blood pressure decreased with vasovagal syncope and incontinence. The events occurred 5 minutes after the first dose of mRNA-1273 vaccine. No treatment was reported, and outcome of reported events was reported as resolved. All events were assessed as related to mRNA-1273 vaccine due to temporal association. |
| 1015978 | 2/9/2021 | SC | 41 | F | 2/8/2021 | 2/8/2021 | I immediately felt nauseated and fatigued, but severe reaction occurred at 10 pm. Extreme weakness and tingling on lips and tongue with difficulty breathing. Migraine and body aches not resolved with OTC meds. Lower back pain was notable and prevented me from sleeping. I passed out in the bathroom when trying to get Tylenol. |

A 91-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL1284) via an unspecified route of administration in Jan2021 (a week before reporting) at single dose in left shoulder for COVID-19 immunisation. Age at vaccination was 91 years. The patient's medical history and concomitant medications were not reported. About 24 hours after shot he started having some dizzy spells and then fainted and fell a couple of times and hurt his back once. He stated he also had had constipation since the shot and do not know if that is related or not. The patient wanted to talk to see if he could get his second shot. He is taking some pain killers for his back. With regards to Physician Office/ Emergency Room: patient stated, 'This for my back and nothing else of that'. The outcome of the events was unknown. The information on the lot/batch number has been requested. |

| 1015667 | 2/9/2021 | NY | 30 | F | 1/20/2021 | 1/20/2021 | diarrhea (7+ loose stools each day starting on this day); headache; severe nausea; worsened muscle pain; new joint pain morning after (Included in aforementioned, but significant stiff neck.); new joint pain morning after (Included in aforementioned, but significant stiff neck.); fatigue/malaise; fatigue/malaise; This is a spontaneous report from a contactable other HCP report for self. This 30-year-old not pregnant female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3302) Intramuscular at left arm on 20Jan2021 at single dose for COVID-19 immunization. Medical history included Asthma, anxiety, allergies to Acetaminophen (seizure like activity and fainting). No COVID prior vaccination. No other vaccine in four weeks. Other medications in two weeks includes fluoxetine, lorazepam, and Ibuprofen. Patient received first dose of bnt162b2 (lot number: EL0140) on 30Dec2020 and experienced injection sight tenderness, severe headache and fatigue. On 20Jan2021 5:00 PM after the second dose, patient experience headache, severe nausea, diarrhea (7+ loose stools each day starting on this day), worsened muscle pain several hours later, new joint pain morning after (Included in aforementioned, but significant stiff neck), fatigue/malaise. Patient received Ibuprofen and rest, supportive care due to events. The outcome of event was not recovered. Rapid Nasal Swab tested Negative on 21Jan2021.; Sender's Comments: The reported event diarrhea was likely causally related to the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) due to temporal relationship, and considering no alternative cause reported currently. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate. |

| 1015656 | 2/9/2021 | AR | 48 | F | 1/7/2021 | 1/7/2021 | Bilateral arm weakness/dysesthesia; Bilateral arm weakness; Severe fatigue; Pretty bad swelling in the shoulder joint that she had the shot in; stiffness in her neck and joints, and in both of her hands, fingers, and elbows.; stiffness in her neck and joints, and in both of her hands, fingers, and elbows; her neck and joints, and in both of her hands, fingers, and elbows; stiffness in her neck and joints, and in both of her hands, fingers, and elbows.; She also had pain in both biceps; Within 20 minutes she had a really weird sharp pain in her upper back the size of a cantelope; This is a spontaneous report from a contactable Nurse. A 48-Year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) on 07Jan2021 at single dose via an unspecified route of administration in right deltoid for COVID-19 immunization. Relevant medical history included Multiple sclerosis/Diagnosed in 1991 or 1992. She also had 2 previous reactions to a pneumonia vaccine two years in a row. About 30-45 minutes after she had fainting episodes. On 07Jan2021 within 20 minutes she had a really weird sharp pain in her upper back the size of a cantelope. On the same day she complained pretty bad swelling in the shoulder joint that she had the shot in, along with stiffness in her neck and joints, and in both of her hands, fingers, and elbows. She also had pain in both biceps. On 08Jan2021 the patient experienced severe fatigue and 10Jan2021 Bilateral arm weakness/dysesthesia. They were floppy noodles and she could hardly use them. She could not hold her purse in her hands. She has not had this issue before with her Multiple Sclerosis. This took about a full week and a half for that to go away. It was like weakness/dysesthesia. She talked to her doctor and he said he felt like the shot had exacerbated her Multiple Sclerosis potentially. At the time of the reporting the patient was recovering from Bilateral arm weakness/dysesthesia. She recovered from fatigue on 09Jan2021, from 'Within 20 minutes she had a really weird sharp pain in her upper back the size of a cantelope' on 10Jan2021 and from other reported events on 12Jan2021. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a possible contributory role of the suspect BNT162B2 in triggering the onset of bilateral arm weakness/dysesthesia cannot be excluded. The events are confounded by underlying multiple |

| 1018558 | 2/9/2021 | WA | 64 | F | 2/3/2021 | 2/5/2021 | 37 hours after Pfizer injection, experienced severe abdominal pain that caused me to have vasovagal syncope. Started sweating, and I lost my vision, then must have fallen on the floor. When I came to, felt very headachy and nauseous. went to urgent care - they ordered an abdominal scan for 2/8/21 but scan did not reveal the cause of the pain. 8 hours later on 2/5/21, started feeling asthma like symptoms. Throat felt tight, voice became hoarse, kept having to cough because airway was starting to feel thickened. went to ER, they took vitals and told me that i wasn't having an allergic reaction because my symptoms were outside the time frame for an allergic reaction. After 3 hours there, they sent me home. Next morning felt like I was having heart palpitations. that feeling eventually went away if I walked around. But the following two mornings, I had the same feeling. |

| 1011581 | 2/8/2021 | MN | 41 | M | 2/4/2021 | 2/4/2021 | <p>Patient screened for first dose of Pfizer vaccine. He checked no history of allergies or reactions to medications or vaccines. In the initial screening he informed me he had a phobia of needles but this is usually with blood draws. He reported he should be fine with vaccinations. I inquired on previous reactions and he denied any allergic reaction just that he does not like them. I asked him how I can help give the vaccine. We had him look away and to think of a different situation. I asked him if he would like to know when I am administering or just use distraction. He chose to be informed when he would feel a slight poke. Vaccine was administered with no issues. Within the minute following the vaccine patient started to feel dizzy. Hung his head a bit but was responsive. I requested staff assistance to help the situation including RN to prevent any episodes of syncope. We provided water which he was able to drink. He was still seated and we suggested putting head between legs. This was not comfortable for him so we moved him to the floor. About 3-4 min in he began to sweat a bit more and appeared Pale. We obtained a BP and pulse. BP was 112/60 and pulse around 60. When he felt hot, sweaty and appeared pale we all decided to call EMS to be cautious. He maintained BP, no SOB, did not lose conscious. EMS evaluated him, med list provided and vitals. He was on medications for anxiety. They released him after about 30min and reported a panic attack and not related to the vaccine. Patient walked out of the clinic with his partner and was stable. He is requesting 2nd dose of the vaccine. I informed him nurse would review and would have a plan for future injection.</p> |

| 1012381 | 2/8/2021 | MA | 24 | F | 1/25/2021 | 1/25/2021 | felt herself losing consciousness; Low blood pressure following event (50/20); My vision went blurry first; This is a spontaneous report from a contactable consumer (patient). A 24-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in the left arm on 25Jan2021 at 09:30 at a single dose in the workplace clinic for COVID-19 immunization. Medical history included asthma and history of vasovagal syncope following vaccinations; this adverse reaction to the vaccination directly aligns with other episodes that have occurred to her following vaccinations/interactions with needles (ie. blood draws). The patient had no COVID prior to vaccination. The patient is not pregnant. Concomitant medication included levonorgestrel (MIRENA). On 25Jan2021 at 09:30 (after getting the vaccine), the patient felt herself losing consciousness, her vision went blurry first and she was able to brace herself by lying down against a wall, and low blood pressure following event (50/20). Blood pressure and pulse rose over the next 25 minutes. 15 minutes more of observation was completed. The patient did not receive treatments for the events. The patient was not tested for COVID post vaccination. The patient recovered from the events. Information on the Batch/Lot number has been requested. |
| 1012647 | 2/8/2021 | TX | 24 | F | 1/4/2021 | 1/4/2021 | Patient walked over to post-observation area and had a near syncope episode. Patient's vital signs taken and was observed for an additional 30 minutes. Water and snacks were offered. Patient left with companion who was driving the patient home. |
| 1011519 | 2/8/2021 | PA | 33 | M | 2/3/2021 | 2/3/2021 | pt fainted post vaccination- caught by paramedic. treated and monitored by paramedic. BS 70, BP 99/40, HR 52. given ginger ale and H2O, assessed and monitored by paramedic- helped to sit/stand- initially felt well then dizzy and helped to sit, HR dipped to 40s/50s after each time of sit/stand attempt- pt was advised on benefit of further eval @ ER- he agreed and ambulance was called. |
| 1012645 | 2/8/2021 | NM | 89 | F | 2/5/2021 | 2/6/2021 | I became nauseous, light headed then fainted. Had mild fever. Recovered after reclining. |

| 1011502 | 2/8/2021 | LA | 68 | F | 2/7/2021 | 2/7/2021 | Patient experienced fever of 100.4, chills, diarrhea, vomiting, nausea, dizziness, and joint/body pain. Patient also passed out and suspects hit head on toilet. There is a scratch on her forehead but no bump. |
| 1011469 | 2/8/2021 | NY | 51 | F | 2/5/2021 | 2/6/2021 | 12 hours after getting vaccinated, I woke up with vicious chills. I took my temp and it was 102.5 F. I became nauseated and then fainted, smacking the back of my head on the bathroom floor. I took naproxen (220mg) for the fever and returned to bed. At around 8am I got up and my fever was 101F and stayed at that temp for 24 hours. I fainted again and blacked out for about 30 seconds. I stayed in bed all day. My fever broke by Sunday morning and I started to feel better by midday. |
| 1011317 | 2/8/2021 | NC | 83 | F | 1/25/2021 | 2/5/2021 | 12 days after first vaccination: Dizziness; high blood pressure; nearly passed out; right arm numbness; inability to grip or pick up items with fingers; feeling of "lopsidedness"; unsteady on feet, requiring assistance to walk. Primary care physician recommended ER visit where possible stroke was diagnosed. Hospital MRI confirmed: " Left acute arterial ischemic stroke, MCA (Middle cerebral artery)" . Spent 2 days in hospital with high blood pressure, dizziness. Residual right finger numbness upon release. |
| 1011297 | 2/8/2021 | MI | 96 | F | 2/4/2021 | 2/6/2021 | syncope 2 days later after taking nitroglycerin |
| 1011215 | 2/8/2021 | IN | 55 | F | 2/6/2021 | 2/7/2021 | I had a headache during the night and on waking the following morning after the vaccine. I passed out twice whilst making breakfast. Not sure how long I was out each time but don't believe it was very long. Took some tylenol and laid down. I experienced chills after taking the tylenol but otherwise felt well enough to get up and fix myself something to eat after about 30 minutes. Stiff and sore the rest of the day from the falls - sore/pain around coccyx/lower back area, right elbow and left shoulder bruise. Ongoing soreness/pain today (Monday) |
| 1011210 | 2/8/2021 | PA | 23 | M | 2/5/2021 | 2/5/2021 | Patient reported feeling lightheaded and dizzy minutes after receiving vaccine. Some diaphoresis. No overt fainting. VS: BP 110/66; P82; RR 16; Pulse Ox: 98% |

| 1010901 | 2/8/2021 | FL | 72 | F | 1/20/2021 | 1/1/2021 | Passed out; Little bit sore arm; I woke up, was not able to sleep; My heart was doing kind of flip floppy; Dizzy/ had the dizziness which was severe; Falling; This is a spontaneous report from a contactable consumer (patient). A 72-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Batch/lot number: EL1283), via an unspecified route of administration on 20Jan2021 at 08:00 AM at single dose because she would like to not get Covid 19. Medical history reported as no. Concomitant medication included levothyroxine. The patient reported that she had bnt162b2 shot on Wednesday the 20Jan2021 about 8 O'clock in the morning, no real problem when she had it, had little bit sore arm but this morning (in Jan2021) about 2 O'clock she woke up, was not able to sleep, moved around a bit, her heart was doing kind of flip floppy, was not thinking much, the next thing she knew, she was extremely dizzy and she passed out, patient was asking could that be a side effect of Covid 19, it was about 36 hours after she had the shot. Patient also stated falling and passing out kind of get you off key. She had the dizziness which was severe and did pass out in Jan2021. No investigation assessment. No treatment was received for the events. The outcome of the events was unknown. |

| 1010692 | 2/8/2021 | LA | 46 | M | 1/15/2021 | 1/15/2021 | tired; not feeling well; nausea; dizziness/almost passed out; This is a spontaneous report from a contactable nurse and a consumer. A 46-year-old male patient received the first dose of BNT162B2 (lot number: EL3247, expiry date: 31May2021), via an unspecified route of administration in left deltoid on 15Jan2021 12:56 at single dose for COVID-19 immunization. Medical history included had allergies as a child and carried as an epi pen. Concomitant medications were not reported. Reported to the waiting area for 15 minutes observation and left then came back to facility at 14:05 was not feeling well, reported dizziness and nausea. RN assessed patient, vital signs 122/84, pulse was 78 and O2 97 on room air, respiratory rate was 20, alert and oriented, was monitored for 30 minutes, reassessed at 14:25 188/76, heart rate 76, respiratory rate 18, O2 sats 98% on room air, encouraged patient to follow up with PCP or ER. Patient walked out with companion and stated he was feeling better. On 18Jan2021, patient was called for follow up, only complained he was as still tired, all other side effects had resolved. Stated he almost passed out upon coming back to the observation unit on 15Jan2021. Reporter stated it was noted that when patient returned for 2nd dose, would monitor for 45 minutes. Outcome of the event tired was not resolved, of event not feeling well was unknown, and of other events was resolved. |
| 1011129 | 2/8/2021 | KY | 77 | M | 1/28/2021 | 2/7/2021 | . Syncope and collapse 2. Respiratory arrest ADMITTED TO ICU |
| 1014404 | 2/8/2021 | NY | 24 | F | 1/24/2021 | 1/24/2021 | Symptom onset within 10 hours after vaccination: Swelling >5cm at injection site, significant pain and throbbing in extending down the arm of the injection site, swelling extending down to the forearm. Syncope and loss of consciousness occurred with trauma to the forehead and nose causing nose bleed. Unable to determine how long patient lost consciousness. When patient woke up, she was laying in a pool of blood from nose bleed and patient described shaking/rigors that were only relieved by taking Ibuprofen 800mg Q8H for 6 days. Denies fever. Due to syncope and head trauma, patient suffered concussion with symptoms of HA, blurry vision, difficulty concentrating, and fatigue. |

| 1015227 | 2/8/2021 | OR | 28 | F | 2/7/2021 | 2/8/2021 | -Nausea, episode of vomiting - occurred about 11 hours post-vaccination (1st dose), vomiting episode lasted half an hour. Nausea improved afterwards and was barely there in the next 16 hours. -Significant chills/shivering - started about 11 hours post vaccination and lasted about 2 hours. Improved after taking Tylenol and managed for the next 16 hours with Tylenol. -Low-grade fever. - Dizziness/lightheadedness/near syncope episodes- started about 11 hours post-vaccination at time of vomiting episode (middle of the night) and lasted about 6 hours. Systolic BP was in the high 80's, usual systolic BP is in the 120's. Managed by increasing fluid intake & drinking caffeinated beverages to increase BP. |
| 1015092 | 2/8/2021 | MI | 46 | F | 2/3/2021 | 2/4/2021 | Fainted , fever of 102.5 and ached all over for 24 hours |
| 1014817 | 2/8/2021 | ID | 44 | F | 2/5/2021 | 2/5/2021 | I felt fine after the vaccination at 11AM. Between 1-3:30PM, I got a pedicure and drank two 5.4% alcohol beverages. I drove home, made dinner, and ate. Shortly after eating, around 7:00PM, the soreness in my arm got intense, I began feeling nauseous and disoriented. I went to the bathroom and got on my hands and knees because I thought I was going to vomit. My boyfriend helped me get up on the edge of the bathtub, but I quickly passed out and fell forward. He said I was out for approximately 30 seconds. I came to long enough to tell him to call my mom then passed out again. for about 15 seconds Within minutes my mom, sister and daughter arrived, followed by first responders. First responders had to keep me from passing out for about 10 minutes, during which time I broke into a cold, soaking sweat, had involuntary muscle convulsions, extreme nausea, disorientation, slurred speech, and loss of ability to get up or walk on my own. I was admitted to the emergency room around 7:45. It took another hour for me to regain muscle control, speech and total coherency. I was released and went home. My arm was severely sore until Monday morning, but I also experienced severe fatigue, nausea, headache and muscle aches until late Sunday. |

| 1014672 | 2/8/2021 | MI | 29 | F | 1/21/2021 | 1/22/2021 | Moderna COVID-19 Vaccine EUA 8-9 hours after my vaccine I fainted. I got up in the middle of the night, used the bathroom and fainted. I was not having stomach issue nor did I have a fever. I had eaten and drank enough fluids before and after the vaccine. I could feel that I was going to faint and started to sit down, luckily I did not fit my head only had a bruise on my forearm and hip. I woke up quickly and family members were nearby to help me slowly sit up. I did not faint anymore after this. I was very fatigued for the next 2 days. I contacted my health care provider, but did not need to be seen or treated. Medical History with fainting: I have fainted before, once in my teens when I had a very high fever and once after my first pap smear (vagal response). |
| 1014625 | 2/8/2021 | MD | 22 | F | 2/8/2021 | 2/8/2021 | fainted felt lightheaded nautious weird and weak |
| 1014486 | 2/8/2021 | WA | 44 | M | 2/2/2021 | 2/7/2021 | Near vasovagal syncope 5 days after 2nd dose. 5 days after my second COVID vaccine, I was outside in snowy, cold weather about a mile from my car. I had stopped moving to rearrange some items. While stopped, I started to feel lightheaded, develop tunnel vision, and feel faint, almost to the point of blacking out. I put my head down and legs up and felt somewhat better. I then attempted to return to my car. I could go 100-200 yards at a stretch, before having to purposefully fall down and elevate my legs. I traveled the mile back to my car like this (slowly). I could not check my pulse because my hands were too cold; my respiration rate was elevated. At the car, I drank fluids and warmed up and began to recover enough to get home. |
| 1014402 | 2/8/2021 | NY | 56 | F | 1/22/2021 | 1/22/2021 | This was my first vaccine. I had Covid last March. As of Jan 2021 i still had some antibodies in my body. After 12 hours i began to get chills and my skin was very achey. I took advil because when i was very sick with covid and too tylenol every 6 hours it didn't lower my temperature or take away any of my pain. two hours later, i had a stomach ache. While having a bowel movement i fainted onto the floor and ended up with a black eye. i do not pass out from having bowel moments otherwise. My cheekbone was sore to the touch for a week. |

| 1012964 | 2/8/2021 | NH | 61 | F | 2/3/2021 | 2/4/2021 | 2/4/21 slight headache during day, tired. Cold on and off, cold feet throughout the day. 5:30pm got home from work had shaking chills, unable to get warm for 2 hours. Finally got warm but it was a hot warmth. No fever. Took Tylenol 500mg. The warmth continued and had mild headache. Took 500mg Tylenol at bedtime 11pm. I was hot throughout the night (no sweats) woke at 6am feeling light headed and dizzy, body aches, still hot. Felt like I had the flu. I went into the bathroom to void. I remember thinking - I am too sick to go to work. My husband said I was standing holding onto the door, white in color, said "i'm sick" he came to stand beside me to help me walk and I passed out. I had loss of consciousness. I do not know how long - he said he tried to shake me to wake me up about 30 seconds. He yelled to my son sleeping upstairs a few times, they got the phone and called 911. He said I vomited a few times and would not wake up. I remember coming to - sitting on the floor with him talking to 911 . I woke up enough to get up and walk to the living room couch with assist and gradually starting feeling better. The paramedics came and took my vital signs. Blood pressure (120/69), heart rate (84) oxygen saturations were all good. Blood glucose 116. I declined ER transport. I had continued light headedness, dizziness 2/6, 2/7/21. Arm soreness gone at injection site on 2/7/21. I believe the dizziness is a mild concussion. I have a provider appointment 2/9/21. |

| 1009467 | 2/7/2021 | OR | 35 | F | 1/20/2021 | 1/21/2021 | <p>Advisories, OB History Report</p> <p>The first night, 1/20. I had chills, but manageable. 1/21 I was fatigued, but also manageable. By the evening of 1/21 I could not stop shivering as I was sweating through 3 outfits a day (this lasted 4 days). By 1/22 my temperature was up to a 103 and I couldn't stand more than 10 minutes without fainting/passing out. Fever was gone by 1/25 but still have extreme fatigue/dreams where I'm almost hallucinating to this day 2/7. Did a virtual doctors visit on 1/29 where I was put on 3 days of bed rest, but still struggle to make it through a normal work day.</p> |

| 1010105 | 2/7/2021 | | 38 | M | 1/14/2021 | 1/25/2021 | Eleven days after the vaccination the patient developed 2 days of heartburn followed by a worsening nonproductive cough, substernal chest pain, diaphoresis, palpitations, and an episode of near syncope. These worsened over about 6 days and then slowly decreased. During this time he was referred to the ED and then admitted to a civilian host nation hospital. Echocardiogram and CT scan were performed and a pericardial cyst was discovered measuring 7.4 cm. He was then referred to another facility for evaluation. The pericardial cyst was confirmed, now 6.5 cm and laboratory tests were performed on 4 FEB, but there was at that time no elevation in inflammatory markers. Cardiology and Cardiothoracic Surgery consultations were obtained, but the consultants and the attending physician (who is an infectious disease physician by training) did not think that the crescendo-decrescendo symptoms could be explained by the pericardial cyst, which was likely an incidental finding. A milder cough may have preceded these events by up to a year, and this may possibly be related to the cyst. The heartburn, chest pain, tachycardia, diaphoresis, palpitations, and near syncope may well be adverse reactions of the vaccine. |
| 1009503 | 2/7/2021 | NJ | 34 | F | 2/5/2021 | 2/5/2021 | Sleepiness right after the dose. Extreme muscle cramps/spams in leg and lower back about 20 after the shot. Tiredness, sore arm, and dizziness the first 12hrs 12hrs mark fever 101.9 and fainted, loss of consciousness for about 5-10 minutes. Dry heaving while unconscious. Woke up from fainting with a lot of dry heaving and proceeded to throw up and sweat vigorously. A headache set in right after the vomiting. Intense headache, teeth pain and sore neck. Now, after almost 48 hrs tremors in hands and blurred vision but all the other symptoms are gone. I took Tylenol pm, and my regular Meloxicam and baclofen for the day. |

| 1007692 | 2/6/2021 | IL | 25 | F | 2/5/2021 | 2/5/2021 | felt fine besides soreness after vaccine. My 9pm I felt dizzy, had a headache, and started feeling nauseous I took some Tylenol and ibuprofen and a snack (can?t take it on an empty stomach when nauseous Was able to fall sleep but woke up at 2am very shaky, nauseous, and with extreme joint pain. I went to get a snack so I could take more pain reliever and I passed out and briefly blacked out my vision. When I came to, all the lights in my apartment were on but I had to use my hands to feel where my bed was so I could get back in. My TV was on but I realized that I couldn?t hear it. All I could hear was a buzzing/wooshing sound and realized my hearing was gone and when I scratched my head and I couldn?t hear the sound on my scalp. It came back about 30 minutes later but happened again the next time I stood up. By around 4am I was in so much joint pain I couldn?t lie down anymore and had to run a bath so I could relieve some of the pain. I?m still in a lot of pain but I don?t have the nausea anymore as strongly. |
| 1008160 | 2/6/2021 | FL | 72 | F | 2/2/2021 | 2/3/2021 | About 1/2hour after I got up, I started feeling off with vision issues. Next thing I knew I had passed out and was laying on the floor. Then severe sweating with a headache and tiredness. My left arm was quite sore. |

| 1008155 | 2/6/2021 | MI | 66 | M | 2/6/2021 | 2/6/2021 | Patient stated they were becoming dizzy and lightheaded. Immediately had patient come into vaccine room to see what else was happening. Patient stated they were also having breathing difficulties. Immediately tested patients bloods pressure. Tested twice and came to 220/120 with heart rate 80. Was an emergent situation. Informed patient I was contacting 911 to have them take him to the hospital as this is an emergency situation. Went and made phone call. Had staff bring patient into waiting area so that we could monitor him if something worsened. 911 advised to just monitor the patient. If he began vomiting or passed out to have him on his side, so he doesn't choke from vomit. We monitored patient until ambulance arrived. They asked for current medications we knew of (listed in report) and that he had received Pfizer Covid vaccine 0.3ml resulting in emergency BP readings of 220/120 after receiving. Ambulance took patient to Hospital. Current condition unknown or if anything even occurred after that point. Whole event lasted about 1 hour before patient left with medical personnel. |
| 1008062 | 2/6/2021 | NJ | 59 | F | 1/4/2021 | 2/4/2021 | Felt suddenly faint. Have hx of vasovagal syncope and when I faint my blood pressure goes very, very LOW. I moved to a armchair near the window thinking if I fainted I would not fall on floor and I mentioned to a nurse that I was feeling off and have a hx of vasovagal syncope and if my BP dropped very low to not worry, I'm fine and it will readjust. They sent medic over and took BP which was 200/120. I have NO hx of high blood pressure. He took it repeatedly and it remained at least 200/120 and he wanted me to get it checked out so I was taken by ambulance to hospital. Pressure normalized a short time later w no intervention. Purchased good BP cuff and that night BP was average 118/84 and now 99/68 (it tends to run low to normal in general) |

| 1007398 | 2/6/2021 | NY | 24 | F | 1/21/2021 | 1/28/2021 | <p>On January 21 I received my first dose of Moderna vaccine on my left arm. After the vaccine I had a red lump that was hot and a bruise that only lasted 2 days. Everything was fine until the January 28th when I developed a large red lump during the day while at work that was severely itchy and hot. When I got home from work I had a low grade fever. I made an appointment with my primary care for the next day which was Friday the 29th. My doctor told me she believes I had cellulitis. I was given an antibiotic 2x a day for 7 days. She drew a purple circle around the area and told me that if it goes outside the marked area or I feel any new symptoms, to go to the emergency room. Saturday morning on the 30th i woke up to my entire arm red and hot. I felt like I had a huge sunburn. I couldn't put my sweatshirt on because it was so hot. The emergency room doctor told me I was fine and to keep taking the antibiotics that were given to me yesterday from my primary care doctor. After the emergency room I went to work and started to feel dizzy and nauseous. My hands became sweaty but the rest of my body was cold. I started having a butterfly feeling in my chest. My Apple Watch alerted me that my heart rate was over 100 bpm. That night before bed I had another low grade fever. On Sunday the 31st I noticed the red area was gone but instead it was a dark purple. I felt okay Sunday besides a rapid pulse. Monday February 1st I woke up out of a dead sleep sweating, butterfly feeling in my chest and dizzy. I tried to take my pulse while laying down but it was so fast I couldn't keep up with it. I put my Apple Watch on which alerted me immediately that my pulse was 152 bpm. I slowly got up but then I passed out falling off of my bed. I couldn't get any words out because my heart was beating so fast that I couldn't breathe. I was sweating horribly and had a hard time walking. Had absolutely no strength in my left hand, my arm was purple/red, cold and numb. My arm felt like someone punched me repeatedly and gave me a dead arm. I called my primary doctors office and they were able to get me in that afternoon. All morning my pulse was spiking and then drastically dropping. About an hour and a half before I went to the doctor everything was fine. I was able to talk but still struggled with breathing while talking. The doctor ordered an EKG which came back clear. My pulse and blood pressure was also fine. The doctor told me she believed all of the</p> |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

symptoms I had were from the medication I take at night (doxazosin-to relax my muscles and help with sleep.) She also told me she believed some of it was my mental health issues taking over. She told me the cellulitis looked fine and sent me home. Later that day I felt exhausted and when I woke up from a nap, I had a fever of 100.5. Took Tylenol and it dropped to 99.5 but wouldn't go any lower. February 2nd I woke up to a large red ring outside of the purple marker, numb finger tips and butterfly feeling in my chest. All day I received alerts that my pulse was falling and spiking. I sent my primary doctor an email and she told me she didn't think it was cellulitis anymore, maybe a hematoma but she wasn't sure. Since January 28th I still struggle everyday with the butterfly feeling in my chest, blurry vision, low grade temps, alerts of pulse, dizziness and breathing difficulties. My arm is always hot, my finger tips are numb and sometimes the strength in my hand is gone. The top of my arm is always a dark purple with red blotches and other times my entire arm is red and hot. When my pulse is very fast, I have a hard time talking, remembering what I was going to say and focusing. I've had multiple coworkers ask me if I'm okay because I'll randomly stop talking and stare off and then I'm alerted that my pulse has either spiked or dropped drastically after spiking. My pulse is never consistent. It is always ranging from 57-155bpm. I realized at first I may have what they call "COVID arm" but my symptoms haven't gotten any better. No answers have been given to me or a diagnosis. The first diagnosis that they thought was cellulitis. Then it was "in my head and behavioral." Then it was a hematoma. Now it's an "I don't know." I have tried Benadryl for the itching, ice packs for the days that I'm swollen, Tylenol for the fevers and pain but I never have any relief.

| 1007788 | 2/6/2021 | CO | 61 | F | 2/4/2021 | 2/5/2021 | Immediate soreness in arm after shot. Some light headedness. Took 2 tylenol after and then again before bed. Felt fine until waking at 2am to muscle soreness. At 4:30am chills and horrible headache, horrible flatulence. 8:30am stomach cramps, almost passed out. More chills, sweats and body shakes. Diarrhea and staved off vomiting. Could not eat most of the day until evening. Drank tons of fluids and Gatorade. Slept most of the day. Woke at 2am the morning of Feb 6th with continued muscle ache. Took more Tylenol. 9:15am as I write, I am feeling better, just exhausted. |
| 1007441 | 2/6/2021 | CA | 44 | F | 1/22/2021 | 1/22/2021 | Approx. 14 hours after receiving the 1st part of Covid vaccine my arm became so sore I couldn't move it. It was sore from my neck down to just below my elbow. I began having chills and a low grade temp shortly after that. by 0130, I was dizzy, experiencing diarrhea, with episodes of diaphoresis, and acute nausea. I felt that I had some postural hypotension, was very pale and every time I would get up to walk I felt like I was going to end up on the ground. I remained in bed for approx. 16 hours before I felt like I comfortable even getting up and going to restroom. I still have intermittent dizziness, with syncope to this date. I had to leave work early as well as calling in sick for the next shift. |
| 1008185 | 2/6/2021 | OH | 33 | F | 2/5/2021 | 2/6/2021 | Flu like symptoms, nausea, light headed, fainting |
| 1007801 | 2/6/2021 | NY | 48 | F | 2/5/2021 | 2/5/2021 | After shot one (left arm) on 01/08/2021 I had severe joint and muscle pain, fevers, chills, exhaustion, nausea and shooting pain down my left arm and up to my neck and back of skull from afternoon of injection on Friday to Sunday night. I slept all weekend. After shot two (right arm) on 02/05/21 I had all of those same reactions by early Friday afternoon. I woke up at 10:00 pm with the need to vomit. While sitting on the edge of my bath tub waiting to vomit, I fainted and fell backwards into the bathtub, hitting me head and wrenching my neck as I was wedged into the tub sideways. My son found me and roused me. I then urinated all over myself, had extreme diarrhea and vomiting x 2 rounds. I fainted a second time while sitting on the toilet with diarrhea and vomited 2x more into my bathtub. |

| 1008689 | 2/6/2021 | NJ | 44 | F | 1/18/2021 | 1/21/2021 | Thursday, 2/21 - started feeling, overall, exhausted, and having lots of aches and pains. My chest and back (near area where I have costochondritis (xiphoid process) was in a great deal of pain. My heart rate also kept jumping around between 65 and 105 without exertion. Tuesday, 1/26/2021 - I was feeling exhausted and got out of breath with minimal exertion. Heart rate jumped up with minimal exertion (e.g. just standing, heart rate climbed about 110). I also started feeling dizzy and , ultimately, fainted, which put me in the emergency room, where they ruled out a PE and all cardiac emergencies. My blood pressure spiked with a systolic around 165 (my usual is 90-95). Labs indicated everything was fine. The only thing different than usual was the vaccine. This was also the day I realized I developed extreme cold feet and also cold fingers, ears, and nose. My cold feet is still an issue - they get so cold, it?s actually painful. I now have to have a heating pad around my feet at home. This has never happened to me before the vaccine in my, now, 45 years alive. I?m still a bit fatigued, have sporadic aches and pains, sometimes get a little dizzy, and have extremely cold feet...two and a half weeks later. |

| 1008792 | 2/6/2021 | VA | 28 | F | 2/5/2021 | 2/6/2021 | The second dose was very painful, compared to no pain when the first dose was given one month ago. My arm was immediately hot and tender after administration. The area around the injection site had less feeling than the rest of my arm - it felt almost numb. My arm was very sore and warm the rest of the evening. I began having fatigue, muscle aches, and joint pain last night as well. I woke up around 6 this morning and the room was spinning. I was also nauseous. I tried to roll over in bed but was unable to feel my arms and legs. I was also temporarily unable to see. Right after, I passed out and lost urinary continence. I regained consciousness a minute later and had normal functioning again. I have not had any more dizziness today but am still sore and fatigued. |
| 1008736 | 2/6/2021 | IL | 67 | M | 2/5/2021 | 2/6/2021 | Not sure if it was related but wanted to let someone know in case others have experienced. Patient has Parkinson?s and gets low blood pressure. However, his blood pressure and temp were taken immediately after incident and both were normal. At 8:30 this morning, he went into the kitchen to make breakfast and blacked out, grabbed the counter and made it to the floor. Never fully fainting. He was extremely pale and had to call for help to get up. The remainder of the day, he has taken it easy but felt fine and normal. |
| 1008695 | 2/6/2021 | OR | 37 | M | 1/31/2021 | 2/1/2021 | Nausea, vomiting, syncope, headache, myalgia, fatigue |
| 1008641 | 2/6/2021 | OH | 27 | F | 2/6/2021 | 2/6/2021 | Patient had a hot/cold sensation. She felt both hot and cold at the same time. She had chills and felt "off." This occurred less than three minutes after receiving the Pfizer vaccine. These symptoms lasted for approximately 30 minutes. A couple of years ago she passed out after receiving the HPV vaccine. |
| 1008596 | 2/6/2021 | FL | 24 | F | 2/6/2021 | 2/6/2021 | I felt dizzy and light headed. Then my body felt very heavy and I passed out. I woke up in the ground and my mom and brother put a wet rag on my forehead. I felt faint for 30 minutes afterwards. |
| 1008475 | 2/6/2021 | KY | 23 | F | 2/6/2021 | 2/6/2021 | Patient fainted. Pharmacists, nurses and EMS responded. Took blood pressure, blood glucose and stabilized patient. She was transported by ambulance to local ER. |

| 1004455 | 2/5/2021 | MO | 25 | F | 1/22/2021 | 1/22/2021 | <p>Passed out; Pulseless for 30 seconds; Feel dizzy and nauseous; Feel dizzy and nauseous; This is a spontaneous report from a contactable Other Health Professional (patient). A 25-year-old female (not pregnant at the time of vaccination) patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot number and expiration date unknown since not available/provided to reporter at the time of report completion), via an unspecified route of administration at left arm on 22Jan2021 11:45 at single dose for COVID-19 immunization at a Nursing Home/Senior Living Facility. The patient's medical history included known allergies: Sulfa and poppy seed. No other known medical history/conditions. For concomitant medications, the patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient previously took amoxicillin, clarithromycin (BIAXIN) and cefaclor (CECLOR), and experienced drug allergy. The patient was not diagnosed with COVID-19 prior to vaccination, and had not been tested for COVID-19 since the vaccination. After receiving the vaccine, the patient was sitting in the observation area for about 10 minutes when she started to feel dizzy and nauseous. She raised her hand up and called for the nurse to come over. She passed out. She was pulseless for 30 seconds and they had to begin giving her CPR chest compressions. She woke up lying on the ground and was taken to the emergency room (ER) where they ran tests to see how she was doing and for observation for several hours. The patient was "discharged" this afternoon and was doing better. The events result in emergency room/department or urgent care. Treatment was received for the events, ER observation and care, and CPR chest compressions. The patient underwent lab tests and procedures which included test on 22Jan2021: unknown results. The outcome of events at the time of last observation was recovering. The reporter's assessment of the events was non-serious, no results in death, no life threatening, not causing/prolonging hospitalization, no disabling/incapacitating, no congenital anomaly/birth defect. Information on the lot/batch number has been requested.; Sender's Comments: The reported passed out and pulseless for 30 seconds were likely related to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) due to temporal relationship. However,</p> |

| 1006831 | 2/5/2021 | MS | 43 | M | 2/5/2021 | 2/5/2021 | Patient had vasovagal syncopal event. This event was not a vaccine side effect but a vasovagal response (previous history of syncope with vaccinations/procedures). Patient received 1st dose of Pfizer vaccine around 11am today. Within 2 minutes of receiving the vaccine, he started to feel dizzy and passed out for around 45 secs. He had cold extremities, looked pale and was sweating. He was immediately transferred from chair to floor and his legs were raised. Cold towel was placed on his head. He regained consciousness but was confused for less than a 1min. Vitals were checked and his BP was 95/50's and HR was around 56. Pulse O2 was 99% during entire event. He was able to converse well after that and was oriented. He informed having anxiety/panic attacks, had taken his medication that morning. He reported similar syncopal episodes in the past. He was monitored in same posture. He was gently hydrated orally with water and soda. He was given sublingual zofran due to nausea and retching. He did not vomit. We continued to monitor his BP on regular intervals. He had slow improvement in BP and after 2 hrs while sitting his BP was 104/65, pulse 56/min (reports being an athlete and previous records show baseline bradycardia). He denied any symptoms and was awake, alert, oriented. As he was not accompanied by anyone, his wife was contacted who came to clinic in 10mins and helped to drive him home. He was transported by wheelchair till entrance of clinic. He reported feeling better and thanked for helping. He does not have any contraindications to receive 2nd dose of vaccine. |
| 1005085 | 2/5/2021 | IL | 22 | M | 2/5/2021 | 2/5/2021 | Pt had the vaccine at 7:15 a.m. today, sat at the facility where he received the vaccine for 15 minutes, pt was with his mother who was driving. Pt then went to his mom's car, they were driving when pt had a syncope episode, per his mother his hands were shaking, pt's mother then drove him to our ER facility. |

| 1007217 | 2/5/2021 | CA | 47 | F | 1/27/2021 | 1/27/2021 | Severe chills, body aches- particularly legs, dizziness, beginning 9 hours post-injection. Worse than ever experienced, even during the flu. These progressed until awakened around 10:30pm and fainted on floor after urinating. Woke up several minutes later vomiting. Nausea and severe body aches continued until the following morning, when they started to subside. Resolved completely the following day, around 48 hours post injection. Mild fatigue in the following days. |
| 1006226 | 2/5/2021 | IA | 30 | F | 2/3/2021 | 2/3/2021 | Head ache; sweaty; Got into elevator to go back to work and passed out. Assessed by physicians assistant and was released, sent home for the day. |
| 1006779 | 2/5/2021 | IA | 41 | F | 1/29/2021 | 1/29/2021 | Patient felt extremely lightheaded, nervous, experienced syncope approximately five minutes after administration. |
| 1007244 | 2/5/2021 | CA | 67 | F | 2/1/2021 | 2/1/2021 | I was hospitalized with a severe reaction to my first dose of the Pfizer vaccine given 2/1/21 @ 9:45. I was discharged Tuesday evening 2/2/21. Dr., my internist, agrees that what happened was not a vasovagal syncope (hospital's diagnosis). My Experience: Within say 7 minutes of the injection I felt woozy, the wooziness intensified, I got intense pins and needles in my lower legs, fore arms and hands, and less so in my face. My speech became very slowed down, slurred and I had a lot of difficulty forming words. It was as if I was extremely drunk. After they called the paramedics, I was not able to get myself out of my car or walk. I lost motor coordination/control in hands and feet. I was cold, never felt faint, and had slightly evaluated blood pressure for me(normal is 110/64 paramedics got it at 152/94). |
| 1007172 | 2/5/2021 | WV | 32 | F | 2/5/2021 | 2/5/2021 | I got sudden sob, had trouble swallowing my water was driving on way back to work. Got pulled over. Heart was racing. Got hot starting shaking. Sob. Hands feet and face started to get numb. And almost passed out. |
| 1007160 | 2/5/2021 | IL | 31 | M | 2/5/2021 | 2/5/2021 | Near Fainting and stiff neck. He was assisted from the chair to the bed and laid down. Vitals monitored for 30 min. No other complaints or reactions. Alert entire time and related to feeling much better after water and the time monitored. He did not want any further assistance and left under his own ability. |

| 1006814 | 2/5/2021 | PA | 59 | F | 2/4/2021 | 2/4/2021 | Symptoms started a few hours after vaccination. Initial symptoms were injection site pain and tiredness. I later developed a mild headache, moderate muscle and joint pain, to which I applied a heating pad. I then developed a low fever and chills. Temp was 99.7 11:30pm on Feb 4, and 99.9 at 10:20 on Feb 5. I then began to feel nauseous and generally terrible, so I went to the bathroom, where I fell and may have passed out. |
| 1006342 | 2/5/2021 | TX | 20 | M | 2/5/2021 | 2/5/2021 | After receiving vaccine, pt walked into the post vaccine observation room located outside the door of the vaccination room. Pt. sat down in chair, went to put his head down towards his knees, then patient slid out of chair and onto the floor. This RN was immediately at the patients side, and pt. immediately responded to his name. Pt. insisted on standing up against this RN's advice, and got back into the chair. Pt stated he didn't know what happened, so I explained to him that he had fainted. His mother and father were present. Pt stated he ate no breakfast today. Pt. states he has no health concerns, allergies, or issues. Pt.s stated that he is very afraid of needles and thinks he was just nervous. BP readings: 09:45 90/75 HR 60, 09:50 90/75 HR 60 10:00 BP 113/72 HR 65. Pt stated he was feeling fine. Pt. released to go home w/Parents at 10:30. This RN called this pt. to f/u at noon today, and patient stated he was feeling good and thinks he was just really nervous. Pt. thanked this RN for the phone call and call was ended. |

| 1006255 | 2/5/2021 | IL | 32 | F | 2/5/2021 | 2/5/2021 | 5 minutes after shot, patient passed out for 10-15 seconds. Nurse woke up patient. Patient reports vomiting about 1 minutes later. Patient states they had a migraine before getting the vaccine today. Patient reports a history of getting anxious and passing out with shots or blood draws. |
| 1006337 | 2/5/2021 | IN | 84 | F | 2/3/2021 | 2/4/2021 | I just got done going to the bathroom (2-4-2021) and was zipping up my pants when I fainted. I fell backwards into the bathtub knocking down both shower doors. My legs were hanging over the edge of the tub. One shower door fell on my upper right chest area. This happened just over 24 hours from when I received the vaccine. I had not felt bad at all from the vaccine. Didn't sleep too well that night (2-4-2021) because I hurt due to the fall. I called my doctor on 2-5-2021 to let her know I fainted 24 hours after receiving the vaccine and wondered if that was due to it. I do feel weak today (2-5-2021). |
| 1006356 | 2/5/2021 | CT | 53 | F | 2/3/2021 | 2/3/2021 | pt states later in the day after the vax she noticed her neck, arm and upper back was sore. She went to bed since she wasn't feeling well. She woke up feeling a little dizzy and foggy. Pt got up next day but fainted after getting out of bed. After coming to she stood up and then passed out again. She had intense fatigue and headache. Pt states that she is better but still has fatigue but has not appetite. Pt has not contacted her PCP since her symptoms were getting better. |
| 1006375 | 2/5/2021 | MA | 25 | M | 2/1/2021 | 2/4/2021 | Severe vasovagal response ~9 hours after injection. Got chills, 15 minutes later got up to get water. Made it about ~20 feet before getting severely lightheaded where I had to sit on the floor for 15+minutes. My roommate reported I was white as a ghost. I was on the cusp of fainting for roughly 15minutes. |
| 1006637 | 2/5/2021 | NV | 78 | F | 1/28/2021 | 2/1/2021 | high fever for three days fainting feeling dizzy and unwell |

| 1006440 | 2/5/2021 | | 22 | U | 2/2/2021 | 2/2/2021 | Got vaccine 02/02/21 starting feeling fatigued immediately 11am, around 5pm started feeling fever, at 7pm started having chills, fever and pain and keep getting worse, by 11pm or 12am fever was 102.6 with lower back pain and all muscles felt weak even with tylenol continued, 3-4 am started getting headache and fever starting going down after tylenol and pain reduced and chills stopped. Now pt continued tylenol and is feeling better tried eating breakfast almost passed out, does not have appetite |
| 1006463 | 2/5/2021 | IN | 50 | M | 2/3/2021 | 2/3/2021 | I became extremely ill about 12 hours after vaccination. I slept about (10pm to 6:30 am) 8.5 hours, and then I woke for work the next morning. I felt a little off, but I thought I was ok. I entered my shower, and then I was found unconscious on the floor of my shower by my wife about 5 minutes later. I passed out 2 more times while attempting to stand and exit the shower. I was extremely fatigued at this point. I went back to bed and slept until 10 pm that night. I woke for about 2 hours, ate some food and drank some water and soda pop. I then went back to sleep until 7:30 am the next morning. I was awake for 3 hours, and then I slept for 3 more hours. I have been awake for about 2 hours, and I am now typing this adverse event document. The entire time I have had temperature regulation issues, severe headache, muscle and joint aches, and fatigue. |
| 1006550 | 2/5/2021 | MA | 37 | F | 2/4/2021 | 2/5/2021 | Vasovagal syncope while walking after getting out of bed at night. This occurred approximately at the onset of chills/rigors. |
| 1006570 | 2/5/2021 | NC | 50 | F | 1/29/2021 | 1/30/2021 | About 18 hours after vaccine, became very hot and felt odd. and fainted. At day 7 after vaccination, still have 2" of redness around perimeter of vaccination site. A little tender still but not bothersome. |
| 1006422 | 2/5/2021 | | 61 | F | 2/4/2021 | 2/4/2021 | I experienced muscle aches the spread across my entire back starting at about 8 PM on 2/4/21. At 2:30 AM on 2/5/21, I passed out three times after rising from the toilet, resulting in a split lip. I was covered with sweat the third time I "came to" and soon got the chills. |
| 1006651 | 2/5/2021 | | 29 | F | 2/4/2021 | 2/5/2021 | Syncope, fever, chills, myalgias |

| 1001444 | 2/4/2021 | TX | 38 | M | 12/30/2020 | 12/31/2020 | headache; sweating; neck was stiff; passed out for about 5-10 seconds; body ache; really bad chills; fever 100.4; unable to sleep; This is a spontaneous report from a contactable Consumer (patient). A 38-years-old male patient started to receive 1st dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0142, Expiry Date: 01Mar2021), via an unspecified route of administration at Left arm on 30Dec2020 18:17 at SINGLE DOSE for covid-19 immunisation. Patient's Medical History (including any illness at time of vaccination) was none. There were no concomitant medications. Prior Vaccinations (within 4 weeks) was reported as 'None' and AEs following prior vaccinations was reported as 'None'. AE(s) following prior vaccinations was reported as None. The patient experienced really bad chills, body aches, fever, unable to sleep on 31Dec2020 with outcome of recovered on 01Jan2021, passed out on bathroom floor for 5-10 seconds, sweating and neck was stiff on 01Jan2021 with outcome of recovered on 01Jan2021, headache on an unspecified data with outcome of unknown. Details were as follows: the patient received the Covi-19 vaccine 30Dec2021. He had a reaction to the vaccine. 24 hours after getting the vaccine he had really bad chills, body aches, fever 100.4. He didn't take any medication for a bit. He then took acetaminophen (TYLENOL). He had a headache, he was unable to sleep. The acetaminophen worked and he went to bed. At 5:00 am he started having a bad headache and took Ibuprofen. He woke up to go to the bathroom. He passed out for 5-10 seconds in the bathroom. His head was leaning in the wall by the door. He was sweating and was stiff all over. He went to the Emergency Room on 01Jan2021. They did an X-ray and a CT scan. They gave him 100ml of saline and some pills. They also did some lab work. Everything was negative. They assumed his body couldn't handle the vaccine. He was supposed to have received the second shot yesterday (20Jan2021). Employee Health said his Primary Care Physician would have to make the decision on him taking it or not. His doctor said he would have to do more research with Pfizer before he says if he can take it or not. Emergency Room visit required due to event passing out. |

| 1001556 | 2/4/2021 | KY | 59 | M | 1/18/2021 | 1/27/2021 | I have had a weekly routine of fasting one day a week for the last 20 years. Sometimes I would extend this to 3 days, water only. I am healthy, 6'1" weight 170-180 all of my adult life. Resting HR <56. 9 days after having my first vaccination, I did a 24 hour fast. I woke at 2 am to go to the bathroom. I became lightheaded and passed out while standing over the toilet. I layed on the floor for over 5 minutes with my head spinning. I then realized I was hypoglycemic. I have never had this issue. I took some orange juice and recovered my strength. I hit my head on the top of the toilet which required my to have 5 sutures in my chin at the ER that night. Today I was working out for 30 minutes on an elliptical. I work out 4 to 5 times weekly. 10 minutes after returning to my room I noticed I was dizzy and checked my pulse from my watch. My HR was 210. this lasted for over 10 minutes. I have never had this issue. I believe it would not be in my best interest to take the second vaccination. |
| 1001571 | 2/4/2021 | TX | 21 | F | 2/3/2021 | 2/4/2021 | After receiving the second dosage of my COVID vaccine at 2 PM on 02/03/21, I only had left arm pain near the site of the injection. However, I went to sleep and at 2 AM on 02/04/20, I started having fever, a severe HA, and myalgia that hindered my sleep. I took 500 mg Tylenol at 6 AM and went back to sleep. When I woke up at 8:30 AM, I went to use the restroom and felt dizzy with hot flashes. Immediately afterwards, I noticed that I had fainted and my mother helped me to my bed. After drinking soup and juice and having a bowel movement, I felt normal and alerted my PCP. |
| 1001924 | 2/4/2021 | OR | 55 | F | 1/11/2021 | 1/12/2021 | CG received 2nd Covid Vaccine 1/11/2021; S/Sx Vertigo,,dizzy,,foggy feeling,generalized malaise on 1/12/21. on 1/13/21 felt near normal. Then 1/14/21 ,almost passed out on way to work,foggy feeling,vertigo,dizzy & therefore called in sick for today,1/14/21. . Vertigo, loss of balance, extreme malaise, near syncopal episodes. . I continued to have neurological symptoms both days. Vertigo, loss of balance, extreme malaise, near syncopal episodes. . 1/20: I continued to have neurological symptoms both days. Vertigo, loss of balance, extreme malaise, near syncopal episodes on 1/15. |

| 1002202 | 2/4/2021 | WA | 72 | M | 2/3/2021 | 2/3/2021 | PATIENT SAID HE FELT LIKE FAINTING SENSATION FOR A FEW SECONDS AND TINGLING SENSATION IN HIS ARM FOR A FEW SECONDS. HE SAID HE WAS FINE AFTER THOSE FEW SECONDS. |
| 1002178 | 2/4/2021 | WA | 66 | F | 1/8/2021 | 1/10/2021 | 7:00 PM onset of chills and fairly severe body aches - concentrated in lower back and hips. Went to bed early - slept to 8:00 PM. Woke up so got up to take evening meds and brush teeth. Had vertigo and moderate nausea. While brushing teeth, I fainted. Came around quickly - was on bathroom floor. Took only one of my medications - the one to prevent migraines and went back to bed. Continued with body aches and chills on and off through the night. In the morning I had worsened vertigo and nausea, but this is typical of my vestibular migraines and I think that was what was going on. I called in sick to work, took one of my pills for treating migraines and basically slept all day. I do not get migraines often - usually |
| 1001071 | 2/4/2021 | CO | 45 | M | 1/27/2021 | 1/27/2021 | Approximately 12 hours after my 2nd injection of the Moderna COVID19 vaccine, I experienced severe nausea and ended up having an episode of syncope where I passed out on the stairs in my home. |

| 999906 | 2/4/2021 | MA | | M | 1/11/2021 | 1/11/2021 | <p>Syncopal episode while driving; Crash; Became extremely warm; Sweaty; Right flank pain; A spontaneous report was received from a nurse concerning her husband, a 53-year-old, male patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced became extremely warm, sweaty, right flank pain, a syncopal episode while driving, and crash. The patient's medical history was not provided. No relevant concomitant medications were reported. On 11 Jan 2021, approximately two and a half hours prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 11 Jan 2021, the patient felt fine for approximately two and a half hours after receiving the vaccine, then became extremely warm, sweaty, developed right flank pain, and had a syncopal episode while driving. The nurse mentioned that the patient was not seriously injured in the crash, nor was anyone else. No treatment information was provided. It was also reported that the patient had followed up with his PCP and seen a cardiologist, some diagnostics were scheduled, and plans to see a neurologist. Action taken with mRNA-1273 in response to the event was not reported. The outcome of the events, became extremely warm, sweaty, developed right flank pain, syncopal episode while driving, and crash, was unknown.; Reporter's Comments: This case concerns a 53-years-old male patient, who experienced serious unexpected events of syncope and non-serious unexpected event of road traffic accident, feeling hot, hyperhidrosis, and flank pain. The events occurred 1 day (approximately 2.5 hours) after first dose of mRNA-1273, lot # unknown. Treatment details not provided. Very limited information regarding these events has been provided at this time. Based on the current available information and temporal association between the use of the product and onset of the event a causal relationship cannot be excluded.</p> |

| 1002131 | 2/4/2021 | FL | 46 | F | 2/2/2021 | 2/2/2021 | No adverse event at 1st shot. After second shot I felt dizzy driving home. Within 2 hrs my joints hurt and I had extreme fatigue. 24hrs later I almost fainted while taking hot shower and then vomited. The fatigue, joint pain, hot/cold feeling lasted till about 6pm the day after shot. The injection site is still red, swollen and itchy 2 days later. Appears to growing in diameter. As of this morning I feel much better and almost back to normal. |
| 1000922 | 2/4/2021 | GA | 39 | F | 1/15/2021 | 1/15/2021 | After the first shot on 12/26/20 I had dizziness, facial flushing, elevated blood pressure, and tachycardia within minutes. It lasted about an hour. I had no issues after that. I received the 2nd shot on 1/15/21, I had the exact same reaction however it only lasted 20 min. I then went to my car and started driving home, about 10 minutes later and while on the freeway I had dizziness, flushing, tachycardia, , shakiness, and facial numbness. I took an exit and was able to pull over in a parking lot. It lasted about 20 minutes. Since that time I have had frequent episodes of dizziness, facial flushing, tremulousness, facial numbness/tingling, and presyncope. The worst episodes were on 2/1/21 and 2/3/21. I was unable to work because of these symptoms. |

| 1000527 | 2/4/2021 | MN | 30 | F | 1/19/2021 | 1/19/2021 | I was so faint/nearly passed out; so hot; very chilled for about 15 or 20 minutes; feeling sort "off"; weak; fatigued/very drained/exhausted; This is a spontaneous report from a contactable consumer (patient). A 30-year-old female patient (not pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EK4176), via an unspecified route of administration on 19Jan2021 at 08:15 AM at single dose in right arm for COVID-19 immunisation. Patient age at time of vaccination was years 30 years. No other vaccine was given within 4 weeks prior to the COVID vaccine. The patient has no known allergies. The patient had no relevant medical history and received no concomitant medications. The patient reported the following: 'About 5 minutes after receiving the vaccine I was so faint I nearly passed out and was so hot I was given an ice pack to try and cool me down. It took about 45 minutes for me to be able walk across one room. I then was very chilled for about 15 or 20 minutes, and very drained. The rest of the day I was back and forth between feeling sort "off" and feeling like I was weak, exhausted, and fatigued'. Adverse events onset date was reported as 19Jan2021 at 08:15 AM. No treatment was received for the events other than ice pack for feeling hot. The patient was recovering from the events. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, has not been tested for COVID-19. |

| 1000228 | 2/4/2021 | NV | 40 | M | 1/21/2021 | 1/21/2021 | <p>dead; Collapsed; bnt162b2 was given to patient with immunocompromised w/ reportable conditions; bnt162b2 was given to patient with immunocompromised w/ reportable conditions; This is a spontaneous report from a contactable nurse. A 40-year-old male patient receive first dose of bnt162b2 (Lot number: EK9231, Brand: Pfizer), intramuscular in left arm on 21Jan2021 15:15 at single dose for COVID-19 immunization. Medical history included immunocompromised w/ reportable conditions from an unknown date and unknown if ongoing, positive for Covid in September from Sep2020 to an unknown date. The patient's concomitant medications were not reported. The patient experienced dead, collapsed on 26Jan2021. Therapeutic measures were taken as a result of collapsed. The outcome of collapsed was unknown. The patient died on 26Jan2021. It was not reported if an autopsy was performed. Received Covid vaccine here on 21Jan2021, was at work on 26Jan2021 and collapsed, no known complaints at the time, CPR (cardiopulmonary resuscitation) was initiated immediately, transported to ER (Emergency room) and pronounced dead. Unknown if other vaccine in four weeks. The patient had COVID prior vaccination. Unknown If COVID tested post vaccination.; Sender's Comments: Based on the information currently provided, the patient was immunocompromised and had prior COVID infection. The death and syncope more likely are associated with the patient underlying medical conditions. More information such medical history, concomitant medications, treatment indication and event term details especially death cause and autopsy results are needed for fully medical assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Dead</p> |

| 999904 | 2/4/2021 | CA | 36 | M | 1/14/2021 | 1/14/2021 | Fainted; Disoriented and didn't know what was happening; Feels a little dizzy; Lethargy; Tenderness in the arm; A spontaneous report was received from a consumer who was a 36-year-old, male, patient, who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced fainted, tenderness in the arm, lethargy, disoriented and didn't know what was happening, and feels a little dizzy. The patient's medical history was not provided. No relevant concomitant medications were reported. On 14 Jan 2021, prior to the onset of events, the patient received the first of two planned doses of mRNA-1273 (Lot number: 25L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On the evening of 14 Jan 2021, the patient had tenderness in the arm and felt lethargic. On 15 Jan 2021, the patient fainted when he woke up in the morning. The patient's legs gave out and he fell into the wall. The patient was disoriented and didn't know what was happening. The patient reported the event as happening pretty quick and described it as "like he had very low blood sugar". The patient reported that sometimes when he gets up too quickly, he feels a little dizzy. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the events, fainted, tenderness in the arm, lethargy, disoriented and didn't know what was happening, and sometimes when he gets up too quickly, was unknown. The event, feels a little dizzy, was considered not resolved.; Reporter's Comments: This spontaneous report refers to a case of a 36-year-old male patient who experienced events of fainted, tenderness in the arm, lethargy, disoriented and didn't know what was happening, and feels a little dizzy. The events developed on the following day after the administration of the mRNA-1273 vaccine (Lot # 25L20A, expiration date-unknown). No treatment was reported, and outcome is resolved for dizziness and unknown for all other events. Based on the information provided which includes a temporal association, a causal association cannot be excluded |

| 1000524 | 2/4/2021 | FL | 72 | F | 1/18/2021 | 1/19/2021 | tends to have low blood pressure; Dizziness; she lies down and then gets up she is dizzy; tired; she might have almost fainted as the room was spinning; This is a spontaneous report from a contactable consumer, the patient. A 72-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EL1284, expiration date 0Apr2021), via an unspecified route of administration in the left arm on 18Jan2021 at 09:30 (at the age of 72-years-old) as a single dose for COVID-19 vaccination. Medical history included Reflux esophagitis, COPD and a root canal on 14Jan2021. Historical vaccinations included the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 28Dec2020. Past drug history includes sore arm after COVID-19 vaccination on 28Dec2020. It was unknown if the patient has any allergies to medications, food, or other products. The patient's concomitant medications included oral famotidine (FAMOTIDINE) 20mg twice daily for reflux, (tiotropium bromide) SPIRIVA 2.5mcg, two puffs once daily by mouth for COPD, latanaprost (LATANAPROST)125mcg; one drop each eye at night for Glaucoma, (TIMOLOL) 5% one drop twice daily to each eye and (LORATADINE) 10mg; take once daily by mouth as needed for allergy. The patient did not receive any other vaccine within four (4) weeks prior to the vaccine. The vaccine was administered to the patient at the hospital. On 19Jan2021 the patient experienced dizziness and feeling tired. The patient further described that she had the vaccine on Monday and since yesterday, when she woke up, she has a lot of dizziness; and again this morning when she woke up. Also, when she lies down and then gets up she is dizzy. Mentions she didn't see dizziness on the list of side effects. She knows that is a side effect of COVID. She is asking is dizziness is a side effect of the vaccine wants to know if she should call her doctor. She continued and mentioned that she noticed when she was waking up on 19Jan2021 she was so dizzy that she couldn't get out of bed. Adds she thinks she might have almost fainted as the room was spinning. Mentions she tends to have low blood pressure but this is not typical. As far as side effects from the vaccine she mentions she is tired. The tiredness started after the second dose and has continued through today but not as bad. The clinical outcome of dizziness |

| 1002504 | 2/4/2021 | | 22 | F | 1/4/2021 | 2/4/2021 | 1/4/2020 vaccine few hours later, started to experience dizzy, SOB. I passed out on the floor, still conscious. Felt weak, sat up. Sweating profusely. Migraine. I went home from work. Couldn't move arm; extreme soreness. Body aches, chills, fever at nights. Peaked within 24 hours. 2-3 days, 2nd day being the hardest. Within couple days, I felt fine. |
| 1003605 | 2/4/2021 | MD | 35 | F | 2/3/2021 | 2/4/2021 | In addition to the normal side effects of the Moderna vaccine (chills, fever, muscle aches, headaches) I also experienced syncope; I completely blacked out and fell on my face. |
| 1003581 | 2/4/2021 | NJ | 27 | F | 2/3/2021 | 2/3/2021 | I received the second dose of my Moderna covid vaccine at 10 am on Wednesday February 3rd. Around 8:30 pm I experienced extreme chills and had a 100-101 F fever all night. I woke in the morning still feeling weak because I spent the whole night uncomfortable from the fever and flushed face I had. I walked towards another part of my house and fell down and fainted. I was unconscious for a few seconds before a family member was able to shake me and wake me up. I take no medications and am a generally healthy individual with no prior medical history or underlying Heath conditions. I also do not have a history of falls or issues from taking any past vaccines. I also am not allergic to anything or have experienced any allergic reactions in my life. It?s the second day now and I am still experiencing a 100 Degree fever and face flushing. I am currently self medicating at home with Tylenol every 4-6 hours. I have not gone to see a health care professional yet. |

| 1003549 | 2/4/2021 | CA | 41 | M | 1/27/2021 | 1/27/2021 | Patient received 2nd dose of Pfizer-BioNTech COVID-19 Vaccine EUA at 2:04pm , <5 minutes after vaccine administration he developed hypotension with loss of consciousness for few seconds. He was sitting in a designated chair for the protocol 15 min observation and fell from the chair to the ground, hitting the right side of his temporal - redness noted around area with skin intact. Clinic staff immediately moved patient to be lying down on the ground with cervical spine precaution and lifted his legs up on a chair. Vitals: HR 78 and BP 118/72 taken in supine position on ground with legs elevated. Patient was transported by EMS to the ED at 2:45pm. ED note: Patient has Hx of vasovagal syncope in the past with similar symptoms after blood draws..Exam and workup shows well-appearing young man, nonfocal neuro exam, normal gait, cardiopulmonary exam unremarkable, no signs of trauma other than a small hematoma to the right forehead. After evaluation, their Canadian Syncope Risk Score is -3 indicating very low risk for 30 day serious adverse events (<1%). Telemetry monitoring during their ED stay has not captured any events. Discussed next steps with patient: given their low risk for 30 day serious adverse events (including death, serious arrhythmia, MI, PE, ICH), they would prefer to be discharged to continue their workup as an outpatient, rather than admission for observation. Patient was deemed stable to discharged from the ED at 5:57pm with counseling to follow up with PCP in the next 2 days and to return to the ED with any persistent or worsening symptoms. |
| 1003507 | 2/4/2021 | DC | 80 | F | 2/4/2021 | 2/4/2021 | Pt fainted, and fell forward out of her chair onto the floor during post vaccination observation. |
| 1003503 | 2/4/2021 | PA | 16 | F | 2/2/2021 | 2/3/2021 | Approximately 20 hours after vaccination patient felt faint, lost all color and fainted. She was in and out of responsiveness. Patient was transported to the ER. Patient was treated with fluids and discharged after observation. According to patient's mom the EKG and lab work were unremarkable. Patient has fully recovered. |

| 1017647 | 2/4/2021 | | 52 | F | 2/2/2021 | 2/3/2021 | Dizziness, Headache & Syncope Narrative: 2nd dose received 0830 on 2/2/21. At 1900 hours body aches & chills. At 2400 hours awoke with abdominal discomfort, became dizzy, then loss of consciences for few seconds and fell to kitchen floor injuring head. Next morning on 2/3/21, syncope in bathroom and loss of consciousness for few seconds and fell to floor. While on floor being held by husband, 2 more episodes of syncope. Went to ER admitted. |
| 1002701 | 2/4/2021 | CO | 73 | F | 2/2/2021 | 2/2/2021 | As soon as I got the shot I felt ?strange? . all over. We waited a bit and then the nurse took my BP. It was sky high. 210/180 They took it a couple of times and even changed machines. Then the took me in a wheelchair to the ER. On the way I could not answer some questions or my answers were slow. According to my husband I slumped a bit. And answered questions in my native tongue. In the room they did all kinds of tests. BP was still high, but came down . After a few hours my ?fog? in my head cleared and I felt ? normal ? again. They let me go around 11 pm. The doctor said it was NOT the vaccine, but I disagree with her. I felt good till I got the shot. She says I had a syncope vasovagal. But that occurs with low BP. I had high BP. |
| 1003658 | 2/4/2021 | MD | 27 | F | 2/3/2021 | 2/3/2021 | I had severe dizziness and fainting for two days after shot, and shortness of breath. |
| 1003484 | 2/4/2021 | CA | 35 | F | 2/4/2021 | 2/4/2021 | Patient felt faint & "tingly" with some mild anxiety post-administration. No true syncope. BP 114/68 sitting, 112/64; no orthostatic hypotension. Remained in an upright position. c/o suborbital ocular twitch x 20 seconds which was observed by this writer. Visual onset of mild swelling L upper cheekbone. Treated with cold pack to area, Benadryl 25mg IM PRN to RD, decrease in environmental stimuli, reassurance, and direct observation x 15 mins. Interventions effective; no further swelling, no s/sx anaphylaxis, anxiety & other symptoms relieved. Client observed with steady gait "I'm better~~ |

| 996742 | 2/3/2021 | MI | 49 | F | 12/18/2020 | 12/1/2020 | Severe headache; malaise; fatigue; syncope and collapse - orthostatic hypotension; Orthostatic hypotension; This is a spontaneous report from a contactable nurse (patient). A 49-year-old female patient (non-pregnant) received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EJ1685), via an unspecified route of administration on 18Dec2020 at single dose at right arm for covid-19 immunization. Medical history included chronic fatigue, hypothyroidism, allergic rhinitis from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine, patient didn't receive other medication within 2 weeks of vaccination. The patient previously took promethazine hydrochloride (PHENERGAN) and experienced allergies: phenergan. After 1st dose, patient had severe headache for five days, malaise, fatigue on 19Dec2020 09:45 PM, day 6 syncope and collapse - orthostatic hypotension in Dec2020. The adverse events resulted in emergency room/department or urgent care. Adverse events treatment included CT head, carotid doppler, echocardiogram, lab work. It was unknown if the patient was not diagnosed with COVID-19 prior to vaccination. Covid test type post vaccination included nasal swab on 24Dec2020: negative. Patient received second dose of bnt162b2 (lot number: eI0142) on 08Jan2021 10:00 at single dose at left arm for covid-19 immunization. Outcome of events was recovered on unspecified date.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of syncope, orthostatic hypotension and other events due to temporal relationship. However, the events may likely possibly represent concurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including head CT/MRI, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

| 997303 | 2/3/2021 | FL | 34 | F | 1/5/2021 | 1/6/2021 | Patient reported on 2-2-21 that she had a "seizure" during the night following the vaccine. Patient reports that around 12 hours after the injection (which would have been around 2 am on 1-6-21) that she woke up with her arm sore and with nausea. Reports that she went to the bathroom because she thought she was going to be sick but husband reports she passed out and had "seizure like" activity. Husband reports that she "was out" for about 1 minute. Patient was evaluated by ER staff with labs, CT, urine specimen. Per the patient everything came back ok except wbc and tsh were slightly elevated. She is establishing care with primary MD and he is desiring MRI. Patient has not had MRI to date due to insurance requirements. Patients stated that she had COVID in September 2020 and since October 2020 she has been having dizziness and that it has been increasing over the last few months. |

| 997228 | 2/3/2021 | TX | 53 | M | 1/13/2021 | 1/16/2021 | <p> Syncope/a complete syncopal episode while standing. Then a 2nd one on return; unconscious approximately 30 seconds each time; chills; fatigue; muscle aches; joint aches; headaches; extreme dizziness and nausea; extreme dizziness and nausea; injure a knee when my legs pretzeled on the 2nd syncopal episode.; This is a spontaneous report from a contactable consumer. This consumer reported for self that the 53-year-old male patient received second dose of BNT162B2 (COVID-19 Pfizer/Biontech, Lot#: EL3248), via an unspecified route of administration on 13Jan2021 11:00 AM on Left arm at single dose for COVID-19 immunisation. Medical history included Controlled hypertension and known allergies: Hypersensitive to narcotics. Concomitant medications included Amlodipine, Irbesartan and Atoravastin. The patient previously took first dose of BNT162B2 (COVID-19 Pfizer/Biontech, Lot#: EK9231), via an unspecified route of administration on 23Dec2020 11:00 AM on Left arm at single dose for COVID-19 immunisation. Facility type Vaccine was Hospital. No Other vaccine in four weeks. The patient experienced Syncope. He had the most common severe reactions (chills, fatigue, muscle aches, joint aches, headaches). But when he walked to bathroom, he had extreme dizziness and nausea, then a complete syncopal episode while standing. Then a 2nd one on return. His wife said he was unconscious approximately 30 seconds each time. EMS was called but refused transport since ERs full. The patient did also injure a knee when his legs pretzeled on the 2nd syncopal episode. The events started from 16Jan2021 01:30 AM. The outcome of th events was recovered. No treatment received. No Covid prior vaccination. No covid tested post vaccination. </p> |

| 998385 | 2/3/2021 | CA | 37 | F | 2/2/2021 | 2/2/2021 | Patient had first dose of Moderna COVID vaccination on 1/5/21 and experienced a syncopal episode approximately 10 minutes post administration. She was found to have a low blood sugar (approx. 70) at the time of the syncope. She had her second dose of Moderna COVID vaccination on 2/2/21. Her starting blood sugar displayed on her pump (type 1 diabetic with insulin pump and continuous glucose monitor) was 172 after approximately 20 minutes her blood sugar had dropped to 92, she ate approximately 100 grams of carbs starting at 10 minutes after the 2nd dose of vaccine. Her blood sugar stabilized and remained in the mid nineties after 45 minutes. Her vital signs were stable and she left stating she didn't feel any signs of low blood glucose. Her pump also indicated that her blood sugar was no longer dropping. |
| 996582 | 2/3/2021 | CA | 30 | F | 1/27/2021 | 1/27/2021 | After taking the vaccine around 9:45 am, 1/27, I started feeling mild pain so took ibuprofen. -after an hour or less, I started getting itchy, burning hives all over my face and scalp. - hives disappeared by the end of the day. - next morning there was bad headache, almost passed out, threw up. -entire body pain for atleast 3 days - have been getting hives on face on and off till this date 2/2. |
| 997108 | 2/3/2021 | FL | 52 | F | 2/2/2021 | 2/3/2021 | Left arm pain, swelling at sight of injection, dizziness, passed out,bump on head |
| 999293 | 2/3/2021 | NJ | 29 | F | 1/13/2021 | 1/22/2021 | Some fever and fatigue first two days, subsequently subsided. 1/22 dizziness and near fainting while driving and heart palpitations (no prior history). Went to urgent care for ekg and bloodwork all normal. 1/28 near fainting again, dizziness and heart palpitations went to er, followed up with cardiologist got halter monitor, monitor showed supraventricular tachycardia (no history prior to vaccine), went to er again following another episode the same day, hasneuro exam, followed up with electrophysiologist who detected no arrhythmia but cited possible vaccine effects. |

| 997911 | 2/3/2021 | | 74 | M | 2/1/2021 | 2/1/2021 | Narrative: Patient received Moderna COVID-19 vaccine via drive thru clinic. The patient was in his vehicle with his wife, when he became diaphoretic and passed out for a couple minutes. Rapid response was called. Patient was removed from the vehicle. He was becoming obtunded and was placed on the pavement. 911 was called. He was given EpiPen at 10:41. His vital signs at 1042 were: saturation 98% on room air, pulse 59, blood pressure 138/80. Patient received Solu-Medrol 125 mg IM a couple of minutes after EpiPen. After the EpiPen the patient became more alert, denied shortness of breath or wheezing, he was nauseated without vomiting. His saturation at that point dropped to 88% on room air, he was started on oxygen with nonrebreather mask. Rescue truck arrived at approximately 1047, and the patient was taken to emergency room. Discharged same day. |

| 999369 | 2/3/2021 | FL | 73 | M | 2/1/2021 | 2/1/2021 | Moderna COVID-19 Vaccine EUA I received a Moderna covid-19 vaccination (Lot # 007M20A) at 10:20 AM on Monday 02-01-2021 at the VA Clinic . Between 3 and 4 minutes later I began to experience difficulty breathing, sweating and feeling warm, and then I passed out behind the steering wheel of my parked car, while sitting with my wife. I came to after few minutes as people were attempting to get me out of my car and into a wheelchair, but I had difficulty breathing, couldn't move, and had to be pulled out. After being put in the wheelchair, I passed out again and came to after I had been taken out of the wheelchair and laid on my left side on the ground by Fire Dept. EMT's. I then began to retch, but did not vomit. My wife said that one of the EMT's pumped my chest a couple of times. They lifted me onto a gurney and put me in an ambulance, hit me with an EPI pen, and placed an oxygen mask on my face, as I was having great difficulty breathing. I was unable to move or lift my arms to help them place a blood pressure cuff on my arm, a pulse monitor on my finger, and lift my shirt to help them attach EKG pads. At that point I realized that I had also lost control of my bladder at some point. I continued to have difficulty breathing, and started to experience extreme shivering all the while to emergency Room. Once in the Emergency Room, I could not move myself off the FD gurney, and they had to lift the sheet that I was laying on in order to move me onto the hospital gurney. I had great difficulty helping the technicians remove my shirt so that they could administer another EKG and start an IV (LR 1,000ml bolus). I continued to have difficulty breathing and kept shivering and sweating for some time. I was advised that the EKG's both appeared normal. After a lengthy period of I gradually reached a point where I stopped shivering and sweating, and returned to almost normal breathing. I was finally released around 1-1:30 PM. |

Medical history included menopause from May2020 and ongoing (She is going through menopause, which started 7 months ago). There were no concomitant medications. Received call from consumer regarding the Pfizer BioNtech COVID vaccine. She had first vaccine yesterday morning and is experiencing some side effects. It looks like it was prescribed by a pharmacist, but she is not able to see the name and does not have any contact details to provide. She signed up at the online thing for reporting. Her arm is much better this morning. She woke up at 03:00 with the headache and still has it. Dizziness and weakness started 06:30 this morning. She kind of fainted. She was walking from one room to the next and she just gave out. It has improved and she is not really dizzy any more. She is having a little fatigue though. Chills began at 06:30 and they come and go. She is going through menopause and it could have something to do with it. She was unable to answer outcome for this. She just wants the headache to stop. She has not been able to do anything today. She is going through menopause, which started 7 months ago. She would like to know if there is something she can take for the headache. AE Details and time of onset: Left arm hurting really bad 18:00. When she first got it, she did not feel it. As the day progressed, she could feel the pain. Headache 03:00. Dizziness and weakness 06:30. Fatigue 06:30. Chills 07:00-07:30. She layed down at that point. Body feels tender and skin feels tender to touch 09:00. NO ER or physician's office required. No prior Vaccinations (within 4 weeks). The outcome of the event dizziness was resolved, Chills was unknown, Headache was not resolved, while the outcome of the other events was resolving. Information on the lot/batch number has been requested. |

| 995142 | 2/2/2021 | NY | 66 | F | 1/14/2021 | 1/19/2021 | Short fainting spell; This is a spontaneous report from a contactable consumer (patient). A 66-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Batch/lot number: EJ1686), intramuscularly on 14Jan2021 after 15:00 (her appointment was at 1510 but she had to wait past her appointment time before she received it) in upper right arm at single dose for Prevent Covid in hospital. No history of all previous immunization with bnt162b2 considered as suspect. No additional vaccines administered on same date of bnt162b2. Medical history included breast cancer from 9 years before 19Jan2021 (2012) and she has been Anastrozole since, she was only supposed to take Anastrozole for 5 years and when she was one month away from being done with it she had a Seizure and she was found to have a Tumor in her brain, she had had Srs surgery on her brain on 13Apr2016, she was prescribed Levetiracetam, a seizure medication, for two years and had not had any problem since. Concomitant medication included ongoing anastrozole taking for about 9 years for Post breast cancer. No prior vaccinations within 4 weeks. The patient previously took levetiracetam for seizure, she stopped taking Levetiracetam 750mg about 2 or 3 years before 19Jan2021, flu shot on 05Dec2020 for immunization at the age of 66-year-old. The patient reported that she had a short fainting spell around 8:30am on 19Jan2021 and she was not sure if it was related to the Covid vaccine. She described that she had been sitting for a while and when she got up she felt like this black curtain coming down which she has felt before in the past but she usually recovered and never lost control to where she fainted. Her husband was there to catch her. She clarified that she never passed out. She did not have any reactions in the past few days since she received the covid vaccine, she did not even have soreness at injection site. The event was not required a visit to Emergency Room nor Physician Office. Relevant Tests was none. The outcome of the event was unknown. |

| 995146 | 2/2/2021 | | 72 | M | 1/15/2021 | 1/24/2021 | Narrative: Patient experienced cardiac arrest with PEA and a witnessed collapse upon arrival to the emergency department on 1/24/21. Patient received his first dose of the COVID vaccine on 01/15/2021 and felt poorly thereafter. He was describing shortness of breath to his wife and requiring 5L of O2 at home to maintain saturations in 80s, while he usually was on 3L to maintain saturations in the mid 90s. He had been oriented but more fatigued than normal and described bilateral shoulder pain (which was not new for him) as well as indigestion. Took Tylenol with some relief. He had decreased PO intake and less appetite. The patient's wife encouraged him to come to the hospital daily for a week prior to admission, but the patient did not want to because he felt his side effects were secondary to the vaccine. Symptoms:RespDepression, Palpitations, Syncope & cardiac arrest Treatment: EPINEPHRINE 1 MG ONCE 3 rounds given ,CALCIUM CHLORIDE 1000 MG ONCE |

| 995223 | 2/2/2021 | | | M | 1/15/2021 | 1/17/2021 | Passed out; Low heart rate; Possible pneumonia; A spontaneous report was received from a consumer concerning an 84-year-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced passed out, low heart rate, and possible pneumonia. The patient's medical history was not reported. There were no concomitant medications provided. On 15 Jan 2021, the patient received the first of two planned doses of mRNA-1273 (Lot # unknown) intramuscularly, for prophylaxis of COVID-19 infection. On 17 Jan 2021, the patient was hospitalized for passed out, low heart rate, and possible pneumonia. The reporter's mom found the patient passed out on the floor. It was thought he may have passed out about 4 or 5pm. The patient was taken to the emergency room (ER) via ambulance. At that time his heart rate was 20 bpm. Physicians said he may have pneumonia. It was noted the patient still works and walks miles every day. The patient was still hospitalized at the time of this report. There was no treatment information provided. Action taken with mRNA-1273 in response to the event was not provided. The outcome for the events of passed out, low heart rate, and possible pneumonia was unknown at the time of this report.; Reporter's Comments: This case concerns a 84 year old male patient who experienced a serious unexpected events of passed out, low heart rate, and possible pneumonia. The event occurred 2 days 7 hours after first dose of the vaccine. Very limited information regarding the events has been provided at this time. Based on temporal association between the use of the product and the start date of the event/s, a causal relationship cannot be excluded. |
| 995355 | 2/2/2021 | FL | | 58 F | 1/26/2021 | 1/27/2021 | Patient had some expected side effects the day of the vaccine which included weakness, headache, body aches. At 24 hours post vaccination, patient been to feel worse and passed out. She woke up on the floor and had hit her head. She felt weak and dizzy and stayed in bed until 8 PM that night. |

| 995255 | 2/2/2021 | TX | 16 | M | 1/17/2021 | 1/1/2021 | He passed out; His blood sugar was 143; This is a spontaneous report from a contactable consumer (patient's parent). A 16-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Batch/lot number: EL3247) via an unspecified route of administration on the right arm on 17Jan2021 at single dose for COVID-19 immunisation. Medical history included hypopituitarism. Concomitant medication included somatropin (NORDITROPIN) taken for hypopituitarism. He passed out (emergency room visit needed) on 17Jan2021, his blood sugar was 143 in Jan2021. Caller stated that her son received his first dose of the Pfizer COVID vaccine on 17Jan2021, stated he passed out. Caller stated they had to drive 3 hours away to get the vaccine and wanted to know that if because he experienced this after the first dose if it would be possible to find somewhere closer to home to get the second vaccine. Caller stated she is in the trial as an adult, that she reached out to her trial coordinator and they told her that they can only administer to persons in the trial. Son feels like maybe there is a drug interaction, caller stated she was not sure about this. Stated after her son passed out, they called an ambulance, states the Medic watched him for about 45 minutes, stated they ran some tests in Jan2021, he did go home that day. His blood sugar was 143 in Jan2021. Heart Rate monitor in Jan2021 she couldn't see so is unsure of the readings. The outcome of the event passed out was recovered on 17Jan2021, of other remain event was unknown. |

| 994612 | 2/2/2021 | WI | 31 | F | 1/28/2021 | 1/29/2021 | Approximately 2am of 01/29/2021 I became very over heated for about one hour. Around 3am I then became incredibly cold and shaking. Around 4am I got out of bed and stood for a few moments, then walked slowly around my room making my way to our bathroom. I noticed my vision was not right, almost like a fisheye affect and I felt dizzy. I made it to our master bathroom and sat down on a chair for a few moments before I completely passed out. I fell forward, face first on to the bathroom floor hitting the left side of my head. When I regained my conscious I was weak and shaking and was unable to call out to my husband. I slowly pulled myself up to the toilet trying to make some noise and my husband then came to my aide. As he talked I noticed his voice sounded much farther away than it really was. I also had a difficult time cognitively answering his questions about how I felt. I was pale, clammy, still shaking. This episode from the time I left my bed from the time my husband walked me back to the bed was about 45 minutes. My husband took my temp and I did not have a fever. The next five hours I alternated between feeling very cold and very hot. I spent the next 24 hours feeling completely depleted. I rested as much as I could and had a greater than normal appetite. |
| 994526 | 2/2/2021 | NE | 49 | F | 12/29/2020 | 12/30/2020 | Chest pain, hypotension, pre-syncope, elevated D dimer, and crp. Myalgia, headache, fever, joint pain, abdominal pain starting around 1030 am the following day. These severe symptoms lasted about 36 hours. Then continued with abdominal/pelvic pain and resulting in an interstitial cystitis symptomatology. This lasted an additional 2 weeks with increased fatigue. |
| 994507 | 2/2/2021 | IL | 41 | F | 2/1/2021 | 2/2/2021 | Severe headache during the day after vaccine given. Then around midnight , woke up with extreme chills, body aches, weakness, nausea.. Got up to go to bathroom to throw up, at this time my husband was with me and when I got to bathroom, I passed out. He was holding me, stated my eyes were open and pupils very dilated. He had to wake me out if it (maybe just under 1 min) When I woke up, I vomited a little. Then until about 4 am I continued to have extreme chills, body aches and threw up a few more times. Still currently (9:30 am) feeling very weak and have a bad headache . |

| 994134 | 2/2/2021 | NY | 42 | F | 1/26/2021 | 1/27/2021 | <p>I am going to describe all my symptoms so far in detail. Shortly after the shot in the medical observation area I experienced mild nausea that went away for the rest of the day. About an hour after the injection, I experienced nasal drainage in the back of my throat that lasted about 30 minutes. 3 hours after my shot, the arm pain at injection site began, followed by 6 hours later moderate to extreme fatigue that did not cause me to be sleepy or drowsy--simply fatigued. I had enhanced sense of taste and smell. On Wednesday, 1/27 I woke up seeming okay and tried to work at my computer from home. I experienced light-headed and dizziness, and a headache that feels like pressure, and sinus pressure at the bridge of my nose. I had to disengage from work. After lunch around 2 PM I had extreme fatigue and had to lie down in bed the rest of the afternoon and evening. I have moderate nausea that comes in goes in waves. This morning, Wednesday, 1/28 I woke up with nausea and ate breakfast with a heightened sense of smell and taste. I logged into work and the lightheadedness and dizziness began again (also sort of in waves, though the headache is more pervasive and less wave-like than the nausea), along with waves of moderate nausea and headache. The arm pain at the site of injection has significantly abated from a punch to mild pain. The "sinus" or sinus pressure on the bridge of my nose seems only a fraction improved. The headache or pressure has moved from the back of my head to the right side of my head. I had no body aches, but this morning has mild to moderate body aches this morning in my legs and hip bones. 1/29 I woke up with 20%-30% reduced symptoms of nausea and headache, but the dizziness and sinus pressure on the bridge of my nose remain the same. I still have enhanced taste and smell (a sensory plus it's not a distorted or odd enhancement, simply the same flavors and tastes enhanced). The ache that began yesterday in my lower body, my legs still ache, though it feels more like numbness than an ache. I tried doing some stretches which felt good, but my legs still feel the same after stretching. Pain at the site of injection is reduced 90%. There are some strawberries sitting next to me, and I can smell them acutely. Yesterday, 1/30, I woke up with mild nausea and fatigue. This nausea dissipated in the morning, but I felt too fatigued to do Pilates. The waves of dizziness and</p> |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

waves of nausea returned mid-day and I had a low-grade fever of 99.4 (my temp. Tends to run slightly lower than 98.6, as I take it regularly). The pain/pressure in the bridge of my nose has reduced 30%, but still remains. The ache or numbness in my thighs remains the same. This morning, 1/31, my temp is normal at 98.6, but I have mild waves of nausea and moderate waves of dizziness. The pain/pressure on my nose remains the same as yesterday. I have some mild ear pressure. My thigh weakness remains the same. I am too fatigued to attempt Pilates. Acute sense of smell and taste remains the same. The headaches or pressure also seem improved since Saturday 1/30. Monday, 02/01 - ah back to work I woke up with moderate nausea and pretty intense body fatigue and muscle aches in my lower body. I had to work, and I just wanted to crawl back into bed. I worked anyway, also the fatigue tends to worsen mid-day. The dizziness is moderate in waves, and the headache is still mild, along with that mild sinus pressure on my nose. I was in bed after dinner but could have rested all day. 02/02 I awoke with a very mild nausea! The intense fatigue (which worsened several days past my vaccine) was mild. I was ready to attempt my regular Pilates routine, and I did it! My muscle aches are mild to moderate (also, why are my muscle aches mostly confined to my thighs and hips I do have vague pain at the injection site, but its vague, and I use my whole body in Pilates) dizziness waves are back as I sit here typing and get ready to login online to my job staring at the computer screen is jarring to the dizziness waves and reminds me of the mild headache. This is the best I've felt since 1/27 through mid-day I tend to worsen and dizziness that is moderate is disturbing. The heightened sense of taste and smell also seems to have waned a bit in the past two days, back to what I was per usual? I tend to have an acute sense of smell and taste. *I would like it noted in light of new evidence that many people that have had COVID are experiencing intense reactions to the first dose that it is quite likely that I had COVID back in March when my learning center (I work with students age 4-adult, some of which are learning disabled and have autism) emergency closed because a client called to say she was positive for COVID. I had taken her sons temperature the day before. Me, and my two co-workers on my management team were also feeling sick. I had a

| 993721 | 2/2/2021 | CT | 75 | F | 1/19/2021 | 1/19/2021 | <p>sore throat and chest pains for approx. a month, but at the time COVID testing was not widely available. Since then, My co-worker has tested positive twice for the antibodies, and her husband, who was also sick at the same time, has tested negative twice. I tested negative once for the antibodies, though given my job, my commute on the subway during rush hour my co-workers positivity, and my intense reaction to the first dose I most likely had COVID. My boyfriend's roommate recently also revealed that he is positive to the antibodies, and he was literally sneezing and coughing in the same room with us this past summer and spring. I think a 2nd dose of the same vaccine will cause fainting and vomiting, and the need for two weeks off of my work. This dizziness is alarming. I'm also thinking not having antibodies means nothing in terms of my body and immune system recognizing the vaccine and the virus, making me more ill than when and if I actually had COVID in March or last year.</p> <p>Dry mouth and nose; Dry mouth and nose; Dizziness/Feeling of fainting; This is a spontaneous report from a contactable consumer (patient). A 75-year-old female patient received first single dose of BNT162B2 (Pfizer, Solution for injection, lot number: EL9261, exp date not reported), via an unspecified route of administration (vaccine location: right arm) on 19Jan2021 09:00 for COVID-19 immunization. Medical history included atrial fibrillation. Patient was not pregnant at the time of vaccination. The patient had no known allergies. Prior to vaccination, the patient was not diagnosed with COVID-19. Patient had received other medications within 2 weeks of vaccination (not specified). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 19Jan2021 11:00, the patient experienced dry mouth and nose, and dizziness/feeling of fainting. The events were considered as non-serious by the reporter. No treatment was received for the events. Since the vaccination, the patient has not been tested for COVID-19. The patient recovered from the events on an unspecified date in Jan2021.</p> |

| 996529 | 2/2/2021 | TX | 68 | M | 1/27/2021 | 1/27/2021 | The patient fainted ~20 minutes post-vaccine while talking to his colleague. I immediately assessed the patient for s/sx of anaphylactic or severe reaction. He woke up within ~30 seconds of fainting. He was breathing and speaking fine. He told me he was anxious and also did not have anything to eat or drink all day and believes this is the cause of why he fainted. I had him take a few deep breaths. Injection site looked normal and no issues with breathing. Called EMS to assess him: glucose, blood pressure, & vital signs were all normal. While being assessed he passed out in chair so EMS took him to the hospital. He was discharged from the ER the same day per RN, at the facility. They did not find anything wrong with him and also believe it was due to nerves/lack of eating. No significant medical history per form patient filled out or that he verbally stated. |
| 996477 | 2/2/2021 | CA | 67 | F | 1/29/2021 | 1/29/2021 | 1) fever , and chills, sweats for 24hours (started few hours after the vaccine) 2) passed out around 3 am next day when woke up from sleep, Wanted to drink water in kitchen but she felt weak, instead got up to use the bath room to urinate, felt weak, mild dizzy, she made to urinate and when got up after urinate, she fainted. She passed out. Not remember the episode. She woke up (think after short period) looking at ceiling and thinking where she was. Next day, woke up with whole clothes wet from sweating. Denies CP, SOB, diff breath, ting, numb, weak over part of body. 3) had diarrhea for 10 days before this shot. 3 times per day, nausea +, watery, no mucus , blood. No v, Tried Immodium. No BM since 2/2. Likely syncope fr vasovagal vs hypotension fr diarrhea. |
| 996472 | 2/2/2021 | OH | 49 | F | 1/27/2021 | 1/27/2021 | At 10p after getting the vaccine at 10a I began feeling dizzy. I had severe chills. Then around 1:00a I got up to get some water and passed out. I fell flat on my back. My husband rushed to me and helped me up because I started throwing up. At that point I had memory issues. I did not know how old I was nor what month it was. My husband called 911 and I was having tachycardia. They took me to the hospital. |

| 995504 | 2/2/2021 | WA | 31 | F | 1/8/2021 | 1/9/2021 | Received #2 dose of Pfizer Covid19 Vaccine on 1/08/21 at 10 AM. Approximately 12 hours later she woke up with right eye pruritus with sensitivity, maculopapular erythematous rash and itching over left cheek to temple. She was rubbing at her eyes and did develop local swelling around the right eye. She treated herself with benadryl and advil. Her swelling and eye sensitivity decreased later that day but she developed a fixed itchy maculopapular rash on btl forearms (pictures in chart). She works in the ED as a technician and was seen during her shift 36 hours post shot. Diagnosed with a possible delayed reaction to the vaccine and discharged with prednisone, allegra, hydroxyzine. Symptoms have resolved except for residual hyperpigmentation over areas on forearms where the rash was and still feels itchy, though this increased after stopping antihistamines for her visit. She reports no episodes of lightheadedness/syncope, increased nasal congestion, difficulty breathing post vaccine. She has no history of anaphylaxis or allergic reaction to prior vaccines. |

| 996058 | 2/2/2021 | NY | 97 | F | 1/31/2021 | 2/1/2021 | My mother fainted on the night she was vaccinated, early in the morning. She had gone to the kitchen to get a heating pad and felt faint while standing. She didn't make it to a chair, but fell and broke her hip. While this could have been due to another health problem, my mother had never had a fall or a near-fall. it is concerning that very old adults are not warned to have someone with them after receiving the vaccine (for instance, overnight), I realize that the vaccine has not been studied specifically in geriatric populations, but it is realistic to assume that there are substantial numbers of very old people living on their own, particularly in cities where there is no need to drive, and where food and other necessities can be delivered. There should be a warning to people that they should not be alone after receiving the vaccine. |
| 995630 | 2/2/2021 | IL | 26 | M | 2/2/2021 | 2/2/2021 | 8 min after receiving the vaccination, client was sitting in waiting area. States after he sat down, he thought about being glad the shot was over. He began to get dizzy and blacked out. Fell out of chair. Unconscious for approx. 15 sec. EMS on site and attended to him. States he did not eat today. Had some snacks, but planned to eat after shot. Admits to being nervous prior to shot. Mother was present. States he has never passed out after vaccines or medical treatment. Mother believes that this was a reaction to the vaccine. Ambulance was called, however, family refused further tx. Client received ice for back of head which hit the floor when he fell out of the chair. Client left after being released from paramedics. Client was taken home by family. |
| 995662 | 2/2/2021 | CA | 44 | M | 1/1/2021 | 1/27/2021 | at 30 a.m. patient got sweaty and passed out. As a result he injured himself. Hospital said all labs were good, full work up and no foreseen reason for passing out. Said possible reaction to vaccine. |

| 990356 | 2/1/2021 | FL | | F | 1/13/2021 | 1/15/2021 | <p>Passed out from cardiac arrest (her head feeling really full and really hot, and felt as if she was going to pass out, then she passed out).; Passed out; fractured her face; Head really hot; Head full; Diarrhea; heart rate dropped; platelets dropped; A spontaneous report was received from a consumer concerning a 75-years-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced head feeling really full and really hot, passed out from cardiac arrest, heart rate dropped, platelets dropped, fractured her face and diarrhea. The patient's medical history was not provided. Concomitant medication included atenolol. On 13 Jan 2021, prior to the onset of the events, the patient received her first of two planned doses of mRNA-1273 (Lot number: Unknown) in her arm for prophylaxis of COVID-19 infection. On 15 Jan 2021, the patient complained her head was feeling full and hot. Felt as she was going to pass out, then she passed out from cardiac arrest and fractured her face. After passing out she got diarrhea. On 15 Jan 2021, the patient was hospitalized. The patient's heart rate decreased to 22 beats/minute three times and to 15 beats/minutes twice, and her platelet count dropped. The second dose of mRNA-1273 was discontinued in response to the events. The outcome for the events, head feeling really full and really hot, passed out from cardiac arrest, heart rate dropped, platelets dropped, fractured her face and diarrhea, and diarrhea, was unknown.; Reporter's Comments: This spontaneous report concerning a 75-year-old, female subject who experienced unexpected events of passed out from cardiac arrest and fractured her face, head feeling really full and really hot, and felt as if she was going to pass out, then she passed out, and got diarrhea, heart rate dropped down to 22, platelets also dropped, after the first dose of the Vaccine (mRNA-1273) (Lot number: unknown, expiration date: unknown). The events developed 2 days after vaccine administration. The patient was hospitalized. Treatment and outcome are unknown.' Based on the information which includes a temporal association and the absence of any other etiology, a causal association cannot be excluded. However, there is inadequate information in that the patient's medical history is lacking and event is also confounded by patient's advanced age.</p> |

feeling a little woozy/dizzy; My head was sideways and every time I would raise my head the room was spinning; there is not enough spit in my mouth. It's very dry; I walked very slowly; slight headache; My blood pressure now is 137/93. It was high this morning; felt lousy like I had the flu; felt like I was fainting; This is a spontaneous report from a contactable consumer. A 68-years-old female patient started to receive received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at SINGLE DOSE for COVID-19 immunisation. Medical history included transient ischaemic attack (I had a TIA prior). The patient's concomitant medications were not reported. The patient experienced "feeling a little woozy/dizzy" on an unspecified date with outcome of unknown, "my head was sideways and every time I would raise my head the room was spinning" on an unspecified date with outcome of unknown, "there is not enough spit in my mouth, it is very dry" on an unspecified date with outcome of unknown, "I walked very slowly" on an unspecified date with outcome of unknown, "slight headache" on an unspecified date with outcome of unknown, "my blood pressure now is 137/93. it was high this morning" on an unspecified date with outcome of unknown, "felt lousy like I had the flu" on an unspecified date with outcome of unknown, "felt like I was fainting" on an unspecified date with outcome of unknown. Reaction description by the reporter: "I had no pain, slight headache. My blood pressure now is 137/93. It was high this morning when I talked with the triage nurse. I had the shot/vaccine (first dose) on Friday. I feel better today than yesterday. Friday I felt fine. I got symptoms yesterday. When I woke up yesterday. I was feeling a little woozy, I always stretch slowly in bed. I slowly raised myself on the bed but before I got up my torso fell backwards. I felt like I was fainting. The room was spinning. All day yesterday I did not drive. I walked very slowly. I was holding onto the wall. I felt lousy like I had the flu. I would lay down for 20 minutes, watching tv. My head was sideways and every time I would raise my head the room was spinning. Also there is not enough spit in my mouth. It is very dry. I had a slight headache. So I did not bother but no headache today. I supposed to get my 2nd dose on 02Feb2021. The action taken was not applicable. Information on the Lot/Batch number has

| 990556 | 2/1/2021 | WA | 43 | F | 1/13/2021 | 1/14/2021 | Hypoglycemic event/blood sugar dropped a bit/sweaty/clammy/hands start to shake when blood sugar is low; This is a spontaneous report from a contactable pharmacist (patient). A 43-years-old female patient receive the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on the left arm on 13Jan2021 at 12:30 at a single dose for COVID-19 immunization. Medical history included Type 2 Diabetic-diabetic for six to seven years and have had no hypoglycemic events. There were no concomitant medications. No additional vaccines administered on the same day of the second dose of BNT162B2. Prior vaccination within 4 weeks included the first dose of bnt162b2 on 23Dec2020 at 12:30 (lot number: EH9899). The patient also experienced arm soreness with prior vaccinations (did not provide product names). The patient is a healthcare worker, diabetic and on insulin only. The patient received the second dose of BNT162B2 on 13Jan2021, and in the last two mornings, she had hypoglycemic events. Nothing in her diet or routine has changed. In the morning of 14Jan2021, she was at work in the clinic and her blood sugar dropped but she doesn't know how low she dropped. She ate a chocolate chip cookie to correct her blood sugar. It was corrected to 91; she didn't have her machine with her. On 15Jan2021 at 1030, the patient was sweaty, clammy, and her hands start to shake when her blood sugar gets low. She had three 15gram fruit bars and two sips of Coke before she passed out. The nurses around her were doing blood pressure checks and a STAT blood sugar check. About five to ten minutes after that, her blood sugar was 93. Her blood sugar was checked again, and it was 198. She stated this is not surprising because she overcorrected her blood sugar. The events required a visit to the physician office that day. The patient clarified that she was diagnosed with type 2 diabetes, takes Lantus - dose changes; normal dose is between 40-45 units once a day with the Solostar pen. That morning, the patient was given a dose of 45 units. Humalog with pen for administration (dose: administered 2 units that morning). The patient uses Humalog only as needed. The patient had undergone blood tests and procedures which included blood sugar tests where blood work was drawn at the endocrinologist's office. The tests included A1C, C- |

| 989275 | 1/31/2021 | KY | 36 | F | 1/14/2021 | 1/14/2021 | <p>Pfizer COVID-19 Vaccine EUA Event Description: Patient at hospital to receive her first dose of Pfizer Covid vaccine in left deltoid at ~1105. ~15 minutes after administration c/o left arm feeling hot and appearing red. Patient was observed for 45 minutes and given Benadryl 25 mg IM, Solumedrol 125 mg IM, and Pepcid 20 mg po. The redness on her arm increased and her BP and pulse continued to be elevated. She was transferred to ED for further evaluation a 1148. patient walked to ED to be evaluated for allergic reaction. Pt. reports having an 1100 vaccine appointment. Pt. received vaccine, then c/o left arm redness/swelling. HISTORY OF PRESENT ILLNESS: patient is a 36y female who presents to the ED with an allergic reaction. Pt reports she received the Pfizer COVID-19 vaccine this morning at 1100, first dose, and noted a rash along the left arm where the injection site was. Pt notes she received the first dose of the Pfizer vaccine. Pt documents a rash along the left arm which she described as "itchy and tingling." Patient initially had an area of redness following the injection site and then it extended down her entire arm to the wrist. She states that she was wearing a tighter shirt and they had her change into a loose scribed top. Patient denies any tongue swelling, throat swelling, itching, sneezing, syncope, presyncope, chest pain, shortness of breath double cough, nausea, or vomiting. No prior history of allergic/anaphylactic reactions. Patient was monitored for 1 hr and had significant improvement of symptoms. She was discharged in good condition and to return with any new, concerning, worsening symptoms. Advised to follow up with PCP in 2-3 days. Dx: acute allergic reaction to COVID-19 Vaccine Provided Rx for Benadryl and Pepcid Seen by PCP 1/22/2021 and internal reported filed, prompting VAERS report</p> |

| 989165 | 1/31/2021 | NV | 32 | F | 1/25/2021 | 1/26/2021 | 1/26 evening I developed body aches, lower back pain, nausea, brain fog, fatigue. On Friday I started my period a week early and it was unusually heavy (this hasn't happened much since I was a teenager) on Saturday I was bleeding so heavily and had lightheadedness, near syncope, headache, nausea, weakness, fatigue and brain fog. Usually menstrual cycle is not as heavy and doesn't come early and I don't experience these types of symptoms (usually just bad cramps and back pain with less heavy bleeding). |
| 989091 | 1/31/2021 | IN | 50 | F | 1/29/2021 | 1/30/2021 | Woke up at 3 am with body aches-got up to take ibuprofen. When I was heading back to bed, my husband heard a loud thud and found me laying on the floor beside the bed, passed out. He rushed over to me and called my name several times before I became conscious. He estimates it was a span of about 30 seconds. When I awoke, I immediately began to cold sweat and dry heave several times. Then I became cold and was shivering. My husband then transported me to the hospital emergency room. I received a cardiac test, which they said was good. I also received intravenous fluids and medication to treat pain and nausea. They drew labs which they said looked normal and did an X-ray my right shoulder because I struck my head and shoulder on a night stand when I passed out. They released me about an hour later after having me stand and walk to ensure my blood pressure did not drop, causing me to feel faint again. They sent me home with a prescription for Zofran to help with any further nausea, advised me to take ibuprofen for head and shoulder pain and body aches and advised rest. They also said to return if any other incidents occur and to follow up with my family doctor if symptoms persist. |
| 989022 | 1/31/2021 | WA | 37 | F | 1/30/2021 | 1/31/2021 | Fainted while returning to bed. Patient has never fainted before. |

| 989328 | 1/31/2021 | | 39 | F | 1/29/2021 | 1/29/2021 | In the evening of receiving the vaccine, I started to feel brief sharp pains in my chest/ back. Overnight, I was awoken by continued shooting pains all over my body, and also fine shaking. Around 2AM a headache started and progressed to be the worst headache of my life. It was received in the morning by tylenol. In the morning, I experienced extreme exhaustion and dizziness after climbing stairs I almost passed out, had to rest on the floor. Later in the day I experienced hours of chills, a temp to 103, which came down with tylenol. By the evening I was feeling well but tired. Today, 2 days after vaccination, I have neck soreness and am a little tired but well. |
| 989873 | 1/31/2021 | WA | 47 | F | 1/29/2021 | 1/30/2021 | I passed out 12 hours after vaccine received while standing in the bathroom. This followed hours of terrible chills and muscle aches that I couldn't sleep through. No medications were taken until after the episode and it didn't happen again. I did not have a working thermometer so unsure how high my temp got. I peed myself when fainted. My husband was present to pick me up off the floor and luckily I didn't hurt myself in the fall. I didn't come to until he took me back to bed. I started feeling better a few hours later and much better by 24 hours. Now just lingering body aches and fatigue at 48 hours and still taking ibuprofen/Tylenol. |
| 989051 | 1/31/2021 | NY | 25 | F | 1/11/2021 | 1/11/2021 | On Jan 11,2021 at 6:30pm I became light headed and almost passed out. My heart rate was elevated felt like it was going to beat out of my chest. My breathing was heavy and short. I got chills and extremely weak and slight pain in my chest. I ended up going to Hospital by 6:45pm. The rest of that week I was super weak, nauseous, and threw up twice. The following week I was nauseous and weak and had heavy breathing on Friday January 22nd and ended up throwing up. Then Thursday January 28th I became nauseous and light headed around 6pm. Friday January 29th around 6pm I was at work when I became extremely nauseous, light headed, and almost passed out. My heart rate was elevated and my breathing was again heavy and short and I had a pressure tingling pain in the left side of the back of my head as well as soreness in my left arm pit. I ended up going to Degraff Memorial Hospital by ambulance. |

| 987977 | 1/30/2021 | FL | 59 | M | 1/19/2021 | 1/22/2021 | <p>Approximately 60 seconds prior to emergency, patient felt a sense of panic (first time ever). Stated to me (wife) "I feel like I am having a panic attack" as we walked on to a parking garage elevator at 12:30 pm on 1.22.21. As I turned to push the button to go down, leaned against the wall of the elevator. His eyes fluttered and back, he was a little pale. When I turned around, again, he fainted and fell face down on the elevator floor. He never stopped breathing and had no convulsions. He was out for less than 30 seconds. When he came to, he got up by himself with minimal assist from me (911 was already on their way). He did not remember saying that he felt like he was having a panic attack; but he remember the fear/panic he felt just prior to. He was oriented x3. I had him smile, stick his tongue out and speak to make sure it was not a TIA or stroke and there were no symptoms of that. His bladder did release. He went by ambulance to the ER (we were on a mini vacation to celebrate his birthday). They did a CAT scan, checked his blood sugar twice, EKG twice, complete blood work panels and urinalysis. All tests were either normal or negative. They found nothing. His BP was normal for the first 30 minutes at the hospital, then increased. But has been normal ever since (he checks it daily). Absolutely no other symptoms since that episode. He met with our PCP on 1.29.21 as a follow-up and she directed us to complete this form. She has ordered a consult with a Neurologist and that is scheduled for 3.10.21. His second shot for the vaccine is due on 2.9.21.</p> |

| 988252 | 1/30/2021 | PA | 29 | F | 1/20/2021 | 1/21/2021 | ~~Pfizer-BioNTech COVID-19 Vaccine EUA" I received my 2nd dose of the Pfizer COVID-19 vaccine on Jan. 20th, 2021. On Jan. 21st, 2021, I woke up feeling feverish. I went to use the bathroom, and after washing my hands I walked towards the bathroom door and felt light-headed and dizzy. Suddenly, I passed out and hit my head and upper neck on the tile floor. My parents heard the sound of my fall and luckily rushed to the bathroom. They found me lying unconscious on the floor with my eyes rolled up for what felt like more than a minute. I regained consciousness on my own, and I drank water with a bit of sugar and salt mixed in. I felt too weak to get up and walk, and the back of my head and upper neck were in pain. I told my parents to call 911 as I wanted to make sure that there was no serious damage to my brain or neck area. I went to the local hospital in an ambulance. I was taken to the emergency room: Vitals were done and my temperature ranged from then was 99.5-101F and my heart rate was high- it stayed around 112 bpm for some time I was given 2 L of IV Saline Fluids EKG result: no clinical abnormalities CT head/neck/spine: negative 2 different types of COVID-19 tests: results were both negative Bloodwork: CBC/BMP/D-dimer: no clinical abnormalities Chest Xray: negative 2D-doppler ultrasound: negative Holter monitor: negative for irregular heart rhythm I was discharged the same day around 4:30pm |

| 985635 | 1/29/2021 | TX | 72 | F | 1/13/2021 | 1/13/2021 | awful burning in the chest/pain in her chest; horrible pressure and pain in her chest; nausea; felt woozy; This is a spontaneous report from a contactable consumer (patient). A 72-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number EL3246), via an unspecified route of administration in the right arm on 13Jan2021 at 17:39 at a single dose in the hospital for covid-19 immunisation. Medical history included anxiety, seizures, and high cholesterol. She passed out last summer and they put her in the hospital from 31Aug2020 and ran all kinds of tests. In the end, they said she only had a few PVCs (premature ventricular contractions) and she doesn't need to see the doctor for a year. Mentioned she also has chronic bronchitis and this is related to having low platelet count and low immunity. All of these events predate treatment with Pfizer COVID 19 vaccine. Concomitant medication included amlodipine, atorvastatin for high cholesterol, clonazepam for seizures, escitalopram for anxiety, levothyroxine sodium for thyroid, and mirtazapine for sleep; all were ongoing. Stated that she had something weird happen after her injection about four hours after the shot. She received the first dose of the Pfizer COVID 19 vaccine on 13Jan2021 at 17:39 in the right arm. About three or four hours later on 13Jan2021, she was getting ready for bed and when she sat down and leaned over she had a god awful burning in her chest and nausea. She was going to take baking soda but when she sat up she had horrible pressure and pain in her chest and felt woozy so she sat on the floor and then the pain started to radiate through her arm and into her neck. The horrible pain and pressure in her chest felt like something was sitting on her chest and the bad pain in her chest was going into her arm and a little into her neck. She laid real still on the floor, and did a lot of praying, and then 20 minutes later it totally stopped. She got up slowly and finished getting ready for bed and was fine. She was just hoping they will still let her get the second shot. The whole event only lasted 20 minutes and when it was over it was completely gone. She did tell her husband when he came home. She was alone when this happened. The patient wanted to know if she can receive second dose of vaccine. She stated it almost felt like a heart attack. She was planning to get the second dose on 03Feb2021. Wanted to know if |

The patient's medical history and concomitant medications were not reported. It was reported that the patient had received two of the COVID vaccine and would like to report about a possible side effect. Three days after each shot the patient had an episode of dizziness with vertigo and syncope. The patient was not sure if this was related to the vaccine but since the patient had not had this before and wanted to report. Information on the Lot/batch number has been requested. |
| 984979 | 1/29/2021 | IL | 51 | F | 1/20/2021 | 1/20/2021 | Presented to ED on 1/21/21 with chest tightness and shortness of breath. Patient reports chest pain with deep inspiration. Shortness of breath started shortly after receiving vaccine on 1/20/21 and persisted into 1/21/21. Patient reports no cough, positive lightheadedness with no syncope, positive nausea with no vomiting. Per exam no fever, no rash, no tongue/mouth swelling. Emergency Department MD states does not meet threshold for anaphylaxis thus no epinephrine administered. Patient received Benadryl 50mg IV, Pepcid 20mg IVPB, Solu-Medrol 125mg IV, and 0.9% NaCl 1L IV bolus. |

| 986016 | 1/29/2021 | | 52 | M | 1/14/2021 | 1/15/2021 | trouble breathing; severe body aches; fevers and chills; extreme fatigue; headaches; passed out/ when trying to return to bed, passed out a second time; This is a spontaneous report from a non-contactable physician. A 52-years-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 14Jan2021 07:30 at a single dose for COVID-19 immunization at the workplace clinic. The patient's medical history was not reported. Patient has no known allergies. Concomitant medication included venlafaxine hydrochloride (EFFEXOR). Patient previously had the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on an unknown date. On 15Jan2021 04:00, patient had severe body aches, followed very quickly by fevers and chills. At 4:45am started to have trouble breathing. Patient was concerned about respiratory symptoms, and woke his spouse, then stood up to try and breathe better, took a couple steps, and passed out. When the patient woke, when trying to return to bed, passed out a second time. Over the next few hours respiratory symptoms improved. Remainder of day characterized by extreme fatigue, body aches and headaches. Patient had an unspecified over the counter anti-inflammatory medication. The patient has a negative COVID 19 test via a nasal swab on an unknown date. Patient was recovering from the events. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported passed out and the administration of the COVID 19 vaccine, BNT162B2, based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate. |

| 984827 | 1/29/2021 | IL | 40 | F | 1/27/2021 | 1/28/2021 | 210 am woke up hot. Walked downstairs had ringing in my ear and saw stars, held the wall almost passed out. Began profusely sweating drenching my clothes. Nausea began. Went back upstairs sat on my bathroom floor due to nausea/ dry heave. All of a sudden SEVERE abdominal pain began 10/10. Cried for my husband. Dripping sweat gave me a cold rag and foam large diarrhea began. Still 10/10 pain in abdomen. Felt like my lower abdomen was getting ripped out. About 45 minutes or so later still 10/10 wanted to go to ER. I could not stand. If I stood my legs and body felt like I wanted to curl in a ball on the floor. He called an ambulance. I was pale as a ghost, no fever, normal vital signs. Went into full reynauds flare from body stress. Ambulance was unable to get oxygen sat and glucose at the time due to flare. Arrived at the ER labs drawn. WBC 10.9 and Glucose 194. I am not or never have been diabetic. Vaccine related. Like a lightswitch all symptoms stopped except sweating hot and cold spells, sore arm and drowsiness. Discharged at 6am |

| 984390 | 1/29/2021 | GA | 32 | M | 12/28/2020 | 12/28/2020 | <p>Felt like might pass out; Proceeded to become limp, pale and sweaty; Proceeded to become limp, pale and sweaty; Hands rhythmically twitched back and forth; A spontaneous report was received from a nurse concerning a 32-year-old, male, patient who received Moderna's COVID-19 vaccine (mRNA-1273) and felt like he might pass out, became limp, pale, and sweaty, and hands rhythmically twitched back and forth. The patient's medical history included allergy to penicillin. No relevant concomitant product use was reported. On 28 Dec 2020, approximately three minutes prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 011J20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 28 Dec 2020, the patient began to feel like he was going to pass out minutes after receiving the vaccine. He became more limp, pale, and sweaty and his hands rhythmically twitched back and forth. His eyes closed and he leaned back in his chair, but he remained upright. The nurse elevated his feet, fanned his face and upper body, and applied wet paper towels to the back of his neck. After approximately two minutes, the patient's level of consciousness returned to baseline and he felt better after five minutes. He remained seated and sipped water for 30 minutes. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the events, felt like he might pass out, became limp, pale, and sweaty, and hands rhythmically twitched back and forth, was considered resolved on 28 Dec 2020.;</p> <p>Reporter's Comments: This case concerns a 32-year-old, male, patient, who experienced a serious unexpected event of presyncope and non-serious unexpected event of pallor, hyperhidrosis This case concerns a 32-year-old, male, patient, who experienced a serious unexpected event of presyncope and non-serious unexpected event of pallor, hyperhidrosis and muscle twitching. The event occurred 15 min after first dose of mRNA-1273, lot # 011J20A. Treatment included no medications, but feet elevation and wet towel on the back of his neck. Based on the current available information and temporal association between the use of the product and onset of the events a causal relationship cannot be excluded.</p> |

| 987347 | 1/29/2021 | TX | 40 | F | 1/28/2021 | 1/29/2021 | 12 hours after vaccine, near syncope episode, severe muscle aches and chills, severe vomiting low grade fever 100.2, unable to sit up for 12 hours without almost fainting or having to vomit |
| 987229 | 1/29/2021 | PA | 43 | M | 1/29/2021 | 1/29/2021 | Patient (DOB 09/20/77) had a reaction to the Moderna Covid-19 vaccine given on 1/29/2021. On the screening form, patient indicated she had allergies. She verbally said she had multiple allergies and had an anaphylactic reaction previously to allergy shots received in a doctor's office. She said she does carry an EpiPen. RPh counseled on the cases of anaphylaxis with the Pfizer vaccine and recommended a 30 minute monitoring period following the vaccine in accordance with CDC guidelines. Patient agreed and received the vaccine at approximately 11:30am with instructions to check back in with RPh at 12:00pm. A few minutes later (at least 5 minutes), a friend of Patient alerted RPh that patient had fainted. The friend was able to catch patient before she fell off the chair and lower her to the ground. Patient was awake and answering questions but appeared to be having trouble maintaining consciousness. She denied shortness of breath, itching, swelling, and no rash or wheezing was evident. An EpiPen was available and present but not administered due to lack of respiratory symptoms. 911 was called at 11:39am with the patient's permission. Her symptoms remained the same until EMS arrived and she left in the ambulance at 11:57am. |

| 987033 | 1/29/2021 | CA | 45 | F | 1/22/2021 | 1/22/2021 | <p>12 hours after my second dose I felt paresthesias in my extremities - particularly in my hands and feet - as well as my face. I also had chills and rigors. I felt lightheaded and nearly fainted. Day 1 post vaccine: I had chills and rigors and the hand/feet paresthesias were persisting. I also felt heavy and weak. Day 2 post vaccine: the chills had resolved but the hand/feet paresthesias were persisting as well and the generalized weakness got worse. I went to the ER and was sent home with instructions to follow up with neurology. That evening my hands became swollen and tight. Day 3 post vaccine: the weakness improved but the paresthesias were persisting. I went to work and on my drive home a I felt electric jolts throughout my body but especially my extremities - which caused me to shake. The rigors came back and I also had abdominal pain. Day 4 post vaccine: I still felt similar symptoms but milder than the night before. I got evaluated and tested for covid which was negative. Labwork and U/A were also negative. The symptoms resolved that evening but the paresthesias were persisting and started to become more painful. I had an MRI of my brain and spine which were negative. Day 5 post vaccine: The paresthesias had become more painful. I was started on Lyrica by my neurologist. Day 6 post vaccine: I felt chest pressure and a globus sensation in my chest, weakness, and jolts in my extremities. The dysthesias in my extremities were persisting. I was evaluated by my neurologist had an EMG which was normal and was diagnosed with small fiber neuropathy. I was told to continue Lyrica and titrate the dose up until the symptoms resolve. Day 7 post vaccine: I have been having heaviness, jolts in my extremities and face, and dysthesias in my hands and feet for most of the day. Lyrica helps a little. Throughout the entire time I have also had intermittent paresthesias in my face and jolts of pain in my face at times. I also had paresthesias in my face and intermittent dysthesias in my extremities 7-10 days after my first Moderna dose. Symptoms got a lot worse after the second one. Given the timing I am concerned that these symptoms are vaccine-related.</p> |

| 982396 | 1/28/2021 | TX | 44 | F | 1/25/2021 | 1/26/2021 | Headache, nausea, body aches, chills and fever (highest 101.1) began around 1am 1/26/21 and continued throughout the day, fever finally breaking around 7pm that night. I woke the following morning 1/27/21 at 7:20a feeling better, only slightly tired. I was awake about 30mins when my husband reported I stated I felt very dizzy while standing in our kitchen, he states I started walking over to our living room when I fainted and fell face first into the side of our sofa. He stated I came too about 20-30 seconds later. After awaking my hearing was muffled and my arms were very tingly for about 3 mins. I felt completely exhausted and slept for a few hours, remaining very fatigued the rest of the day. Today, 1/28/21, I woke up feeling tired but tightness to base of my head and neck, no other symptoms. |
| 981659 | 1/28/2021 | NY | 54 | F | 1/8/2021 | 1/8/2021 | Client states "I feel warm" approximately 2 minutes post vaccination. Client became nauseous, dizzy and fainted. Paramedics and Physician assisted and client recovered. |
| 981624 | 1/28/2021 | FL | 70 | F | 1/7/2021 | 1/8/2021 | 28 hours post vaccine : fever of 101.2, headache,chills,fainting,nausea, arm sore,red. Systemic symptoms lasted 40 hours and resolved. Arm continued to swell and a hard, hot red lump developed. Redness expanded to cover entire upper arm. A hive like rash developed day 2-3 and lasted for 3 days. Day 7 I contacted my physician and was told he doesn't deal with COVID and vaccine issues. Day 15-16 swelling and redness mostly resolved. Day 21 arm is still sore. |

| 981582 | 1/28/2021 | NH | 63 | F | 1/21/2021 | 1/23/2021 | Patient received her vaccine on Thursday, 1/21/21. From then until Saturday afternoon she had been experiencing extreme fatigue. On Sat. around 5:00 PM she was standing at her flat-top stove cooking dinner. A wave of very extreme fatigue came over her, so she leaned over to turn off the burner. When she did this, she passed out leaning forward with her hand on the burner and touching the frying pan. When she came to, she went to the couch and laid down - not realizing for 10 minutes that her hand and right breast were burned. The resulting injuries lead to her having to see her PCP on Monday, and then a General Surgeon on Weds 1/27/21. Injuries sustained include a second degree burn on her right breast, On the right arm, laterally above the wrist is a small superficial partially healed burn. On the dorsal aspect of the right fifth finger there is a longitudinal burn that goes from the MCP joint to almost the tip of the finger. She has limited range of motion due to discomfort and swelling. The blister encompasses the entire dorsal lateral aspect of the finger. The fourth right finger has a less extensive blistered area on the PIP joint. The burn on the fifth finger is deep second degree. |
| 981577 | 1/28/2021 | MA | 37 | F | 1/27/2021 | 1/27/2021 | I receive the injection at 7:30 in the morning. At 10:30 in the evening I awoke to having severe Rigors . Shaking uncontrollably. I then became very nauseous. I walked to my bathroom but then felt very dizzy so I had ole my husband up and got myself to the floor . I then passed out and lost consciousness. My husband almost called 911 as he said I was convulsing and he thought I was having a seizure. When I came to I started vomiting . Today I have a headache , body aches , body chills and exhaustion . |

| 981451 | 1/28/2021 | AR | 36 | F | 1/14/2021 | 1/14/2021 | 1/14/21: 7:30PM = arm pain & extreme fatigue (hit by truck) and went to bed 1/15/21 0300am = woke up with 10/10 left arm pain - crushing, dizzy, nauseous, continuous night sweats - went to stand slowly and almost fainted immediately. took ibuprofen 800mg and applied anicar cream to left arm when I could get up - helped pain 6/10. am - left nostril congested, headache. ibuprofen 800mg 1/17: sore throat 1/18: worse sore throat and drainage - like a sinus infections, fatigue, headache (ibuprofen 800mg) 1/19: same as on 1/18 and now coughing up thick clear sputum also. Got COVID tested today, nausea COVID neg. took Cepacol lozenger, drank tea w/honey, soup 1/20: weds - headache, nausea, sore throat/drainage - improving - ibuprofen 800mg 1/21: same as on 1/20 but significantly better 1/22 - minor sore throat, on/off headache 1/23 all better 1/25 - returned to work. was off from 1/15-1/24 due to my reaction and pending COVID test result im still fatigued and getting headaches on/off. My headache history was fixed until receiving the vaccine on 1/14. |
| 981277 | 1/28/2021 | OH | 62 | F | 1/25/2021 | 1/25/2021 | About 9PM after the receiving the vaccine I started had riggers which lasted for about an hour. I couldn't reach for my phone or call for help. I either passed out or fell asleep. Around 1AM I woke up and checked my temperature 102.7. Some point after I took some Tylenol but don't remember when. I finally had to call for help from my family in the morning because I was not able to pee or drink. Tuesday was my fever was still 102.7 with taking Tylenol and Advil it would just go back up. Tuesday I had Riggers again about 5:30 it only lasted 3-5 minutes. Wednesday my fever went down to 101.4-101.5. Have had difficulty swallowing when the fever is high, did not feel as if I had a allergic reaction or that my throat was sore it was just hard to swallow. I have a weird bruise on my arm I have clue where I got it. I didn't urinate for 9 hours. Headache. Pulse OX was at 93-94 for Monday and Tuesday but then it came it up 95-98 yesterday. As of today I still pretty weak no fever when I woke up. |
| 981227 | 1/28/2021 | GA | 81 | F | 1/27/2021 | 1/27/2021 | night of injection chills lasted about an hr. this morning when i woke up i felt very weak and went to the bathroom and tried to sit down and i passed out. |

| 980617 | 1/28/2021 | TN | 75 | F | 1/8/2021 | 1/10/2021 | Dizziness; history included compromised immune status; history included compromised immune status; getting really tired/fatigue; Gets real sweaty; chills; almost passed out at doctor's office; Nausea; Felt cold; Blood in urine; Feeling unwell; Feeling bad; This is a spontaneous report from a contactable consumer (patient). A 75-year-old female received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number EJ1686), intramuscular in the left upper arm on 08Jan2021 at 15:45 at 0.3 mL, single for COVID-19 immunization. Medical history included Leighton Plantar Alopecia (hair follicle is an enemy), skin infection (infection in body most of the time, at least on skin), diagnosed allergies, compromised immune status, respiratory illness, genetic/chromosomal abnormalities, endocrine abnormalities, obesity, autoimmune disorder (diagnosed 8 months ago). She has lost some height, prior to taking the vaccine and she said it was related to age. There were no concomitant medications. The patient experienced feeling unwell on 10Jan2021; blood in urine on 10Jan2021 at 17:00; nausea at 10:00, chills at 11:00, almost passed out at doctor's office at 10:00, felt cold - all on 11Jan2021; getting really tired/fatigue on 14Jan2021 at 09:30; gets really sweaty on 13Jan2021 at 10:00; and dizziness on unknown date. The patient had the first shot on Friday (08Jan2021). On Sunday (10Jan2021), she started feeling bad. She was feeling good about getting it and had no reaction. She has an autoimmune disorder that made her a little afraid to take, but with all the indications, they said it would be much better for her to take it than to get the COVID virus. Sunday (10Jan2021), she does not feel good. So, she started having blood in urine. She thought she had a UTI and had not had one in 20 years. It felt like that is what she had and with the blood in urine. She just took Tylenol and waited until Monday morning because she does not like sitting in doctor's office. They gave her a cup to give sample and said she didn't need to see provider. They will have it checked and in the meantime call in a prescription. It kept getting worse and worse. She was about to passed out in the doctor's office on 11Jan2021, she got nauseous and almost threw up. She got in the car with her husband and he was trying to get her home. She got chills and got so cold and could not warm her body up. Her husband gave her Phenergan and it kind of knocked |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

her out for a while to ease her nausea. She was thinking of going later today (14Jan2021), when she gets enough energy, to get a COVID test. She does not know if it will give false positive or not. She had chills and now she gets sweaty since 13Jan2021. She took her temperature and she did not have one. She just now got up. It is 10:00. She got up this morning (14Jan2021) and was really tired. She was not sweating this morning. Tiredness is kind of new, and when she talked to the nurse, she sort of felt like maybe it was a reaction to the COVID vaccine, but then she talked to her daughter and she said the symptoms she was having are usually symptoms that occur with second dose of the vaccine. It is not uncommon for people to have symptoms she was having. She wanted to know if she should have a COVID test. If she has had just one shot, would the test give a false positive coming from the COVID. They were asking if patient should take the second dose, and should she continue her UTI medication. Doctor's visit to give urine sample on 11Jan2021 (results: negative for UTI). She did not see a doctor though. They sent sample and prescribed a sulfa based medication for a UTI. She did start feeling a little better and stopped having blood in her urine. She plans to continue it because she does not like to stop taking an antibiotic. She did not have any clue that it was not a UTI until the nurse from her provider's office called to tell her results of urine sample was negative. Outcome of event getting really tired/fatigue was not recovered; events almost passed out at doctor's office, blood in urine, chills, and gets really sweaty was recovering; and unknown for other events.

| 980361 | 1/28/2021 | NY | 40 | F | 1/12/2021 | 1/12/2021 | Fainted to the floor; Dizzy; Too dizzy, hot and sweaty; Nausea; A little vomit; sweaty; A spontaneous report was received from a non-health professional who was a 40-years-old, female patient who received Moderna's COVID-19 vaccine and fainted, was dizzy, felt hot, had nausea and vomiting, and sweaty. The patient's medical history included a propensity for fainting and low blood pressure. Concomitant product use was not provided by the reporter. On 12 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 039K20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. On 12 Jan 2021, after receiving the vaccine, the patient got dizzy, had nausea, a little vomit, and fainted to the floor. She reported feeling dizzy, hot and sweaty. Patient did not take medication to treat her symptoms. Action taken with the second dose of mRNA-1273 in response to the event was not reported. The outcome for the events, fainted, dizziness, felt hot, nausea and vomiting, and sweaty were unknown.; Reporter's Comments: This case concerns a 40-year-old female patient with medical history of propensity for fainting and low blood pressure who received their first of two planned doses of mRNA-1273 (Lot unknown), and who experienced the unlisted event of Syncope which was considered medically significant. Additionally, the patient experienced the non-serious listed events of Nausea and Vomiting, and the non-serious unlisted events of Feeling Hot, Dizziness and Hyperhidrosis. Based on the current available information and temporal association between the use of the product and the onset of events on the day of vaccination, a causal relationship cannot be excluded and the events are considered possibly related to the vaccine. We would note that the patient's history of propensity for fainting and low blood pressure could be also contributory. |

| 980362 | 1/28/2021 | PA | 51 | F | 1/13/2021 | 1/13/2021 | Fainted; unconscious for 1-2 minutes; Felt dizzy; sweating; shaking; brain feels foggy; didn't sleep well; left arm started hurting from shoulder to elbow; A spontaneous report was received from a consumer who was an 51-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced the events of left arm started hurting from shoulder to elbow, didn't sleep well, felt dizzy, fainted, unconscious for 1-2 minutes, sweating, shaking, and brain feels foggy. The patient's medical history included asthma, hypoglycemia allergy to penicillin and tuberculin (TB) test. No concomitant medications were reported. On 13 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 012L20A) intramuscularly in the left deltoid for prophylaxis of COVID-19 infection. On the same day, the patient experienced left arm started hurting from shoulder to elbow. On 14 Jan 2021, the patient reported that she didn't sleep well, felt dizzy, and fainted. The patient was unconscious for 1-2 minutes before the ambulance arrived. It was noted that the patient's vitals were normal, so she declined to go to the hospital. The patient also experienced sweating, shaking, and brain feels foggy like she has a hangover. The patient stated that the Moderna vaccine gave her the same reaction except with penicillin and TB test she went unconscious immediately. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not provided. The events, fainted and unconscious for 1-2 minutes, was considered resolved on 14 Jan 2021. The outcome for the events, felt dizzy and brain feels foggy, was not resolved. The outcome for the events, left arm started hurting from shoulder to elbow, sweating, shaking and didn't sleep well, was unknown.; Reporter's Comments: This spontaneous report refers to a 51-year-old female patient with medical history of asthma who experienced unexpected serious events of fainted and loss of consciousness (1-2 minutes), and non-serious events of dizziness, sweating, shaking, brain feels foggy, didn't sleep well and left arm started hurting from shoulder to elbow) the next day after administration of the first dose of mRNA-1273, lot # : 012L20A, Exp date-unknown. Based on temporal information provided and with no other etiological factors, a causal association cannot be excluded. The event of |

| 983757 | 1/28/2021 | CA | 53 | M | 1/28/2021 | 1/28/2021 | He tolerated the injection and went to the waiting room for sit. About 13 minutes after the injection, the patient walked back to the nurse's station, stating that he did not feel good. He was pale and clammy and started to fall. He was sat in the chair, and he started to lose consciousness. Pulse was faint and the blood pressure was initially 61, pulse about 60. He has no skin rash, stridor, respiratory distress. Respiration was regular and unlabored. Within 10 minutes, he opens his eyes and started responding, his blood pressure improved to 110-120's, pulses 60's, O2 sat 98%, unlabored breathing. He was transferred to a wheelchair and laid down on the exam table. He was observed for another 30 minutes. His vital signs remained stable. He is able to drink water and able to walk around in his own power without difficulty. The patient stated that he does not like needles, and he has not had any vaccination for a long time. Impression: Vasovagal syncope Adverse reaction to the SARS-CoV-2 vaccine, not anaphylactic reaction. |

| 983369 | 1/28/2021 | IL | 49 | F | 1/21/2021 | 1/21/2021 | 1/21/21 Vaccine given at 4:30pm CST. By 11:30pm, felt feverish, started chills and headache. 1/22/21-3:30am- body and joint aches started and chills worsened, headache continued 6:30amCST- chills continued, body and joint pain worse. Took 2 Excedrin to help. 10:30am- fever of 100.3 noted. Continued with chills. Arm visibly red and sore. Swelling started in arm at injection site. 12:00pm- dizziness started. Tunnel vision, and almost passed out. 1:30pm- dizziness worsened, and weakness started in legs. 2:30pm unable to stand without assistance. Left work because unable to continue working and called the doctor. Went home, and started to drink electrolyte supplements. 5:30pm- fever went up to 102.5. Unable to stand without assistance and experienced extreme dizziness. Frequent urination at that time. Arm developed a very large swelling about the size of an egg at the injection site, and was very red. Glands under the arm started swelling, and experienced pain if I tried to lower my arm to my side. Chills continued, joint/muscle/bone pain continued. Became nauseated from the dizziness. Took 2 additional Excedrin for fever and pain. Could not sleep due to the pain in my joints and bones, and pain under arm from glands. 1/23/21 3:30am- Frequent urination during the night. Finally regained ability to stand on my legs, and dizziness started to lessen. 8am Remained on the couch all day except to use bathroom. Fever reduced to 100.1. Continued to use Excedrin as needed for joint/muscle/bone pain. Arm too sore to touch, and swelling protruding from muscle size of a large egg. Very red, hot and itchy as well as pain. 1/24/21- A.M.- most of the dizziness subsided, with just occasional issues. Temperature went back to normal. Still severe pain at injection site with swelling, redness, and itching. Some joint/muscle pain still. 1/25/21- Mostly Arm/injection site issues. Still red/painful, swollen, and itching. very mild joint/muscle pain. 1/26/21- Arm/injection site issues more mild. Swelling reducing, pain & itching reducing. Glands under arm reduced, and pain reducing. 1/27/21- Slight redness at injection site. Swelling down to size of a grape. Slight pain & Itching. Glandular swelling & Pain completely gone. 1/28/21- A.M- No symptoms at all. By 9am, started having twitching/muscle spasms on Left side of scalp above ear. Progressed and worsened through day. By 4pm, spasms and twitching lasts bursts |

| 978313 | 1/27/2021 | FL | 66 | F | 1/6/2021 | 1/6/2021 | Tiredness; A sore arm/Arm was a little sore; Dizziness; Passed out; Chills; Tremor in fingers; A headache; This is a spontaneous report from a contactable Nurse (patient). A 66-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; Batch/lot number: EH9899, expiry date: unknown), via an unspecified route of administration on 06Jan2021 10:30 at single dose (Right upper arm) for COVID-19 immunization. Medical history included Blood pressure (takes blood pressure medication). The patient's concomitant medications included blood pressure medication. The patient experienced a sore arm, chills, tremor in fingers and a headache when she came home from being vaccinated. The morning after, she experienced dizziness, tiredness and passed out. She then checked her blood pressure and it was fine and then she went to bed and slept all day. She got up around 7 pm and was fine. It was further reports that the patient received first COVID Vaccine on 06Jan2021. She came home and was fine. Arm was a little sore. During night had chills and noticed fingers had tremors. Had a bad headache. Woke up in morning and went to do usual things. Was dizzy and passed out. Woke up on floor. Husband helped her back into bed and she slept the whole day. After that she was absolutely fine. They were curious, but a little bit concerned about taking the second dose. Advised patient to follow up with primary care physician. She went to primary care physician yesterday. Primary care physician advised her to take the second dose of COVID Vaccine stating he didn't see why she couldn't take it. HCP Details: Address and email address are unknown Received first dose of COVID Vaccine on 06Jan2021 around 10:30. Chills: began at 23:00 Fingers had tremors: began 23:00 Bad headache: did not provide time of onset Dizzy and passed out: 08:00 Woke up absolutely fine on 07Jan2021 around 19:00 Indication: 66 years old and it was available to her Causality: Yes, because she was fine before then History and Investigations: Takes blood pressure medication, but blood pressure has been normal. Product name not provided by caller. Vaccination facility type was at a skilled nursing facility. The outcome of the events was unknown. Chills, Tremor in fingers, headache, Dizziness, and Passed out were reported as Medically significant events. Reaction assessed for Chills, Fingers had |

tremors, Had a bad headache, Dizzy, and Passed out. Source of assessment: Primary Source Reporter, Method of assessment: Global Introspection, Drug result: Related.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported events including chills, tremor in fingers, headache, dizziness, and passed out, and the administration of COVID 19 vaccine, BNT162B2, based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

| 977516 | 1/27/2021 | MO | 52 | F | 1/20/2021 | 1/21/2021 | this is a report of my personal experience I received the 2nd dose of the Moderna Covid Vaccine Wednesday January 20th at approximately 4:30pm Cox North. The injection was painful, the person administering the injection inserted the needle VERY slowly, and then pressed the plunger VERY slowly. However, other than injection site pain, I had no symptoms at that time. I then went home and went to bed for the evening at approximately 6:30pm. The following morning, Thursday January 21st, I woke up at 5am (normal time). Before getting up, my stomach felt "funny" mild nausea. When I stood up, I experienced weakness, mild lightheadedness, and nausea; and sat back down IMMEDIATELY. I then stood up to walk to the restroom with the intention to take Tums to settle my stomach. I walked approximately 12 feet, put one tums in my mouth and immediately passed out. (my partner reported that I was unconscious for approximately 2 full minutes). When I regained consciousness I was very disoriented. (did not know where I was, what day it was) I could not stand, and could not use my arms. My partner picked me up and physically put me back in bed. I was unable to roll over on my own. (he then called my supervisor to report the event. My supervisor called him back after speaking with the Nurse who advised "bed rest and hydration") I slept on and off for the next 5 hours. at which time I attempted to sit up. I was unable to remain upright, but could sit in a recliner at that time. I was unable to hold a bottle of water on my own until approximately 2pm. I had no headache, no fever, no nausea (after the initial 5am experience) but DID experience extreme muscle weakness until approximately 2pm Thursday January 21, 2021. (too weak to chew food) Friday January 22nd, I felt "fine", but still mild tiredness. (I was told by our office manager that I should fill out an RL to report my experience) |
| 978621 | 1/27/2021 | MO | 38 | F | 1/20/2021 | 1/20/2021 | Shot recieved Wednesday. By Wednesday night, I had a headache (forehead and back of neck) and fatigue. Friday I became dizzy, and had 2 near fainting spells (this included dizziness, weak muscles, and slight loss of sight). I became achy (back and shoulders) and my headache continued. These dizzy spells and headaches have continued for 6 days. The dizziness is starting to subside, however the headache and fatigue remains. |

| 976812 | 1/27/2021 | PA | 26 | F | 1/12/2021 | 1/12/2021 | syncope; Fever; Joint pain; Weakness; Dizziness; Tachycardia; Fatigue; This is a spontaneous report from a contactable nurse (patient). A 26-year-old female patient (not pregnant) received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), lot number EL3302 via an unspecified route of administration in left arm, on 12Jan2021 17:00 at single dose for covid-19 immunisation. Previously the patient received the first dose of BNT162B2 on 22Dec2020 at 17:00, lot number EJ1685, in left arm, for covid-19 immunisation. The vaccine was administered at Hospital Facility. No other vaccine was administered in four weeks. No COVID prior vaccination. COVID was not tested post vaccination. No known allergies. Medical history included asthma and postural orthostatic tachycardia syndrome, from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. On 12Jan2021 the patient experienced syncope, fever, joint pain, weakness, dizziness, tachycardia, fatigue. The events required Physician Office visit. The patient was not treated for the events. The outcome of the events was resolving.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported syncope cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate. |
| 978630 | 1/27/2021 | CA | 63 | F | 1/26/2021 | 1/26/2021 | The patient experienced syncope after the first vaccine dose. Has been on thyroid medications for hypothyroidism and on a long-acting beta blocker. |

| 976544 | 1/27/2021 | TX | | F | 1/8/2021 | 1/11/2021 | Fainted; A spontaneous report was received from a consumer concerning a 79-year-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and fainted. The patient's medical history included diabetes, cholesterol, hypertension, and osteoporosis. Concomitant product use reported included unspecified medications for diabetes, cholesterol, high blood pressure, and osteoporosis. On 08 Jan 2021, approximately three days prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: VW7392) intramuscularly in the arm for prophylaxis of COVID-19 infection. On 11 Jan 2021, the patient fainted at 3:00 am and again at 7:00 pm. No treatment information was provided. Action taken with mRNA-1273 in response to the event was not reported. The outcome for the event, fainting, was not reported.; Reporter's Comments: This case concerns a 79 year old female subject, with medical history of diabetes, cholesterol and hypertension, who experienced a serious unlisted event of syncope. The event occurred 3 days after the first dose of mRNA-1273. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. However a definitive assessment is confounded by the patient's history of diabetes and hypertension. |

| 979162 | 1/27/2021 | FL | 65 | F | 1/25/2021 | 1/25/2021 | When I signed up for the vaccine, the website said that i was at high risk for the vaccine and would need to wait 15-30 minutes after the injection. I checked with doctor re: this warning and she felt the vaccine was still beneficial but to do my research and make a decision. I received the vaccine at the Center. I sat down as instructed. 5 minutes later, something felt off and I removed my protective visor. A paramedic came over about a minute later and asked if i was ok. I said that i didn't feel well. He said that he was going to get a chair with wheels for me and at that time i must have passed out. The next thing that i remember was waking up laying on the floor. My husband said that there were 4 paramedics in attendance. The primary paramedic was telling me that my BP was 72/60. An ekg was being run, an iv inserted and run full force. they checked my blood sugar which was fine. The primary paramedic kept talking to me to check my level of consciousness. I was there for quite a while. Not sure who the paramedics checked with, but they decided that i needed to go via ambulance to the hospital. The paramedics were very concerned that the ambulance go to the back door to pick me up so others getting the vaccine would not be frightened. I was transported to Medical Center for further evaluation. I was there for a few hours and my labwork was normal. EKG and chest xray were completed as well as cardiac monitoring. I called doctor's office the next morning to notify her of the event. It was very scary!!! |

| 974589 | 1/26/2021 | KY | | F | 1/8/2021 | 1/8/2021 | 5 - 6 bowel movements; A little achy; Passed out; Dizziness; Arm tingling; Shaking; Chest burn; Triggered acid reflux; Stomach rolling around; Vision was blurry; Eyes bloodshot; Weakness; Funny feeling; Felt like a heart attack from the bad heart burn; Headache; Sore arm; Nausea; A spontaneous report was received from a consumer concerning a 55-years-old, female patient who received Moderna's COVID-19 Vaccine, and who experienced passed out, headache, sore arm, dizziness, arm tingling, shaking, chest burn, triggered acid reflux, stomach rolling around, 5 - 6 bowel movements, vision was blurry, eyes bloodshot, a funny feeling, nausea, weakness, achy and felt like a heart attack from bad heartburn. The patient's medical history included acid reflux. Concomitant medication included lansoprazole. On 08 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number 012L20A) at 13:07 intramuscularly in the deltoid muscle of her left arm for prophylaxis of COVID-19 infection. On 08 Jan 2021, right after the first vaccination, the patient reported that she got a headache and sore arm but over all felt okay. As the day went on, she got dizzy and lightheaded. She went to bed around 22:30 but had to get up to use the bathroom. As she was getting up, she felt bad to the point where her husband asked her if she was okay, which she told him that her head felt funny and dizzy, and a couple of seconds later she couldn't see him anymore as if her vision was going blurry. Her husband took her to the couch, and she blacked out or passed out for a few seconds according to her husband. Shortly after she had aroused, her husband noticed that her eyes were bloodshot, and she said she felt weak, she was shaking, and her arm was tingly. At that time, her husband took her to the emergency room (this was about 12 hours after she got the Moderna COVID-19 shot). On arrival to the emergency room she felt confused and shaky. Shortly after arrival to the emergency room she was better and the worst of it was subsiding. The emergency room (ER) nurse said she could take paracetamol. The patient stated that she felt like she was physically there, but she was not mentally there. That day, the patient was discharged from the emergency room. Once home she had 5-6 bowel movements throughout the night (but not diarrhea), her stomach was rolling around almost as if she had a |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

stomach virus, nausea, bad acid reflux to the point where her chest really burned. She felt like she was having a heart attack from the bad heart burn. She ended up taking lansoprazole to help. On 09 Jan 2021, her head was still hurting while eating breakfast, so she took paracetamol, and it helped. She was a little achy but not a whole lot; it wasn't bad. On 10 Jan 2021, she felt a little better but did still feel weak and shaky; however, her headache was gone. On 11 Jan 2021, she had a funny feeling and dizziness. Action taken with mRNA-1273 in response to the events was unknown. The events of passed out and vision was blurry were considered resolved on 08 Jan 2021. The event of arm tingling was considered resolved on 09 Jan 2021. The event of headache was considered resolved on 10 Jan 2021. The event of shaking was considered resolved on 11 Jan 2021. The outcome of the events sore arm, dizziness, chest burn, triggered acid reflux, stomach rolling around, 5 - 6 bowel movements, eyes bloodshot, and funny feeling were unknown.; Reporter's Comments: This case concerns a 55-year-old female patient with medical history acid reflux who experienced a serious event of passed out and non-serious events of dizziness, felt weak, shaking and her arm was tingly, confused, 5-6 bowel movements through the night, nauseous, triggered her acid reflux, felt like she was having a heart attack from the bad heart burn, chest burn, vision blurry, eyes bloodshot, funny feeling, headache, sore arm, little achy and weak, within one day of the administration of the first and only dose of the mRNA-1273 (Lot number 012L20A, Exp. date: unknown). Based on temporal association between the use of the product and the start date of the reported events and the absence of any other etiology factors, a causal association cannot be excluded. The events of headache and sore arm are consistent with the known safety profile of the vaccine.

Was sitting and working on CEs for work, had taken medications for the day, but added in hydrocodone, half of a 7.5/325mg tablet and ibuprofen 200mg. Felt a severe wave of nausea. Laid my head down on my arms on the table. Do not remember getting up, but remember walking through the kitchen in front of the refrigerator, reaching up to feel my pulse, felt two beats which were too far apart and thought to myself, "I'm going to faint". Apparently I was able to walk about 6 feet further, but I don't remember it. I don't know what time I fainted, but I think I must have fallen. I woke up sometime after 7, disoriented and my head hurt, lying on the kitchen floor. My husband came to my side after I called out to him about 5 times. I was drenched in sweat and very weak. When firefighters arrived they said my heart rate was 'all over the place', from 46 to I don't know what (did not hear). Ambulance arrived around 0730. Glucose was normal. Was taken for evaluation. Was given IV NS (I think 1000mls). Labwork was drawn. CXR, CT, and EKG. ER Dr recommended I follow up with my cardiologist, as she noted mitral valve regurgitation and thought a Holter monitor would be advisable. CXR and CT normal. EKG normal sinus rhythm, but showed anteroseptal infarct of unknown age, confirmed by cardiologist who read the EKG. Also seen by my PCP at 1430, he checked my ears, as they had been hurting as well, said they were clear. Advised alternating tylenol and ibuprofen Q4-6H. Friday and Sunday 1/15 and 1/16 night sweat, TMJ pain, nauseated, headache, neckache, fatigue, shoulders sore, eyes sore, inner ear pain Sunday, 1/17 0500 woke up,</p> |

| 976114 | 1/26/2021 | TX | 72 | M | 1/21/2021 | 1/22/2021 | Moderna COVID-19 Vaccine EUA At 9:00 AM on January 22, itching, breaking out in hives on more than 50 % of the body. dizziness, and passed out.. 911 was called and I was taken by ambulance to hospital. Given fluids, and the following medications, Sodium Chloride 0.9% 1000ml by IV. methylprednisolone 125 mg by IVP, famotidine 20mg by IVP, These were started at about 11:00 AM and by 3:pm I was release to go home feeling much better |
| 976033 | 1/26/2021 | GA | 80 | F | 1/19/2021 | 1/20/2021 | The patient received the Moderna Covid 19 vaccine on 1/19/21 and reported to the pharmacy that during the night on 1/20/21, she passed out. She reported having a mild headache all day but no other problems. She was putting drops in her husband's eyes around 11pm and told him she needed to sit down that she was going to "pass out." Her husband said she did pass out and he called 911. He said she was unconscious maybe 3 or 4 minutes. She woke up alert and knew what had happened. The EMT's checked her out--said she had no temperature, blood pressure was ok, and blood sugar was 280. They told the couple they thought it was probably from the vaccine. They wanted to transport her to the ER to be "checked out" but the patient refused to go. She has not had any problems since the incident except some fatigue |
| 976007 | 1/26/2021 | CT | 45 | F | 1/20/2021 | 1/26/2021 | I woke up at 1 am to go to bathroom , I fainted in hallway , waking up husband. I then came to , didn?t feel good and vomited 4 times with no energy. The following day facial swelling at 1 am . Could be from fall . Very bad migraine until Saturday afternoon. |
| 976001 | 1/26/2021 | MI | 56 | F | 1/25/2021 | 1/25/2021 | Moderate headache immediately after vaccination, sore arm; Excedrin taken 1400 hrs. 12 Hours P vaccination: chills; light headedness w/subsequent syncope; ostensible "sneezing" during syncope (reported by family member); emesis; errythema over face, arms, chest (vasculitis-like appearance); severe headache, multiple joint pain. Vasovagal response continued 11 hrs later. Treatment: hydration as tolerated, sleep, Excedrin at 24 hrs P vaccination, and 4 hrs later. General fatigue and feeling of pre-syncope persisted between 24 hr mark and 32 hr mark P vaccination. Symptoms resolved by 36 hrs P vaccination. |

| 975887 | 1/26/2021 | MS | 38 | F | 1/26/2021 | 1/26/2021 | About 25-30 minutes after I left the site I had chills and started feeling weird. I had to pull over because I started to black out. Was seeing stars, ears ringing, sweating, and feeling heavy. Almost passed out completely. Slurring words while talking to 911. Went to ER. Have felt heavy, arm sore, heart rate high, and tired after this event today. |
| 975407 | 1/26/2021 | WA | 31 | F | 1/25/2021 | 1/26/2021 | Was fine immediately post vaccine. Drove home and proceeded with a normal rest of the day at home. Went to sleep around 10 pm. Woke up at 4 am with my arm very sore. Got up to take meds for my arm pain and once I got to the bathroom felt pale, sweaty, nauseous and had chills, very weak - an overwhelming sense of not feeling right and strong fatigue. I sat on the toilet and went to the bathroom (urination and defecation) but did not have the energy to wipe properly. I stood up and turned on the sink faucet, took my meds with a few sips of water and next thing I remember is me laying on the bathroom floor confused and with my ears ringing. I figured I had laid down but then I realized the toilet was running and the sink faucet water was still running and I looked in the mirror and had a cut bleeding on my chin that I had no idea was there. Then I realized that I must have passed out while standing at the sink. I put a bandaid on the cut and went back to bed. In the morning when I was able to assess my self better, I realized during my fall/ fainting episode I had bitten my lip, cut my chin, had abrasions on my right thigh and left shoulder and bruised my right knee and some poop in my underwear I hadn't wiped properly at the time, that's how out of it I was. I have never fainted or passed out ever before in my 31 years of life. I live alone and it was a very scary incident for me. Luckily my injuries were minor and I have recovered but I felt like I might die during the episode. My body had a very strong adverse reaction 12 hours post vaccine. |

| 975817 | 1/26/2021 | AR | 66 | F | 1/19/2021 | 1/19/2021 | Patient states worst of side effects started about 11:20pm that night. Patient went to bed after getting home about 8pm. Patient had pain that started in arm where she got shot, then hurt in right leg, and then left leg and arm. Patient passed out at one point, causing her to fall and hit head on bathroom floor. She did not seek any medical attention at that time and has not since her vaccine. She had extreme thirst from 8pm until 3am. She could not sleep due to pain. Patient was foggy after that for several days, but she is back at work today and feels much better. Patient doesn't think she had fever. She did have a lot of hot/cold flashes. Patient states she is entering information into the VAERS online system herself since she knows all her symptoms. Patient is wanting to speak to someone that knows about Mold toxicity and if it correlates to the covid Vaccine. She states she had the same symptoms when she had mold toxicity before. States she had a mold toxin dump at that time when she lived in Dallas and was given an IV which caused symptoms to stop. Patient states she will look up someone if she needs to and does not want the provider to do any leg work. She has several books and has ordered more. When this occurred before, she had hyperbaric oxygen therapy and believes this pushed toxins out of her cells into her body |
| 975800 | 1/26/2021 | MA | 40 | F | 1/21/2021 | 1/21/2021 | Roughly 25 minutes after getting vaccine I passed out and when I came to my throat felt like it was closing and I was very itchy on my neck and chest . Had hives |
| 975746 | 1/26/2021 | NY | 60 | F | 1/25/2021 | 1/25/2021 | The patient experienced syncope within 30 minutes after receiving the covid-19 vaccine. At 2:30pm, she felt dizziness, her head was spinning, weakness of the arms, and slurred speech. Her FS was at 108 (Normal), BP 195/105 (Extremely high), Pulse 91, O2 saturation was at 100%. At 2:48PM, her BP lowered to 167/92. At this time, she can smile, she can put her hands up, she can kick her feet and she can opened/closed her eyes. Due to her high BP, Doctor requested that the should go to the ER via the ambulance. |
| 975650 | 1/26/2021 | CA | 95 | F | 1/26/2021 | 1/26/2021 | Patient fainted on the toilet. EpiPen brought her back to consciousness. |

| 976123 | 1/26/2021 | NJ | 58 | F | 1/21/2021 | 1/21/2021 | Having Ehlers Danlos and Mast Cell Degranulation as well as Dysautonomia... Anaphylaxis is often referred to as slow roll and without the typical face swelling and rash. It is more subtle and can be harder to detect. And that was my experience: as follows: I became faint and briefly passed out within 2 minutes of injection. I stabilized quickly within a 30 minute hold although developed increasing nausea, I and med tech was satisfied that it might just be my dysautonomia. I spent the evening with severe headache vomiting as passed out again. I experienced throat tightening but not full closure. The next day I had flue like symptoms that I assume were normal and vaccine related. When this passed in the evening I again suffered nausea and dizziness, vomiting and throat tightening when I tried to eat. These symptoms were not similar to the flush feelings earlier in the day. The symptoms ebbed and waned for 2 days with increased frequency as I took chromalyn , Benadryl with some effect at first and ate with great care as not to introduce more allergens. I had increased chest pain, sweating, fainting, throat tightening became severe Benadryl was not effective. I was having trouble swallowing. I was forced to use an epi pen and call 911. This is a typical anaphylactic response for EDS< Mast Cell patients. It became clear that I could not get past this on my own and the symptoms were increasing. I started to shake with chills and feared shock as my chest pains increased. The epi pen injection and hospital visit via ambulance occurred Monday 1/25-1/26. I became very faint during the Ems intake with the techs having to hold me up to check vitals etc.. My HR dropped despite the Epi. At the ER I was given IV steroids, IV Benedryl and Potassium, tablets and fluids throughout the night, admitted for evaluation. |

| 971272 | 1/25/2021 | NY | 25 | F | 1/12/2021 | 1/12/2021 | Nausea; diarrhea; vomiting/Throwing up; Hot and sweaty from head to toe; Hot and sweaty from head to toe; Fainted in the bathroom; Chills and could not stay warm; could not stay warm; This is a spontaneous report from a contactable consumer (patient). A 25-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in the left arm on 12Jan2021 (reported as yesterday) around 11 AM as a single dose for COVID-19 immunization, lot number: EL0140 3-4. Medical history and concomitant medications were reported as none. First vaccine dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) was administered on unknown date via an unspecified route of administration for COVID-19 immunization lot number: EL0140. Patient stated that she experienced side effects such as vomiting, diarrhea, fainting while going to the bathroom 14 hours after receiving her second shot of the Covid vaccine. She wanted to know if these were normal side effects and if she should seek medical attention. Patient reported the side effects that she had from the second dose of the Pfizer COVID Vaccine. She has gotten no answers regarding the side effects and she wanted to speak with someone about it. She got the second dose on 12Jan2021 (reported as yesterday) around 11 AM. She felt pretty normal. By 5 PM she got chills and could not stay warm. She thought it was normal. Then over night she got really nauseous, had diarrhea and was throwing up. She was hot and sweaty from head to toe. She tried to get up afterwards and fainted in the bathroom. She was reading what the pharmacy gave her for mild to moderate side effects, and none of what she experienced are listed on there. She also stated that nausea started around 1 AM this morning. It has persisted and is intermittent. Diarrhea occurred a little after 1 AM she got up to pee. Then went back to bed. Then about 10 minutes later had to go to the bathroom, and it started then. It is still occurring this morning. It last happened around 9 AM. She has not eaten anything new. Throwing up Lasted for about 15 minutes and fainted occurred one time. Patient recovered from chills and could not stay warm on 12Jan2021, she recovered from throwing up, hot and sweaty from head to toe and fainted in the bathroom on 13Jan2021, she had not recovered from nausea, diarrhea. |

| 971989 | 1/25/2021 | TX | 70 | M | 1/15/2021 | 1/16/2021 | <p>Following are my symptoms and severe side effects and events after receiving the COVID-19 Vaccine. 1- Receive COVID 19 vaccine at 4.00 PM on 01/15/21. 2- Stay about 20 minutes after Vaccination and observe no reactions and symptoms. Dive back home. take dinner and sleep well whole night. 3- Next day morning when I wake up feel till bit of Nausea/Vomiting. 4- Take breakfast at about 10.00 AM and after that feeling of Nausea got increased and i also start feeling weakness. These symptoms remains all day. 5- At about 5.15 PM I went to take Shower. After about 2 minutes during shower, i feel shortness of Breath,pressure on chest and Dizziness 6- These Symptoms was for about 4 to 5 second and goes off. 7- After about one minute I feel second time shortness of Breath, pressure on chest and Dizziness. It was bit intensive and for a longer period for about 10 second. 8- At this point I realized that this is something serious happening to me. 9- I came out from the Vertical Shower and called my wife that I am not feeling well. She was at this time at first floor. 10- I think it is about 1 minute after when I came from shower, I feel third time shortness of Breath, pressure on chest and Dizziness. I was very severe and within a second or so I passed out and fell down into the Jacuzzi which is beside the Vertical Shower. 11- Within a minute, my wife and my son came to the scene. At this time my wife finds me unconscious with my eyes open. 12- She shouted my name and then I came into my senses and told them to get me out of Jacuzzi. 12- My wife and my son get me out and carried over to the bedroom. I was feeling no shortness of Breath and Dizziness but mild pressure on chest, shivering and chill. 13- Thanks GOD I did not get any body injury except little bit of hit at my Neck and back of the Head. 14- My wife immediately called to my Primary Care Nurse and then I talk to her explain the whole situation and then asking for advise. 15- She advise me to go to any near Hospital Emergency for any urgent Medical care. 16-A about 6.00 PM I went to Emergency. At this time I was feeling Nausea and Shortness of breath. 17- The Nurse immediately check my blood pressure, temperature, oxygen and pulse. These all was normal. Nurse also provide me IV medicine for Nausea. 18- During my stay at Emergency, I again feeling mild tightness/pressure in chest beside shortness of breath and shivering, therefore Emergency</p> |

| 969615 | 1/25/2021 | OR | | F | 1/4/2021 | 1/4/2020 | High Troponin Levels; Felt dizzy; Chest felt tight; Mitral valve filling defect; Difficulty breathing; Concern of anaphylaxis; Passed out unconscious; A spontaneous report was received from a physician concerning an approximately 28-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced the events, felt dizzy, chest felt tight, difficulty breathing, passed out unconscious, concern of anaphylaxis, non-ST segment elevation myocardial infraction, high troponin levels, and mitral valve filling defect. The patient's medical history as provided by the reporter included a history of anxiety. Concomitant medication use included sertraline, buspirone, acyclovir, propranolol, hydroxyzine and lorazepam for unknown indications. On 04 Jan 2020, prior to the onset of the events, the patient received her first of two planned doses of mRNA-1273 (Lot number: 011L20A, Exp. date: 03 Jul 2021) intramuscularly, in her left deltoid, for prophylaxis of COVID-19 infection. On 04 Jan 2020, a couple of minutes after receiving the vaccine, the patient experienced dizziness, chest felt tight, difficulty breathing, and she passed out unconscious. Due to concern of anaphylaxis, while the patient was still unconscious, she was treated with epinephrine followed by intramuscular injection of cetirizine hydrochloride. In addition, ammonia salt was used. The patient woke up briefly and passed back out. Emergency medical services (EMS) arrived and almost had to intubate the patient. The patient stayed overnight in the hospital due to lab values indicating non-ST segment elevation myocardial infraction, high troponin levels, and a mitral valve filling defect. It was noted that the patient has never had an allergy to anything, including the excipients in the Moderna vaccine. In addition, the patient had no history of loss of consciousness or anaphylaxis. Relevant laboratory tests conducted included an echocardiogram which found no issues with cardiac function and noted a mitral valve filling defect. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the events, felt dizzy, chest felt tight, difficulty breathing, passed out unconscious, concern of anaphylaxis, non-ST segment elevation myocardial infraction, high troponin levels, and mitral valve filling defect was unknown.; Reporter's Comments: This case concerns a 28 year old female patient with medical |

| 969653 | 1/25/2021 | TX | | M | 1/8/2021 | 1/8/2021 | <p>Passed out; Feeling funny, that his insides were cold; Heart rate low; A spontaneous report was received from a 32-years-old male patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and reported felt funny, his insides were cold, low heart rate, and passed out. The patient's medical history was not provided. Concomitant medications were not reported. The patient received their first of two planned doses of mRNA-1273 on an undisclosed date. On 08 Jan 2021, prior to the onset of events, the patient received their second dose of mRNA-1273 (Batch number: unknown) intramuscularly in his left arm for prophylaxis of COVID-19 infection. Afterwards, he felt funny, his insides were cold, and he passed out. His smartwatch reported that his heart rate was low. He said now he was feeling better. No treatment information was provided. The patient received both scheduled doses of mRNA-1273 prior to the events; therefore, action taken with the drug in response to the events is not applicable. The outcome of the events, felt funny, his insides were cold, low heart rate, and passed out, were recovered on 08 Jan 2021.; Reporter's Comments: This case concerns a 32 year old male patient who experienced serious events of Loss of consciousness and Chills and a non-serious event of Heart rate decreased following their second dose of mRNA-1273 (Batch number: unknown). Very limited information regarding the events has been provided at this time. Based on temporal association between the use of the product and the onset of the events, a causal relationship cannot be excluded.</p> |

| 971537 | 1/25/2021 | FL | 36 | F | 1/11/2021 | 1/12/2021 | Vasovagal syncope with asystole; Vasovagal syncope with asystole; This is a spontaneous report from a contactable pharmacist (patient). A 36-year-old female patient received the second dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EJ1686), via an unspecified route of administration in the right arm on 11Jan2021 at 14:45 at 36-years-old at a single dose for COVID-19 immunization in a hospital. Medical history included Wilms tumor from an unknown date and unknown if ongoing, Kidney resection and chemo from 1986 to an unknown date, sulfonamide allergy from an unknown date and unknown if ongoing, premature ventricular contractions (PVCs) from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. The patient previously received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EH9899) for COVID-19 immunization on 21Dec2020. On 12Jan2021 at 04:00, the patient experienced vasovagal syncope with asystole (hospitalization, medically significant). The patient was hospitalized for vasovagal syncope with asystole on unknown dates for 4 days (at the time of the report). It was reported that the patient did not receive any treatment due to the events. The clinical course was reported as follows: The patient experienced what was believed to be a vasovagal syncope with asystole; approximately 12 hours after receiving the second dose. The patient had been admitted to the hospital since all cardiac diagnosis tests were negative for structural or functional abnormalities. The patient remained in-patient at this time for initiation of therapy for frequent PVCs, which were diagnosis about one year ago; but chose not to treat at that time, as the symptoms were not affecting her lifestyle. The patient underwent lab tests and procedures which included cardiac diagnosis tests: negative for structural or functional abnormalities on an unknown date. The clinical outcome of the events was recovering. The patient did not have COVID prior to vaccination; and was not tested for COVID post vaccination.; Sender's Comments: Based on the information currently available, a possible contributory role of the suspect BNT162B2 in the development of the vasovagal syncope with asystole cannot be excluded. The event is confounded by the patient's underlying |

| 971007 | 1/25/2021 | KS | 32 | F | 1/22/2021 | 1/22/2021 | <p>premature ventricular contractions. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p> <p>FRIDAY 1/22/21- 2:30pm headache started, 3pm started feeling really tired, by 6pm started feeling achy - arm was super warm to touch and hurt a lot, went to be early due to extreme exhaustion and malaise around 9pm Saturday - woke at 4am to extreme body aches - had to move to couch to stay sitting up to be able to sleep; all day felt horrible body aches, fever, chills (was super hot but also freezing at the same time), skin felt hot to touch-almost painful, extreme fatigue, joint pain - worst in knees and shoulders, hurt to walk, had a little cough, migraine (I'd rate pain around a 10/10) Saturday night into Sunday morning - woke several times drenched in sweat, got up to use bathroom, would be freezing to the point of shaking, then 30 mins later sweating under the covers but still so cold. Continued though out night. Sunday - same symptoms but less painful (rate it around a 9/10) - went to store to get groceries with husband around 8:30pm and almost passed out, super weak and felt like puking - not sure if it was just the mask making it hard to breathe. Monday - woke drenched in sweat but not as bad as over the weekend, still achy but not as bad, headache, arm is still super sore and enlarged, hot to touch, fatigue, malaise - but able to go to work (pain down to 6/10, so definitely better than before)</p> |

A 51-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EL1284; expiry date: unknown) via an unspecified route of administration in the left arm, on 03Jan2021 at 10:00, at a single dose, for covid-19 immunization. Medical history included known allergies (unspecified). The patient is not pregnant at the time of vaccination. The patient was not diagnosed with COVID prior vaccination. The patient did not receive other vaccines within four weeks prior to COVID vaccination. The vaccine was administered in a doctor's office/urgent care. The patient experienced 3 "waves" or what her many coworkers were describing as "whooshes". The first two occurred minutes apart approximately 4-5 minutes post vaccine-last less than one minute each. The 3rd wave occurred after lunch approximately 3 hours later-lasting approximately 2 hours but not as intense as the first times. The patient further described the symptoms as "felt like a rush" (unspecified) experienced when receiving epinephrine. She was short of breath, lightheaded, dizzy, like pre-syncope as she felt like she could pass out but did not do so. The events occurred on 03Jan2021. The patient did not receive treatment for the events. The patient recovered from the events on an unspecified date. The patient has not been tested for COVID-19 since vaccination. |

| 971555 | 1/25/2021 | NC | 85 | M | 1/11/2021 | 1/12/2021 | Passed out; massive diarrhea; fell and hit his face; fell and hit his face; This is a spontaneous report from a contactable consumer. An 85-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 11Jan2021 at single dose for covid-19 immunisation. Medical history included epilepsy from an unknown date and unknown if ongoing (Caller says her father in law hasn't had seizure in years, it was diagnosed when he was a kid, 60-70 years ago). There were no concomitant medications. The reporter is calling on behalf of her father in law. She said he had his first dose of the COVID vaccine recently, she pulled this number off of the paperwork today. She says that she believes he had a side effect for it, and also he was rescheduled for his second dose. She says his second dose was supposed to be in 21 days but they rescheduled him for it at 18 days instead. She says he got the first dose on 11Jan, and they rescheduled his next for the 29th. She says she wanted to know if this was correct or ok. The reporter says that the following day he ended up having massive diarrhea, that it caused him while he was on the commode to pass out and he fell and hit his face, the best she can tell he was alone at the time. She says he did not go to the hospital for that, he got up and cleaned himself off and took a nap, and the nurse next door checked on him later on. The outcome of the events was unknown. Information on the lot/batch number has been requested. |

| 972909 | 1/25/2021 | NV | 39 | F | 1/14/2021 | 1/14/2021 | I got the first dose of the Moderna COVID-19 vaccine last Thursday (1/14/21) at clinic and had a pretty severe reaction within a few minutes of the receiving the vaccine. I didn't alert anyone because I wasn't sure if it was related to the vaccine or not. I felt hot suddenly, then very dizzy/faint, then experienced very bad tinnitus and couldn't hear any of the words being spoken around me, just muffled sounds. I felt slightly nauseous, was seeing spots, and felt very close to fainting. My pulse was racing. I did deep breathing until it subsided (which was about 10 minutes later). For the next 5 days after the vaccine, I experience extreme soreness and weakness in the left arm where the injection was given. I also had redness and itching and it was hot to the touch and slightly swollen. I had extreme fatigue and a headache and a loss of appetite. After 5 days, those subsided. 1 week after the vaccine (01/21/21), I experienced intense itching at the injection site and redness and it was hot to the touch. I also experienced intense itching on my chin and skin numbness in that area of my chin. The chin area resolved after about 4 hours. The arm itching did not resolved. i woke up on 01/22/21 with the entire left shoulder area swollen, red, hot to the touch, and extremely itchy. it lasted all day. I woke up on 01/23/21 and the swelling had gone down, but the redness spread to a larger area on the upper left arm and the itching persisted all day. I woke up on 01/24/21 and the redness and swelling was almost gone but the itching was still there and the area that had swollen up felt very bruised, but no visible bruising. Today (01/25/21) there is no more itching or redness but the bruised sensation continues. |
| 972894 | 1/25/2021 | | 55 | F | 1/11/2021 | 1/12/2021 | Intense throbbing and pain at injection site, severe nausea, got up to vomit in bathroom, fainted and hit my head, was unconscious a couple of minutes. |

| 972638 | 1/25/2021 | CA | 38 | F | 1/21/2021 | 1/22/2021 | <p>The day following the 2nd vaccination dose, I had zero symptoms other than a slightly sore injection site. Around hour 30 following the vaccination I began to feel warm, and I got up to brush my teeth and cool off in the bathroom. As I was brushing my teeth, I started experiencing an increasing ringing noise in both my ears that I thought was strange and somewhat alarming, but I didn't feel any signs of dizziness or dysphoria. The next thing I remember is waking up the bathroom floor with my husband standing over me. Apparently I experienced a complete lose of consciousness and fell to the floor, hitting my chin on the bathroom vanity as I fell and splitting my chin open, which I have zero recollection of. My husband states that when he found me, that my eyes were open, but I was staring blankly at him with a glazed over look and my whole body was limp and diaphoretic. I came too in about 30 seconds after he found me, but I was very confused, not making a lot of sense, and felt very disoriented and weak. It took about 20 mins for my fever to break, and to have the strength and power to get up and walk to bed. We changed all my clothes because I had soaked through them, and he got me into bed after cleaning/bandaging up my chin. I then slept solidly until noon the next day, which is very unlike me, but since then I have felt relatively fine with no other experiences of fever/chills/disorientation, just some continued mild fatigue off and on. After discussing with my nursing colleagues, they all had similar experiences around hour 24-30 post 2nd vaccine with fevers, chills, restless sleep, or just general malaise, but no one experienced a complete lose of consciousness, so I reached out to my PCP yesterday, and she confirmed today that I should report this to VAERS. I have never experienced any form of loss of consciousness/fainting/black-out/syncope prior to this, which is another reason I thought it was important for me to report this.</p> |

Patient panicked stating she needs air. Patient instructed to remove mask and deep breath. Assisted x 2 into w/c and taken to private observation area. EMT on site in attendance. 1349 - c/o inability to catch breath, opened back doors and sat partially outside. Mask off, on room air. BP 135/103; HR 85. Offered water, patient declined. 1356 - BP 129/95; HR 73 1405 - BP 135/111; Recheck of BP with another cuff and is 144/96; O2 sat 98% on r/a. HR 79 then 71. Denies SOB, or difficulty breathing. Talking and explaining medical history. States she feels a lot better. Patient denies injuries from being assisted to the floor. EMT does not indicate need for ambulance for further eval or for transport. Patient declines EMS for further eval. 1417 BP 118/89; HR 72 Patient states she feels fine. States she has had this vagal reaction before but not with an injection. Discussed with patient to attempt to obtain dose #2 in a private setting, however to notify wherever second dose is taken to notify staff so she can be placed in a w/c from beginning through observation. Pt. laughed, stating she will be fine. Re-stressed the need to avoid fainting and should either recline or be in a w/c for dose #2. Patient agreed. Patient stood and re-assessed. No dizziness noted. Patient ambulated to parking lot independently, accompanied by nurse. Gait steady. No SOB noted. |

| 972077 | 1/25/2021 | GA | 34 | F | 1/20/2021 | 1/21/2021 | After I received the vaccine I felt fine. Later that night I had a slight headache and the injection site was sore. I took my medicine and went to bed. I woke in the middle of the night in serve pain at the injection site and still had a headache. I went back to sleep. I woke at 8am feeling nauseous and I started trying to walk to the bathroom and tried to throw up. I passed out my husband caught me. He sat me up and put water on face. He called the 911. EMS came out and checked my blood pressure was really low 80/60 range. The night before I checked my blood pressure before taking my blood pressure pill and it was 121/80. Refused to go to the hospital and I stayed at home and just rested for a couple of hours. I went to work later that night. Every since then I have been feeling weak, dizzy, and moving slow. I feel like it I turn to fast I will fall. I have not been feeling myself. Just got new insurance and has been trying to find a new doctor and she has been unsuccessful. She is going to urgent care tomorrow. |
| 971985 | 1/25/2021 | TN | 75 | M | 1/21/2021 | 1/21/2021 | Patient was in observation area after having the 1st dose of the Pfizer COVID Vaccine. He became short of breath, complained of chest tightness, and nearly passed out.911 called at 0945AM and responded to the Center. Patient moved to wheelchair without incident due to fall concerns. Patient transported to ER via ambulance to follow up due to reaction. Treatment Rendered: Patient was assessed by EMS and placed onto stretcher. He was then transported via ambulance to local ER. |

Thought I was coming down with the stomach flu. Reaction disappeared after about an hour. |
| 969381 | 1/24/2021 | MO | 34 | F | 1/21/2021 | 1/21/2021 | COVID-19 vaccination - 2/2 in series. Reportedly, patient fainted following first dose. Approximately 5-6 minutes after patient received second dose, she become lethargic, progressing to non-responsive. A rapid response was called and patient was transferred to the emergency department. She was protecting her airway. En route to the ED, patient's eyes rolled backwards and she began having generalized tonic-clonic movement indicative of a seizure. Patient was turned onto her side until seizure activity subsided. Post-ictal state lasted approximately 5-10 minutes after seizure activity ceased and patient became alert and oriented and able to answer all questions. All lab tests and imaging were normal. |
| 968737 | 1/24/2021 | AZ | 21 | F | 1/22/2021 | 1/22/2021 | Passed out twice. Once at 6:20am was going to the bathroom and ended up on the floor going in and out of consciousness for roughly 30 minutes (boyfriend is witness) Around 9am was standing at bathroom sink fell forward with my head rested on the mirror, drooled, then passed out backwards, boyfriend was able to catch me. I was out for 10-15 seconds non responsive. When conscious again, both arms were tingling and my hands were spasmed with my thumbs stuck reaching toward my middle fingers for 5-10 minutes. |
| 967482 | 1/23/2021 | MA | 73 | F | 1/22/2021 | 1/23/2021 | 8pm tried to get up out of the bathtub, called husband he helped me to the toilet and i passed out. He helped me up and I vomited twice. Very crazy experience, I never had something happen to me like that. I only received one regular flu shot in my life no other shots. |

| 964750 | 1/22/2021 | CA | 76 | F | 1/21/2021 | 1/22/2021 | <p>Pt well until approximately 2:55am when she passed out in bathroom according to her husband. Pt was diaphoretic. Denied dyspnea, chest pain, fever, redness, or difficulty breathing. Patient: Age: 76 Years</p> <p>Additional information for Item 18: Date/Time: 01/22/21 03:19 Time of my initial contact with patient: 0319</p> <p>Mode of Arrival: Ambulance Private Medical Doctor: Triage Narrative: Pt. bib medics from home after near syncopal event in bathroom, lowered herself on the ground, no LOC/trauma. BP on medic arrival was 86/50 HR in 50s, improved to 100/68 w/ lying down and 250ml bolus. Received 1st covid vax today, has felt weak w/ diarrhea since then. Denies pain, skin pale/w/d, AxOx3, resp e/u. Chief Complaint: Syncope/Near syncope</p> <p>History of Present Illness: This is a 76-year-old female with history of CAD status post remote PCI, previous CVA on Plavix, hysterectomy, migraines who presents ER today for a syncopal event. Patient was given her first dose of Covid vaccine earlier today, per patient's primary doctor found in prior to arrival she had been very hesitant because she was concerned for triggering migraines, this was clear with her neurologist that she was pretreated with Benadryl, she states that she initially felt fine after vaccine administration, she states however later in the evening she developed 4 episodes of loose watery bowel movements and crampy abdominal pain, she states she was feeling tired and so she laid down to go to bed, she states that she woke up feeling as if she had to have another diarrheal episode, she reports that when she stood up and went to the bathroom she was not feeling well, she reports feeling very lightheaded while on the toilet and trying to have a bowel movement, she attempted to stand up however felt acutely lightheaded, she states that she sat back down on the toilet and slumped down and woke up on the ground. She denies any pain other than her abdominal pain and a sensation that she has had further bowel movements.</p> <p>Per EMS patient was noted to be hypotensive on arrival 86/50 with heart rate in the 50s, this improved with laying flat on the gurney and given a 250 cc bolus. Patient has been seen in the past for syncopal events with postural changing. She denies any new medication changes, she states that she had been drinking water throughout the day but has had a poor appetite no dysuria frequency urgency no headache head injury neck pain back pain</p> |

new numbness tingling or weakness in arms or legs no difficulty with speech Problem List & Past Medical/Surgical History: CAD (coronary artery disease) Dysuria Hysterectomy Migraine Potential stroke Stent Family History: No related illness Social History: The patient does not smoke tobacco or abuse alcohol. Allergies: Imitrex morphine (Nausea) shellfish traMADol Medications: Available Med List Reviewed Review of Systems: All other systems reviewed and are negative except per HPI Physical Exam: Vital Signs BP: 151/93 mmHg Temp (Oral): 36.4 DegC (97.5 DegF) HR: 73 bpm Resp: 18 br/min SpO2: 97 % GENERAL: Patient appears well developed, well nourished. HEENT: Normocephalic and atraumatic. EOMI. No scleral icterus. Airway is patent NECK: Supple Trachea is midline. No midline tenderness full range of motion without pain or discomfort RESP: Lungs are clear to auscultation bilaterally.  Preliminary CT head reveals no acute intracranial
 abnormality Preliminary CT abdomen pelvis revealed no
 acute intracranial abnormality other than hiatal hernia
 Chest x-ray is negative for acute pulmonary pathology
 EKG Results EKG obtained at 0323 interpreted by me
 reveals normal sinus rhythm, patient has diffuse T wave
 flattening which appears similar to previous no STEMI,
 no ectopy no heart block no WPW Brugada prolonged
 QTC Emergency Department Course and Procedures:
 Medications, IV's and Blood Products Ordered Sodium
 Chloride 0.9% (Sodium Chloride 0.9% Bolus) 1,000 mL
 once IV Bolus, Reason for Infusion = Abnormal fluid
 losses Other Orders Nursing to Initiate Saline lock
 Insertion Careset (Stat) Oxygen Therapy (Titrate for
 SaO2 > 95%) Reexamination/Reevaluation: Critical
 Care Note The high probability of sudden, clinically
 significant deterioration in the patient's condition required
 the highest level of my preparedness to intervene
 urgently. Critical care was necessary to treat or prevent
 imminent or life-threatening deterioration of the following
 conditions: cardiac failure, circulatory failure, CNS failure
 or compromise, dehydration, hepatic failure, endocrine
 crisis, metabolic crisis, renal failure, sepsis, respiratory
 failure, shock, toxidrome and trauma. I provided critical
 care services requiring my management in the following
 manner: chart data review, documentation time,
 medication orders and management, re-evaluations, vital
 signs assessments and reviewing monitor data, and
 ordering and reviewing lab tests. Aggregate Critical care
 time was 30 minutes. My time did not include minutes
 spent treating any other patient simultaneously or on
 activities that did not directly contribute to the patient's

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

treatment. It did not include time spent performing other reported procedures. Medical Decision Making: This is a 76-year-old female who presented ER today for evaluation of syncope. Patient was reportedly mildly hypotensive which improved with IV fluids. I suspect that patient had dehydration given 4 episodes of large watery stools. Patient had no recent antibiotic use and has no C. difficile risk factors, suspect this may be related to her Covid vaccine, she had no evidence to suggest anaphylactic shock, patient felt better after IV fluid bolus was able to ambulate around the emergency department without lightheadedness or near syncope. She had troponins x2 which were negative, her EKG was nonischemic and there was no evidence of ectopy or arrhythmia. Patient did have syncope and fell onto her side, she denies discrete head injury although patient is anticoagulated, CT head was obtained to rule out intracranial hemorrhage given the syncopal event. Patient CT abd/pelvis was negative for obvious cause of patient's abdominal tenderness may be related to her diarrheal illness patient will be prescribed Bentyl. She will call her primary care doctor in the morning to arrange close follow-up. She understands need for aggressive oral hydration at home. She will have low threshold to return should she develop lightheadedness syncope chest pain shortness of breath palpitations worsening abdominal pain bloody or dark stools any new or concerning symptoms. The patient presented to the emergency department with potentially life or limb-threatening symptoms. After my history, examination, and workup have decided that the patient is stable. My impression is that they are safe to go home at this time. I have reviewed ED return precautions with the patient. They understand to return if they are concerned for any reason. They will follow-up with their PCP in 1-2 days. Impression: Syncope, hypotension-improved, dehydration Plan: Discharge Follow Up Within: 1-2 days Comments: Please call your doctor in the morning to arrange follow-up with your primary care doctor in the next 24 hours. Please stay well-hydrated and eat regular meals. Please take Bentyl as needed for abdominal cramping with diarrhea. Please return to the ER if you develop worsening abdominal pain, feelings of lightheadedness passing out any new or concerning symptoms. Patient Education Syncope, Easy-to-Read

| 963802 | 1/22/2021 | FL | 68 | F | 1/4/2021 | 1/4/2021 | Diarrhea, Adult Discharge Meds dicyclomine 10 mg 1 cap, PO, QID, 20 cap Referral for suspected pre-hypertension or hypertension was given. Please note: Unless specifically stated, all procedures mentioned, tests done and medications given were performed/interpreted by the emergency physician, or were under the direct supervision of the emergency physician. This ED Note was completed using voice-recognition transcription and may contain inadvertent errors. Additional information for Item 9: Fainted; Did not feel well; Hit head; A little pain in arm; A spontaneous report was received from a 68-year-old female patient, who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced the events, fainted, hit head, did not feel well, and a little pain in arm. The patient's medical history was not provided. Relevant concomitant medications reported included ezetimibe, atorvastatin, and atenolol. On 04 Jan 2021 at 9:00 am, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 in the left arm for prophylaxis of COVID-19 infection. On 06 Jan 2021, the patient reported that she took the vaccine on 04 Jan 2021 and she did not feel anything after but a little pain in her arm. On 05 Jan 2021 around 7:00 pm, the patient went to her fridge for a drink and told her husband she did not feel very well, and then fainted. The patient reported that she hit her head and has never fainted before. No treatment information was reported. Action taken with mRNA-1273 in response to the events was not reported. The outcome for the events, fainted, hit head, did not feel well, and a little pain in arm, were unknown.; Reporter's Comments: This case concerns a 68-year-old female patient with unknown medical history, who received their first of two planned doses of mRNA-1273 (Lot unknown), and who experienced the serious unlisted event of Syncope, the non-serious listed event of Pain in extremity, and the non-serious unlisted events of Head injury and Malaise. Based on the current available information and temporal association between the use of the product and the onset of the events on the day after vaccination, a causal relationship cannot be excluded and the events are considered possibly related to the vaccine. |

| 963815 | 1/22/2021 | FL | 68 | F | 1/4/2021 | 1/4/2021 | fainted; a little pain in arm; A spontaneous report was received from a consumer concerning a 68-years-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced fainting and pain in her arm. The patient's medical history was not provided. Concomitant product use was not provided by the reporter. On 04 Jan 2021, at approximately 09:00am, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 011J20A) intramuscularly in the left deltoid prophylaxis of COVID-19 infection. On 04 Jan 2021, after receiving the vaccine, the patient felt a little pain in her arm. On 05 Jan 2021, at approximately 19:00 the patient fainted after standing up. She hit her head on the floor and had a small bump on her head. No treatment information was provided. Action taken with the second dose of mRNA-1273 in response to the event was not reported. The outcome of the events, fainting and pain in her arm, were considered unknown.; Reporter's Comments: This case concerns a 68-year-old female subject with who experienced a serious, unexpected event of fainting and pain her arm. Her medical history and con meds were not provided. The fainting event occurred 1 day after the first dose of the mRNA-1273 study medication administration, after patient stood up, fainted, and hit her head on the floor and sustained a small bump on her head. Treatment for this event was not provided. Very limited information regarding the fainting event has been provided at this time. Based on temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. |
| 967026 | 1/22/2021 | LA | 35 | F | 1/19/2021 | 1/20/2021 | Body aches leading into flushing and nausea. Then vasovagal event. Unconscious for an unknown period of time. Symptoms occurred at approximately 02:30am, no treatment sought at time of event. Dizziness and weakness continued for about another hour. No further episodes of fainting. Body aches and fatigue continued into the next day for approximately 24 hours in total, pain managed with Motrin. All symptoms then resolved. |

| 967072 | 1/22/2021 | CO | 37 | F | 1/14/2021 | 1/15/2021 | Flu like symptoms and fainting started 12 hours after receiving the vaccine and continued for about 36 hours. |
| 965942 | 1/22/2021 | PA | 31 | F | 1/8/2021 | 1/8/2021 | I received the vaccine at approximately 10:45a, I then went next door to be monitored for 15 minutes. Within a few minutes, I began to feel dizzy and lightheaded. I waited out the 15 minutes and went back to my office. When I got into my office I still felt lightheaded and I informed my supervisor. I explained to him that I was going to try and eat something and drink some water and I would feel better. I went into my office and continued to work for the next hour. After that hour, I began to feel very dizzy and "out of it" as I almost didn't know where I was at. I went to speak to my supervisor and I sat down in his office where I almost fainted. He took me back to my office where I sat with another co-worker. Duri time, I continued to feel light headed, although it came in waves. My husband drove me home, I showered, ate something and was feeling better. Around 6:00p, I began to feel lightheaded again and began to experience body aches, hot and cold flashes that would come in waves. Saturday morning, I woke up feeling better, but around 10:00a I began to experience the same symptoms. I laid down for a few hours that would get up and attempt tasks around the house, then I would ended up back in bed at 6:00p with the same symptoms again. I did meet virtually with a doctor and she explained to me to wait it out. On Monday, I met with my pcp and she informed me of the same, that these symptoms would eventually go away. Sunday, Monday, Tuesday, Wednesday, the only symptom that remained was the dizziness. At times, I still will feel dizzy for instance Saturday morning I woke up and felt pretty dizzy throughout the day. |

| 966131 | 1/22/2021 | NC | 34 | F | 12/16/2020 | 12/17/2020 | The Patient is a 34 year old female. The patient is a 34 yo female with a history of hypothyroidism who received Pfizer Covid vaccine on 16 DEC (lot #EK5730) after work. She experienced no immediate adverse effects other than about 5 minutes after vaccine receipt she experienced a sensation of ' blood rushed to my ears.' No dizziness or syncope occurred. She had no oral/face/throat/tongue swelling, no urticaria, pruritis, SOB, Wheezing, dyspnea, cough, CP, n/v/d. The following morning she awoke with pruritus to eyes, face, and urticaria to arms, thighs, chest, face and head. She was treated with 8 mgs of decadron and a dose pack. The symptoms abated. The following morning she experienced recurrence which improved with next steroid dose. She took benadryl that night. Symptoms have continued to recur as steroid wanes. |
| 966312 | 1/22/2021 | NY | 26 | F | 1/22/2021 | 1/22/2021 | Within five minutes I felt very faint and dizzy along with nausea. Then came the shortness of breath and the feeling of pins and needles which also brought itching and some minor hives with it. The dizziness, nausea, and feeling of fainting went away after about 10 minutes and I had to go to the Emergency Department to take care of the shortness of breath and hive like reaction. I was given some medications and they diagnosed it as a moderate allergic reaction to the vaccine. I was completely fine with the first one. |
| 961639 | 1/21/2021 | OH | 23 | F | 12/29/2020 | 12/30/2020 | On 12/30/2020, I experienced extreme abdominal pain and cramping, diarrhea that resulted in syncope, severe fatigue, injection site pain and swelling, nausea, dizziness, lethargy, apathy. These symptoms lasted for over a week. The only syncope episode was the morning after the vaccine. |

| 962330 | 1/21/2021 | NY | 32 | F | 1/18/2021 | 1/18/2021 | She had a history of hives and fainting when she received the pertussis vaccine. This was her first dose of the COVID-19 vaccine and she had no known allergy to components of the COVID-19 vaccine. She said she had spoken with her doctor prior to her appointment. Staff at the vaccination facility set up a precaution in case she fainted including 1:1 observation immediately following injection. She had no fainting, and proceeded to the post vaccination area after about 15 minutes, when she said she felt fine. At about 30 minutes after receiving the vaccine, she reported a rash across her chest, visible hives and hot to the touch, and she had a few areas of rash on her arms. She did not express any difficulty breathing. EMS was onsite and were immediately notified. In the course of her evaluation by EMS, she drank water, used an ice pack on rash, and took her own Benadryl and reported that she was beginning to feel better after approximately 30 more minutes. EMS confirmed that she was stable and okay to leave. On-site DOHMH medical greeter informed her about v-safe, told her to talk with her PCP, and inform people at the time of her next vaccination. At approximately 6pm, this reporter (non-medical professional) followed up with patient to check on her symptoms. She expressed that she was feeling better, the rash subsided but that her hands were swollen. This reporter reiterated the importance of following up with her regular medical provider. |
| 961725 | 1/21/2021 | MD | 21 | M | 1/20/2021 | 1/21/2021 | Headache and pain in arm that injection was given in then passed out |

| 960569 | 1/21/2021 | KS | 38 | M | 1/12/2021 | 1/12/2021 | About one hour after shot, I fainted while going up stairs to go to work. I woke up on stairs. No head injury. This was around 1200pm on 12 JAN. I began to feel ill. Arm hurt, headache, weight on chest. Body hurt. I went to bed early. I woke up on 13 JAN and felt worse. I stayed in bed until around 1300. I got up and went and sat in my office to work. At around 1700, I went to go get my children from a neighbors yard to bring them for supper. I made it to my back yard before feeling to tired to continue. I went inside and laid down. At around 1900 or 1930, I was putting my kids to bed. I then fainted once more. I don't know how long I was out each time. I don't think I hit anything with my head. I got up and went to my bed and texted a Doc. |

| 961479 | 1/21/2021 | FL | 55 | F | 1/7/2021 | 1/8/2021 | several fainting spells because of everything going on; elevated HR in the 130's; Uncontrollable chills; fever of 102.8; pain all over my body; intractable vomiting; This is a spontaneous report from a contactable nurse (patient). A 55-year-old female patient (not pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), lot EL0140, via an unspecified route of administration in left arm on 07Jan2021 10:45 at single dose for covid-19 immunisation. Medical history included covid-19 on an unknown date prior vaccination. There were not known allergies. Covid was not tested post vaccination. Concomitant medication included vitamin D; vitamin E. On 08Jan2021 at 02:00 the patient experienced several fainting spells because of everything going on, uncontrollable chills, fever of 102.8, pain all over the body, elevated heart rate in the 130's, and intractable vomiting. The patient was not treated for the events. The outcome of the events was resolved in Jan2021.; Sender's Comments: Based on the time association, all events are reasonably related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate. |
| 961397 | 1/21/2021 | NC | 50 | F | 12/16/2020 | 12/16/2020 | She report receipt of vaccine and 30-45 minutes later experienced severe headache, nausea, scratchy throat and loss of voice and breathing was 'heavy'. She reports pallor, increased heart rate and near syncope. She denies pruritis, urticaria, flushing, watery eyes, face/tongue or lip swelling, CP, cough. She was seen in ER and treated with zofran, pepcid, solumedrol, monitored and then released. ER records note tachycardia at 107 but otherwise normal VS and exam. . |

| 961281 | 1/21/2021 | MI | 44 | F | 12/19/2020 | 12/19/2020 | near syncope; Sinus Tachycardia; Hypothyroidism; tested positive for Covid 19; tested positive for Covid 19; lost weight; No sense of taste or smell; No sense of taste or smell; losing hair; heart rate started increasing; high blood pressure; Increased cough; Sleepy; tired; Headache; This is a spontaneous report from a contactable other healthcare professional (patient) through the Medical Information Team and Pfizer-sponsored program Pfizer First Connect. A 44-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EL0140), intramuscularly on the arm on 19Dec2020 11:15 at a single dose for COVID-19 immunization. Medical history included tachycardia and stroke from 2019 and diabetes mellitus diagnosed in summer of 2020 and ongoing. Family medical history included father had type 2 diabetes. Concomitant medication included metformin hydrochloride, sitagliptin (JANUMET) for diabetes. The patient previously took regular flu shot and had body aches; it did not happen at the year of report but in years past she did have it. The patient took the COVID vaccine for precaution as she was a healthcare worker/paramedic and stated there was no prescriber. She received the vaccination at a health department facility, not a military facility. She had no previous immunizations and no additional vaccines were administered on the same date as COVID-19 vaccine. The patient received her first dose of COVID-19 vaccine on 19Dec2020 and after nine days, she tested positive for COVID-19 on 30Dec2020 and had an inpatient hospital stay. She mentioned she was so happy that she did not have any symptoms for those days. She stated that she got the shot on the 19th and later that evening was when she started having symptoms. She tried to sleep and it woke her up, she felt sleepy, tired and experienced headache on 19Dec2020 20:00 to 21:00. On 28Dec2020 23:00, she had an increased cough. She initially had increased cough from wearing mask and was having post nasal drip, then she got wet cough and that was when she decided to get tested. She went back and forth on dates; stated she was confused with the dates because of being in the hospital, it had been a while and the dates were all meshing in together. Her specimen was collected and they did the test on 29Dec2020 then found out that she tested positive for COVID virus with a COVID test nasal swab |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

on 30Dec2020 17:30. She mentioned she lost weight after she got COVID, had no sense of taste or smell on unspecified dates. She did not know if it was related to her thyroid but she started losing hair and her heart rate started increasing on Monday, so they took her off all her meds and said the COVID was doing crazy things to the body. She had to go on Carvedilol for the sinus tachycardia and had high blood pressure now. This was all new after she tested positive. She has had bouts of tachycardia before and did have a heart monitor as she had a stroke last year. So those have never been persistent or symptomatic. If she did have a high heart rate, it always went down. This one was symptomatic. She did fine the whole week after the shot, just had that little bit of sleepiness, was tired, and had a headache. The patient reported near syncope with sinus tachycardia due to COVID-19 and hypothyroidism on 08Jan2021 14:30 to 15:00, which required hospitalization from 08Jan2021 to 10Jan2021 (2 days). ER or physician's office was required. She never went to the ER for the vaccination, it was just for the near syncope with sinus tachycardia due to COVID-19 and hypothyroidism that she went and was then admitted to hospital. She just got out of the hospital the day before report (10Jan2021), was there for two days and was still recovering. She was supposed to receive her second vaccination on the day of report however her doctor did not know if she should get the second dose due to double antibodies. She did not ask if she still had the virus or it went away. She has not been to work in two weeks. Outcome of the events tested positive for COVID virus was not recovered; near syncope with sinus tachycardia due to COVID-19 and hypothyroidism was recovered with sequel; sleepy, tired and headache was recovering; while the remaining events was unknown.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

| 961215 | 1/21/2021 | NC | 77 | M | 1/17/2021 | 1/17/2021 | The patient reported a history of syncope episodes with injections in the past. He reported that he vomited and passed out with his last four vaccines- flu and pneumonia. This time he was given his vaccine at 9:45 am and was sent to "high risk" observation and was monitored for 30 minutes. He experienced hypotension and tachycardia but did not faint. He was evaluated by the EMS at 10:10 and transported to the ED at 10:39 am. Upon arrival, his systolic BP was 90 mmHg with normal heart rate. He was monitored and discharged home with the final diagnosis of vasovagal syncopal response. |
| 961122 | 1/21/2021 | IN | 30 | F | 1/19/2021 | 1/19/2021 | I had mild to intense sensitivity to light within 5 hours of the vaccine. Around 9pm the night of my second and final dose, I could not settle. I tried to sleep under my usual schedule and routine. I kept waking up for no apparent reason. I felt like my body would rest but my brain never actually fell into sleep. I was not able to achieve REM sleep until around 7am. I woke up late around 11am feeling like I passed out from sleep deprivation. I woke feeling like I had a strange "hang over". I felt dizzy and light headed. I had a general feeling of being unwell. I had a pressure in my head above my temples that circled my head to the back of my crown area. |
| 961079 | 1/21/2021 | CA | 85 | F | 1/13/2021 | 1/20/2021 | 1 week after receiving vaccine. 85 year old patient experienced fainting and very low blood pressure. |
| 960944 | 1/21/2021 | NC | 41 | M | 1/19/2021 | 1/20/2021 | Started with flu like symptoms, chills, aches, etc. For about 12 hours. Then I rapidly spiked a 102.7 fever and became so physically weak I felt paralyzed. Oxygen saturation dropped into the low 90s and I began to have labored breathing. I made an attempt to stand up and urinate, then passed out and collapsed. Ems came to the house and checked me out. I declined their offer to go to the hospital because I broke the fever, was breathing better, and had no concussion signs from the fall. |

| 963248 | 1/21/2021 | WV | 41 | F | 1/1/2021 | 1/14/2021 | <p>Within first 15 min my throat started to feel like it was closing up. My tongue also felt like it going towards the back of my throat and I was dizzy/lightheaded. It lasted. About 5/7 min. It felt like was easing up so the school nurse told me wait an additional 15 min to be sure I was ok. She also took my blood pressure and said was normal. Dr. a pharmacist brought me orange juice a d said maybe was just low blood sugar. I said it felt similar to when my epidural during last delivery was up too high and my throat closed up and I couldn?t breathe. About ten min later it began again. I tried to get up and walk around some and I felt a little better at first but then started to get significantly worse. I felt like I was struggling to breathe and tongue was swollen feeling and stuck to back of mouth as if it was paralyzed. I say back down and my blood pressure was high (just told bottom number was 106). I was moved to another room to lie down and pharmacist mentioned using epi pen or benedryl shot. I had to sit up and almost passed out. I was having difficulty breathing. Not because of my lungs but my throat and tongue seemed frozen. He decided to give me a 25 mg Benadryl shot but had me drink it. It had a horrible bitter taste and made my throat and tongue numb. At this point it was about 12:30. My administrator called a coworker to drive me home. I decided to leave about 29 min after I had the benedryl. I could still feel that my throat was somewhat tight but it had improved enough that I didn?t think I was in danger of not being to breathe again. I went home (15 min drive) and by then my throat felt a lot tighter. I took 25 mg more of benedryl and it felt better. About four hours later it became tight again and I took 50 mg of benedryl. Through out all this I had severe pain at site of injection in my left arm, dizziness, nausea, and headache.</p> |

| 962617 | 1/21/2021 | CA | 48 | F | 1/12/2021 | 1/13/2021 | Patient received #2 COVID-19 vaccine 1/12/21 and slept through the night. When she was standing at the kitchen sink making breakfast at 10:00 am on 1/13/21 she fainted and woke up on the floor. Her child stated that she had fallen to the floor. She did not hit her head. Patient had an appointment to see her PCP the following day concerning something else. She did relay this information to her PCP who is asking that she follow up with a cardiologist. The PCP had no opinion if the vaccine may have caused her syncope. She currently has a appointment with a cardiologist. |
| 964020 | 1/21/2021 | CA | 38 | F | 1/5/2021 | 1/5/2021 | Was completely fine about 13-15 I got dizzy and blacked out. I was not able to talk. I don't think I completely passed out but everything went black. Spent a couple hours on a gurney being monitored. My blood pressure (normally low/normal) went up to 170/101. And my heart rate was in the 140s. My oxygen saturation at one point was 82% but I was not having any trouble breathing and was breathing normally. I had a terrible headache and was shaking uncontrollably for about 20 min. Eventually I felt well enough to go to work. About five hours after my shot, I passed out again. I was taken to emergency room. My blood pressure was high and my heart rate was still elevated. They ruled out anything being wrong and eventually sent me home. I had a migraine and fatigue for two days. I felt tired for two weeks. And everything that usually hurts, hurt extra bad. |
| 963006 | 1/21/2021 | AL | 85 | M | 1/13/2021 | 1/18/2021 | bilateral neck pain, low back pain, Left arm pain. Pt reports he "passed out" at ER. Pt states he went to the ER at 6:00 due to symptoms- Pt reported all testing in ER came back normal |
| 962613 | 1/21/2021 | CA | 48 | F | 1/12/2021 | 1/13/2021 | Employee received #2 COVID-19 vaccine 1/12/21 and slept through the night. When she was standing at the kitchen sink making breakfast at 10:00 am on 1/13/21 she fainted and woke up on the floor. Her child stated that she had fallen to the floor. She did not hit her head. This employee had an appointment to see her PCP the following day concerning something else. She did relay this information to her PCP who is asking that she follow up with a cardiologist. The PCP had no opinion if the vaccine may have caused her syncope. She currently has a appointment with a cardiologist. |

| 957831 | 1/20/2021 | | 37 | F | 1/16/2021 | | 37y female with history of anxiety disorder who presents to ED with chief complaint of feeling shaky, hot, and racing heart after receiving 1st dose of Moderna COVID-19 vaccine. Patient reports receiving injection, subsequently walking to the check out line and suddenly feeling hot, tremulous, and tachy. She endorses tingling and numbness in bilateral upper extremities, diaphoresis, heart palpitations, and blurry vision. She denies HA, n/v chest pain, SOB, hemoptysis, syncope, loss of consciousness, bowel incontinence, and bladder incontinence, HR improved, patient left ED with no concerns |
| 958743 | 1/20/2021 | NC | 69 | F | 1/20/2021 | 1/20/2021 | Patient is a 69 y.o. female with history of multiple medical problems as indicated below including rheumatoid arthritis. She is a non-smoker. She tells me she has "a heart condition" and is followed by a cardiologist. She tells me she was in her usual state of health and took her COVID-19 first vaccine today. Approximately 30 seconds later she noted chest tightness/burning that has been constant. It is rated 9/10 at maximum and improved to 5/10 after about 10 to 15 minutes. She also states, "my eyes feel funny. I feel cold. I am dizzy." She endorses palpitations and dyspnea. She denies any abdominal pain, nausea, vomiting, fevers, diaphoresis, headache, cough, rash, or syncope. She does have a history of seafood allergies and had similar reactions after eating seafood. She tells me 3 years ago after a flu shot she fainted. She tells me the past 2 years after her flu shot she had nausea or vomiting. She tells me she fell yesterday and hurt her hip but she did not hit her head. No LOC. She tells me she takes baby aspirin nightly. Family history: Mom and dad both died at age 82 from lung cancer. They both had heart disease. She was sent back from the vaccination area to urgent care to be evaluated after her reaction to the COVID-19 vaccine. |
| 957972 | 1/20/2021 | IN | 33 | F | 1/18/2021 | 1/18/2021 | Onset 10-12 hours after dose on 1/18/21 Body aches, chills awakening from sleep. Fever 100.5 after acetaminophen. Weakness, dizziness, mild Pre-syncope, nausea. Persisted through the night and early morning and gradually improving the next day. 24 hours after symptom onset, temp was still 99.5. Much improved with residual generalize muscle soreness upon awakening on 1/20/21 |

| 958841 | 1/20/2021 | PA | 65 | F | 1/7/2021 | 1/9/2021 | <p>passed out; dizzy; hit the ground; nausea; pain at injection site; fever; chills; tired; severe headache; vomiting x 2; cold; experienced orthostatic hypotension; This is a spontaneous report from a contactable other HCP. A 65-years-old female patient started to receive bnt162b2 (BNT162B2; Lot # EK9231) vaccine , intramuscular in the left arm on 07Jan2021 11:00 at single dose for Covid-19 immunisation . Medical history included rubber sensitivity (Latex). The patient's concomitant medications were not reported. On 09Jan2021 12:00 the patient experienced orthostatic hypotension , passed out with outcome of recovered , dizzy with outcome of recovered , hit the ground with outcome of recovered. These events were considered serious because medically significant. On 09Jan2021 12:00 the patient also experienced the following non serious events: nausea with outcome of recovered , pain at injection site with outcome of recovered , fever with outcome of recovered , chills with outcome of recovered , tired with outcome of recovered , severe headache on with outcome of recovered , vomiting twice with outcome of recovered , cold with outcome of recovered. The reporter stated the patient attempted to get out of bed and she passed and hit the floor. Caller states she think she may have experienced orthostatic hypotension. Caller stated if she had stayed in bed she probably would not have fallen. Her husband found her laying in vomit The patient underwent lab tests and procedures which included body temperature: 99.6 fahrenheit on unknown date.; Sender's Comments: Based on a chronological temporal association a causal relationship between events orthostatic hypotension , passed out dizzy and falling down and BNT162B2 vaccine cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p> |

| 957700 | 1/20/2021 | | 26 | F | 1/13/2021 | 1/13/2021 | I had been lying down for 1-2 hours. When I got up, I suddenly became lightheaded and nauseous. I had to sit on the floor to steady myself. I became extremely sweaty with chills and my entire left arm (side of injection) became numb and tingly. The episode lasted approximately 20 minutes, and I was symptom-free within an hour. I never fainted or vomited. |
| 959929 | 1/20/2021 | | 70 | M | 1/17/2021 | 1/18/2021 | Narrative: Patient seen in ED 1-17-21 with c/c of "bloating with epigastric pain". Patient with complicated medical history including stage 1B pancreatic cancer (was currently on chemotherapy mFOLFIRINOX), and a leadless permanent pacemaker implantation on 1-11-21 for long episodes of SR with complete heart block following symptoms of syncope (other cardiac history: CAD s/p CABG 2009, PAF, and HTN). Regarding ER visit for epigastric pain, nothing notable was found on workup and patient was to discharge home to rest. There were available doses of COVID-19 Vaccine following a vaccine clinic that same day, and patient was offered and agreed to a dose of vaccine. Patient was monitored for 15 minutes post vaccine with no notable issues. The following day, Monday 1-18-21, patient's caregiver called facility at 22:30 to report he had a fever of 102.8 degrees and that he had been "feeling kind of bad all day". Patient was advise to seek urgent medical care and reported back to ED on 1-19-21 at 00:55. Patient was admitted for SIRS (tachycardia and febrile) -- patient also reported diffuse myalgia. WBC WNL, CXR unremarkable for infection, UA neg for bacteria, LFTs WNL, blood cultures negative. Procalcitonin elevated at 17.8 -- suggesting inflammatory response. Patient initially reported feeling better on the morning of 1-19-21, but around 13:00 began rapidly declining (confusion, unable to walk) and started experiencing EKG changes (9 beats of SVT). Patient then coded and resuscitation was attempted for approximately 30 minutes. Patient did not survive the code. Coroner has been notified and family is considering autopsy at time of this report. |

| 958843 | 1/20/2021 | WA | 58 | F | 1/9/2021 | 1/10/2021 | <p>I began to pass out and yelled for my husband, he said when he came in I was sitting on the toilet with my head back, eyes rolling back not responsive.; I had my 2nd vaccine at work early Sat the 9th and felt increasingly worse all day; I woke up at midnight and felt extreme malaise; I was covered in sweat; vomited; I checked my temp and it was 99.7°F; sore; I think I had either a seizure or a vasovagal response.; This is a spontaneous report from a contactable nurse (patient). This 58-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot EJ1685 or FJ1685), intramuscular at single dose in the left arm on 09Jan2021 06:00 for Covid-19 immunisation. Medical history included atrial fibrillation on unknown date (1 episode), allergic to Keflex. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot EJ1685 or FJ1685), intramuscular in the left arm on 22Dec2020 for Covid-19 immunisation. On 10Jan2021 01:00 AM, the patient experienced: I began to pass out and yelled for my husband, he said when he came in i was sitting on the toilet with my head back, eyes rolling back not responsive (loss of consciousness) (medically significant), I had my 2nd vaccine at work early sat the 9th and felt increasingly worse all day (feeling abnormal), I woke up at midnight and felt extreme malaise (malaise), I was covered in sweat (hyperhidrosis), vomited (vomiting), I checked my temp and it was 99.7°F (pyrexia), sore (pain), I think I had either a seizure or a vasovagal response (seizure). No treatment required. The outcome of the events was recovered. The events were described as follows: I am healthy RN with no active medical problems. I had my 2nd vaccine at work early Sat the 9th and felt increasingly worse all day, I expected this so was not alarmed and went to bed around 10pm. I woke up at midnight and felt extreme malaise and went to the bathroom in case I might vomit, etc. and I tried to have a BM. I began to pass out and yelled for my husband, he said when he came in I was sitting on the toilet with my head back, eyes rolling back not responsive. He yelled at me for about 10 seconds and I came to, I was covered in sweat. I asked him to walk me back to the bedroom where I again passed out, fell to the floor and hit the bed, then was unresponsive</p> |

| 960034 | 1/20/2021 | CA | 55 | F | 1/13/2021 | 1/20/2021 | again for about 10 seconds then came to again and vomited. After this I felt completely relieved of my malaise. I checked my temp and it was 99.7°F. After this I was sore but otherwise completely okay, the next day I had a temp of 99.5°F. Today I am back to normal. I think I had either a seizure or a vasovagal response. The vaccine was administered at Hospital Facility. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. The patient had not been tested for COVID-19 since the vaccination. The patient was not pregnant at the time of vaccination.; Sender's Comments: Based on the close temporal relationship, the association between the event "began to pass out" with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate. |
| 960034 | 1/20/2021 | CA | 55 | F | 1/13/2021 | 1/20/2021 | Red, raised bump where injection was administered, the circumference is about 1/4 inch. Directly below the injection site there are approximately 8 distinct scattered red raised dots(bumps) surrounded by cloud-like formation of swollen, also raised dark pinkish skin (surrounding the red bumps), although no distinct borders between the swollen , raised pinkish skin. The size of this swollen area is about 2 inches in diameter, right below the injection site. The said area is very warm to touch, but no pain, however it is very itchy. The bumps do not appear to contain fluid. No break in the skin or bleeding is evident. No nausea, no fainting, no dizziness experienced. However, slight headache experienced. Registered nurse on call recommended washing the area with warm water, applying cold compress and placing steroid cream |
| 954699 | 1/19/2021 | OR | 35 | F | 1/15/2021 | 1/15/2021 | After 5-8 minutes I suddenly became hot/sweaty, pale, dizzy, nauseous, sudden drop in blood pressure, syncope. I was given epinephrine and a rapid response team was called and I was taken to the ED |

| 955933 | 1/19/2021 | UT | 53 | F | 1/11/2021 | 1/12/2021 | I experienced chills, body aches, back pain, dizziness, nausea, dry heaves and passed out. When I passed out, I bit my lower lip and it bled quite a bit. I had brain fog, and couldn't come up with the correct words. Also, I could not sleep that night, at all without taking a few sleeping pills. It has been a week since this happened and I still can't sleep on my own. I used to be able to go right to sleep without any sleeping pills within about 5 min after laying down at night. |
| 955926 | 1/19/2021 | KS | 25 | F | 1/13/2021 | 1/18/2021 | Syncope Woke up from a nap, stood up about 1 minute later I started seeing black and woke up on the floor. Went to ER and all tests and labs were normal. |
| 955899 | 1/19/2021 | CA | 28 | F | 1/15/2021 | 1/15/2021 | blood pressure drop, cold body, sweaty/clamy, dizziness, loss of hearing, shortness of breathe and unconsciousness/fainting. This happened 4 hours after vaccine was administered with a duration of 5 minutes. |
| 955313 | 1/19/2021 | MD | 36 | F | 1/14/2021 | 1/14/2021 | Day of vaccine, headache, feeling of fainting, weakness, feeling of being nauseous. Felt better after eating. Next day, felt very weak, had headache in forehead and eye area, bit of dizziness. Throughout day arm got feeling bad and extremely painful with long sleeve on. Could not move arm due to pain. Got a bruise in the puncture area, 2 finger underneath got very hard and slightly red, not rash but raised and hard. Throughout the next day, was going away, and through the night able to raise arm normally, but still had bump and redness until Sunday. Still slightly red, but has lessened and almost gone, but still has bruise which is not unusual for her. Also had itching and was painful to scratch, could only lightly touch. All has resolved. |
| 955214 | 1/19/2021 | OH | 22 | F | 12/28/2020 | 12/28/2020 | Right after I felt fine.. I felt nauseas . Later that night , I was really dizzy, Fainted, nauseas, I felt feverish |

| 955179 | 1/19/2021 | TN | 79 | F | 1/2/2021 | 1/4/2021 | Two days after her shot, she was sitting down working on her computer paying bills. She became nauseas and dizzy and then fainted. She hit the tile floor. |
| 955138 | 1/19/2021 | | 21 | M | 1/19/2021 | 1/19/2021 | Near syncope 2 minutes after vaccine. Patient caught by personnel prior to falling. |
| 955070 | 1/19/2021 | WV | 31 | F | 12/23/2020 | 12/28/2020 | She began to have full body urticaria, facial and lip swelling, fever, diarrhea, nausea, and vomiting 5 days after receiving dose 1 of Moderna COVID vaccine. She reports at that time she was experiencing dizziness, but denies syncope. She was given Solu-Medrol 125mg IM and this helped. |
| 954979 | 1/19/2021 | IN | 33 | F | 1/16/2021 | 1/17/2021 | Syncope Fatigue Malaise Chills Weakness when walking Dizziness Lethargic |
| 956019 | 1/19/2021 | MN | 32 | F | 1/15/2021 | 1/15/2021 | Employee received the Covid 19 vaccine around 4pm on 1/15/21. Employee waited 15 minutes then returned to the floor her shift. Around 5:15 employee felt dizzy and has slight headache and stomachache. Employee passed out and hit head on floor and was not breathing. RN Charge at time called code blue and started compressions and gave employee O2. 911 was called, paramedics arrived and transferred via ambulance . |
| 955000 | 1/19/2021 | FL | 42 | F | 1/8/2021 | 1/8/2021 | Patient was administered 2nd vaccine on 1-8-21 by a nursing student. During 15 observation period, arm began to feel cold at injection site area. At that point the patient realized the vaccine was given toward the back of upper left arm near the fatty tissue instead of toward the middle of the arm. Approximately 20 min after vaccine administration, patient became short of breath, dizzy, light headed, and throat felt a little swollen and almost passed out. A rapid response was called and the patient was seen by Occupational Health. The patient's BP and heart rate were elevated but normalized during observation in Occupational Health. At this time, the patient did not feel they needed to be seen in the emergency department. The patient was discharged home at this time. 12 hours after the shot, the patient began experiencing normal side effects from the vaccine. The nursing student was informed of administration at the incorrect site. |

| 957185 | 1/19/2021 | OH | 48 | F | 1/15/2021 | 1/16/2021 | I went to bed Friday night around 10:00PM. I woke around 12:30AM with a throbbing headache, sore throat, post-nasal drainage, body aches, chills, fever, sweating, weakness and nausea. I went down to use the bathroom and then back to bed but could not sleep due to the throbbing headache and chills. I got back up around 2:30AM and soaked in a warm bath. I went back to bed around 4:30AM. I was able to go to sleep. I slept until around 8:30AM. At that time, I drank some water and went back to sleep. I slept until approximately 10:30AM and started drinking Powerade Zero. The Powerade was taken to bed and sipped on when I would stir and change positions. I slept until approximately 2:30PM, when I got up to use the bathroom. I urinated, washed my hands and went to walk out of the bathroom when everything went black. I remember yelling for my husband but then nothing else until I heard him yell my name several times and I was lying on the floor in the doorway of the bathroom. I passed out. I was sat up in the recliner and monitored. Above symptoms continued. Tylenol and Motrin were alternated every 4 hours for the fever. |
| 956010 | 1/19/2021 | ME | 29 | F | 1/18/2021 | 1/18/2021 | Symptoms within 15 minutes of vaccination. Staggering, flushed and dizzy. Low pulse. Passed out while sitting in the chair while waiting to go to ED. Regained conscious within 1 minute, disorientated, complaining of chest pain. Taken to ED - thought to be a vasovagal episode. |

| 954426 | 1/19/2021 | IL | 43 | F | 12/29/2020 | 12/31/2020 | <p>Hospitalized for stroke on 31Dec two days after vaccine.; sudden loss of hearing to right ear; dizzy and lightheaded/severe dizziness/felt like fainting; difficulty breathing; vomiting; This is a spontaneous report from a contactable nurse (patient). This 43-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), (Lot number: EL1285) via intramuscular route on 29Dec2020 14:30 at single dose on the left arm for COVID-19 immunization. Medical history included anxiety. No known allergies. Concomitant medications were not reported. Patient was not pregnant. Facility type vaccine was Nursing Home/Senior Living Facility. No other vaccine received in four weeks. Patient hospitalized for stroke on 31Dec2020 two days after vaccine (Days of hospitalization: 4). Day of vaccine-6 hours after patient had dizzy and lightheaded for about 45 min then went away. On 31Dec2020 at 19:15 had sudden loss of hearing to right ear and severe dizziness, difficulty breathing, vomiting, and felt like fainting. Paramedics were called-sent to ER, had CTA which showed partial blockage and received TPA. Treatment included TPA, fluids, medications, hospital stay, outpatient follow ups, physical therapy. Patient was not diagnosed with COVID prior to vaccination. Patient has been tested for COVID post vaccination. The patient underwent lab tests and procedures which included Nasal Swab: Negative and Pixel: Negative on 08Jan2021. Outcome of the events was recovering.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported events including stroke, dizzy/lightheaded/felt like fainting, difficulty breathing, vomiting, and sudden loss of hearing to right, and the administration of the COVID-19 vaccine, BNT162B2. More information regarding the patient's underlying medical conditions, relevant lab tests would be helpful for the Company to make a more meaningful causality assessment.</p> |

| 951972 | 1/18/2021 | KY | 69 | F | 1/8/2021 | 1/9/2021 | I felt quite sick, like I had the flu; became very lightheaded and dizzy; passed out; felt quite sick; This is a spontaneous report from a contactable consumer (patient). A 69-year-old non-pregnant female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 08Jan2021 at 12:30 at single dose in left arm for covid-19 immunization. Medical history included R.A.D., osteopenia, migraine with aura, the patient had previously suffered episodes of vasal vagal syncope when she got the flu or other severe illnesses, and the patient was diagnosed with COVID-19 prior to vaccination. Concomitant medication included atenolol, atorvastatin, azelastine, and fluticasone. The patient previously took gramicidin, neomycin sulfate, polymyxin b sulfate (NEOSPORIN) and experienced allergies. The morning after receiving the vaccine, she felt quite sick, like she had the flu. When she got up from bed and went to the bathroom to urinate, she became very lightheaded and dizzy. She attempted to return to bed, but passed out on the bedroom floor before she could get to the bed, and seized while she was unconscious. Once she came to, she was helped to bed and, after about 90 minutes, felt much better, and got up, and ate food and had coffee. All events occurred at 07:30 AM on 09Jan2021. All events were reported as non-serious by reporter. The patient did not receive treatment for the events. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient has not been tested for COVID-19 since the vaccination. The outcome of the events was resolved in Jan2021. Information on the lot/batch number has been requested. |
| 953085 | 1/18/2021 | MN | 24 | F | 1/15/2021 | 1/16/2021 | Dizzy, nauseous, fainted, emesis, severe sweating from 6am-8:30am |

| 951973 | 1/18/2021 | VA | 30 | F | 1/8/2021 | 1/1/2021 | <p>Blacked out; Fainted; Felt very unwell; Nauseous; Chills; Fell; Knocked out, hit her nose, started to bleed; Humongous scar on her nose; In her hand there's a rash with different dots/red; She has petechiae/rash on the forearm; hit her face; knocked out, hit her nose; This is a spontaneous report from a contactable physician. This physician reported that a 30-year-old female patient (daughter) received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 08Jan2021 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced blacked out, fainted, felt very unwell, nauseous, chills, fell, knocked out, hit her nose, started to bleed, humongous scar on her nose, in her hand there's a rash with different dots/red, she has petechiae/rash on the forearm, all on an unspecified date in Jan2021. The Caller wanted information on side effects specifically looking at platelet or clotting or bleeding issues. Her daughter, (female, age 29 date of birth) received the 2nd dose of Pfizer vaccine, received it at the (State name), last night. She felt very unwell, nauseous, chills, and then blacked out, fell, knocked out, hit her nose, started to bleed; fainted and hit her face, didn't stop bleeding for 2 hours. There's a humongous scar on her nose. It took 2 hours to stop bleeding. She's going to urgent care today. Her daughter was healthy, yesterday was 2nd dose. In her hand, there's a rash with different dots/red. She has petechiae/rash on the forearm. Thankfully it (bleeding) did stop. The outcome of events for 'knocked out, hit her nose, started to bleed' was resolved on an unspecified date, for other events was unknown. The case was reported as non-serious. Information on the Batch/Lot number has been requested.; Sender's Comments: Based solely on a chronological association a causal relationship between events blacked out and fainted and BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), cannot be completely excluded. The case will be reevaluated should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly</p> |

| 951979 | 1/18/2021 | IN | 30 | F | 1/7/2021 | 1/1/2021 | fist dose on 21Dec2020, second dose on 07Jan2021; pain and stiffness radiating from injection site all the way down arm,into breast, and middle of back; pain and stiffness radiating from injection site all the way down arm,into breast, and middle of back; pain and stiffness radiating from injection site all the way down arm,into breast, and middle of back; Started having chills; Severe headache; collapsed on the way back to bathroom and was unable to get up for about 20 minutes; tachycardia; extremely fatigued entire day; This is a spontaneous report from a contactable Pharmacist who reported for herself. A 30-year-old female patient received her second dose of BNT162B2 (Pfizer/ BioNTech Covid-19 vaccine, lot number Ej1685) at a single dose at 09:45 AM 07Jan2021 at left arm for Covid-19 immunization in a hospital. The patient had her first dose of Pfizer Covid-19 vaccine on 21Dec2020 at 12:00 PM at left arm, and experienced very mild reactions which included mild pain at injection site and runny nose/sneezing day after vaccine. The patient had a medical history of rash to penicillin as a child. Concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to her first dose of Pfizer COVID vaccine. In the evening of second vaccine (around 17:00), pain and stiffness radiated from injection site all the way down arm, into breast, and middle of back. She started having chills. Around 10 hours after dose chills became somewhat violent despite being under 4 blankets. Severe headache also started. In the middle of the night to go to bathroom, she collapsed on the way back and was unable to get up for about 20 minutes. She also suffered from tachycardia overnight. her baseline heart rate runs in 60s- 70s, but was in 110s-120s (based on Apple Watch monitoring). Day after vaccine, she was extremely fatigue entire day and spent all but a few hours in bed. Arm pain mostly gone. Headache was very strong and persistent through the day. On second night chills not as bad but still occurred overnight. HR still elevated in 80s overnight. Morning of day 2 still had headache and fatigue. The patient did not receive any treatment for the events. The outcome of collapse and unable to get up for 20minutes, pain and stiffness radiating from injection site all the way down arm,into breast, and middle of back was resolved, chills and tachycardia was resolving, headache, fatigue was not resolved. Prior to vaccination, |

| | | | | | | | the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The reporter considered that the events was non-serious.; Sender's Comments: Based on a chronological temporal association and known BNT162B2 vaccine safety profile, causality between events fainting, violent chills and severe headache and BNT162B2 ((Pfizer/ BioNTech Covid-19 vaccine) cannot be completely excluded. The case will be reevaluated should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate. |
| 954041 | 1/18/2021 | IL | 51 | F | 1/7/2021 | 1/8/2021 | On 1/8 I passed out at home, losing consciousness for a few seconds. |
| 953123 | 1/18/2021 | CA | 34 | F | 1/11/2021 | 1/12/2021 | At 1:00 - 3:00 in morning - 100.3 temperature and chills and headache. Headache became severe - 7:00 in morning. Really severe joint pain and headache - not quite a migraine - no aura but very severe headache. Had to medicate with 1000 mg Tylenol and 600 of Advil. Headache for days. Pain at injection site and that has been with every vaccine I've ever had. Headache went away within three or four days. Joint pain was there for about two days. Only medicated the headache the first couple of days then it slowly got better. Didn't get vertigo and didn't get flushed after the vaccine. Didn't have the fainting feeling. |

| 953598 | 1/18/2021 | FL | 29 | F | 1/8/2021 | 1/8/2021 | <p>Started to have symptoms and fainted; Hit her nose and has a scar now; She blacked out; hit her nose, got the scar in the nose, ...she was bleeding from that scar; hit her nose, got the scar in the nose, ...she was bleeding from that scar; She started to feel unwell; Chills; Nausea; Rash in her arm; She had little red in her bumps; This is a spontaneous report from a contactable physician. A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE Solution for injection, batch/lot no. and expiry date: unknown), via an unspecified route of administration on arm on unspecified date at a single dose (2nd dose) for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Physician stated, "she had no medical conditions, she was in very good you know very like standing with herself." Patient had her 1st dose of Covid vaccine on unspecified date for COVID-19 immunization. Physician (reporter) stated, "I am the parent of someone who got the COVID dose, the second dose yesterday. I am very concerned because my daughter yesterday (08Jan2021) started to have symptoms and fainted at 4:00 in the morning and hit her nose and has a scar now. She had her second dose yesterday (pending clarification), after the second dose last night she started to feel unwell, getting chills, nausea and when she got up to go to the bathroom, she fainted, she blacked out. She lives alone, she is an adult, she hit her nose, got the scar in the nose, and the bleeding wouldn't stop, she was bleeding from that scar. She told me it took two hours for bleeding to stop from that scar." When asked when the events started, Physician stated, "Last night (08Jan2021), at 4:00 am she took the shot during the day while she was at work. She said, she started to getting chills and then she was nauseated." When asked if patient was still experiencing the event, the parent reported no as patient was just resting. Also stated, "She didn't take any treatment but she said she took Tylenol." Physician further added, "I am concerned, we are going to be taking her to the urgent care now but I am concerned about what is going on with platelets and all of that because of what had happened, last night the bleeding wouldn't stop for two hours and she was alone at the night and weekends. She said, she had to lay down and then her dad is there now because he is closer, he is going to be taking care of the urgent care</p> |

| 953126 | 1/18/2021 | OH | 53 | F | 1/16/2021 | 1/17/2021 | Moderna COVID-19 Vaccine EUA received on Saturday. Sunday morning in the middle of my sleep, I woke feeling hot and sweaty, slightly nauseated, and like I had to defecate. I stood up, felt like low blood pressure but wanted to get to the bathroom. I walked towards the door, opened the door and fainted, falling backwards. My spouse states I was pale, staring at the ceiling and kind of stiff in my arms and legs for about 3 minutes. He spoke to me, checked my pulse, covered me, poked my feet. As I came back to awareness I tried to speak and was unintelligible but then became more conscious. He tested me with questions to make sure I was ok. I defecated after that but did not vomit. I was tired the rest of the day and napped for several hours. I don't seem to have hurt anything in the fall. I am instructed to be off work Monday by my supervisor. |
| 954100 | 1/18/2021 | TX | 58 | F | 1/15/2021 | 1/16/2021 | Unable to make out the Lot number due to illegible. The pain in my right arm and around the back of my head and neck increased all day on Saturday, latter that night the pain woke me out of my sleep, and as I attempted to go to the restroom, I passed out. I woke up on the floor where I had passed out face down, with a busted bloody lip and bruises and broken skin on both knees. Very frightening, Thank God that I woke up because I live alone. Thank you. |
| 951647 | 1/17/2021 | DE | 27 | M | 1/16/2021 | 1/16/2021 | Approximately 6 hours after injection, fainted 4-5 times. Struggled with consciousness for about 10 minutes. Had low blood pressure and required emergency medical attention. |
| 951436 | 1/17/2021 | GA | 38 | M | 1/16/2021 | 1/17/2021 | I had a headache and fatigue starting about 5 to 6 hours after shot. After going to sleep at 10 am, I woke up not feeling well at 2am...after going to the bathroom and walking towards my bed I passed out. My wife found me on the floor a few seconds later confused and covered in sweat..my headache was much worse.. I went back to sleep and in the morning still had a headache as well as muscle aches and pains. \ |

| 951123 | 1/17/2021 | TX | 53 | F | 12/18/2020 | 1/1/2021 | On 01/01/21, I experienced a vaso vagal syncope episode and actually passed out and injured my upper back and right side of rib cage. I am a nurse and was looking up the required reporting and saw this as a reportable event, and even though it indicates within 7 days, I thought it might be worth reporting. I have never passed out like that before. |
| 951169 | 1/17/2021 | MS | 20 | F | 1/16/2021 | 1/16/2021 | Patient became pale and experienced a vasovagal syncope episode. She never lost consciousness and once she vomitted she felt better. An IV was started and normal saline was given at a KVO rate and patient's status improved back to baseline within minutes. She was transferred to the local ER to be evaluated out of caution. |
| 951182 | 1/17/2021 | FL | 30 | F | 1/15/2021 | 1/16/2021 | Woke up at 3 am with severe chills, went to the bathroom to check temperature. Got incredibly nauseous and light headed. Passed out on the bathroom floor and hit my chin. Had to get stitches, fluid, and CT. |
| 951211 | 1/17/2021 | NY | 30 | M | 1/16/2021 | 1/17/2021 | Around 11:15 am, Jan 17, 2021, while standing at the toilet, my son either lost his balance or fainted and fell to the floor. He was able to cushion his fall so that he did not have any broken bones, bleeding etc. He said he felt weak and tired. I had to help him up from the floor. He was able to assist me but it was like lifting a dead weight (he weighs about 150). He was able to walk to his bed with his arms around my neck holding him upright. He is very tired/lethargic and not himself. Temperature is 99.7F by mouth. He has rested since the incident. Giving him apple juice to keep him hydrated. I need to help him up to a sitting position before he can drink. |

| 949903 | 1/16/2021 | WI | 35 | F | 1/15/2021 | 1/15/2021 | That morning I had taken amlodipine for the 2nd time in my life to help Raynaud's. Both times I have taken amlodipine now I have felt lightheaded and less cognitively sharp than normal basically the entire day. I received the above Pfizer COVID-19 vaccine around 12:45 PM, within about 3-5 minutes of receiving the vaccine and standing in line to check out I suddenly felt I was going to loss consciousness/collapse so started lowering myself to the ground and then became unconscious and fell. Healthcare staff informed me I was unconscious for about 20-30 seconds. I woke up and initially felt confused, but quickly realized what had happened. Then I felt nauseated, had some stomach cramps and thought I was going to have diarrhea. They considered giving me Epi for possible anaphylaxis, but I requested they observe further for any skin reaction/hives, airway symptoms, etc given I was skeptical the syncope may have been fully or partially related to the amlodipine I took that morning. Symptoms slowly improved over 20-30 minutes, but the lightheaded feeling and nauseated lasted hours. No Epi, medications, or interventions were needed. |
| 949942 | 1/16/2021 | VA | 37 | F | 1/14/2021 | 1/14/2021 | About 10-20 seconds after receiving vaccine I felt faint and the darkness started to close in and I almost passed out. The back of my tongue became very dry. I felt better after 10 minutes and never passed out. They took my vital signs and everything was normal. I have never been bothered by needles before at all so it was strange. However I do have a long history of anxiety so it?s possible it was just that. |
| 949992 | 1/16/2021 | TX | 79 | M | 1/9/2021 | 1/9/2021 | Vasovagal syncope several minutes after administration Patient transferred to the ER for cardiac evaluation and left against medical advice |

| 950096 | 1/16/2021 | OH | 23 | F | 1/11/2021 | 1/12/2021 | Moderna COVID-19 Vaccine EUA Night of shot arm began to hurt. It became very painful by the time I went to bed. 10x worse than a flu shot Next morning at 8am, got up and almost passed out. Went back to bed. Got up at 10. Arm was painful to move. Began fever at 12 noon. Highest was 102. Terrible chills and aches and pains throughout entire body... lasted through bedtime. Tylenol did not manage the symptoms. Day 3 I was much better. I did experience fatigue, but arm pain was wearing off quickly. |
| 950238 | 1/16/2021 | IA | 43 | F | 1/16/2021 | 1/16/2021 | Right arm cold feeling progressed to neck and legs. Tried to return to facility after 25 minute interval after the vaccination. Then felt faint and called 911 who responded reported passed out while on 911 dispatch. |
| 949824 | 1/16/2021 | CA | 32 | F | 1/15/2021 | 1/15/2021 | Patient had her first Moderna COVID vaccination at 4:00 PM today and 5 min later felt dizziness, worsening, associated with headache, nausea, sore throat, hot flashes, and dizziness is from side to side when she looks at her phone, no dizziness when she does not look at it. Patient primary complaint is headache on bilateral temples. All other symptoms resolved, and no dizziness if not looking at phone. Patient has history of headaches, similar in quality, but this is more intense (6/10 intensity, less than her scoliosis pains, but more than usual headache pain), but otherwise the same, pounding sensation, and she can feel throbbing. Headache is about the same currently. Started simultaneously as dizziness, immediately, unchanged. No changes in vision. Peak intensity of headache around 30 min after onset, peak at 4:30 or so. Patient notified the vaccine clinic staff and was instructed to be observed in another area, and did not improve. Patient remembered that her initial blood pressure was low and it fluctuated. Patient was then sent to the ED. Upon initial assessment in the Emergency Department 2 hours after her initial injection, the assessment is likely vasovagal near syncope with tension headache, rather than true allergic reaction. Given metoclopramide, diphenhydramine, normal saline, and obtained labs. |

Benadryl 50 mg was administered. 45 minutes after Benadryl administration driven home and severe dizziness was present until next morning. 17 hrs post injection had severe flu like symptoms (chills, severe headache, muscle/body aches/no fever). Took Advil 800mg. At 48hrs no symptoms remain. At 69 hrs post injection had severe dizziness that is still present at 72.5 hrs post injection. |
| 950624 | 1/16/2021 | NY | 65 | F | 1/16/2021 | 1/16/2021 | Patient started to feel dizzy after approximately 10 minutes. She was taken into counseling room and laid flat on the floor with her feet up as syncope treatment. She stated her tongue was swelling and her throat was scratchy and EMS 911 was called. She stated she was having trouble breathing and was administered 1 epinephrine 0.3mg auto-injector. After approximately 5 minutes symptoms continued to progress and she stated her entire body was tingling. She stated she was still having trouble breathing and a second epinephrine 0.3mg auto-injector was administered. |
| 950683 | 1/16/2021 | NY | 35 | M | 12/30/2020 | 12/30/2020 | About 45 seconds after injection. A warm cloudy feeling spread over my body from the injection site. Became dizzy, when I sat down I passed out. They estimated about 15-20 minutes. When I came to my body was limp, sweaty, shivering, I had motor functions but could not feel my body. Fingers and toes had a painful pulsating feeling. EMS was called I was placed on oxygen why they took my vitals |
| 950697 | 1/16/2021 | PA | 27 | M | 1/15/2021 | 1/16/2021 | About 8 hours after vaccine administration on 1/15/21 - woke up in the middle of the night with chills, headache, pain in joints and injection site, nausea. Sat up on the side of the bed - passed out and woke up on the floor. Tried to readjust slowly, passed out again. Place ice pack on stomach and behind neck to treatment with legs up. 1/16/21 continued to experience chills, headache despite cool compress and Tylenol 1000mg TID and Motrin 600mg x 1 dose at 1900. Fatigue and body aches throughout the day - very limited on any daily activities. Sweats and joint pain and pain around L arm injection site. |

Pt PCP/Cardiologist contacted, kept on heart monitor, pt discharged Monday afternoon. 1/14/21 chest pain, nausea, 102. fever. symptoms |
| 946804 | 1/15/2021 | VA | 30 | F | 1/14/2021 | 1/15/2021 | approx. 17 min after receiving vaccine, pt returned to desk to get the vaccine card that she had forgotten to take with her, She was handed the card, went to sit in the chair near her, asked if she was feeling ok, slumped to a sitting position, then passed out. Immediately regained consciousness, denied shortness of breath, no evidence of hitting head on ground during this episode |
| | | | | | | | 20 hours after first dose of COVID19 vaccine arm was very sore (normal). Around 2:30am felt pressure and warmth (coming in waves) up towards my chest, lasting 1-2 seconds and occurring about every 5 minutes . Was able to withstand feeling until it became difficult to breath. Lips and face turned white and blue, fainted. Felt extremely nausea when awake. Called 911. Vitals were normal apart from BP was very high 130/100's. EKG was NSR. Blood sugar taken was normal around 113. After 1 hour of event, I took a shower and drank water. I felt the wave one more time before trying to fall asleep. Then stopped. Woke up fine. |

| 947480 | 1/15/2021 | NC | 22 | F | 1/7/2021 | 1/7/2021 | fainting spell; almost passed out; dizzy spells; weak; This is a spontaneous report from a contactable consumer (patient herself). A 22-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot: EL3246), via an unspecified route of administration on 07Jan2021 in right upper arm shoulder area at single dose for prevent covid. Medical history included ongoing acne. Concomitant medication included doxycycline from 2020 (taking it 6 months ago) and ongoing for acne. Patient stated that she got the Covid vaccine yesterday 07Jan2021 and almost passed out in her kitchen after a couple hours. Patient stated got in shower had dizzy spells and was weak 07Jan2021, she felt better now. Patient stated that she was a small girl of 105 pounds and the dose could have made her sick. She wanted to make sure she did not need to go and be seen. Patient had another spell in shower this morning and stated that the fainting spell and feeling weak started at 9:00 yesterday evening on 07Jan2021. Outcome of dizzy spells was recovering, and outcome of other events were unknown. |

| 947506 | 1/15/2021 | PA | 44 | F | 1/5/2021 | 1/1/2021 | Dizzy; headaches; flu feeling; side effects she had were like the COVID symptoms she had, like the chills and everything; lethargic feeling; weak; Nausea; the whole left side of her body went numb including even her vagina; left side of her body was so numb and weird and tingly feeling/left leg went numb; whole left side of face swelled up; left eye turned red; pressure in head; felt like someone squeezing her eyeball out; eye went black/left eye looked bruised/blackness around the eyes; whole face went numb/left side of face slightly numb; bells palsy; allergic reaction; This is a spontaneous report from a contactable consumer (patient). A 44-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in arm left on 05Jan2021 at single dose for COVID-19 immunization. Medical history included cutaneous t-cell lymphoma from 2017 and ongoing, ongoing cholesterol, ongoing thyroid, covid-19 from Nov2020 to an unknown date not ongoing (lasted about 1-1.5 months; she did not have any breathing problems) and blood cancer. Concomitant medication included bexarotene ongoing for cutaneous T-cell lymphoma, rosuvastatin ongoing for cholesterol, levothyroxine ongoing for thyroid. The patient underwent lab tests and procedures which included COVID 19: positive in Nov2020, found out tested positive around holiday. Clinical course: onset about 26 hours after administered the first dose; onset as soon as she got back to work next day: 06Jan2021. The side effects were at their worst for at least 24-48 hours. Further described as all side effects occurred only on left side of her body: whole left side of face swelled up on 06Jan2021; left eye turned red on 06Jan2021; whole face went numb/left side of face slightly numb on 05Jan2021; eye went black/left eye looked bruised on 05Jan2021; pressure in head on 06Jan2021; felt like someone squeezing her eyeball out on 06Jan2021, within the first 24-48 hours, her 'left leg went numb'. She called to talk to physician and nurse who advised her to take Benadryl; which she did take and the Benadryl stopped the side effects; but she could not take a lot of Benadryl or anything because she was at work. She stayed at work because at least there were healthcare professionals, adults in case she passed out; at home she has 7 young children and is also raising her grandchild. The side effects did not completely go away. |

| | | | | | | <p>The arm thing was normal; The next day she was at work and had the swelling on left side of face; blackness around the eyes; arriving home she had headaches on 07Jan2021 and then her leg went numb for like 20 mins; the whole left side of her body went numb including even her vagina; left side of her body was so numb and weird and tingly feeling that she started panicking because she was driving on 06Jan2021. She calmed herself down thinking it's only the left side; you can drive with your right side to get home and be fine. It was more like left side of her body was asleep, tingling, she has never had that happen before. Everything else like the headache, flu feeling was about 48 hours later (on 07Jan2021). She had COVID already back in Nov2020 for about 1-1.5 months; the next side effects she had were like the COVID symptoms she had, like the chills and everything on 06Jan2021. She had the lethargic feeling again, her head was hurting, she felt extremely weak on 06Jan2021. Patient also felt nausea on 06Jan2021, Dizzy on 08Jan2021. Another doctor said it sounded like the side effects she experienced with the vaccine sounded like allergic reaction or Bell's palsy. Patient was asking the doctor if she could get like an Epi-pen or prescription Benadryl or something because she is afraid to get the second dose of Pfizer COVID-19 Vaccine and not have something to respond to side effects with. The outcome of event whole face went numb/left side of face slightly numb was recovered on 07Jan2021, for headaches was recovering, chills and nausea was recovered on 08Jan2021. Outcome of other events was unknown. Information about lot/batch number has been requested.</p> | |

| 946232 | 1/15/2021 | PA | 24 | F | 1/14/2021 | 1/15/2021 | When I woke up the next morning, my blood sugar had dropped. I did not have a glucometer to measure my blood sugar, by I almost had an episode of syncope at approximately 7:00 am. |
| 946179 | 1/15/2021 | PA | 42 | F | 1/6/2021 | 1/7/2021 | I felt very heavy (especially my limbs) and had a slight headache on Thursday (the day after receiving the vaccine). This feeling continued into Friday morning when I nearly passed out (blacked out and collapsed for a split second) as I was crouched position for approximately 10 minutes at work. I felt dizzy and slow moving for the next several hours. My blood pressure was rated as normal, blood oxygen normal, and pulse slightly low by a nurse on staff who took my vitals after the episode. My temperature, which had been 97.8 prior to the event that morning (typical for me) was elevated during this time to 100.2 and returned to normal after approximately 4 hours without medication. I was fatigued, so I slept for approximately 4-5 hours that afternoon and began feeling better the following day (Saturday). |

| 949735 | 1/15/2021 | NE | 21 | F | 1/14/2021 | 1/15/2021 | I got up to use the bathroom at 4:30 this morning. I was extremely shaky but made it. I was using the bathroom and had the feeling that I was going to vomit. Next thing I know I was seeing stars and I fainted and fell off the toilet face forward and hit my head on my tile floor. I don't remember getting to the couch, but my dad was awake to let out the dogs and I couldn't really speak but he heard me and came downstairs and got me water and a cool rag. I was sweating but shivering. I am nauseous and have slept a total of 13 hours since 4:30am. I am pretty sure I have a concussion. I have a headache, on and off chills, muscle spasms beginning at 9:00PM on 1/14/21. I also have ringing in my ears. My resting heart rate is typically between 75-85 and I checked it at 7pm and it was 100. I have not sought out medical attention and have been debating it all day. |

| 947518 | 1/15/2021 | OR | 34 | F | 1/5/2021 | 1/5/2021 | tunnel vision; experienced a sudden onset of vertigo; presyncope; My hands became cold and numb; My hands became cold and numb; fatigue; sore arm, leg/thigh aching; sniffles; sore throat; brief dry cough; slight headache; neck ache; This is a spontaneous report from a contactable Nurse (patient). A 34-year-old non-pregnant female patient received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular on 05Jan2021 at 12:30 at single dose in left arm for covid-19 immunization. Medical history included Mild ADHD/ADD. The patient's concomitant medications were not reported. Approximately 5 minutes after receiving vaccination, she was standing in the observation room (where they had all of them stay for at least 15 minutes to ensure no severe reactions) and experienced a sudden onset of vertigo, tunnel vision and pre-syncope. Her hands became cold and numb and she was trying to talk to another staff member who was arranging/scheduling her second vaccination dose at the same time when this event occurred, but it subsided quickly and she started to feel normal again. All these events occurred at 12:45 on 05Jan2021. She reported this event right away and they had her stay in the room longer. She was stable at that point but experienced these symptoms again but very mildly twice more while she walked back to her car to go home. Other side effects on 05Jan2021 that started in the evening and for the following 2-3 days included fatigue, sore arm, leg/thigh aching, sniffles/sore throat, brief dry cough and slight headache/neck ache. Very mild and tolerable symptoms. All events were reported as non-serious by reporter. The patient did not receive treatment for the events. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination, and the patient has not been tested for COVID-19 since the vaccination. The outcome of all events was resolved in Jan2021. Information on the lot/batch number has been requested.; Sender's Comments: Based on temporal association, a possible contributory role of BNT162B2 cannot be excluded for reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern |

| 947528 | 1/15/2021 | MA | | F | 1/8/2021 | 1/9/2021 | Experienced vasovagal syncope after standing, resulting in fall; Experienced vasovagal syncope after standing, resulting in fall; Awoke with severe chills; nausea; body/muscle aches; body/muscle aches; left arm pain; extreme thirst; fatigue; This is a spontaneous report from a contactable consumer. A 44-year-old female patient (non-pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot: EK9231), via an unspecified route of administration on 08Jan2021 14:30 in left arm at single dose for covid-19 immunization. There was no medical history and concomitant medications. Allergies to medications, food, or other products was no. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The most recent COVID-19 vaccine was administered was in hospital. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. On 09Jan2021 01:30 am, patient woke with severe chills, nausea, body/muscle aches, left arm pain, nausea, extreme thirst. Patient experienced vasovagal syncope after standing, resulting in fall. Worst symptoms were lasted about 30 minutes, muscle aches and fatigue continue about 16 hours later. All events were reported as non-serious. No treatment was received for these events. Outcome of all events were recovering. |
| 949578 | 1/15/2021 | OH | 32 | F | 1/8/2021 | 1/8/2021 | Immediate slight dizziness, continued for 1.5 hours, slight headache. Then 1.5 hours post vaccination syncope, fall to floor. ER workup was clear immediately following event, no abnormal testing, labs and ekg all normal. 1 week post vaccine, no other symptoms aside from sore arm. |

| 949620 | 1/15/2021 | WA | 61 | F | 12/21/2020 | 12/21/2020 | As stated I fainted about 3 hours after injection. I thought it was because I had worked all night. I fell forward and sustained bruising to my right cheek and temple. I will be reporting another report regarding the second dose with adverse reaction that is the same but required EMS and Emergency Room visit. Approximately 3 hours after injection I was getting ready for bed (as I work nights). I was talking with my daughter and I stood up and remember waking up on the floor. Bruising to the right cheek and temple. I did not seek medical attention and went to bed. I had no further episode but remained dizzy for several days. |
| 949761 | 1/15/2021 | NC | 49 | F | 1/15/2021 | 1/15/2021 | Patient information was reviewed. Patient was asked if they ever had any form of severe reaction to anything they had had in the past. Patient did not state yes to anything other than having a reaction that was managed at home to shellfish as a child. They stated their throat had swollen as a child during the event. Patient was told that it was an anaphylactic reaction and shouldn't have been managed at home as a child by nurse and should have been taken to the hospital. Patient was told they would be monitored for 30 minutes after receiving the vaccine. Within 2-3 minutes after receiving the vaccine the patient reported tingling or burning around the site of injections. Within 5 minutes they stated to be feeling tired and that their arm had felt numb. After this the patient began starring into the distance and was unresponsive. Called for help and advice by turning around as patient had syncope. Got nurses and other team members attention and had an epi-pen ready just in case it was needed. Patient began having notable distress with respiration and administered an epi-pen. Advised for a nurse to call EMS for patient and crash cart/oxygen was also obtained by the facility. Oxygen was required. Patient was not responsive after the first dose and was given a second as they remained un-alert with notable distress. The patient became alert a while after receiving the second shot and not long after that the EMS arrived to the event. |
| 949442 | 1/15/2021 | MI | 62 | U | 1/15/2021 | 1/15/2021 | She passed out. Developed a rash on both arms with itching, and nauseous. Gave patient EPI PEN IM into right thigh. started IV and transferred to the ER. Patient was discharged. |

| 949744 | 1/15/2021 | WA | 63 | F | 1/9/2021 | 1/10/2021 | extremely dizzy, passed out, took blood pressure 3 times over 45 minutes, 56/34, 62/43, 81/56 |
| 949400 | 1/15/2021 | RI | 32 | F | 1/15/2021 | 1/15/2021 | Shortly after receiving Dose 1 of Pfizer-BioNTech COVID-19 vaccine, patient reported feeling dizzy and nauseous. Patient was given water and apple juice. Patient educated on techniques to reduce symptoms/prevent fainting. Patient was then escorted to a room in the facility to lay down and elevate feet. Patient vomited a few times. Patient closely monitored for over 30 minutes by pharmacist and facility staff. Patient symptoms improved and did not require EMS. |
| 948484 | 1/15/2021 | VA | 22 | F | 1/14/2021 | 1/15/2021 | Fever and chills, headache, syncope (experienced around 6:30 am following the morning after vaccination was received) |
| 948458 | 1/15/2021 | CT | 32 | F | 1/13/2021 | 1/14/2021 | Severe arm pain at injection site night of. At 5:15 AM the following morning (1/14/21) I experienced lightheadedness and fainted off the toilet hitting my face on the wall/radiator in front of me. My husband (who witnessed the fainting episode) stated I began convulsing and my eyes were rolled to the back of my head for 5-10 seconds. Upon regaining consciousness I was covered in sweat. After being assisted back to bed, I had nausea and headache with continued severe pain at injection site. I went to the ER around 6:45 AM since my severe headache, dizziness and nausea continued and to examine if I broke my nose in the fall. While in triage at the ER I experienced severe nausea and a second episode of fainting. |

| 948410 | 1/15/2021 | NC | 40 | F | 1/14/2021 | 1/14/2021 | This facility staff member received her first dose of the MODERNA COVID-19 vaccine (Lot037K20A/EXP 6/22/21) at clinic at approximately 9:15AM on 1/14/21. She initially answered "no" to any allergies on the VAR but revealed to the pharmacist reviewing the VAR that she had experienced an allergy to food and contrast dye that required an epi-pen and hospital attention. She did not offer additional details and explained that she had tolerated other shots (including the 2020 flu shot) without incident. I advised patient to remain for a 30 minute monitoring period post-vaccination due to history of allergic reaction. Patient presented with some anxiety before the shot and immediately started to complain of feeling "sick" and said she was having trouble breathing due to chest pressure. We advised patient to remove her mask and provided her with water and a trash can though no vomiting occurred. After 15-20 minutes, patient still complained of chest pressure and difficulty breathing. When asked if she was experiencing any itchiness or throat swelling, patient said she did feel some throat swelling so she was given 25MG of Benadryl. After an additional 15 minutes, patient's condition seemed unchanged (not worsening, not improving) so the facility's nursing team was called to evaluate patient. Patient said she was still experiencing difficulty breathing and throat swelling so nursing advised use of EPI-PEN and patient consented. I administered a dose of 0.3MG (LOT0FM4066/EXP 02/2022) to the right lateral thigh and nurse called for EMS. Immediately after injection, patient's eyes fluttered and she seemed to be on the verge of fainting. Nursing checked her oxygen saturation which was 100%. Patient reported no improvement after 5 minutes so another EPI-PEN 0.3MG was administered to the left lateral thigh. Nursing also gave the patient 81MG chewable aspirin due to the patient experiencing a stroke last month. EMS arrived a few minutes after the second EPI-PEN dose and patient was transported to the hospital for evaluation. Facility reported that patient went home that afternoon but did not provide details. Based on my assessment of patient's symptoms and behavior, I feel it is likely that she experienced either an acute panic attack or anaphylaxis due to vaccine administration. I called the patient today (the day after the incident) and she confirms that she received treatment for an anaphylactic reaction to the Moderna COVID shot and is |

| 948143 | 1/15/2021 | FL | 68 | F | 1/15/2021 | 1/15/2021 | Patient was given Covid vaccine and then was instructed to sit for about 15 minutes. About 5 minutes later after receiving vaccine she passed out and fell onto floor. I went over to provide aid and rolled her over to have her lying face up while another staff member was calling 911. She was still awake and responsive when I proceeded to ask her questions and she informed me she felt "hot all over and dizzy." 911 informed us to keep her lying down on the floor as comfortable for her as possible until EMS arrives on scene. While waiting for EMS to arrive her pulse was low (~40 bpm), but shortly before EMS arrived on scene her pulse rose to a normal heart rate (~80 bpm). EMS then took her to the hospital for further evaluation. |
| 948095 | 1/15/2021 | NM | 54 | F | 1/8/2021 | 1/8/2021 | Syncope. Rested and recovered. Fainted about 5 minutes after receiving the vaccine- walked quickly from the vaccination station to the observation station, and was seen wobbling, caught her and laid her until she recovered. She was embarrassed, indicated she has fainted with shots before. |
| 948075 | 1/15/2021 | CA | 24 | M | 1/14/2021 | 1/14/2021 | Vasovagal Syncope |

| 948073 | 1/15/2021 | NJ | 65 | F | 1/14/2021 | 1/14/2021 | Immediate sensation of slight mental status change which resolved but within 2 minutes started to feel slightly woozy and pre-syncope, as if anaphylaxis starting. Informed staff. Put on stretcher. Vital signs obtained. O2Sat upper 90s. BP elevated with diastolic in low 100s with sensation of pre-syncope and very slight confusion. Resolved slowly over 30 minutes to about 90% of prior mental status. Continued to feel somewhat dizzy for several hours. Went to bed early. Had very intense disturbing dreams. Very sore vaccine site. Resolved by morning. Arm soreness about 50% of day prior. |
| 948046 | 1/15/2021 | NM | 69 | F | 1/8/2021 | 1/8/2021 | Nauseated and lightheaded, near syncope. Lasted about 20 minutes, took vitals, rested, and recovered. |
| 948416 | 1/15/2021 | TX | 31 | F | 1/13/2021 | 1/14/2021 | Just over 24 hours after I received the COVID-19 vaccine I had a syncope episode while standing talking to others at work. I began feeling hot, started feeling like I was sweating, started seeing black and white lines, and then fainted. The symptoms came on very quickly. I did not remember falling and we believe I hit my head on the corner of a table when I fell, and I had to get 3 staples in my head. I have no other medical concerns at this time, and all of the test run at the ER showed no concerns. At the ER they ran labs, took a CT scan, and did an EKG. I was released from the ER after about 4 hours. I have had a 3 other episode previously when I felt like I was going to pass out, most recent March 2020, but they were linked to the flu and strep. This event has not been linked to either of those conditions at this time, and my doctor encouraged me to report it. |

| 943636 | 1/14/2021 | CO | 25 | F | 1/13/2021 | 1/13/2021 | Vasovagal syncope (loss of consciousness) Tonic seizure (tensing and twitching of arms) Irregular heartbeat (per EKG) Extremely low blood pressure I received the vaccine at a public health pop-up, drive through clinic for first responders - I accessed the vaccine through my employer as a first responder. The vaccine was administered to my left arm without complication at approximately 1:00pm (my scheduled appointment). I proceeded to the area designated for patients to be observed after receiving the vaccine and was asked to wait 15 minutes. I recall getting to the observation area then telling my spouse I felt unwell - after the event he notified me that I told him I was about to pass out and asked him to get medical help. I lost consciousness approximately 5-10 minutes following the vaccine. My husband reported that after losing consciousness I seemed to have a minor seizure, as evidenced by my head jerking and my arms and fingers "tensing and curling up". I was sitting in the passenger seat of my car at this time, so I suffered no fall or fall related injury. Public health officials and EMT responded. They indicated to my spouse that I had experienced a vasovagal syncope episode and that I had "gone tonic"/ had a "tonic seizure". They took my blood pressure, which was very low (I don't recall exactly but it was 80 over something). They also took my blood sugar among other things that I do not recall. I was given oxygen and put into an ambulance. I was shaking, so they wrapped me in blankets. I believe they may have done an EKG and placed a blood pressure cuff while I was in the ambulance, but I do not recall any specifics about this. The EMT also drew my blood, placed an IV, and administered IV fluids while I was in the ambulance. I was taken by ambulance to the emergency department |

| 943194 | 1/14/2021 | TX | 38 | F | 1/13/2021 | 1/13/2021 | Symptoms - EE reports after vaccine she waited the 30 minute observation period and felt fine. At approximately 7:00 pm EE reports she went to store and when she went to get out of her car she felt really dizzy. EE reports she hadn't eaten much that day so tried to eat some chocolate covered pretzels and coke. EE denied syncope. EE reports she started feeling ?chest tightness? and starting panicking. EE denies airway issues and SOB. EE said she got nervous and went to hospital across the street for assessment. EE reports at triage her SPO2 was 100% but slightly tachycardiac. EE reports after her triage assessment she called her daughter to come pick her up and did not seek further medical care. EE reports when she got home she started with generalized itchiness, denies rash. EE reports she took 50 mg Benadryl, 25 mg Atarax, and 40 mg Pepcid at 8:45 PM. EE reports not change in itchiness and took 2nd dose of 50 mg Benadryl around 01:30 (1/14). EE reports she woke up around 06:45 (1/14) with bilateral arm bruising from scratching overnight per EE and feeling chilled. Last day of work and shift - ? scheduled to work tonight (1/14) Home remedies? ? see symptoms for home remedies Any improvement? ? mild improvement Recommendation? EE encouraged to continue to monitor symptoms and to contact EH vaccine support line with further questions or concerns. EE encouraged to take Claritin and Benadryl as outline by the Medical Directive at hospital. EE educated to only take Benadryl if she will be at home today and that is she unable to take Benadryl when at work, EE verbalized back understanding. EE educated if she is still feeling unwell for her shift tonight, to notify her manager and to manage per hospital Illness in the Workplace Policy. EE denied further questions at this time. |
| 942975 | 1/14/2021 | PA | 52 | F | 12/22/2020 | 12/23/2020 | Patient returned for 2nd Covid vaccine and reported that after previous vaccine she fainted 3 times, had a swollen arm, severe leg pain and nausea and vomiting. At that time, we decided that she should receive guidance from her PCP prior to receiving the 2nd dose in the series. |

| 944279 | 1/14/2021 | NH | 27 | F | 1/8/2021 | 1/1/2021 | fever and chills; fever and chills; blood pressure was low, about 90/50; did not feel well; syncope episode; unconscious; This is a spontaneous report from a contactable other health professional. A 27-year-old non-pregnant female patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EH9899), via an unspecified route of administration in the left arm on 08Jan2021 at 12:00 at a single dose for COVID-19 immunization; received at a nursing home/senior living facility. The patient did not receive any other vaccines within four weeks prior to the COVID vaccine. Medical history included COVID-19 from an unknown date and unknown if ongoing. No known allergies. Concomitant medications included unspecified birth control taken for an unspecified indication from an unknown date to an unknown date; within two weeks of vaccination. The patient experienced the following events and outcomes: syncope episode in Jan2021 with outcome of unknown, unconscious in Jan2021 with outcome of unknown, fever and chills on 09Jan2021 with outcome of unknown, blood pressure was low, about 90/50 on 09Jan2021 with outcome of unknown, did not feel well in Jan2021 with outcome of unknown; all of which were assessed as medically significant. The clinical course was reported as follows: the fever and chills began about one hour after vaccination (as reported). About 18 hours after the vaccination, the patient was getting up to take more paracetamol (TYLENOL) and did not feel well. The patient had a syncope episode in the bathroom (no issues as she sat on the floor before hand). The patient was unconscious for about 1-2 minutes. The patient's blood pressure several minutes later was low, about 90/50; however, the patient took the blood pressure measurement herself, so it may not have been exactly accurate. The patient underwent lab tests and procedures which included blood pressure measurement: low, about 90/50 on 09Jan2021. Therapeutic measures were taken as a result of fever. Prior to vaccination, the patient was diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of all reported serious events cannot be excluded, considering the plausible temporal relationship and the known |

| 942614 | 1/14/2021 | MD | 42 | F | 1/6/2021 | 1/1/2021 | <p>adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p> <p>acute onset nausea; diaphoresis; presyncope; left arm weakness with numbness; numbness and tingling of first 3 fingers in left hand (median nerve distribution); tingling of first 3 fingers in left hand (median nerve distribution); significant cervical lymphadenopathy; painful neck; This is a spontaneous report from a contactable physician reporting for herself. A 42-year-old adult female patient received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 Vaccine, Lot number: EJ1686, via an unspecified route of administration, in left arm, on 06Jan2021 at 9:52 am, at 42-years of age, at single dose for COVID-19 immunization. The patient was vaccinated in Hospital. Medical history included overweight and no known allergies. Concomitant medications included the second dose of HPV VLP vaccine rL1 4v (yeast) (GARDASIL) received in left arm on 18Dec2020 and ergocalciferol (Vitamin D). On 06Jan2021 by 10:05 the patient experienced acute onset nausea, diaphoresis, presyncope and concomitant left arm weakness/flaccid arm with numbness and tingling of first 3 fingers in left hand (median nerve distribution). The patient informed vaccine staff of symptoms and advised ongoing observation. Flaccid arm/weakness/numbness continued for more than 24 hours, although at the time of the report it was slowly improving. At the time of the report the patient further reported significant cervical lymphadenopathy and painful neck (specific onset date not provided - captured as Jan2021). The events were reported as non-serious. The reporter specified that the injection was not given anywhere near brachial plexus. At the time of the report the events "Left arm weakness" and "Left arm numbness" were resolving, the outcome of the events "Nausea", "Diaphoresis", "Presyncope", "Tingling of first 3 fingers in left hand", "Cervical lymphadenopathy" and "Painful neck" was unknown.</p> |

| 943187 | 1/14/2021 | TX | 38 | F | 1/13/2021 | 1/13/2021 | <p>Symptoms - EE reports after vaccine she waited the 30 minute observation period and felt fine. At approximately 7:00 pm EE reports she went to store and when she went to get out of her car she felt really dizzy. EE reports she hadn't eaten much that day so tried to eat some chocolate covered pretzels and coke. EE denied syncope. EE reports she started feeling ?chest tightness? and starting panicking. EE denies airway issues and SOB. EE said she got nervous and went to Hospital across the street for assessment. EE reports at triage her SPO2 was 100% but slightly tachycardiac. EE reports after her triage assessment she called her daughter to come pick her up and did not seek further medical care. EE reports when she got home she started with generalized itchiness, denies rash. EE reports she took 50 mg Benadryl, 25 mg Atarax, and 40 mg Pepcid at 8:45 PM. EE reports not change in itchiness and took 2nd dose of 50 mg Benadryl around 01:30 (1/14). EE reports she woke up around 06:45 (1/14) with bilateral arm bruising from scratching overnight per EE and feeling chilled. Last day of work and shift - ? scheduled to work tonight (1/14) Home remedies? ? see symptoms for home remedies Any improvement? ? mild improvement Recommendation? EE encouraged to continue to monitor symptoms and to contact EH vaccine support line with further questions or concerns. EE encouraged to take Claritin and Benadryl as outline by the Medical Directive at TCH. EE educated to only take Benadryl if she will be at home today and that is she unable to take Benadryl when at work, EE verbalized back understanding. EE educated if she is still feeling unwell for her shift tonight, to notify her manager and to manage per hospital Illness in the Workplace Policy. EE denied further questions at this time.</p> |

| 942615 | 1/14/2021 | | 21 | F | 1/6/2021 | 1/7/2021 | almost fainted; body pain and chills; body pain and chills; This is a spontaneous report from a non-contactable other health professional (patient). A 21-year-old female patient (pregnant: No) received first dose of BNT162B2 (Batch/lot number: EUA), intramuscularly in left arm on 06Jan2021 12:00 PM at single dose for COVID-19 immunization. The patient's medical history was not reported. Concomitant medication included lisdexamfetamine mesilate (VYVANSE), celecoxib (CELEXA). The patient experienced almost fainted, body pain and chills all on 07Jan2021 03:30 AM. About 15 hours the vaccine, the patient woke up at 3 am with extreme body pain and chills and almost fainted when trying to get paracetamol (TYLENOL). The events were reported as non-serious. The adverse event was not resulted in doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. No treatment received for the adverse event. The outcome of events was unknown. Facility where the most recent COVID-19 vaccine was administered: Nursing Home/Senior Living Facility. Prior to vaccination, the patient wasn't diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. No follow-up attempts are possible. No further information is expected. |
| 945643 | 1/14/2021 | | 21 | F | 1/14/2021 | 1/14/2021 | Patient felt light headed/faint and flushed. (self reports history of fainting with shots/vaccines) BP 78/41 HR 67 sat 100. Encouraged to lay supine, however, patient requested to sit with head between knees as this helped in the past. Cold back to back of neck. No SOB or trouble swallowing. Patient alert and conversant. Observed x 30 mins and all symptoms resolved. Repeat BP 108/78 HR 85 sat 100 |

| 944335 | 1/14/2021 | NC | 43 | F | 1/12/2021 | 1/13/2021 | ~~Moderna Covid-19 Vaccine EUA" No problems the day of the vaccine. Overnight I developed a sore arm, chills, and headache, which I expected. The next morning I got up to get ready for work and I passed out, hitting my forehead on the tile floor very hard. I woke up on the floor, then got in shower and immediately passed out again, hitting the back of my head on shower wall. My husband found me sitting on shower floor still groggy. He called primary care provider, who said to take me to emergency department. He took me to emergency department. |
| 942909 | 1/14/2021 | PA | 68 | M | 12/28/2020 | 1/12/2021 | Chief Complaint Patient presents with ? Vomiting pt reports dry heaving and nausea that started an hour ago Patient is an 68 y.o. year old male with PMHx significant for HTN, BPH, who presents to the ED today with nausea and dry heaving for one hour PTA. States that he was at work as a courier when he had onset of sensation of room spinning, nausea, and dry heaving. Also having tinnitus which he thinks is b/l. This happened once about two weeks ago and resolved spontaneously overnight when he was asleep. No preceding illnesses, medication changes, or other associated symptoms. Vertigo has no clear exacerbating or relieving factors. Has not yet taken anything for symptoms. The patient denies fevers, chills, headaches, syncope, chest pain, shortness of breath, rhinorrhea, sore throat, cough, abdominal pain, changes in usual bowel movements, changes with urination, back pain, pain anywhere else in body. The patient has no sick contacts, recent travel history. |
| 946898 | 1/14/2021 | KS | 40 | M | 1/13/2021 | 1/13/2021 | About 1 minute after receiving vaccine, pt fainted while on the way to recovery area. Pt was standing in entryway when he started to fall down but was caught on the way down by a nurse. While on the floor the pt was asked his name and responded with correct answer, EMS was called and then pt was placed in wheelchair and transferred to cot after. the BP and pulse was taken (63/46, pulse 51) Glucose gel was provided orally. EMS arrived shortly after BP was take but pt refused stating that he was feeling better and he waited out the remainder of his recovery time laying in cot with no other incidents. |

| 945584 | 1/14/2021 | CA | 27 | M | 1/13/2021 | 1/13/2021 | At 11:00 PM awoke with severe full body chills and subjective fever that lasted about an hour. Woke again at 1:30 AM drenched in sweat with pounding frontal headache and eye aches, got up to use restroom and had vasovagal syncope while standing in front of the toilet. |
| 945548 | 1/14/2021 | TX | 50 | F | 1/13/2021 | 1/13/2021 | 15 minutes after receiving the vaccine I felt like I was going to faint and then called out someone's name and she came and caught me as I fainted. They called for Rapid Response Team. They put me on a stretcher, asked what happened, and took some vital signs - I was tachycardic, BP was 184/108 pulse ox 97 and they also saw nystagmus only in my left eye which I've never had before. |
| 945294 | 1/14/2021 | FL | 36 | F | 1/11/2021 | 1/12/2021 | Approximately 12 hours after receiving the booster dose, she awoke feeling extremely ill and nauseous, roused me to say so, and then immediately became unresponsive and pulseless. She was admitted to hospital for cardiac work up, and all diagnostic tests have found her heart to be normal in structure and function. Cardiology believes she experienced a vasovagal syncope with asystole. She remains hospitalized at this time for initiation of sotalol therapy; she was diagnosed with frequent PVCs approximately 1 year ago. |
| 945147 | 1/14/2021 | GA | 42 | M | 1/12/2021 | 1/12/2021 | States had a syncope event shortly after 2nd COVID vaccine. Vaccine administered approximately 10am then about 40-45 minutes later had a syncope episode and fell from a standing position. |
| 945025 | 1/14/2021 | MN | 26 | F | 1/12/2021 | 1/13/2021 | About 16 hours after second dose of the Pfizer COVID-19 vaccination: - Fever of 101-102F - Chills - Body aches - Joint aches - Headache About 40 hours after time of vaccine: - Fainting spells x2 (shakiness, blurry vision, ringing in ears, loss of balance) |
| 945019 | 1/14/2021 | MN | 68 | F | 1/7/2021 | 1/8/2021 | Most concerning was dizziness to the point of almost fainting. This happened 2 times. Once on the first day after injection and once on the second day after injection. Other S.C. were fatigue, muscle aches, chills, indigestion and sore arm. No fever noted. |
| 944943 | 1/14/2021 | CO | 71 | F | 1/12/2021 | 1/12/2021 | Systemic: Fainting; symptoms lasted 1 day |

| 944477 | 1/14/2021 | NJ | 75 | F | 1/14/2021 | 1/14/2021 | Patient given vaccine. Within 5 minutes husband said she?s having another spasm. She was being monitored for 15 minutes after the injection. After the spasm it appeared to. become a seizure and passed out for 5 minutes . Husband said she missed her medicine and needed her carbidopa/levodopa. 911 arrived and administered oxygen and took to the hospital. |
| 944807 | 1/14/2021 | FL | 77 | M | 1/12/2021 | 1/14/2021 | Arm was sore starting approximately 4 hours. after the shot. I usually set thermostat to 68, but got so cold last night i pushed it up to 74 and added a blanket. Around 4:00 I woke up to go to the bathroom. Problems similar to Cirpro. Did not have control over direction I was walking.. Had to rock back and forth to sit up so I could get out of bed. I estimate this was a 3-5 minute ordeal. Drank some Powerade and went back to bed. I had gone to bed just before midnight. Slept till 10:30 because maid was coming at 11. I was totally unstable. When she saw me she immediately made me sit in a recliner. Said my face was pale and my eyes were blood shot. I would have fainted within seconds. |
| 944456 | 1/14/2021 | WA | 27 | F | 1/7/2021 | 1/7/2021 | Pt. received vaccine at 1520. At 1530 pt. started with itching, burning pain and patchy erythema without urticaria. No dyspnea, angioedema or wheezing. Pt. also experienced mild anxiety with O2 sat at 99, pulse 90 and BP 120/84. At 1535 50 mg diphenhydramine given IM in R deltoid and ice pack applied to L shoulder. At 1550 pulse 90, O2 sat 99%, BP 130/90, respirations unlabored and pt. reported mild dizziness, but not feeling like fainting. At 1615 itching reduced, pt.'s primary care provider, contacted and situation was reported to triage nurse and on-call provider. Provider advised pt. okay to go home if responding to the diphenhydramine. |

| 944517 | 1/14/2021 | | 44 | F | 12/23/2020 | 12/25/2020 | Myalgia chills, fatigue, syncope vs seizure 43 yo employee falt fatigue on 12/24 and again on 12/25/20. The patients husband reports she was walking down the stairs, seemed "off" and missed the step/slid on step injuring both feet/ankles. Pt got up and was able to stand for a few minutes. Husband reports that he than sat her on the steps-few minutes later she had syncope with convulsions vs seizure. Per his report this lasted over a minute, she stopped breathing and was unresponsive. He reports she was confused while he was on the phone with 911 operator (3 minutes). Patient was taken to Health Center for work up. The head CT, labs, X-rays, EKG were unremarkable. Followed up her physician Dr. and was referred to neurologist. She had a MRI without contrast which was unremarkable and is scheduled to undergo a sleep deprived EEG. She is undergoing physical therapy at this time for injury to bilateral feet/ankles. |
| 944554 | 1/14/2021 | ME | 37 | M | 1/13/2021 | 1/13/2021 | Rapid heart rate, severe sweating, inability to breathe, narrowing vision, fainting, anxiety |
| 944601 | 1/14/2021 | NY | 42 | F | 1/11/2021 | 1/11/2021 | Monday, 1/11/2021 (8:30a): 2nd dose administered ? I felt fine the rest of the day and when going to bed. Overnight, I started to experience chills followed by extreme perspiration and weakness to the point that I struggled to open a bottle of water I had by my bed. Tuesday, 1/12/2021: Headache, weak and tired but attempted to work. I had to leave shortly after arriving because my symptoms were becoming progressively worse to the point I almost passed out from standing. Upon arriving home, I started to experience nausea and vomiting x 3. Intense chills followed by the extreme perspiration still existed. Most of these symptoms subsided by 9:30p that evening. Wednesday, 1/13/2021: Intense headache, weakness and dizziness. Of note, my left underarm/armpit (the arm where the vaccine was administered) is sensitive to touch. |

| 944605 | 1/14/2021 | PA | 51 | F | 1/13/2021 | 1/14/2021 | Arm soreness, unable to sleep, patient is hypoglycemic - felt like having an episode, dizziness, patient loss consciousness for about 2 min, spouse called 911, patient had food then milk and ham, patient was pale, sweating, hands cramping, dizzy, shaking. Paramedics checked BP 118/76, sugar levels back up and oxygenation normal. Patient refused offer for transport to ER. Doctor visit in the AM ? EKG test: normal. Doctor requested for F/U prior to receiving 2nd COVID19 vaccination. Doctor unable to determine cause of low blood pressure that caused patient to faint. Previous TB test 20 years of age, 1988, caused fainting spell- blood pressure dropped and sugar levels for patient in the past. Patient today 1/14/21 is feeling foggy, dizzy, and fatigue blood pressure is still low, arm still sore. |
| 944637 | 1/14/2021 | OH | 37 | F | 12/31/2020 | 12/31/2020 | Tachycardia, palpitations, lightheadedness/near syncope, and numbness/tingling to tongue and lips 10 minutes after receiving vaccine. All symptoms resolved in about 15 minutes with the exception of numbness/tingling to tongue and lips which lasted 3 hours. Symptoms resolved on their own without treatment/medication other than lying flat with feet up and drinking a bottle of water. I was assessed by medical professionals at the vaccine clinic which was located inside of the hospital. I consulted with an ED physician but did not require any additional treatment. |
| 944688 | 1/14/2021 | MI | 36 | F | 1/12/2021 | 1/13/2021 | My first dose of COVID vaccine I didn't have any symptoms (1st dose: 12/23/20). Received 2nd dose at 0800 on 1/12/21. First symptom was on 1/12 at 2000 when I had a headache and malaise so I went to bed early. Woke up at 0200 on 1/13 with nausea, body aches and chills. My temp felt fever-ish (100.4 via temporal scan). So I took Tylenol and Pepto to go back to sleep. Same symptoms carried throughout the morning of 1/13. By noon 1/13 = my L arm where the injection had occurred was swollen, painful and hard to move. That evening I had a presyncopal event where I felt flushed and nearly passed out. My L arm continued to hurt but the swelling moved down into my lymph nodes where lymphadenopathy continues to be a problem until now. |

| 939865 | 1/13/2021 | CO | 46 | F | 1/12/2021 | 1/12/2021 | Around 11:30pm on 1/12/2021, began having pretty serious chills (fever not measured but felt very warm). At about 1:45am on 1/13/2021, was feeling very achy and uncomfortable, so I went downstairs to get some Tylenol. Rapid heart rate and sweating, so much I had to sit down in the kitchen for a few minutes. Eventually took the Tylenol, and as I was heading back upstairs, I passed out (I don't remember going down to the floor) and dropped the cup of water I was taking with me. Was out for less than 30 seconds. A couple episodes of heaving/vomiting small amounts of liquid while on the floor. Made it back to bed and was starting to feel improved around 4:00am. |
| 939847 | 1/13/2021 | CO | 46 | F | 1/12/2021 | 1/12/2021 | Around 11:30pm, I woke up with incredible chills and had them for about 1.5 hours. Around 1:45am/2:00am on 1/13/2021, aches began, so I went downstairs to take acetaminophen. Increased heart rate and sweating while in the kitchen (had to sit down on the floor), eventually took Tylenol, and as I was heading back upstairs with cup of water, I passed out (less than 30 seconds) dropping the cup of water. Heaved/vomited small amount of liquid two or three times. Made it back to bed and began to feel better around 4:00am 1/13/2021. |

| 940331 | 1/13/2021 | TX | 71 | F | 1/4/2021 | 1/4/2021 | Very nauseous all night long. Ate a breakfast bar in the morning, threw it up, had dry heaves for a while, then seemed to be OK. About an hour or so later got up to go to the restroom and just remember walking thru the door. Next thing I knew I was on the floor bleeding, passed out approx. 24 hrs after receiving shot. No way to know how long I was out, received head cut. |
| 942458 | 1/13/2021 | AZ | 44 | F | 1/1/2021 | 1/12/2021 | Syncope |
| 941456 | 1/13/2021 | MI | 20 | F | 12/30/2020 | 12/30/2020 | Systemic: Fainting-Medium |
| 939601 | 1/13/2021 | WA | 33 | F | 1/10/2021 | 1/11/2021 | Moderate-Severe chills, fever (maximum temperature: 101F), moderate body aches/joint pain, moderate headache, moderate fatigue, fainted twice |
| 941437 | 1/13/2021 | NC | 39 | F | 12/29/2020 | 12/29/2020 | within 5-10 minutes of injection, felt light-headed and fainted, support was with her and we helped her to the floor until stretcher could be moved over to her, immediately came to, placed on stretcher, rested for 10-15 minutes, drank water, felt well and got up from stretcher, no issues |
| 942377 | 1/13/2021 | CT | 47 | M | 1/7/2021 | 1/7/2021 | Approximately 13 hours after receiving the vaccine I became overwhelmingly tired. Went to get ready for bed by first going into the bathroom. While getting ready I passed out (micturition syncope). Hit my head on the floor and sustained a concussion. I am still experiencing post concussive symptoms but this is to be expected as it has been less than a week. |
| 942354 | 1/13/2021 | CT | 33 | F | 1/13/2021 | 1/13/2021 | Within minutes of receiving the vaccine Pt said she developed a "fruity" taste in her mouth. She said she got dizzy, extremely hot and felt like she was "swaying" She said she also got what she described as "menstrual like cramps" that radiated all around her abdomen and back. She was under observation as advised per Pfizer protocol. An associate of the Pt noticed she passed out for a second she then turned beet red from her head to her neck as we could see. The associate yelled for us to grab a BENADRYL. They hooked her up to a BP machine and she did present with a spike in BP. After a few minutes, the redness and symptoms subsided. She was observed by the medical staff at the facility. |

| 942074 | 1/13/2021 | CA | 38 | F | 12/28/2020 | 12/29/2020 | The next morning (12/29/20) - I had typical symptoms --> minimal body aches/fatigue and a sore Left arm At 6pm (12/29/20) --> I just finished dinner and all of sudden I felt like I zoned out/passed out for a minute. When I came to --> my sight was blurry, I felt very nauseous, dizzy, light-headed and felt like I was going to pass out. I ran to the kitchen and drank some water to try and calm it down, the sensation of passing out was still there with palpitations. I called out to my roommate who called an ambulance. My bp/hr were a bit on the lower side initially when the EMTs got to my apt. I was still feeling like I was going to pass out. My labs, vs, and tests all came back WNL when I got to the ED and by that time, I had a severe migraine and nothing else. From that night (Tuesday night 12/29) until the following Tuesday (1/5/21), I had a migraine, severe lethargy, body aches, and a swollen left armpit lymph node. |
| 941983 | 1/13/2021 | WA | 37 | M | 1/12/2021 | 1/12/2021 | Patient received the Covid vaccine on 1/12/2021 at 11:18 am. He felt light headed a minute or two post vaccination. He then lost consciousness for about <30 seconds. The staff eased him down the floor from the chair he was sitting on. He regained consciousness at 11:21am. He was diaphoretic and very pale. BP was 128/73 and HR was 46. Patient was given O2 at 2L/min and Gatorade which he tolerated well. At 11:26 am BP was 121/75, HR 53, O2 Sats at 99%, and RR 16. At 11:40am, patient stated he felt well and at this time, his color had returned. Patient stated he has a history of fainting with blood draw in 2003 but no issues with vaccines in the past. Also stated his HR usually runs in the 50's range. |
| 941882 | 1/13/2021 | MI | 34 | F | 1/13/2021 | 1/13/2021 | Pt experienced tachycardia, lightheaded, sweaty, nausea, and near syncope. Pt says she is anxious and feels this was anxiety-related. |
| 941876 | 1/13/2021 | NC | 89 | F | 1/7/2021 | 1/8/2021 | Patient was hospitalized within 24 hours after a syncopal episode due to hypotension. She was found to have a UTI due to E.coli and subsequently treated for the infection. It was felt, that the syncope was due to sepsis related to the UTI caused by known chronic constipation rather than the vaccine. |

| 941828 | 1/13/2021 | MA | 31 | M | 1/13/2021 | 1/13/2021 | Vaccine was given at 1250 pm. Approximately 20 min. after receiving the vaccine patient became general weak accompanied by near syncope, nausea. He was transported to hospital for treatment. |
| 936909 | 1/12/2021 | TX | 48 | F | 12/23/2020 | 12/23/2020 | I got the vaccine and had a headache that lasted 2-3 minutes. I then got in my car and I felt little bit sick and I picked up food and I started to feel sick. I went to work and my symptoms got worse and I sat in my desk and I felt like fainting. I just felt so sick and I thought it was my diabetes. A coworker saw me and told me i looked deathly pale and felt fainting and they took me to a ER room. They gave me Benadryl and IV fluids. I started seeing the floor and ceiling warped out, I was hallucinating. My legs felt numb as well. My eyes were twitching constantly. My blood pressure 147/95 and pulse was 112. I went home, ate and went to sleep. On Saturday I felt better and went back to work 12-28-2020, I felt weak and stayed working at my shift. On Tuesday I worked 1 hour and still felt super weak. Today I am starting to feel like myself again. I will not get my second dosage due to my symptoms I have experienced. |

| 936192 | 1/12/2021 | NJ | 24 | F | 12/26/2020 | 12/26/2020 | Passed out twice; Pain in the injection site; Slight headache; A spontaneous report was received from a consumer concerning a 24-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced the events, passed out twice, pain in the injection site, and slight headache. The patient's medical history was not reported. No concomitant medications were reported. On 26 Dec 2020 at 1:58 pm, approximately three hours prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 026L2DA) intramuscularly for prophylaxis of COVID-19 infection. On 26 Dec 2020, at 5:00 pm, the patient passed out. She also had pain in the injection site and a slight headache. On 27 Dec 2020, at 8:30 am, the patient passed out again. No treatment information was provided. The Action taken with mRNA-1273 in response to the events was not reported. The outcome for the events, passed out twice, pain in the injection site, and slight headache was unknown.; Reporter's Comments: This case concerns a 24 year old female patient, who experienced a serious unexpected event of loss of consciousness and non-serious expected event of injection site pain and headache. The event occurred apparently few hours after first dose of mRNA-1273 (Lot # 026L2DA) administration. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. |

| 934919 | 1/11/2021 | | | M | 1/5/2021 | 1/1/2021 | <p>syncope; diaphoresis; varying HR; blurred vision; This is a spontaneous report from a contactable physician (patient). A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on 05Jan2021 as single dose for COVID -19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced syncope, diaphoresis, varying HR (heart rate) and blurred vision in Jan2021. The patient underwent lab tests and procedures which included heart rate: varying in Jan2021. Details were as follows: Patient received the vaccine in the morning. He reported diaphoresis, syncope, varying HR, and blurred vision within 10 minutes of receiving the vaccine. He was taken to the emergency room and therapeutic measures were taken as a result of the events; he was given fluids. The patient generally tolerated vaccines and has recovered from the episode. The events, syncope, diaphoresis, varying HR (heart rate) and blurred vision recovered in Jan2021. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up .; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event due to temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators as appropriate.</p> |

| 933808 | 1/11/2021 | VA | 33 | F | 1/7/2021 | 1/8/2021 | Summary: syncopal event, hypotension, leukocytosis About 22-24 hours after receiving the first dose of the vaccine (1/8/21), the patient became nauseous and lightheaded, sat down in a chair for at least 30 minutes, felt worse and let a coworker know, then had a syncopal episode lasting 5-10 minutes, coworkers witnessed patient had stable vital signs but unresponsive, diaphoretic, pale, and shaking, a hospital rapid response was called (patient works at the hospital). Patient was taken to the ED for observation, remained hypotensive (90's/50's) for about an hour, then slowly returned to normal BP (110's/80's) over another hour. Patient likely did not require going to the ED, however was taken there as a precaution due initially to the length of time passed out and hypotension. Prior to this episode, the patient only experienced soreness at the injection site. Following this episode, the patient felt some weakness and had a mild headache for another 24 hours before returning to baseline. |

A 53-years-old non-pregnant female patient (nurse) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EJ1685), in the right arm on 28DEC2020 08:15 as a single dose, for COVID-19 vaccination. Facility where the most recent COVID-19 vaccine was administered was a Hospital. Medical history included asthma and gastroesophageal reflux disease from an unknown date and unknown if ongoing. Known allergies include Tape, Walnuts, and Cat hair. Concomitant medication received within 2 weeks of vaccination included acyclovir [aciclovir] (ACYCLOVIR [ACICLOVIR]), ferrous gluconate, herbal nos, vitamins nos (FLORADIX), lansoprazole (PREVACID), cholecalciferol (VITAMIN D [COLECALCIFEROL]). No other vaccines were given within 4 weeks. Prior to vaccination, the patient was not diagnosed with COVID-19. On 28DEC2020 08:15 within 2 min. of injection had near syncope that would come in waves every 2-3 minutes, face red, chest pressure, tightness /pressure in throat, headache, BP 186/90, rapid HR. The patient Spent 1 hour in ER. Later in day 28Dec2020, continued to have dizziness, chest pressure, chills, headache, fatigue. This continued for 4 days and had mild cough. The adverse events resulted in an emergency room (ER) visit. and Physician Office Visit. Treatment included Xyzal which relieved majority of symptoms. Laboratory test and procedures on 28Dec2020 include Electrocardiogram (EKG) with normal results, Blood Pressure Measurement 186/90 and Heart Rate Rapid. Treatment was given for chest tightness, throat tightness and red face and No treatment was given for chills, cough, dizziness, fatigue, headache, heart rate increase, blood pressure high and near syncope. The clinical outcome of near syncope that would come in waves every 2-3 minutes, face red, chest pressure, tightness /pressure in throat, headache, BP 186/90, rapid HR, dizziness, chest pressure, chills, headache, fatigue, mild cough was recovered. No follow-up attempts are possible. No further information is expected.; Sender's Comments: The Company cannot |

| 934924 | 1/11/2021 | OH | 58 | F | 1/4/2021 | 1/4/2021 | tired; no energy; low back pain; her fingers are hurting; passed out on toilet; Nauseated; hit head on wall, head just hurts; hit head on wall, head just hurts; Chills; she was very cold; could not sleep good; site of vaccine was sore; Muscle pain; Joint pain; This is a spontaneous report from a contactable consumer. A 58-year-old female patient started to receive first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Batch/lot number: EK9231) by injection once to left arm, via an unspecified route of administration on 04Jan2021 12:30 at single dose for covid-19 immunisation. Medical history included thyroid disorder. Concomitant medication included levothyroxine sodium (SYNTHROID) for thyroid disorder; patient started it after she had her son, and her son is 18 years old. The patient had her vaccine yesterday (04Jan2021) at 12:30, and at nighttime, around 22:00, she started having chills, she was very cold, so she went to bed, she could not sleep good, she kept waking up, and the site of vaccine was sore, she had muscle pain, joint pain, she didn't have fever, but she got up late today (05Jan2021), around 11:00, and had breakfast and felt nauseated, so she stopped eating, and she went to the bathroom and passed out on the toilet, when she woke up, she had her nightgown inside the toilet, it was all wet, she felt better, so she stood up and then she woke up again, and was inside the tub, her legs were inside the basin, she was lying down with her back inside the tub, she thinks she hit her head on the wall, and it just hurts, it didn't bleed or nothing. The patient stated she had the paper she was given. Again stated she can not even function. Patient still feels Chills a little bit, not as bad as last night. She is awake now, but she feels very very tired, like she has no energy, she is laying down on couch right now. She kept waking up and noticed this morning, she had low back pain, in the muscles, even her fingers are hurting. Regarding hitting her head on the wall, states she has a terrible headache, not a little pain, she thinks it is because she hurt her head. The patient is supposed to get second vaccination on 25Jan2021. The outcome of events Chills, Joint pain and nauseated was recovering; of events site of vaccine was sore and muscle pain was not recovered; of other events was unknown. |

| 935797 | 1/11/2021 | NY | 38 | M | 1/10/2021 | 1/11/2021 | Felt completely normal at time of injection, and for several hours afterward. Began feeling pain and soreness at injection site around 11PM. Felt overall coldness and increased soreness at injection site when retiring to bed at 11:30PM. Experienced extremely vivid dreams prior to awaking at ~4AM with the need to urinate. Felt extremely hot, and somewhat concerning shortness of breath. Sat up in bed for 45-60 seconds prior to standing vertical. Felt normal when walking to bathroom and while urinating, no straining or abnormal effort required. Upon nearing completion of emptying bladder, ears began increasing intensity of ringing, followed immediately by cascading sensation of weakness. Realizing I was probably rapidly losing consciousness, I grabbed sink for support, in order to get as close to the ground as possible. Regained consciousness an unknown period of time later, though believed I was in bed. Upon noticing how cold my "bedsheets" were, I realized/remembered that I had lost consciousness. Felt completely weak and rested on floor for 30(?) minutes; attempts to move to a more vertical position were met with vague sensations of nausea. Eventually felt strong enough to drag myself to a nearby couch, where I slept on and off until 11:30AM, and gradually woke up to eat breakfast. I have experienced 1-2 episodes of syncope in my lifetime, and this instance aligns with how I felt at those times. Have never experienced micturition syncope at any point before, though. |

| 935780 | 1/11/2021 | OH | 61 | F | 1/5/2021 | 1/5/2021 | Extremely tired went to bed at 8:30. At 11:00, tossed and turned until 12:16 a.m. Did not think she could stand up. Walked in the bathroom had pain in stomach, was very hot and freezing at the same time, was shaking. Head hurt was hurting so bad. Tried standing up from toilet, was passed out. Eye, half of face is bruised and swollen , eye shut for two days. More than forty minutes passed before she could call her husband. Does not remember anything because she was passed out. Husband came in and grabbed her, to get her back into bed. she could not stand. Went to ER at Hospital. Had CT scan, blood work , EKG, chest xray. Was still kind of out of it but was able to communicate with nurses. Face is still black and blue. Last night got up at 4:00 a.m. something was wrong with her throat. Felt like a walnut was in her throat. Went to doctor this morning. They said it was a reaction from the shot. Got an EpiPen, prednisone. Call them in 2 days to let them know how she's doing and also wear a heart monitor because they do not know how to take care of her, Has had vision blurriness in both eyes. Has not felt well at all. |
| 935742 | 1/11/2021 | CO | 32 | F | 1/7/2021 | 1/8/2021 | Vaccine at 600pm on 1/7. Waking up every hour from 330am-800am. Woke up 8am chest scratchiness/itchiness, generalized joint pain, and body aches, and fatigue. Episode of lightheadedness at around 6pm and near syncope. Started experiencing axillary swelling and pain. All symptoms resoled by 1/9 except for L axillary swelling which persisted until 1/11. |
| 935519 | 1/11/2021 | | 34 | F | 1/11/2021 | 1/11/2021 | Patient is a 34 y.o. female who was seen at COVID Vaccine Clinic today for her dose of the COVID 19 vaccination. She denied any history of previous adverse reactions to vaccines. She was given the Moderna vaccination in the left deltoid muscle. During her waiting period after the injection, the patient began to experience dizziness / lightheaded. She denied syncope, N/V, visual changes, headaches. This provider was notified of patient reaction and she was then assessed in the emergency bay area. Monitored patient for severe reaction symptoms, including but not limited to shortness of breath, swelling of the throat, Difficulty breathing, chest pains. Patient did not experience any of these symptoms She is 18 weeks pregnant. No complications with pregnancy. |

I walked back to my bedroom and passed out on the floor. I believe I was only blacked out for a minute or less but I did hit my nose and bruise it. The next morning I was very tired and had a headache. Along with the sore arm. |
| 929124 | 1/8/2021 | | 26 | F | 1/3/2021 | 1/4/2021 | drop in blood pressure resulting in fainting; drop in blood pressure resulting in fainting; Severe headache; fever; This is a spontaneous report from a contactable other healthcare professional (patient). A 26-year-old female patient (non-pregnant) received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EK9231), via an unspecified route of administration on 03Jan2021 at single dose at left arm for immunization. Medical history included allergies to Penicillins. The patient's concomitant medications within 2 weeks of vaccination included birth control pill, prenatal vitamin. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, patient was diagnosed with COVID-19. Since the vaccination, patient has not been tested for COVID-19. The patient experienced severe headache, fever, and drop in blood pressure resulting in fainting the morning following receiving the vaccine on 04Jan2021 with outcome of recovering. Patient didn't receive treatment for events. Adverse events resulted in doctor or other healthcare professional office/clinic visit. This report is considered non-serious. No follow-up attempts are possible. Information about Batch number cannot be obtained. No further information is expected.; Sender's Comments: Based on the close temporal relationship, the association between the event fainting with BNT162b2 can not be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate. |

| 928475 | 1/8/2021 | NJ | 40 | F | 12/22/2020 | 12/23/2020 | Around at 7AM when I arrived at work I started feeling chills, took temperature 99.5F that is already elevated for me. About 9:30 my temp was 101.8F and they sent me home. I just had the chills and fever. I got home and developed a headache and around 1PM I started feeling really dizzy. The temperature did not subside and the next day I woke up and I couldn't function, I felt really dizzy I kept laying down and drinking water, I could not keep anything down my stomach did not feel well. I felt like I had to vomit. When I sat down in the toilet then my ears started ringing pretty bad all of a sudden I could not hear anything and I passed out in the toilet. My husband found me and tried to wake me up. After that I still feel dizzy. I did not have any appetite either. I could barely hold water. The next day I was not as dizzy but my stomach was still upset but I could hold some soup down but then started with diarrhea. Employee health kept calling me everyday and I did the the telehealth appt and I also had a little bit of a rash in my chest that appeared all of a sudden red like a streak. The dizziness I had for the first 4 days, diarrhea did not come until the 3rd day and I had it for 2 days and my temperature was back to normal on the 4th day. Everything started to get better (my stomach stopped feeling queezy) around the 4th day but still felt fatigued until about 12/29/2020. |

| 927603 | 1/8/2021 | CO | 34 | F | 12/20/2020 | 12/20/2020 | Near syncope; lightheaded/dizzy; vision narrow; Tingling in lips; This is a spontaneous report from a contactable physician. A 34-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: Eh9899), via an unspecified route of administration on 20Dec2020 09:00 in left arm at single dose for COVID-19 immunization. Medical history was reported as none. The patient's concomitant medications were not reported. The patient experienced near syncope, lightheaded, dizzy, vision narrow and tingling in lips on 20Dec2020 09:30 AM. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. No treatment given to the patient for the events. The outcome of the events was recovered on unspecified date. The event was considered non serious as it did not results in death, was not life threatening, did not cause/prolonged hospitalization, was not disabling/Incapacitating and had no congenital anomaly/birth defect. |

| 927517 | 1/8/2021 | NJ | 62 | M | 12/30/2020 | 12/1/2020 | Felt pinched when the vaccine was administered; soreness at the muscle site; little muscle soreness from the vaccine; Postnasal drip in throat; Feeling warm then really hot; Feeling weak; Clammy; sweaty; As if he was going to pass out; almost like a vagal reaction if you got a needle or were scared; vagal reaction but delayed; Heart might have been beating fast; Experience is like the dizziness related in the signs of a severe allergic reaction; Experience is like the dizziness related in the signs of a severe allergic reaction; Anxiety; anxious; This is a spontaneous report from a contactable physician (patient). A 62-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot Number and Expiration Date were not reported), intramuscular in left deltoid, on 30Dec2020 10:30, at a single dose, for COVID-19 immunization. The patient's medical history included ongoing mild intraocular pressure. The patient's concomitant medication included unspecified eye drops for a mild intraocular pressure. The patient previously took tetanus vaccine and experienced vagal reaction and passed out (in his childhood). The patient's past COVID tests were always negative. On 30Dec2020, the patient received it at a facility where he is a physician on staff, and they started giving it that day. It was administered by a pharmacist who was very clean and professional, and everything was fine. The patient received the COVID-19 vaccine in the left deltoid and felt pinched when the vaccine was administered, and he felt fine. He did not have any immediate reaction. He sat down, then got up and was standing talking to some colleagues, and about 10 to 15 minutes later, they were talking and felt a little postnasal drip in throat. His colleagues said that is what they felt as well. About 10 minutes later, the patient was feeling warm then really hot to the point where he felt the need for cool air. He added feeling weak and clammy as if he was going to pass out. He started to feel weak and warm and almost like a vagal reaction if you got a needle or were scared. It was almost like he felt hot, sweaty, and weak and feeling like he needed to get to a cool place and sit down. The patient's heart might have been beating fast, but he did not check his pulse. The patient went outside where the temperature was in the thirties and cold. The patient broke out in sweat and felt weak. The patient sat down, and it was cold outside, and he felt |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

better. It passed and he felt fine after that. The symptoms lasted 10-15 minutes top, and it was resolved after the peak. The patient had soreness at the muscle site which got better overnight; little muscle soreness from the vaccine. The patient then got better and felt no other symptoms. He looked up the side effects and talked to the pharmacist. He spoke with a pharmacist, who provided the information on the reported adverse reaction of the COVID-19 vaccines and the signs of a severe allergic reaction included in the PI. He is not an allergic type person. He is familiar with those reactions and never had any trouble. He wasn't quite sure if it was related but then said it is probably somewhat related. The patient explained that he doesn't have any of the reported adverse reactions in the PI; but his experience is like the dizziness related in the signs of a severe allergic reaction in the PI, and he did feel that his heartbeat was fast. He is fine now though. The patient asked if his event is related to the vaccine and what is the impact on getting the second dose when reacting to the first. The patient was thinking that this event is a vagal reaction but delayed. He also explained that he was speaking with his colleagues, right after receiving the COVID-19 vaccine, regarding postnasal drip reaction. The patient also wondered if anxiety related to this discussion could have triggered his symptoms. Originally, he thought it was just him. But after talking to colleagues, maybe he was just a little anxious. He did not feel anxious going in. He did not need any intervention. He did not take any diphenhydramine hydrochloride (BENADRYL) or anything. He sat and rested, and it passed. He has been fine since. He needs a second dose in 3 weeks. There is not a lot of information about the side effects. It was not like he got a rash. He did not have any swelling of the tongue or throat. He just wanted to find out about if he should get the second dose. He really wanted to get the second dose. He just wanted to know if this was common or a concern and should he take the second dose. There were a lot of people getting the vaccine and this was not anything that stopped anyone from getting it. He is just trying to make sure and see how likely it was that it was related to the vaccine and how does it affect him getting the second dose. The patient was recovering from "Felt pinched when the vaccine was administered; soreness at the muscle site;

| 930596 | 1/8/2021 | HI | 38 | M | 1/7/2021 | 1/7/2021 | Officially I fainted, but I describe in detailed events of occurrence below. I was using my laptop doing some busy work while I waited the 15 minutes after taking the first shot of the Pfizer/BT Vaccine. I had the feeling that I could feel the vaccine coursing through my chest but I thought that was irrational and my mind and nerves playing tricks. I continued to work and let my mind wander for a moment. Next thing I know I was dreaming for a time and then I slowly awakened by the staff calling my name asking "are you OK, do you know where you are?" I was able to answer correctly, but my mind felt fuzzy/foggy where I felt as if I was running on automatic but my conscious mind was not in full control. At the time, it was hard to describe at the time how I was feeling as I was trying to note it down for future reference. All I could put down were simple words and I could not form full statements. Though I was very present in the moment. I can remember the name of the Nurses who I was talking to, and what we were talking about. They took me to be observed for about an hour longer. While I waited, I felt warm, especially in the areas of the back of my head and chest. I was not in any pain, but I was very thirsty. I was also getting pretty hot sitting there, but that may be because of the fact the ER Triage room has full glass wall in full sun. At the end of the hour the sun dropped lower in the sky I felt the normal cold refrigerated Hospital I am used to. I felt weak initially but by an hour I had regained most of my strength by the time the triage nurse took my vitals. After the physician looked over me and my report, they did not give me a reason of concern that would warrant keeping me and let me go home to rest. |
| 930588 | 1/8/2021 | | 52 | M | 1/2/2021 | 1/8/2021 | Patient had severe nausea/vertigo episode upon awakening on 1/8/21. Patient fainted and collapsed onto bathroom floor. He hit his head on the wall during the fall. Patient was found barely conscious by his wife right after the fall. Patient temperature, O2 sat and BP all within normal limits measured within 5 minutes of fall. Patient does have history of Meniere's disease x 5 years, but is well-controlled with medication and middle ear steroid injections. Patient has not had severe vertigo episode in 2+ years. |

| 930402 | 1/8/2021 | | | U | | | Throat felt clogged, almost passed out, This lasted about 30 secs about 10 mins after injection. Then became very hot and sweaty and started itching all over. This happened about 15 mins after injection and lasted all day. There is now a rash all over my face and small hives on my chest. I have taken 2 benadryl. This is now 7 hrs post injection |
| 929655 | 1/8/2021 | FL | 40 | F | 12/28/2020 | 12/28/2020 | After receiving the vaccine, I went into a waiting room for the post-vaccine 15 minute observation. Approximately 2 minutes after sitting down I felt a sensation that can be described as a wave through my body. It only lasted for 10 seconds; however, it was immediately followed by a rapid heartbeat. It almost felt as though I might pass out (I have never passed out before). I alerted a nurse, and she monitored me for the 15 minute duration. After about 2 minutes, I felt 'normal' again. |
| 930277 | 1/8/2021 | CA | 50 | M | 1/8/2021 | 1/8/2021 | patient described feeling lightheaded, near syncope, 'almost passed out' 15 minutes after vaccine administration |
| 930247 | 1/8/2021 | WA | 31 | F | 12/31/2020 | 1/2/2021 | 15 min after vaccine administration I was extremely dizzy/nearly fainted this lasted for 25 minutes. 2 days later I developed some redness at the sight of injection/itchiness. This got better. On day 7 after getting the vaccine I developed a firm, raised, HOT and extremely itchy area at the site of injection. This is measuring at 5cm by 5 cm on my Left deltoid. This continues to get larger and larger. I have also had daily headaches since the vaccine was given. I seen a doctor who recommended calling the CDC who then advised me to complete a VAERS report. |

| 929937 | 1/8/2021 | FL | 25 | F | 1/8/2021 | 1/8/2021 | Patient states that she got her coronavirus vaccine and about 10 min later she felt very weak diffusely, felt her ears ringing and passed out. Patient was caught and lowered to a chair, thus did not hit her head. Patient states she has passed out before but this felt different. Patient felt her heart racing prior to passing out. |
| 929774 | 1/8/2021 | | 31 | M | 1/7/2021 | 1/7/2021 | I felt fine the rest of yesterday but started to feel really tired and worn down late last night. I took my sleeping pill like normal and went to bed. I woke up feeling really achy and cold so I went to take some Tylenol in case I had a fever. Started feeling dizzy and light headed and I passed out. I cut my foot on the glass I dropped and scraped my back as I fell. I don't remember being blacked out very long. I just remember sitting on the floor feeling really lethargic. My whole body felt tingly and my ears were ringing really bad. Was able to get up and get back to bed. Decided to go back to sleep and not go to the ER. This morning I'm still a little dizzy but mostly just have a headache and am extremely tired. I plan to get into my doctor today so I will keep you updated. Just wanted to let you know what happened so you could report it. |
| 929695 | 1/8/2021 | DC | 26 | F | 12/30/2020 | 12/31/2020 | Hives, started 24 hours after vaccine administration, present for about 1 week after vaccine dose, improved with antihistamine therapy. no lip/tongue swelling, shortness of breath, vomiting, syncope, hypotension |
| 929300 | 1/8/2021 | WI | 70 | F | 1/7/2021 | 1/7/2021 | Allergic reaction / Syncope and collapse Patient reports feeling dizzy, hot, and that her eyes felt funny. Patient was sweaty, heart rate within normal rhythm. Patient lost consciousness and began seizure-like activity and was assisted to the ground. Patient regained consciousness about 20 seconds later. At 12:48: BP was 91/44 upper right arm, HR 78, O2 sat 100%. At 12:50 BP was 76/50 and patient report shortness of breath and the sensation that her throat was closing up. She was assisted to supine position again. at 12:54 Epinephrine 0.3ml was administered IM. At 12:56 NS administered wide open with pressure. Blood glucose 109. at 12:59 BP was 133/67. Taken to Emergency Department where she received famotidin 20mg IV, Methylprednisolone 80mg IV and KCL 20mEq po due to Potassium level of 3.4. |

| 930297 | 1/8/2021 | RI | 29 | F | 1/7/2021 | 1/7/2021 | 29-year-old previously healthy female presenting today with difficulty sleeping, sore throat, and nausea after receiving the second Pfizer COVID-19 vaccine around 10 AM. Patient says that after her first dose of the vaccine she had mild sore throat and hoarse voice that resolved spontaneously. She had her vaccine around 10, several hours later before coming to the emergency department between 2--230 she had the sudden onset of difficulty speaking with associated sore throat and nausea. She has had dry heaving but no large amounts of vomiting. She has not had stridor, wheezing, shortness of breath, syncope, or the development of a rash or hives. She has not had a reaction to her prior vaccines she does not have any other allergies in general. She has otherwise been well recently without infectious symptoms including fevers, chills, cough, and has not been exposed to Covid to her knowledge. Medications administered in ED included diphenhydramine 50 mg IV once, dexamethasone 10 mg IV once, famotidine 40 mg IV once, ondansetron 4 mg IV once. Had brief episode of shaking and R arm rigidity in the ED. Patient denies LOC during the episode, did not have a post ictal state, no tongue biting or episodes of incontinence. Given single event without LOC, less concern about episode being a seizure. Patient has had no further episodes of shaking since admission. CT brain was wnl, no FNDs noted on exam. |

| 924892 | 1/7/2021 | FL | 89 | M | 12/30/2020 | 12/30/2020 | <p>extremely lightheaded; like he was about to fall down; This is a spontaneous report from a contactable physician. This physician reported similar events for 2 patients. This is the 1st of 2 reports. An 89-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number; EL0140), intramuscular on the right arm on 30Dec2020 10:10 at single dose for vaccination. Medical history included covid-19 on Jul2020 and had it fairly severe and almost died and he mentions he was overweight. There were no concomitant medications. The patient previously took flu shot (INFLUENZA VACCINE), a couple of months ago. He mentions he was in the military so he had a lots of shots in his life but he has never had a reaction like this. The patient stated that on 30Dec2020 10:30, "he became extremely lightheaded, like he was about to fall down. He sat down and is currently sitting down. This lightheadedness started about 20 minutes after the injection. When probed for the outcome, the caller explains it might be improving a little. The lightheadedness is not still not gone, but it has not worsened. When probed for seriousness criteria, the caller explains he is just resting and sitting. He would say its not serious but it could be medically significant. He states he isn't sure if this is something that happens to just people who have had COVID before. He states none of his friends or relatives have this type of reaction. He lives in a retirement home and everybody is getting the injection. This is the second day of injections. He doesn't know if anybody had a reaction to the COVID-19 vaccine here". The outcome of the events were recovering.;</p> <p>Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of lightheadedness and pre-syncope due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern</p> |

Woke up with chills, headache, weak, felt like fainting, arm pain. Called off work. Fever of 100.4. |
| 925753 | 1/7/2021 | NY | 46 | F | 12/28/2020 | 12/28/2020 | Fainting; Red Palms; blotching; sweating profusely; heart palpitations; Chest pain; Elevated BP; This is a spontaneous report from a contactable consumer (patient). A 46-years-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 28Dec2020 09:15 at single dose on left arm (Lot number: ek9231) for COVID-19 immunisation. Medical history included asthma, bronchitis, mitral valve regurgitation, herpes, depression, ADHD. COVID prior vaccination: Yes. Known allergies: tramadol, milk products. No other vaccine in four weeks. Concomitant medication included amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (ADDERALL), bupropion, and, losartan/hydrochlorothiazide. The patient experienced red palms/blotching, sweating profusely, heart palpitations, chest pain and fainting, elevated BP, all on 28Dec2020 09:15. All these events required Emergency room visit. Therapeutic measures were taken as a result of the events included 50 mg of Benadryl, 60 mg of Prednisone, omepresol. No COVID tested post vaccination. Outcome of events was recovered with sequelae. |

|-----------------|-----------------|--------------|----------------|------------|-----------------|-------------------|---|
| 925649 | 1/7/2021 | | | F | 12/1/2020 | 12/1/2020 | <p>It sounds like to be an allergic reaction; She passed out; Tachycardia; Nausea; Lightheadedness; This is a spontaneous report from a non-contactable physician. A 32-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) in Dec2020 at single dose to be vaccinated for her protection. Medical history was none. The patient's concomitant medications were not reported. Patient took the Pfizer COVID-19 vaccine and next day she had a very serious reaction. She did not know that if it was due to the vaccine. But she had tachycardia requiring her to go to the emergency room and she passed out and she had nausea and lightheadedness as well. It sounds like to be an allergic reaction. Given the seriousness of tachycardia and passing out as well as the lightheadedness and nausea it sounds too severe just to be a mild immune response. So, it was sort of rare immune response or it was unrelated it was unknown at this time. Outcome of event was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Based on the compatible time association, the contribution of suspect BNT162B2 to the events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p> |

| 925442 | 1/7/2021 | MA | 67 | F | 1/6/2021 | 1/7/2021 | I received the vaccine yesterday 1/6/21. Today, 1/7/21, I went for my walk this morning and felt off balance/swayed to the right a bit at one point. I don't think lightheadedness precipitated this, but it unnerved me. I steadied myself and finished the walk without a problem. I checked and surface/pavement was uneven. My temp is 97.5 and I feel fine now but am just a little nervous that is a possible reaction to the vaccine. I had a reaction to the second dose of the hepatitis B vaccine 10 yrs ago, I fainted in early morning hours after getting up to go to bathroom. I had received the second dose at about 11:30a the day before, and developed flu like symptoms by afternoon with a fever and ended up dehydrated which I think contributed to my fainting at about 3a when I got up to void. I had a concussion and was treated with IV fluids at the local ED. |
| 925218 | 1/7/2021 | VA | 28 | F | 1/6/2021 | 1/7/2021 | 06Jan21-Unable to sleep, increased heart rate, headache. 07Jan21- Increased heart rate, headache, back pain, neck pain, passed out, weak, fever, chills, hot, dehydrated (even after consuming lots of water all day). Took motrin and one hour nap, decreased symptoms severity but did not get rid of them. |
| 925159 | 1/7/2021 | VA | 28 | F | 1/6/2021 | 1/7/2021 | Moderna COVID-19 Vaccine EUA. Around 7pm on 06Jan21, symptoms began with a headache, increased heart rate, inability to sleep/relax. On 07Jan21, Migraine headache, inability to sleep/relax, increased heart rate, passed out, lightheaded, back pain, neck pain, weak, fever, chills, hot, dehydrated (even with large consumption of water). Took two motrin and an hour nap, which severely decreased above symptoms but still experienced them. |

| 924817 | 1/7/2021 | TX | 32 | F | 12/22/2020 | 12/22/2020 | As soon as I received my shot it was like an electric shot from the injection shot, up the back of my neck, into my brain. I was instantly woozy and disoriented. They moved me to observation. My hemiplegic migraine started within 10 minutes of the vaccine. I take a preventative every day, and to be honest after the vaccine it was like I had never, ever taken my preventatives. The migraine I got that day is the worst one I have experienced since the first one I ever got. Now on top of the migraines, the vaccine gave me waves of new symptoms. I was having spells of intense heat flashes, with wooziness, and nausea. So the new symptoms were paired with the hemiplegic migraines that, if you aren't familiar with, mimic strokes because my whole left side tends to go limp, and I struggle with speech, and cognitive issues. So it really wasn't all too long before the nurse kindly suggested that I didn't look great and we should head to the ED. They treated the migraine, gave me a CT, everything came back fine. They reached out to my neurologist, gave me some fluids, really they wanted to keep me a little longer, but I know the migraine drill and just wanted to go home and sleep and eat. I promised to follow up with my neurologist and fill out my CDC form. Over the next week the migraine and extra symptoms seemed to slowly but surely let up. The only note worthy thing was really that my left side would get extra tender at times. Not just my injection site, but it was almost like all my nerve endings all over my left side were on fire at times and a pinch on the thigh may as well have been a stab, or a pat on the back a punch. It was pretty intense at times. And just when I thought it was all over my menses started, you see my hormones trigger my migraines. And once again it was like I wasn't on a preventative. I had an intense Migraine start. I was able to take my bail out medication (sumatriptan) though and get to work. I moved forward with my day, and just when I thought all was normal, I got one of those brutal heat flashes, the room started moving, and I was nauseous. Unfortunately I was in full PPE, I almost passed out, I had to get a coworker to help, they had to get my supervisor. It was a big, unnecessary-necessary, pride-wounding scene. Now I am not a scientist or a doctor, but I might speculate that people with neurological deficits, like myself, are going to have a harder time with this inactive Covid strand. I would much rather be immune to Covid |

| 926892 | 1/7/2021 | WA | 55 | M | 12/30/2020 | 1/2/2021 | Patient received 0.5mL Moderna Covid19 vaccine at mass vaccine clinic on 12/30. This patient was a walk thru and not a patient of HP at this time. Daughter reported to ARNP, RN Director Clinical Support on 01/03 the following outcomes: Patient first exhibited the first signs of reaction started about 60 hours after vaccine: hives only (no difficulty breathing, dizziness, lightheadedness); applied hydrocortisone cream, took diphenhydramine. Patient slept for a few hours then woke up for lunch. Around 12:30-1:00 the patient exhibited three episodes of syncope. Emergency services was called after the first. Firefighters couldn't find BP, was in 70s by doppler only. Patient taken to hospital for care. Discharged from ED around 5, suspecting hypotension 2/2 to diphenhydramine use. Monitored vitals at home; became severely hypotensive (BP 70s/40s both with automatic monitor and manual read) and lethargic again about an hour or so after, but normotensive again right before about to call ambulance. Pt claimed to be okay and had some dinner. Fourth episode of syncope, ambulance was called. Patient remains at hospital ED since, still in observation unit. BP's normalized but itching returns periodically. IV steroids and diphenhydramine. Took head CT yesterday; no word on the results. Stable and alert enough since yesterday to communicate with us with his phone. Patient is scheduled for an echo to be done today. No hx of severe allergic reaction. Treated for active TB 30 years ago, shingles x2 in the past few years; otherwise healthy 55 y/o male. Pt discharged 01/04 to home with fatigue and malaise. Not additional symptoms reported since then. Provider doing full cardiac and neurologic work up. |
| 926805 | 1/7/2021 | CA | 42 | F | 12/23/2020 | 12/23/2020 | 12 minutes post vax felt warm, dizzy, hypotensive, syncope. Transferred to ED, monitored and discharged. On 12/24/2020 developed cyanosis to lips. Returned to ED and placed on 5 day steroid therapy and diphenhydramine. Mildly improved. |

| 926801 | 1/7/2021 | IL | 41 | F | 1/5/2021 | 1/5/2021 | I received the injection around 2:15 pm. There were no immediate effects. By late afternoon/early evening, my arm was a bit sore and later started to feel warm near the injection site. However, I otherwise felt fine. At 9 pm, I suddenly became very dizzy and passed out for several minutes. When I regained consciousness, I felt a little short of breath, which resolved within 20 minutes or so. However, I was also extremely nauseous, which got worse any time I tried to move. This continued for several hours. I also alternated between being very warm and chills during this time - it was like waves of heat. I did not have a fever. Later, my head began to hurt and I took tylenol to help with that. I also had diarrhea. These symptoms began to gradually lessen after a couple of hours and I was able to fall asleep around 12:30 pm. I woke up hot and sweaty several times throughout the night. The following day, 1/6, I was very tired and had a headache and could not eat much, but otherwise felt much better. |
| 926779 | 1/7/2021 | OH | 28 | F | 1/5/2021 | 1/6/2021 | After receiving vaccine, woke up around 3 am experiencing nausea, loss of vision x 1-2 minutes, syncope, difficulty breathing, numbness & tingling in hands and feet. Measured temperature of 102 F. Slept most of the next day and missed work x 1 day. The following day was improved but still with moderate fatigue and nausea. Took ibuprofen with some improvement. |
| 926500 | 1/7/2021 | IL | 45 | M | 1/7/2021 | 1/7/2021 | Patient received vaccination approximately at 10:45 am, he had told immunizer he had felt nervous and had fainted previously with other vaccinations. Patient was monitored after vaccination patient said he felt dizzy, approximately 11:15 am he fell forward from chair and was attended to by staff. EMTs were called and patient was taken to hospital for observation. After vaccination pt had blood pressure readings of 130/80 5 min after 150/80 15 minutes after his blood sugar readings reported by family member on scene were 325 the previous evening and 255 the morning before he came in. EMTs took a blood sugar reading 365 upon their arrival. |
| 929355 | 1/7/2021 | | 35 | M | 12/23/2020 | 12/23/2020 | Dizziness, RespDepression, passed out Narrative: |

| 922524 | 1/6/2021 | FL | 62 | F | 1/5/2021 | 1/5/2021 | Within 30 seconds to 1 minute, I had a strange taste in my mouth. It was neither pleasant nor unpleasant, just different. Following this I began to feel bad. It felt as if my blood pressure dropped. I became dizzy and had to hold my head up with my hands. Thank God, I was in my car when I got this injection, or I would have fainted. I felt my temp increase, and my breathing and heart rate became rapid. I used meditation to get my breathing under control, and within a few minutes, I broke out in a cold sweat all over. Then these symptoms subsided and I felt much better. This entire reaction was under 5 minutes. 15 minutes after the injection, a nurse returned to my car and I told her that the vaccine triggered a hot flash or something. My arm became very sore, and that night I felt a goose-egg lump, very warm at the injection site. Also, the left side of my throat felt tight, and it hurt. This morning my arm is still very sore, but no lump, and my throat feels better. |

| 920968 | 1/5/2021 | CT | 30 | F | 12/22/2020 | 12/23/2020 | <p>It looks like one of the ingredients may have an animal cell lipid; Syncope; Dizziness; feeling faint; like going to pass out now and then; overall achiness, severe headaches, fever; overall achiness, severe headaches, fever; overall achiness, severe headaches, fever; This is a spontaneous report from a contactable nurse reporting for herself. This A 30-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot # EH9899), intramuscular at single dose in the left arm on 22Dec2020 09:00 for covid-19 immunisation. Medical history included reaction to pork, porcine and/or if she ever was exposed to exposed to heparin. There were no concomitant medications. On 23Dec2020, the patient experienced syncope (medically significant), dizziness (medically significant), feeling faint; like going to pass out now and then (medically significant), overall achiness, severe headaches, fever. The outcome of the events syncope, dizziness, feeling faint; like going to pass out now was recovering and outcome of overall achiness, severe headaches, fever was recovered on 24Dec2020. The patient ask: are there any animal products, pork gelatin or a lipid form of that contain in the vaccine? The events were described as follows: She experienced a significant amount of syncope and dizziness, for greater than 4 or 5 days post-receiving the vaccination. Also feeling faint like she is going to pass out every now and then. Has a more important question, wondering along with the doctors if one of the ingredients may have an animal product, like pork gelatin or a lipid form of that. It looks like one of the ingredients may have an animal cell lipid and was wondering if she was having a reaction to that. Declines to provide primary care provider details. States she received this first dose at occupational health in her workplace. Received the vaccine on the 22Dec2020 at 9am. 24 hours post vaccination, 1 day after, the syncope, dizziness, feeling faint started. Also the other symptoms, overall achiness, severe headaches, and fever were also experienced, but they stopped after that 24 hours. Those were expected since it was listed as side effects that popped up, so she expected those and they stopped after 24 hours. The syncope, dizziness, and faint feeling are not any worse and are very slowly improving, but she still has it and had to call out of work today because of it. That's consistent. Mentions it takes her a while to get down the stairs when</p> |

| 920569 | 1/5/2021 | GA | 38 | F | 12/18/2020 | 12/18/2020 | It was extremely painful when I received the vaccine and I immediately felt my fingers tingling. In about 10 min I felt very hot in my face, back and felt like I was going to pass out. My heart was racing, it was about 130. My BP initially was 139 and then 160 after that. I never passed out but I felt those waves with a tingling to my face and my neck as I was going to pass out and I started shaking and my heart was racing and my BP was up and it lasted about 45 min before it started going down. They gave me some Ibuprofen at the Employee health and they kept observing me and it started getting better after 45 min. I still felt the waves of feeling flush and hot and cold and very fatigued. |
| 920701 | 1/5/2021 | IL | 27 | F | 12/17/2020 | 12/18/2020 | 12/18/20- reports suddenly got sweaty, hands felt cold, then got nauseous. Reports vomitted x 1. Reports the rest of the day felt tachycardiac for a few hours (HR 120-140) and dizzy. Started getting muscle aches/joint aches. Denies any recent COVID exposure. Tested positive for COVID In 8/2020. Reports hips/knees are throbbing today; Heart rate WNL. /// Presenting today due to intermittent presyncope and palpitations. Also notes generalized weakness. Patient evaluate 2 L of fluid given her Mirena IUD D-dimer was sent which was negative patient with no pleuritic symptoms or dyspnea to suggest pulmonary embolism. Otherwise hemodynamically stable on exam ambulates with no difficulty no focal neurologic deficits. Patient did describe on her initial presentation that she noted some weakness of her bilateral legs. Given her possible viral reaction and description of weakness it is possible the patient is developing an early autoimmune reaction however she has no evidence of GuillainBarré or transverse myelitis on my exam. We will plan to discharge with neurology follow-up as outpatient. |

| 921588 | 1/5/2021 | TN | 36 | F | 12/22/2020 | 12/22/2020 | I have learned that it was syncope. I felt like time was moving quickly. I was jittery and felt like my heart was beating quickly. I was taken to a separate area and felt warm and flush in my chest. They laid me down on the cot and said I looked pale. My hands were cold and within minutes I was shaking uncontrollably. I think it was an anxiety related to my research I've done at my job related to COVID. I don't think it was an allergic reaction, but I do have an appt on Thursday. I was monitored for about an hour. Symptoms went away but I wasn't totally ok until the next day besides soreness in next arm. |
| 921615 | 1/5/2021 | PA | 38 | F | 12/28/2020 | 12/28/2020 | Within first 5 mins - Sudden onset of warm sensation (similar to the feeling of IV contrast administration), flushed feeling, pale, near syncope followed by nausea and dry heaving. Lasted 30 mins. Felt fatigued and mild headache for next 24-48 hours. |
| 921631 | 1/5/2021 | MI | 83 | F | 1/3/2021 | 1/5/2021 | ~~Patient with seizure this am during 1 assist transfer, resident passed out, lowered to shower chair next resident with incontinent episode and was sent to Emergency Department emergently and currently under evaluation with possible admission. ~~ |
| 921646 | 1/5/2021 | | 40 | M | 12/22/2020 | 12/22/2020 | syncope 4 hours after chills 2-5 hours after body aches off and on for 7 days |
| 921836 | 1/5/2021 | CT | 25 | F | 12/29/2020 | 12/30/2020 | Fatigue, chills, nausea, headache. Next morning, felt dizzy. Tried to get up. Sat at table, felt dizzy again, passed out, felt like she was deep sleep, was told she was foaming at the mouth. Felt better afterwards. |

| 921029 | 1/5/2021 | LA | 31 | M | 12/23/2020 | 12/23/2020 | After receiving the vaccine, I was instructed to wait i for 15 minutes to ensure there were no reactions. I sat down in the provided chair, put my headphones in my ears, and started my timer on my watch for 15 minutes. after about 5 minutes I began to feel like my injection arm was a little weak, as if perhaps my arm was stiffening from the injection sore. I remember feeling slightly warm and started to read over the COVID-19 Vaccine symptoms sheet and then I blacked out (Fainted). The nurse in the hallway woke me up and was asking me if i was alright and then rushed me in the back room where they tested me and ensured I was ok. I had not eaten anything the morning of the vaccination shot and barely anything the night before. I have been experiencing higher levels of anxiety recently due to pressures of day to day life; school, work, etc. The nurses are thinking it is likely I had more of a reaction to the anxiety and low food or blood sugar (I am not diabetic), than a reaction to the vaccine itself. They did refer to my experience as sounding like Vasovagal syncope. I have never had this experience with any flu vaccine or shots before; I do not have a fear of needles or shots. |
| 922082 | 1/5/2021 | CA | 21 | F | 1/5/2021 | 1/5/2021 | Patient received Moderna covid 19 vaccine on 11:15am 1/5/2021. Patient had rested for 15 minutes after vaccination and reported felt fine. Patient went back to work. Patient fainted around 3:30pm. Patient regained the conscious quickly and the Paramedics said her blood sugar was normal and she had little orthostatic hypotension. The Paramedics gave her some fluid. |

| 918799 | 1/4/2021 | NY | 67 | F | 12/23/2020 | 12/24/2020 | disoriented; hit her head and cut herself; hit her head and cut herself; Passed out at night; This is a spontaneous report from a contactable consumer (patient). A 67-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), via an unspecified route of administration on 23Dec2020 at single dose at left arm for COVID-19 immunization. Medical history included Atrial fibrillation/heart problems diagnosed prior to the vaccine, got the COVID virus on 18Nov2020, disoriented in Nov2020. Concomitant medications included her heart medication every day and vitamins, nothing out of the normal. Caller stated she had heart problems. The heart problems were diagnosed prior to the vaccine. Caller also stated that she got the COVID virus this year before the vaccine as well and she was off, of work for like a month. On 23Dec2020 she got the vaccine. Then on Thursday 24Dec2020 and Friday 25Dec2020 she had a reaction. She had passed out in the night, hit her head and cut herself, she was then disoriented for 1 full day. Caller stated that the last time she was disoriented like this was when she had the COVID Virus, because she had heart problems. Caller stated that she was fine now. Caller stated that she had been off, of work so much. The heart problem she had was Atrial Fibrillation. Caller clarified that she had the COVID virus this year in Nov2020, it was before thanksgiving, on 18Nov2020 she had the virus, then on 19Nov2020 she got tested and it was positive. She got the vaccine on the 23Dec2020 Wednesday then on 24Dec2020 at night she passed out and on 25Dec2020 she was disoriented all day. Investigation Assessment: No. On 24Dec2020 she was going to bathroom, and found herself on the floor, then the following day 25Dec2020 was when she was disoriented. She knew this because when she had the actual COVID virus previous in Nov2020 this happened previously. When queried outcome of being disoriented she stated that she still felt a little weird but if getting better very, very slow. The Second dose was schedule for 13Jan2021. Caller confirmed that she did have a Positive Test for Covid Previously. Her treatment at the time was in the Emergency Room, they gave her an Antibody infusion, she had to schedule it because it was actually a clinical trial. Caller was asked if she knew the name of covid test, she stated that she does not know, |

| 918081 | 1/4/2021 | NY | 26 | M | 12/30/2020 | 12/31/2020 | I received the shot around 0730 on 12/30/2020. Went home and got ready for work. Around 12am 12/31/2020 my arm started to radiate at the injection site and was very tense. I placed a heat pack on the right arm but the pain did not dissipate. My arm continued to be in pain for the rest of the night. Around 0240 I ate dinner, had water and still had some arm pain. Around 0345 my arm started to flare up and sent pain sensations throughout my body. My right arm was increasingly discomforting, I could barely move it. The sensations spread to my legs, numbing them and my throat had felt as if it were closing up. I got up to get the attention of the nurse and was able to flag her down. She said I was pale as a ghost. My vision was very blurry, I could not hear anything because my ears had filled up and everything was muffled. My head had begun to ring and I was on the brink of fainting when a chair was given to me. My eyes had become extremely sensitive to the light, I was given water and spoken to about what had happened leading up to the event. I was greeted by the paramedics who drew my blood, placed an IV and transferred me to the Acute Care portion of the Emergency Department. My vitals were 76/49, 80/50, 90/56, 100/60 before being brought to the ER. On 1/1/2021 My thighs have been sore/tense, my knees and ankles have been stiff and just feeling sickly. On 1/2/2021 much of the same symptoms are present. The soreness in the muscles isn't as prevalent, however joints still are stiff On 1/3/2021, congestion and runny nose are still present, stiffness in ankles and now shins are prevalent. |

| 918541 | 1/4/2021 | UT | 43 | M | 12/30/2020 | 12/30/2020 | 10 min after injection, my mouth started getting hot, then it moved down my throat and it was difficult and painful to swallow. I got quite dizzy. They initiated rapid response, when they came they simply monitored symptoms and Vitals. Blood pressure and Heart rate were elevated. after about 10 min the symptoms eased, but swallowing was still difficult and slightly painful. then a second wave of dizziness hit me and I nearly passed out. my heart rate was elevated once again and had ringing in ears. these symptoms lasted another 5-10 min then eased. I then had a headache. The symptoms didn't return, just a headache and fatigue the rest of the day. i was then given option to go to ED, which i didn't feel at that time I needed, so I left. The next day, i had some standard symptoms of pain in left arm from injection, and fatigue, but then toward the evening i developed a fever of 101 deg F than continued for a couple of hours. I used ibuprofen and Tylenol rotating to keep the fever down. On day 3 only mild fatigue. |

| 918200 | 1/4/2021 | FL | 27 | F | 12/23/2020 | 12/23/2020 | Pfizer-BioNTech COVID-19 Vaccine EUA - Patient witnessed another patient with syncope prior to her injection. She was already anxious about receiving vaccination and this increased her anxiety, though she proceeded with immunization. Patient was in 15 min observation window in a chair and began to feel light-headed like she may pass out. A SWAT was called. With RN assistance, patient was lowered to the floor, with no loss of consciousness. Patient was pale and reported anxiety, racing /pounding heart, and felt hot with facial flushing. Patient was transferred to ED and was noted to be tachycardic (120s), but dropped to 80s. She noted that this episode felt different than her prior syncopal episodes associated with anemia. Patient was observed for 5 hours and discharged to home. Patient returned to ED roughly 2.5 hours later complaining of continued dizziness and unsteady gate. Patient was pale and anxious. Patient reported had not eaten/drunk enough during her shift and received vaccine immediately post a stressful shift. Additionally, patient witnessed another patient have syncopal episode prior to her receiving her vaccine which made her anxious. Patient was given IV fluids and had electrolytes replacement. Patient additionally received diazepam. Patient was discharged at 2358 on 12/23. Patient returned to ED on 12/24 at 0239 complaining of near syncope and lightheadedness. Patient had tachycardia and self-reported palpitations. Received IV fluids and observation on telemetry with no rhythm disturbance. Patient discharged 1428 on 12/24. On 12/29, patient returned to ED at 0326 for continued dizziness, fatigue and near syncope. Was admitted for cardiac evaluation. Noted to have unprovoked tachycardia and was discharged with a Halter Monitor to evaluate cardiac symptoms. patient was discharged 12/31 at 1619 |

Next day, fatigue all day, couldn't talk, or eat. Went back to bed again. The following day hot flashes, weakness. went to ER. Felt like blood pressure was dropping, tingling in legs, difficulty lifting her head. |
| 919646 | 1/4/2021 | OH | 64 | M | 12/29/2020 | 12/30/2020 | Patient began having headache and fatigue 12/29. Early morning of 12/30 patient reported severe chills. Felt better during the day of 12/30 with only a headache. Night of 12/30 patient reported severe chills again and wanted to call the doctor in the morning, but the felt better on 12/31. The night of 12/31 patient again had chills, but less severe (rated 3/10 on scale). Night of 1/1 patient reported slight hive like rash that went away with warm Epsom salt bath. 1/3 0100 patient woke up with severe hives down back of legs and lower back. Got into a hot tub to soak and once the patient got out he was standing at the sink and passed out. His wife got him back to bed. Around 0700 on 1/3 patient woke up to urinate and he passed out again. He states both times he passed out felt the same stating "I felt like I was going to vomit and then all of a sudden I couldn't breath, almost like I was choked out.~~ |
| 919689 | 1/4/2021 | CA | 57 | F | 1/4/2021 | 1/4/2021 | Pt reported feeling dizziness, lightheaded, near syncope, numbness/tingling up neck into chest area, numbness and tingling in extremities. Feeling of impending doom, chest pressure with SOB. Pt was given Epi-Pen 0.3mg in clinic, transported via EMS to local ER at which time 50IV Benadryl given while in Ambulance, and 4mg decadron in ER. Pt was discharged from ER at 3:00pm |
| 918873 | 1/4/2021 | | 33 | F | 1/4/2021 | 1/4/2021 | lightheaded, sweaty, BP113/77. Administered vaccine supine as patient indicated history of fainting with injections. Symptoms resolved shortly after administration. |

| 919504 | 1/4/2021 | MT | 54 | M | 12/29/2020 | 12/29/2020 | About an hour after being vaccinated, I got very pale, and almost had a syncope episode at work. I felt weak kneed for about 2 hours afterwards, and was still wobbly knees the next day. I also had muscle/joint aches the same day, which went away within 24 hours. In the past 6 days, I have had reoccurring headaches, fatigue, and this morning, had a severe enough headache to bring on nausea. I am med compliant with all my meds and I take care of my Type II diabetes, I am also a volunteer firefighter - advanced EMT, so I know when there is a problem. |

| 917426 | 1/2/2021 | OR | 52 | F | 1/2/2021 | 1/2/2021 | Caregiver (cg) received Covid vaccine on 1/2/21 @ 0910. Cg was nervous but did ok with vaccine administration. Once in the observation area, cg became nauseous and raised her hand to report. Cg was sitting in one of the back rows so observation RN came to her. Observation RN was walking cg to lower level when she experienced syncope and fell forward down several steps and to the right hitting the front of her head and right shoulder on the wall. Cg was unconscious for approximately 30-45 seconds. Once alert, cg responded appropriately to questions, but slowly. Vitals were 120/82 P 107 at 0915 and 150/84 P 96 at 0920. Cg had 2 events of uncontrollable bilateral arm shaking lasting approximately 5-10 seconds. Rapid Response Code was called and cg taken to ED at 0940. C-collar and back board was used to transfer cg from floor to stretcher. Unknown at this time if caregiver was admitted. |
| 917505 | 1/2/2021 | CA | 39 | M | 1/2/2021 | 1/2/2021 | Patient became lightheaded, clammy and passed out (typical vagal reaction). Patient aroused easily, VS monitored.... patient was able to sit up after about 5 minutes. Monitored for 30 minutes post vaccination. Patient did not need any other intervention or care. |
| 917615 | 1/2/2021 | IN | 42 | F | 12/30/2020 | 12/31/2020 | I had chills, headache, and was nauseous all day but around 630 I passed out and smacked my face when getting out of the shower. |

| 915499 | 12/31/2020 | RI | 30 | F | 12/29/2020 | 12/30/2020 | I started to become very tired around 2:00 pm on Wednesday 12/30, with a mild/moderate headache. The fatigue and headache continued through the evening, and at around 7:30 pm I experienced stomachache and indigestion. I went to bed early at 9:00 pm, with the headache, stomachache, fatigue, and my arm feeling very sore. I slept very restlessly with horrible dreams, as if I were sick or had the flu. In the middle of the night, I'm not sure when, I woke up feeling very achy and sore and freezing cold. After using the bathroom, I passed out, and hit my head on the floor or wall, resulting in a bump/cut. My husband heard me fall and found me lying on the floor. I kept repeating "help me" and "water", and he was thinking that I would likely need to go to a hospital. He elevated my legs, put an icepack on my head, and got me water, and I became more lucid and started to feel better. I took 2 ibuprofen and drank water, then was able to get back into bed. I was very very cold but at one point woke up sweating. I slept the rest of the night and woke up this morning at 7:00 am (12/31) feeling fine, aside from tiredness, with no temperature. |
| 915317 | 12/31/2020 | KS | 23 | F | 12/28/2020 | 12/28/2020 | Intractable vomiting and diarrhea along with chills and fainting. Lasted almost 18 hours |
| 916186 | 12/31/2020 | IL | 24 | F | 12/28/2020 | 12/28/2020 | Patient complained of feeling dizzy 13 minutes after vaccine. Symptoms lasted approximately 15 minutes. Patient had not had anything to eat for 18 hours prior to shot. History of migraine headaches. Examined by MD; option of care explained. Note by MD: 24 year old female who complained of dizziness a few minutes after injection. No other complaints. No syncope. Patient did not eat today. Assessment: Normal exam. Plan: follow-up with primary care provider. |

| 915473 | 12/31/2020 | WI | 30 | U | 12/31/2020 | 12/31/2020 | Patient got vaccine at 8:17am and started feeling nauseous and lightheaded at 8:32am. 8:33 BP was 100/50 and HR of 80. At 8:51 BP was 110/80 and HR 80. At that time, she had some crackers and water. She reported having issues in the past with fainting when seeing needles. We elevated patients legs and put ice packs on head. She started feeling less nauseous after a while of laying down but was still anxious. Patient has a history of anxiety and takes medications for it. Patients husband came in to help patient leave. Told patient we could bring her to the ER to get evaluated and she declined. When walking outside the room and walking around more, she started to not feel nauseous anymore and just felt anxious. Told patient if any other symptoms occur please go to ER. She stated she understood. |
| 913768 | 12/30/2020 | KY | 45 | F | 12/30/2020 | 12/30/2020 | Approx 4-5 minutes after injection patient was seated in a chair. She slumped back in the chair and her head rolled back. Patient did appear to lose consciousness with eyes rolling back. Patient was carefully lowered to the floor to be assessed. She was given one dose of Epi-Pen at 10:53 am. The hospital's code team came to assess the patient. She was able to answer questions. When patient became alert, she reported a history of syncope with injections and had had breakfast yet. Vital signs were stable. She was taken to the ER via wheelchair for observation. |
| 914928 | 12/30/2020 | | 36 | F | 12/23/2020 | 12/23/2020 | Passed out after the vaccine, she felt better after being monitored in the area. |
| 914855 | 12/30/2020 | CA | 35 | F | 12/23/2020 | 12/24/2020 | Fatigue, fever (100.4), tachycardia, lightheaded/near syncope, muscle aches |
| 914767 | 12/30/2020 | RI | 33 | M | 12/30/2020 | 12/30/2020 | Pt within 1 minute after vaccination began to feel lightheaded. No full syncope. I personally evaluated the pt. Icepacks applied and pt given PO. BP systolic on initial eval was 105, improved to 130 within 5 minutes. Pt after 10 min obs ambulatory, feels resolution of symptoms. There was never any c/o SOB/throat tightening or tongue swelling sensation, or N/V. Pt states historically he usually becomes pre-syncope during any blood draws or vaccinations. |

| 914575 | 12/30/2020 | | 40 | F | 12/20/2020 | 12/29/2020 | Client reports that she had a reaction to the vaccine about 1 hour after the vaccine. Stated she was working at the hospital became diaphoretic, had shortness of breath, all most passed out, had pain in her throat. Stated hospital staff started an IV gave her benadryl. Reported that her blood pressure was low and that she had rigors for a hour after. Stated she was monitored at the hospital then released home where she is doing okay at this time. |
| 914485 | 12/30/2020 | GA | 49 | F | 12/21/2020 | 12/21/2020 | HR and BP suddenly elevated 10 minutes after vaccine and I almost passed out. I was monitored for 30 minutes and released after HR and BP came down with no treatment. I felt dizzy and almost passed out 3 more times that day at home. |
| 914350 | 12/30/2020 | TN | 39 | M | 12/28/2020 | 12/29/2020 | I got the vaccine on Monday for first responders. Everything was fine besides the routine ape was in my left arm. About 1030 last night, I was standing at my fireplace and started to rub my arm where I got the vaccine. That?s the last thing I remember. My wife said as I was walking towards the bed and went completely stiff and fell backwards on our floor. She said my eyes were wide open and I wasn?t breathing. I started to come too while she was on the phone with 911. My body felt very heavy and I couldn?t really feel anything. Cotton mouth and shaking very badly. I was taken to the hospital and spent the night there. All test came back good. Today I feel really lethargic and foggy. I find it very suspicious that immediately after I rubbed my arm that I passed out. My wife thought I was dead, I didn?t know what happened. I?m in shape and workout 4-5 days a week and am very active. I feel it is important to report this adverse reaction. This has never happened before to any other vaccines. |

| 914179 | 12/30/2020 | NY | 48 | F | 12/22/2020 | 12/22/2020 | lips were tingly and swollen; lips were tingly and swollen; fatigued; allergic reaction; passed out; breathing fast; her brain felt like a rock, like she was there but not there; head was so heavy,wouldn't open her eyes; her throat started to tighten up; chest pain; nauseous; headache; felt a little lightheaded, a little wobbly; palpitations; sweaty; This is a spontaneous report from a contactable consumer (patient) via Pfizer Sponsored Program. A 48-year-old female patient (no pregnant at the time of vaccination) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899) via an unspecified route of administrationon 22Dec2020 on left shoulder at single dose for COVID-19 immunization. The patient's medical history included pernicious anemia and She had problems with B12 and Vitamin D like 10 years ago, she had none in her body, everyone said she was deficient and this year with her new primary care, they sent her to do some antibody tests, and found out she has pernicious anemia, allergy to MRI and CT contrast. MRI and CT contrast NDC, lot, expiry unknown. Her CT contrast allergy happened when she was 9 and 12 years old. It turns out to be her dad has an allergy the same way, his airways close. Whenever she needs a CT, they do without contrast, if she does need, they prep and give her Benadryl and keep an eye on her. This only happened once, that she needed with contrast, and with prep she was ok. With the MRI, this happened 4 or more years ago, maybe like 5 years ago. She needed an MRI, they said she would be fine, they injected contrast, she felt pretty hot, then she doesn't know, 20 minutes into it, she couldn't handle her gown, she looked at her chest, her whole chest was red like a burn. They gave her the IV Benadryl, she guesses, and it went away, now she knows, she doesn't know if her dad is allergic to MRI dye, but she knows she got the allergy from him for the CT contrast. The concomitant drugs was not reported. The patient was taken to ER with a severe allergic reaction. She had an allergic reaction on 22Dec2020: she passed out, said her brain felt like a rock, like she was there but not there, she then received an Epi Pen shot, when she got to the ER, her throat started to tighten up, lips were tingly and swollen, she was breathing fast, she had chest pain, she scaled it from a scale of 1-10, as about a 3 to 4 for chest pain, she felt nauseous, sweaty, and had a |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

headache. She went to bed last night, and woke up, feeling better but a little fatigued on 23Dec2020. She is wondering if she should take the second dose, and wants to be in the clinical trial for this type of reaction. She needs transfer to Regulatory Authority. Caller confirmed details. Caller states she works in a hospital, and all this happened at the hospital, and her doctor was not involved. Outcome of allergic reaction: asks what does lasting effects mean? Right now she has a little fatigue and headache, but she knows they are regular symptoms she can have with the vaccine, are those lasting effects? She was discharged from the ER to home. She mentioned to the nurse she has, she went to get the shot, she told the registration nurse, she said she has a severe allergic reaction to CT contrast, her airway closes and she has a severe reaction to MRI contrast, her skin burns, it turns red and feels like a horrible burn, she cannot handle anything to contact her skin, it burns, and she mentioned that to the nurse, she said, instead of staying 15 minutes, said to stay 30 minutes there to observe just in case. She got the vaccine, and 10 minutes after the vaccine, she felt a little lightheaded, a little wobbly, but she didn't think much, it was mild, and on the mark at 30 minutes, the nurse asked her to stand, and that is when she started feeling, like her head was so heavy, the only way to describe, was like her brain was like a rock, she had to lay down, and when they laid her down, she wasn't there, she was there but wasn't, and they didn't wait at all to give her the Epi Pen, she had a feeling of heaviness that got worse, she wouldn't open her eyes, she was able to answer questions, but it was not her there, it was weird, then she didn't have. she breathed fast, had palpitations, chest pain, so they called a Rapid Response team, they were keeping an eye on her breathing, which was super fast, and they rushed her to the ED, and the doctor did what they were doing, giving her IV of whatever medication, and she was also very nauseous, then at one point in the ED, she started feeling, like imagine if fists were on throat, pushing her throat, a little bit, and she tried to tell to the ED doctor, but guessed she was calling everyone to give her things, and didn't catch it, but it didn't last long, at the same time, she started to feel her lips tingly, so she thinks that, because they gave the Epi Pen so quickly, they wasted no time, she didn't have the airways closing like she does

| | | | | | | | when she gets the CT contrast, they were quick. NDC/lot/expiry: She reads from the card they gave her: states first dose COVID-19 EH9899, states it doesn't specify lot, but she can find that out, they just gave her a vaccine record card. Epi Pen: NDC, lot, expiry unknown, states everything happened so quickly, she didn't think to get this information before calling, but she can get it. There at the hospital, she went to see the occupational health doctor, and based on guidelines from the CDC, he read supposedly she cannot get the second dose, but the doctor said because it is so new, and she has to wait the 3 weeks she guesses, things can change, and she wanted to be proactive. The outcome of the events, allergic reaction, passed out, throat started to tighten up, lips were tingly and swollen, chest pain, nauseous, headache, lightheaded, palpitations, sweaty was recovering. The outcome of other events was unknown. |

| 914114 | 12/30/2020 | VA | 54 | F | 12/29/2020 | 12/29/2020 | I received my first Covid vaccine 12/29/2020 around 1 PM. 14 minutes after injection I had a major dizzy spell and I almost passed out. My blood pressure was 184/101. No hx of HTN. They watched me for a while. My blood pressure/HR stayed up all evening and I felt just horrible. Did not have a good night. Bodyaches, low-grade fever, headache, nausea. A lot of pain at the injection site. I have to keep taking Tylenol every four hours in order to control symptoms. Blood pressure improving but still elevated based on my norm. I feel like my immune system is in overdrive. No airway and breathing difficulties, chest pain or shortness of breath or rash. Nausea but no vomiting or diarrhea. Drinking a lot of fluids. It was verified prior to vaccine administration that there was no contraindication receiving the vaccine with a history of having Covid. No timeline was given in between the dose and Covid recovery. |

| 913332 | 12/30/2020 | NE | 30 | F | 12/17/2020 | 12/17/2020 | COVID-19 vaccine on 12/17. After waiting 15 minutes, she felt slight dizziness but thought it was a "little panic attack", as she reports being nervous prior to vaccination. She was on the elevator with a nurse when the dizziness increased, she became sweaty and nearly passed out. The nurse assisted, but she felt ok by the time they reached their floor. She drove home and couldn't do anything but lay on the floor because the dizziness had increased and her right arm was swelling and hives on lips. She called Employee Health, but didn't get an answer (after office hours) so she called the house supervisor, who told her to take Tylenol and benadryl. She didn't take benadryl for fear of becoming more fatigued and she wouldn't be able to get help. She had a sore throat and slight SOB. She reports 100.1 fever for a short time and didn't feel well x 36 hours, general malaise, dizziness, swelling in rt arm and hand so bad that she couldn't bend her fingers. She didn't seek medical treatment or evaluation other than calling the house supervisor. hx of: Raynaud's and cold induced urticaria, but denies hx of allergic reactions to anything including vaccines or medications. Denies any current medications. EE was advised to see PCP for evaluation and do not receive 2nd dose. |
| 913328 | 12/30/2020 | NC | 27 | F | 12/29/2020 | 12/29/2020 | About 12 hours after receiving the vaccine, I developed chills and had a near vasovagal syncope event. I also developed cervical lymphadenopathy, nausea, and felt lightheaded. Because I felt so lightheaded I needed to leave work. The chills, nausea, and lightheadedness lasted for at least 10 hours. |
| 913249 | 12/30/2020 | NY | 35 | M | 12/22/2020 | 12/22/2020 | 30 seconds following IM injection, felt warm, flushed, lightheaded, vision dimming., near syncope. Symptoms improved lying supine. Blood pressure measured to be 90's systolic, Heart Rate 60's. NO RASH, NO ANGIOEDEMA, NO Shortness of breath. Symptoms resolved completely within in 3 minutes. |

| 913246 | 12/30/2020 | OK | 27 | M | 12/28/2020 | 12/29/2020 | On Dec 28th I received the shot & initially didn't feel anything. When I woke up on the morning of Dec 29th I had a really bad headache, felt burning up & cold at the same time. My right arm (shot arm) and my left hip were super soar. I couldn't keep liquids down. I passed out the first time between 6:55 A.M. & 7:05 A.M. Later that morning I passed out a second time for 2 mins. I still plan to get the second dose on Jan 25th 2021. Since I'm a contact tracer I texted my supervisor. I was advised to take the day off & report it just in case it was related to the vaccine. |
| 913243 | 12/30/2020 | IL | 27 | F | 12/29/2020 | 12/29/2020 | Syncope, severe bradycardia followed by 20+ hours of chills, fatigue, weakness, body aches |
| 913162 | 12/30/2020 | AZ | | F | | | near syncope episode, orthostatic; feels a little foggy; This is a spontaneous report from a contactable Physician. A 38-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), via an unspecified route of administration on unspecified date in 2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The emergency medicine physician was monitoring a patient that came in from a vaccination event, stated that it was Pfizer BioNTech Covid 19 vaccine. The patient had a near syncopal episode. They did orthostatics (unspecified) and found that she was orthostatic (near syncope episode, orthostatic). There was no anaphylaxis reaction or allergic reaction. She still felt a little foggy. The physician did a blood glucose, labwork and EKG that look good. The physician wanted to know if there was any data for things that they should looking for with the vaccination and will direct the patient to contact Pfizer to report it. The outcome of the events was unknown. Information on the lot/batch number has been requested. |

| 913895 | 12/30/2020 | WA | | F | 12/21/2020 | 12/21/2020 | patient got up and woke up on the floor; She never passed out. She got out of her chair, turned off the light and woke; Turned off the light and woke w a bruise to my right cheek; swelling to the right side of my head; This is a spontaneous report from a contactable emergency room nurse (patient). A elderly female patient (also reported as age: 61; unit: unknown) received the first single dose of BNT162B2 (Lot number: EI0249, exp date not reported), intramuscular (vaccine location: Left arm) on 21Dec2020 at 06:15 AM for immunization. Medical history included hypertension (HTN). The patient had no known allergies. Concomitant medication included meloxicam (MOBIC), levothyroxine sodium (SYNTHROID), lisinopril, and metoprolol tartrate (LOPRESSOR). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 21Dec2020 at 08:45 AM the patient got up and woke up on the floor. She never passed out. She got out of her chair, turned off the light and woke with a bruise on her right cheek and swelling to the right side of her head. She was a bit freaked out just worked "another 12" with no side effects. No treatment was received for the adverse events. The events were considered as non-serious by the reporter. The patient did not receive prior Covid vaccination and was not tested for Covid post vaccination. The patient recovered from the events on an unspecified date in Dec2020. |
| 914380 | 12/30/2020 | ME | 33 | M | 12/30/2020 | 12/30/2020 | Lightheadedness and near syncope that lasted about 6 seconds |
| 912946 | 12/29/2020 | VA | 42 | F | 12/29/2020 | 12/29/2020 | After administration of vaccine at 1:00 pm, I looked up and saw patient had fainted in chair, that time was maybe around 1:01 pm. When I rushed over to her, she regained consciousness, noticed she was not able to speak well, nurses removed her mask and we noticed her lips were swollen and was having an anaphylactic reaction, I then administered one dose of Epi-pen at 1:04 pm and called 911. We took her BP but it was high due to the Epi-pen injection, we tested her blood sugar. When the EMT arrived, they took over and took her to the ER. |

| 912061 | 12/29/2020 | FL | 39 | M | 12/22/2020 | 12/23/2020 | chills all night and syncope; chills all night and syncope; This is a spontaneous report from a contactable other health professional (patient). A 39-year-old male patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number and Expiration Date: Unknown), intramuscularly in the left arm (also reported as the right arm) on 22Dec2020 at 15:00 at 39-years-old at a single dose for COVID-19 immunization. The facility where the most recent COVID-19 vaccine was administered was reported as: other. Medical history included Penicillin allergy from an unknown date and unknown if ongoing. Concomitant medications included estrogens conjugated (PREMARIN), progesterone (MANUFACTURER UNKNOWN), estradiol (MANUFACTURER UNKNOWN), montelukast (MANUFACTURER UNKNOWN); all taken for an unspecified indication from an unspecified date to an unspecified date (all of which were received within two weeks of vaccination). The patient did not receive any other vaccines within four weeks prior to the COVID vaccine. On 23Dec2020 at 00:00, the patient experienced: chills all night and syncope. The event syncope was considered medically significant; and the event chills was non-serious. There was no treatment received due to the adverse events. It was reported that prior to vaccination, the patient was not diagnosed with COVID-19; and since the vaccination, the patient had not been tested for COVID-19. The clinical outcome of the events, chills all night and syncope, was recovering. The batch/lot numbers for the vaccine, bnt162b2, were not provided and will be requested during follow up.; Sender's Comments: Based on temporal association, a possible contributory role of suspect BNT162B2 vaccine cannot be excluded for reported event syncope. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate. |

She denies any recent vaginal bleeding, or abdominal pain. Denies any history of cardiac disease, or history of arrhythmias. Denies any history of prolonged immobility, recent travels, or history of clots. In ED:32 year old female with PMHx as listed in HPI presents with concern for allergic reaction to mod chair and a COVID-19 vaccine, felt tingling in the back of her throat and lower lip, no swelling, wheezing, shortness of breath, throat tightening, rash, nausea vomit or dizziness. Vitals reviewed found to be within normal limit. Physical exam as per above, no signs of mucosal or oral swelling, no hives or rash and no wheezing on exam. Given above findings, low suspicion for allergic reaction this time but plan to observe patient in the ED for any delayed reaction. |

| 911035 | 12/28/2020 | AL | 47 | F | 12/22/2020 | 12/22/2020 | Approximately 7 hours after receiving the vaccine patient who is a L&D Nurse return to work in her area. She describes that after finishing with a C-section she felt burning in both of her eyes (she thought this feels like an allergic reaction, but I am not sweating and haven't rubbed my eyes). She went to the restroom to get a cloth to wash her eyes; afterwards she reports her vision went totally black in both eyes. She reports feeling frustrated that no one came to help and some panic in trying to figure out how to get out of the restroom. She did make it out of the bathroom. Her Staff reports she postured and turned arms inward, head going to one side and passed out. They also report ~ 10 minutes of incoherent conversation and stating "I got the vaccine, maybe I was given the wrong thing and now I'm blind". Upon waking, patient vision fully restored and patient does not remember incoherent conversation. Differential diagnosis- TIA vs. CVA > seizure disorder>>> complex migraine |
| 911028 | 12/28/2020 | CA | 53 | F | 12/28/2020 | 12/28/2020 | Became dizzy, warm, tachycardic. Lost consciousness (fainted?), quickly regained consciousness and was taken to the Emergency Department. Before transfer, Benadryl IM 25mg administered. |
| 910998 | 12/28/2020 | NY | 28 | F | 12/28/2020 | 12/28/2020 | Vasovagal syncope episode occurred right after receiving the Pfizer COVID-19 vaccine injection, patient became pallor, not diaphoretic, no c/o CP nor SOB, patient felt dizzy, HR in the 50's, BP 78/50, glucose = 91, pt given water and OJ. After fluids pulse was stronger, bounding in the 60's, color improved, patient was still feeling faint, taken to cardiac intervention area to lay down, patient refused to go to ER, RRT paged and came to pod - escorted patient to lay down. Of note the patient only had 1 egg for breakfast. Patient continued to be pale, starting shaking and was escorted to the ED for IV fluids and monitoring. |
| 910383 | 12/28/2020 | MT | 42 | F | 12/23/2020 | 12/24/2020 | Moderna COVID-19 Vaccine Nausea/Vomiting/Diarrhea upon awakening on 12/24. Lightheaded, near-syncope, diaphoretic. Lasted approximately 3 hours. Vomited then nausea subsided after about 1hr. Chills starting 12/26. Difficulty warming up after being outside in the cold. Prolonged effects that are not normal for me. 12/28 cold/clammy hands despite being in warm environment. |

| 910309 | 12/28/2020 | | | F | 12/17/2020 | 12/17/2020 | fainted right after taking the vaccine; This is a spontaneous report from a non-contactable consumer (Pfizer company representative). A female patient of an unspecified age received the bnt162b2 (BNT162B2; also reported as COVID-19 vaccine; Batch/lot number, NDC number, Expiry Date: Unknown), via an unspecified route of administration on 17Dec2020 at a single dose for COVID-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient experienced fainted right after taking the vaccine (medically significant) on 17Dec2020. It was unknown if the patient received other products, and any investigation assessment was unknown. The clinical course was reported as follows: The reporter stated they had seen quite a bit on social media and on the (site name), where people have been sending around a video regarding a healthcare worker who fainted. The caller was just wondering " if Pfizer has been made aware of this. "Apparently, this was on the news. This healthcare worker was taking the COVID-19 vaccine and as she was talking to the press, she apparently fainted. It looks as if she fainted as one would do when taking blood tests or faint from fear of a shot or being worried. However, this video has been sent all over social media, as seen as an AE, and telling people to not take the vaccine." The reporter further clarified the healthcare worker was in (city name) and received the COVID-19 vaccine. As the healthcare worker was talking to the press, she fainted right after taking the vaccine. The reporter further clarified she was sent a link via (site name) from the news channel where it had the video recording. The reporter did not have a specific reporter. The reporter explained it was a " whole group that was talking about it." The reporter clarified she was in a (state name) group on (site name) with friends and family. The reporter also saw it on social media. " People are sending it left and right." When probed to determine if the reporter had any patient details or further details regarding the event, the caller stated the only information she had was that on (News name), and click on (City name) news and find the video of the healthcare worker taking the vaccine and fainting. The reporter clarified the news article was dated as 17Dec2020 "so this event must have happened yesterday." From the reporter's understanding from the news, the patient was fine, she |

| 910237 | 12/28/2020 | | 23 | M | 12/21/2020 | 12/21/2020 | 23 y.o. male who arrived by to the emergency department for suspected allergic reaction. Patient received his Covid vaccine 3 hours prior to ED arrival. Initially he was asymptomatic however, as the morning progressed, he developed a redness around the injection site. He then noticed a rash all over his face, that was mildly itchy in nature and felt warm. He denies any associated wheezing, shortness of breath, facial swelling, throat swelling, severe abdominal pain, vomiting, lightheadedness, dizziness, or syncope. He has not taken anything for his symptoms, and they continue to worsen. He has no prior history of allergic reaction to vaccines or other known allergies in the past. He states this is mildly itchy in nature. Patient was given 50 mg of p.o. Benadryl and Pepcid for symptomatic control. He was observed in the ED for 2 hours without any progression of his symptoms, no associated facial swelling, wheezing, shortness of breath, abdominal pain, vomiting, or hypotension to suggest anaphylactic reaction. He was discharged home in stable condition |

| 910547 | 12/28/2020 | MO | 45 | M | 12/24/2020 | 12/26/2020 | I'm not sure this is entirely vaccine related, but I wanted you to be aware. I occasionally experience unexplained swelling of my lips. It has been investigated by an allergist, but the cause is unknown -- doesn't appear to be a food allergy (no trigger foods identified, and it has never appeared immediately after eating), and may not even be histamine related. It could be something immune-system related, and my experience this weekend might support that. I had normal, expected symptoms on Friday evening (chills, headache). Those resolved Saturday. Saturday night, my lower lip swelled dramatically. Swelling spread into the upper lip as well. I have seen this before, but this was one of the more severe instances I have experienced. Lips remained swollen overnight. When I woke up Sunday morning and went to the restroom, I became suddenly lightheaded and passed out. That's a symptom I have never experienced before. I consulted with my primary care doctor and took it very easy the rest of Sunday. He and I will follow up to further asses what happened. No further light-headedness on Sunday or today. Lips eventually resolved late in the afternoon. This is all about 72 hours after the vaccine, so I can't be sure it is related, but I do wonder if it is related to having my immune system revved up by the vaccine. I reported it on the CDC check-in app and my primary care physician is noting it on his side as well. |

| 910367 | 12/28/2020 | MN | 38 | F | 12/21/2020 | 12/21/2020 | I got vaccine tonight ~1750. I felt fine immediately after and stayed for the recommended 15 minutes. During my drive home, ~20 minutes, I had some expiratory wheezing and a sensation of something in my throat. No angioedema or swelling. No skin symptoms. This was mild but made me think twice so I drove back to the er. The wheezing resolved, but I felt like I was going to faint with hot flushing and nausea in the parking lot. I didn?t go in because things seemed better and my stomach was turning like I was going to have diarrhea. Since the wheezing was gone, I decided against going in. I stayed in the parking lot for ~ 15 minutes and feeling of unease and presyncope waxed and waned, but eased. I continued with some nausea. I had waves of nausea, chills, flushing, and presyncope. The wheezing didn?t return. No tachycardia. I had chills and nausea on the drive home and at home. Took Tylenol and Pepcid when I got home and feel absolutely fine now after ~2 hours of fluctuating nausea, chills and sense of unease/anxiety. None were as severe as they were when I was in the parking lot. Throughout, I didn?t have high or low heart rate. After 8 pm or so, I feel just fine. I have zero symptoms now. |
| 909563 | 12/27/2020 | FL | 20 | F | 12/26/2020 | 12/26/2020 | Chest pain followed by Syncope approximately 5 minutes after injection. |

Orthopedics Cosigned by: MD at 12/22/2020 9:46 AM Expand All Collapse All 12/21/2020 Patient: Date: 12/21/2020</p> <p>Subjective Patient is a 58 y.o. female who was seen at COVID Vaccine Clinic today for her first dose of the COVID 19 vaccination. She denied any history of previous adverse reactions to vaccines. She was given the Pfizer vaccination in the left deltoid muscle. During her 15 minute waiting period after the injection, the patient began to experience dizziness/shakiness. This provider was notified of patient reaction and she was then transferred to the emergency bay via wheelchair where she was assessed. Monitored patient for severe reaction symptoms, including rapid progression of symptoms, respiratory distress with dyspnea, increased work of breathing, persistent cough and cyanosis, vomiting, hypotension, dysrhythmia, chest pain and collapse. She denied difficulty breathing, throat tightness and tongue swelling, nausea. She reports a history of atrial fibrillation and states that she had a procedure in the past and the anesthesia provider questioned her about this diagnosis. She reports taking metoprolol and methimazole on a daily basis. She took all of her am medications today, including an 81 mg aspirin. Reports history of watery eyes and blurred vision, takes Zyrtec daily. Denies any worsening of these symptoms outside of her baseline. Denies use of anticoagulant use or diabetes. Last ate and drank about 1130 or noon. Review of Systems Constitutional: Negative for diaphoresis. HENT: Negative for congestion, drooling, facial swelling, rhinorrhea, sneezing and trouble swallowing. Eyes: Positive for discharge. Negative for redness. Respiratory: Negative for chest tightness and shortness of breath. Cardiovascular: Negative for chest pain and palpitations. Gastrointestinal: Negative for nausea and vomiting. Skin: Negative for color change, pallor and rash. Neurological: Positive for dizziness and headaches. Negative for syncope. Psychiatric/Behavioral: Negative for agitation and confusion. The patient is not nervous/anxious. Objective Vitals There were no vitals filed for this visit. Physical Exam</p> |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

Constitutional: General: She is not in acute distress.
Appearance: Normal appearance. She is obese. She is not toxic-appearing or diaphoretic. HENT: Head: Normocephalic and atraumatic. Nose: No rhinorrhea.
Eyes: Comments: Watering of both eyes
Cardiovascular: Rate and Rhythm: Normal rate and regular rhythm. Comments: At right radial pulse
Pulmonary: Effort: Pulmonary effort is normal. No respiratory distress. Skin: General: Skin is warm and dry. Coloration: Skin is not pale. Findings: No rash.
Neurological: Mental Status: She is alert and oriented to person, place, and time. Assessment/Plan Stress reaction following vaccine administration. Patient was transported to the emergency bay via wheelchair.
Treatment included no therapy, but did continue with vital checks at approximately 5 minute intervals. 1603-blood pressure using the large adult cuff was 154/60 with large adult cuff, heart rate 69 with regular rate and rhythm at right radial pulse, 96% O2 sat on room air. Patient continues to feel slightly dizzy and shaky though denies any chest pain, shortness of breath, swelling of the lips or tongue. 1611 vital signs reassessed with blood pressure of 150/63, heart rate 64, 97 percent on room air, continues to feel slightly dizzy/shaky, though, reports not nearly as bad. Patient continues to answer questions appropriately and is talking without any signs of further decompensation. 1618-reports feeling better. Vital signs rechecked with BP of 121/55, 59 hearty rate and 96% RA. No new complaints. 1624- patient reports a slight headache, but denies chest pain, shortness of breath, chest tightness, lip or tongue swelling. Discharge vitals obtained at 1626-with blood pressure of 135/55, heart rate of 58, 95% on RA. No new complaints, except feeling a bit cold. Patient reports feeling better and feels that she can safely discharge. Discussed need for urgent evaluation at the emergency department or to call 911 if symptoms of chest pain, shortness of breath, angioedema present. Patient expresses understanding and all questions were answered to her satisfaction today. Follow up response to treatment:excellent.
Patient discharge: Stable to go home and follow up with PCP. Orders Placed This Encounter Procedures ? COVID-19 MRNA PA-C Electronically Signed

| 907426 | 12/23/2020 | NM | 48 | F | 12/22/2020 | 12/22/2020 | 48 y.o female with history of atrial tachycardia who presents to the ED via EMS for a possible adverse reaction to Covid vaccine. Patient received her Covid vaccine around 1600 today, and soon became diaphoretic, shaky, and lightheaded. She had presented to the emergency department. Currently she denies any chest pain, difficulty breathing, throat swelling, tongue swelling, or any other symptoms currently except for palpitations. Allergic Reaction The primary symptoms are shortness of breath. The primary symptoms do not include cough, abdominal pain, vomiting, dizziness or rash. The current episode started 1 to 2 hours ago. The problem has not changed since onset. The onset of the reaction was associated with a new medication. Significant symptoms also include flushing. 48-year-old female with a history of atrial septal defect, status post atrial septal defect repair in 1980. She works as a nurse at Hospital and has been experiencing increasing rapid palpitations associated with chest pain, and hypertension. With her episodes, she experiences marked lightheadedness, dyspnea, and feeling marked anxiety, as well as chest tightness. She received the COVID-19 vaccine today and while waiting in the observation room, she started feeling unwell, with rapid palpitations, associated with lightheadedness and dyspnea. She last had a sustained episode 2 - 3 weeks ago and had presented to ER and Hospital. No syncope. No orthopnea, PND or increased lower extremity swelling. Active Hospital Problems Diagnosis ? Atrial paroxysmal tachycardia ? History of repair of atrial septal defect 1. Paroxysmal atrial tachycardia in setting of prior atrial septal defect repair - she is having breakthrough episodes through flecainide/digoxin - it is likely her atrial tachycardia is related to her ASD patch. Will hold flecainide/digoxin for now, and try to schedule an ablation during her hospital admission due to highly symptomatic episodes resulting in multiple ER visits. 2. Acute renal insufficiency - most likely pre-renal - iv fluids started. 3. Possible COVID-19 vaccine reaction - she probably had an incidental atrial tachycardia episode post vaccine administration, rather than an actual adverse reaction. Continue to monitor. |

| 907944 | 12/23/2020 | KS | 34 | F | 12/22/2020 | 12/22/2020 | <p>Progress Notes PA-C (Physician Assistant) ? ? Orthopedics Cosigned by: MD at 12/22/2020 9:48 AM Patient: Date: 12/21/2020</p> <p>Subjective Patient is a 34 y.o. female who was seen at COVID Vaccine Clinic today for her first dose of the COVID 19 vaccination. She was given the Pfizer vaccination in the right deltoid muscle. During her 15 minute waiting period after the injection, the patient began to experience generalized feelings of "not feeling quite right" as well as anxiety/nervousness, nausea and chills. She denied difficulty breathing, throat tightness, dizziness, chest pain, or other GI complaints. This provider noticed her raising her hand from across the waiting area and tended to her where she noted the above complaints. she was then assessed in the emergency bay area. She was monitored for severe reaction symptoms, including rapid progression of symptoms, vomiting, hypotension, chest pain, collapse and Respiratory distress. Past medical history includes anxiety for which she takes Effexor on a daily basis as well as type 2 diabetes, diagnosed approximately seven or 8 years ago during a pregnancy. She is on oral medication during the day and insulin at nighttime. She did take her oral medication today and last ate a pasta lunch right before arriving to the vaccine clinic. Last A1c was 6.5. Patient states that she generally runs a postprandial blood glucose following a heavy meal of about 180. She reported a previous history of anxiety and nervousness following vaccinations in the past. Most recently, she experienced a 30-minute period of anxiety and nervousness following her flu vaccine this past October. These feelings passed without further incidents. Review of Systems Constitutional: Positive for chills. HENT: Negative for drooling, facial swelling, hearing loss, rhinorrhea, sneezing and trouble swallowing. Eyes: Negative for redness and visual disturbance. Respiratory: Negative for cough, chest tightness and shortness of breath. Cardiovascular: Negative for chest pain. Gastrointestinal: Positive for nausea. Negative for vomiting. Skin: Negative for color change, pallor and rash. Neurological: Negative for dizziness, speech difficulty and light-headedness. Psychiatric/Behavioral: Negative for agitation and confusion. The patient is nervous/anxious.</p> |

Objective She ambulates into the emergency treatment bay under her own power and without difficulty. She is seated on the gurney, and continues to answer questions appropriately. Physical Exam Constitutional: General: She is not in acute distress. Appearance: Normal appearance. She is not toxic-appearing or diaphoretic. HENT: Head: Normocephalic and atraumatic. Nose: No rhinorrhea. Cardiovascular: Rate and Rhythm: Regular rhythm. Tachycardia present. Pulmonary: Effort: Pulmonary effort is normal. No respiratory distress. Skin: General: Skin is warm and dry. Coloration: Skin is not pale. Findings: No rash. Neurological: Mental Status: She is alert. Gait: Gait normal. Psychiatric: Mood and Affect: Mood normal. Behavior: Behavior normal.

Assessment/Plan Stress reaction secondary to vaccine administration and history of anxiety and nervousness following vaccinations. Vital signs obtained at 1352 with blood pressure at 154/95, mild tachycardia at 109 and 97% O2 saturation on room air. Patient denies any chest pain, shortness of breath time. She is given a bottle of water and assisted to lie down with the head of the bed slightly elevated. She continues conversating appropriately without any acute distress. Vitals reassessed at 1359 with blood pressure of 133/76, heart rate 97% on room air. Dr. at the bedside now. Suggested obtaining a blood glucose. Blood glucose obtained at 1405, elevated at 234. She continues to deny any chest pain, shortness of breath, chest tightness, swelling in the throat, nausea/vomiting or other GI complaints. Vital signs checked again at 1406 with blood pressure 133/77, heart rate 107 and 97% on room air. Vital signs last checked at 1415 to reveal a blood glucose of 219, blood pressure 127/82, heart rate 100 and O2 saturation of 97% on room air. Patient has no additional complaints at this time and reports feeling well. Her mother has driven her to the clinic today. She felt that she was able to safely walk out with any issues. She was assisted by nursing staff and ambulated out of the treatment bay independently. Treatment included routine surveillance of vital signs at about a 5-minute intervals following notification of her feeling poorly. Vital signs continued to normalize and remained stable through the duration of her 30 minutes following her vaccination. Follow up response to treatment: excellent.

| 905999 | 12/21/2020 | NC | 49 | F | 12/20/2020 | 12/20/2020 | Employed as a nurse at this hospital. Around 8 PM she received her COVID-19 vaccine. She waited the 15 minutes she was required to wait and then walked to her car. She reports that as she walked to her car she had a pain in her left shoulder which was short-lived but followed by numbness and tingling of her left arm and the left side of her face going up the back of her head. Symptoms started around 8:20pm. She reported back to the clinic to report the symptoms--she lives along and wanted to be assessed before going home. In the clinic, she was assessed by myself. Employee noted that she had not eaten. She ate in the clinic and had something to drink. While in the clinic over the next 10-15 minutes, she noted that she had some numbness and tingling in her feet and calves bilaterally. No leg pain or swelling. Around 9pm, the clinic was closing and she could no longer be monitored under observation. She opted to go to the ER for observation. Per ER note-- She denies any headache. She denies any left-sided weakness. Patient is right-handed. She also reports some mild chest heaviness that lasted for about 20 minutes and then resolved. No shortness of breath. No dizziness, syncope or presyncope. No nausea or vomiting. No rash. No visual or speech changes. No ataxia. Patient continues to have the left-sided numbness and tingling but states that it is less intense than it was. She denies any other complaints. Follow up this AM-- Pt is only fatigued and has some muscle soreness where she had the vaccination. All of her symptoms have resolved and she is not having any further sx's of chest tightness or numbness |

| 905959 | 12/21/2020 | CA | 37 | M | 12/19/2020 | 12/19/2020 | 4 hours after vaccination, patient reports feeling shortness of breath, palpitations, lightheaded, shivering, and almost fainted. Symptoms lasted 30 mins and resolved but returned. He called 911 and went to Hoag hospital. Patient was seen and released but symptoms reoccurred after he got home so he went again. He was administered diphenhydramine 50mg IVP at 12/19, 2136; famotidine 20mg IVP at 12/19, 2136, lorazepam 0.5mg IVP at 12/19 2136 and started on lactated ringers 1000ml bolus at 12/19, 2138. He was discharged on 12/19 after symptoms resolved. |
| 906041 | 12/21/2020 | AZ | 25 | M | 12/18/2020 | 12/18/2020 | Employee, 1st Pfizer COVID19 vaccine today. ~6min s/p shot, he felt a little itchy just @injection site, then got anxious & felt woozy, sweaty. Wearing big mask and a face shield, seemed anxious. Walked independently to go lay down. No syncope. BP up to 140/90, HR 90, RR 20, breathing fine, no itchy throat/swelling/hives. Improved w laying down. To ER out of an abundance of caution-- vitals nL, nL exam, still itchy at shot site. Got 1L NS IV, 25mg PO Benadryl for itchiness- likely anxiety > severe allergy |
| 905423 | 12/21/2020 | IN | 34 | F | 12/17/2020 | 12/20/2020 | On 12/20 at 9am started having left sided facial numbness, tingling, flushing. Near syncope episode (tachycardia, diaphoretic, blurred vision) around 1130am. Took Benadryl seemed to help. On 12/21- around 7a near syncope episode, tachycardia, diaphoretic, facial flushing, itching. Took Benadryl-improvement in facial itching, decreased heart rate. |

Date:
12/21/2020

Subjective Patient is a 33 y.o. female who was seen at COVID Vaccine Clinic today for her first dose of the COVID 19 vaccination. She denied any history of previous adverse reactions to vaccines. She was given the Pfizer vaccination in the left deltoid muscle. During her 15 minute waiting period after the injection, the patient began to experience feelings of hypoglycemia. She checked her blood glucose with her own monitor and had 77 at 1104. She chewed 1 glucose tab that she had in her purse. She noted some difficulty with swallowing it and notified clinic staff. Associated dizziness and was escorted by clinic staff to the emergency bay. This provider was notified of patient reaction and she was then assessed in the emergency bay area. She denied difficulty breathing and chest pain, history of adverse reactions with prior vaccinations or allergies to medications with the exception of spironolactone. Patient had already been given a bottle of water by clinic staff and reported that the glucose tablet went down easier following the water. She took a second glucose tab sometime before 1113. She rechecked her sugar and had slight increase of 79. She did eat breakfast this morning about 0800 and had a protein bar right before her arrival today. Monitored patient for severe reaction symptoms, including rapid progression of symptoms, respiratory distress with dyspnea and increased work of breathing, vomiting, abdominal pain, hypotension and chest pain. Review of Systems HENT: Positive for trouble swallowing. Negative for facial swelling, hearing loss, rhinorrhea and voice change. Eyes: Negative for redness. Respiratory: Negative for cough, chest tightness and shortness of breath. Cardiovascular: Negative for chest pain. Skin: Negative for color change, pallor and rash. Neurological: Positive for dizziness. Negative for syncope and speech difficulty. Psychiatric/Behavioral: Negative for agitation and confusion. The patient is not nervous/anxious. Objective Vitals There were no vitals filed for this visit. Physical Exam Constitutional: General: She is not in acute distress. HENT: Head: Normocephalic and atraumatic. Nose: No rhinorrhea. Cardiovascular: Rate and Rhythm: Normal rate and regular rhythm. Pulmonary: Effort: Pulmonary effort is normal. No

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

respiratory distress. Skin: General: Skin is warm and dry. Coloration: Skin is not pale. Findings: No rash. Neurological: Motor: No weakness. Psychiatric: Mood and Affect: Mood normal. Behavior: Behavior normal. Assessment/Plan Patient is a 33-year-old female who has a 15-year history of type 2 diabetes, and experienced a hypoglycemic event without complaint of chest pain or shortness of breath. Vital signs obtained at 1105 with blood pressure within normal limits at 132/88, heart rate 83 and 98% O2 saturation on room air. Patient continued to compensate appropriately and reported feeling slightly better. Glucose checks repeated by patient at 1117 was 84, vital signs were blood pressure 116/80, heart rate 89, O2 saturation of 98% on room air. She continues to deny chest pain, shortness of breath or difficulty swallowing at this time. At 1117 a 10 mg cetirizine was administered by mouth. Patient was able to swallow this with a small sip of water without any difficulty. 1121, patient continues to deny chest pain or shortness of breath. She continues to be compensating appropriately and sitting at the edge of the bed. She states that she is feeling better. Vital signs obtained at 1123 with blood glucose per the patient's own meter, continuing to elevate at 103, blood pressure within normal limits at 116/91, heart rate at 85 and 100% O2 saturation on room air. At 1126, the patient continues to feel better. She is provided a granola bar to eat. She does note feeling sleepy though attributes this to this being the first day she has had off after working 4 days last week. She notes that she has been sleepy even prior to her arrival at the vaccine clinic today. She is able to eat the granola bar and continues conversing appropriately without difficulty. She continues taking small sips of water without issues. Continues to deny chest pain or shortness of breath. Blood sugar is rechecked at 1138 and continues to elevate to 116. She reports that her meter says her sugar is "stable." Final set of vital signs obtained at 1138 revealed blood glucose within normal limits at 116, blood pressure of 119/84, heart rate 83 and 100% O2 sats on room air. Patient denied complaints of chest pain, shortness of air, nausea, dizziness or blurred vision at this time. She felt much improved and we discussed her leaving the clinic and heading home to have lunch. She had no further complaints. She was able to rise to standing on her own

| | | | | | | | Patient is a pleasant 83 y.o. female pediatrician with history of Sjogren's, hypothyroidism, hyperlipidemia, hypertension who had been at Hospital to get her Covid vaccine. 30 minutes after doing so she reports being in the lobby and about to walk upstairs and feeling fine. The next thing she knows she wakes up on the stairs with her nose and face bleeding surrounded by healthcare team. She denies any precipitating symptoms such as chest pain, shortness of breath, fevers dizziness, headache. She reports feeling well otherwise in the last few days. I did a thorough bony palpation exam including spine and he only point of tenderness besides on her face was the area above her right ankle. She does not have a history of syncope or collapse |

| 904585 | 12/20/2020 | AK | 39 | F | 12/19/2020 | 12/19/2020 | About 3-5 min after injection I felt tingling and warmth/flushing in my entire left arm and anterior chest, upper back and achy pain in my left upper trap- felt like a warm IV running through my arm. Associated with tongue tingling. Symptoms lasted about 10 minutes with the exception of the achy upper trap pain which lasted a couple hours - being a health care provider I associated these symptoms with anxiety/excitement about receiving the vaccine but subsequently developed other unexpected symptoms. Over the course of the next several hours noted metallic taste and transient extremity tingling (all extremities) also with some extremity and facial itching - no rash. Now >24 hours after still have the intermittent and transient extremity tingling (most notable in LE's and feet, but also in arms) and skin itchiness/prickly sensation though improved. Had one episode this afternoon (~28 hours after vaccine) of lightheaded, nausea, chills and profound sensation of extremities being "heavy" - felt like pre-syncope - which resolved in about 30 min with rest, hydration . |

| 904534 | 12/20/2020 | MA | 29 | F | 12/18/2020 | 12/18/2020 | About two to three minutes after the Covid vaccine was administered in the vaccine clinic at my hospital where I work, I began to experience pre-syncopal symptoms (mostly light-headedness and nausea). I stood up to get help and walked to the back of the auditorium where they were observing us for 15 minutes post-vaccine, and due to standing and walking, I became much more dizzy and lightheaded and then sat down on the floor and was eased to a lying-down position on the floor by a nurse as I briefly lost consciousness. I regained consciousness very quickly (maybe 10-20 seconds, but I'm not sure) and was taken care of by a set of nurses who noted me to be hypotensive and pale, with I think a bit of a lower heart rate, though I'm not sure what my vitals were exactly. They had me then stand to do orthostatic vitals and I was orthostatic. I was too dizzy to remain standing and felt very nauseas so I was taken to the ED (in the hospital where I work) to be observed. I had a normal EKG, blood glucose, and urine sample there. After having some juice and lying down, I felt better but was very cold and had some chills. After a little over an hour, they released me from the ED and it seems to have all been an episode of vaso-vagal syncope. I've had vaso-vagal responses before, but not in response to a vaccine since I was about 13, so I was surprised by how quick and severe the vaso vagal response was. Later in the day, I felt better but was fatigued and had a headache. I also had a lot of pain at the injection site. The day after the vaccine I felt tired and had a headache, and for part of the day a mild sore throat. Now two days after the vaccine, I feel much better, and the arm pain is more mild. |
| 904489 | 12/20/2020 | MO | 52 | F | 12/18/2020 | 12/18/2020 | Sudden onset of fainting sensation . Followed by dizziness moderate shortness of breath lightheaded ness panic tingling in hands feet top of head headache distress. |

| 904215 | 12/19/2020 | | 33 | F | 12/19/2020 | 12/19/2020 | brief lightheadedness Pt arrived at observation area at 1500. Was informed she has a history of allergies in teh past so instructed patient to wait or 30 minutes in observation area. Around 1505, pt stated she was feeling lightheaded, near syncope. Advised pt to lay on ground. Vitals taken - BP 140s/90s, with HR 118, pulse ox 100%. After 5 min, pt stated she was feeling better while laying down. At 1515, vitals retaken with BP 120s/80s HR 90s. At 1520, pt sat up from floor still feeling better. At 1525 pt sat in chair feeling better and at 1530 pt stated feeling no side effects. |
| 904082 | 12/19/2020 | IL | 36 | F | 12/18/2020 | 12/18/2020 | was in waiting area and about 10 min after vaccine said she got tachycardiac and checked her heart rate on the apple watch and it was 140. She felt tunnel vision also did not alert staff in waiting area as did not want to call attention to herself. Symptoms subsided after 1-2 minutes. said she would have passed out if she stood up at the time. Went back to work and told coworker. Vaccine clinic staff called her this am and she is fine- no further symptoms. |
| 904040 | 12/19/2020 | CO | 41 | M | 12/17/2020 | 12/18/2020 | I had no adverse events immediately after the vaccine was given. I waited 15 minutes at the facility after the administration, and I went to sleep that evening without any issues. Approximately 5 hours after administration I woke up to use the restroom. I then had 3 syncopal events in succession (I have never had syncope or a vaccine reaction in the past). I have remained lightheaded for 24 hours after the syncopal events. However I did not have fevers, myalgias, or other adverse events other than fatigue and arm pain. I took my vitals throughout the next day. Hr 65-75, BP 120/70, afebrile, SpO2 98%. |
| 903407 | 12/18/2020 | MA | 29 | F | 12/18/2020 | 12/18/2020 | Patient with a h/o syncope to vaccines, felt light headed and laid down on floor roughly 3-5 minutes after vaccination in the observation area. Patient pale, pulse regular in mid-60's, A&O x3, conversant. Medical assistance team called, bp 94/60, lightheaded after attempt at standing for 90 seconds. Transported to ED for observation. |
