

COVID-19 Vaccine Drug Reactions: Fainting

Preliminary Notes – Reactions Listings Start on Page 2 Below

1. Fainting cases Reported through June 4, 2021 in the United States to the Vaccine Adverse Event Reporting System (VAERS).
2. In order to understand the two charts above:
 - a. The VAERS COVID-19 vaccine drug reported cases + backlogged cases **versus** the flu vaccine reported cases
 - b. The VAERS reported cases versus the total cases in the United States

It is **crucial** to at least one time, carefully read through the two answers in the FAQs related to backlogged cases and then the VAERS reporting rate:

https://www.covid19vaccinefacts.net/VAERS_FAQ.shtml#Backlog

https://www.covid19vaccinefacts.net/VAERS_FAQ.shtml#ReportingRate

3. The cases listed below were pulled from the VAERS raw data files with a query that looked for fainting reactions. Please keep in mind that while some of the cases may seem mild, other cases involve a litany of very serious symptoms after the vaccination often including losing consciousness. As you read through the cases below, it is possible that there will be an occasional erroneous case not related to fainting because of the query criteria. The exact query is as follows:
(symptom_text like "*passed out*" or symptom_text like "*fainted*" or symptom_text like "*fainting*")

Fainting: COVID-19 Vaccine Drugs

| 1373307 | 6/4/2021 | WI | 68 | F | 3/9/2021 | 3/9/2021 | <p>broke her ankle; blacked out and passed out; trouble breathing; didn't feel good; nauseated; felt light headed; This spontaneous case was reported by a consumer and describes the occurrence of LOSS OF CONSCIOUSNESS (blacked out and passed out) in a 68-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No medical history was provided. Concomitant products included PREDNISOLONE, TIMOLOL, LABETALOL and LOSARTAN for an unknown indication. On 09-Mar-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 09-Mar-2021, the patient experienced DIZZINESS (felt light headed), MALAISE (didn't feel good) and NAUSEA (nauseated). On 09-Apr-2021, the patient experienced DYSPNOEA (trouble breathing). On 11-Apr-2021, the patient experienced LOSS OF CONSCIOUSNESS (blacked out and passed out) (seriousness criterion medically significant) and JOINT INJURY (broke her ankle). At the time of the report, LOSS OF CONSCIOUSNESS (blacked out and passed out), DIZZINESS (felt light headed), JOINT INJURY (broke her ankle), DYSPNOEA (trouble breathing), MALAISE (didn't feel good) and NAUSEA (nauseated) outcome was unknown. Treatment medications were not provided. Based on current available information and the temporal association between product use and the start date of the events a causal relationship cannot be excluded.; Sender's Comments: Based on current available information and the temporal association between product use and the start date of the events a causal relationship cannot be excluded.</p> |

| 1373366 | 6/4/2021 | | 23 | M | | | lightheadedness; This is a spontaneous report from a non-contactable health care professional (other HCP). A 23-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection; Batch/Lot Number: EN6205; Expiration date was not reported), via an unspecified route of administration on an unspecified date (at the age of 23-years-old) as first dose, single dose for COVID-19 immunisation. Medical history included lightheaded from an unknown date and unknown if ongoing; it was reported that the patient stated the he always gets lightheaded when he gets a shot. The patient's concomitant medications were not reported. On an unspecified date, during the patient's 15-minute waiting period after the injection, the patient experienced lightheadedness. The patient denied difficulty breathing, difficulty swallowing, throat tightness, nausea and any episodes of syncope in the past. The outcome of the event was recovered on an unspecified date; lightheadedness resolved prior to discharge. No follow-up attempts are possible. No further information is expected. |

| 1373702 | 6/4/2021 | OH | 34 | F | 4/13/2021 | 4/13/2021 | Throat swelling; Trouble swallowing; Coughing; Facial tingling; Facial numbness; Face got hot; Face was swelling; Rash on legs and back and arms; really her heart was racing after she got the vaccine; This is a spontaneous report from a Pfizer sponsored program via a contactable consumer (patient). A 34-year-old female patient received second dose of BNT162B2 (Lot Number: EN6203), via an unspecified route of administration, administered in right arm on 13Apr2021 at 14:30 at age of 34-year-old as single dose for covid-19 immunisation. Medical history included ongoing Hashimoto's thyroiditis (autoimmune conditions, had the Hashimoto's since she was around 16, that is when she started getting symptoms), ongoing neurocardiogenic syncope (kind of an autoimmune, started when she was 16). The patient previously received first dose of BNT162B2 (Lot Number: EN6203), via an unspecified route of administration, administered in right arm on 23Mar2021 at 14:30 at age of 34-year-old as single dose for covid-19 immunisation, and face got hot and face was swelling on 23Mar2021. None other vaccines administered on same date with the Pfizer vaccine considered as suspect. None other Prior Vaccinations within 4 weeks. None family medical history relevant to AEs. Concomitant medications were not reported. On 13Apr2021 at 17: 00 or 17: 30, the patient experienced throat swelling, facial numbness, trouble swallowing, coughing, face got hot, face was swelling, facial tingling, rash on legs and back and arms and really her heart was racing after she got the vaccine. Caller came on the line. She had throat and facial swelling, facial numbness, and a rash on her legs and back and arms. Then, she didn't know if she has nerve damage or what, she still had tingling in her face where it was originally numb. Caller was just wondering if there was a program in place. She was told to go to the ER because she was having a reaction. The hospital had no way of billing it as a Covid-19 vaccine reaction. After the second dose her face got hot and she took a lot of medication and the facial swelling and hotness went away. Her cheeks were red and hot, she was not sure if it was swelling. Her face was hot and bright red, she doesn't know why. It kind of seemed puffy, but she was not sure if that was what it was. She had swelling about a week after the second dose her face was swollen and puffy, but she thought it's gone like the hotness was gone. She |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

thought the tingling in her face was related to that. Her face was tingling and hot and swollen, she thought the tingling was a lasting effect. She didn't still have swelling in her face and it wasn't hot. It was in the same area as the tingling. With the second dose she had the hotness and swelling 30 minutes after the vaccine, and it was a kind of a puffy tingling numbness. The hotness and swelling went away a little bit later, about 45 minutes after she had the vaccine. She had trouble swallowing after the second dose. She didn't know if it was because her throat was swelling. She had autoimmune issues and thyroid problems. She didn't know if her thyroid was swelling. She didn't realize she had the rash until a few hours after the second dose of the vaccine. Her throat was swelling after the second dose. She took diphenhydramine hydrochloride (BENADRYL) immediately and that helped. She took it right when she started noticing her throat was swelling and it went down some at that point so she didn't feel like panicking. She went to the ER and they gave her steroids and antihistamines, and it was completely gone after that. She did not have an NDC, lot, or expiration date available for the Benadryl she took. She recovered completely. It went away that same day. She thought the facial numbness after the second dose was a little better. It still felt tingly, but it had gotten a little better. She was not really sure, the numbness and tingling were kind of together and she didn't know how to describe it. She didn't want to be dramatic, she thought that people should get the vaccine. Reactions were normal for her. She had trouble swallowing about 30 to 40 minutes after she had the second dose of the vaccine. She was driving and realized she was having trouble swallowing or tightness in her throat area. When she went to the hospital she was still having trouble swallowing and was coughing. She thought the coughing was just from the throat swelling. It got better. She only still had the tingling. They did monitor her heart rate, really her heart was racing after she got the vaccine and did slow down after she got medication. They monitored her heart rate and blood pressure on 13Apr2021, results not provided. She hasn't had any other bloodwork or anything. The patient went to the hospital close to home and went to the ER but was not admitted. They gave her medications and everything returned to normal. She guesses they

No arrived physician office. The outcome of events throat swelling, trouble swallowing, coughing, face got hot, face was swelling was recovered on 13Apr2021, of event, rash on legs and back and arms and really her heart was racing after she got the vaccine was recovered on unknown date, of event facial tingling and facial numbness was recovering. Information on Lot/Batch number was available. Additional information has been requested.</p> <p>Fainted; Feeling very light-headed; Slightly nauseous; This is a spontaneous report from a non-contactable consumer (patient). A 50-year-old female patient received 2nd dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, LOT number: EW0179, expiration date unknown) via unspecified route of administration on left arm on 15May2021 at 12:00 PM at age of 50-year-old at single dose for COVID-19 immunization. Patient was not pregnant at time of vaccination and events onset. Medical history included back pain. Patient had no known allergies. Patient previously received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, LOT number: EW0171, expiration date unknown) on 24Apr2021 at 12:00 PM at age of 50-year-old via unspecified route of administration on left arm for COVID-19 immunisation. Concomitant medications included cyclobenzaprine, gabapentin, both administered within 2 weeks of vaccination. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient wasn't diagnosed with COVID-19. Since the vaccination, patient hasn't been tested for COVID-19. In the morning after the injection on 16May2021 at 09:30 AM, patient was in the kitchen and started feeling very light-headed and slightly nauseous. Patient sat in a chair but still felt the same. She got up to go lie down and fainted. After crawling to the couch and lying down for a few minutes, she felt better. The events didn't result in emergency room visit or physician office visit. Outcome of the events was recovered. No treatment received for the events. No follow-up attempts are possible. No further information is expected.</p> |

| 1373769 | 6/4/2021 | VT | 78 | F | 2/21/2021 | 2/22/2021 | syncope; Acute subarachnoid hemorrhage involving both hemispheres; acute on chronic right subdural hematoma up to 7 mm thick; hemorrhagic contusion with edema; hemorrhagic contusion with edema; fatigue; malaise; HA; This is a spontaneous report from a contactable physician. A 78-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular, administered in arm left on 21Feb2021 (Lot Number: EN6200) (at the age of 78-year-old) as single dose for COVID-19 immunisation. Medical history included hypertension (HTN), hyperlipidemia (HDL) and hypothyroidism, all from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. Prior to vaccination the patient was not diagnosed with COVID-19 and since the vaccination the patient has not been tested for COVID-19. The patient previously took SSRI, PNC (unknown), sulfa and oxycodone; the patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular, administered in arm left on 31Jan2021 (Batch/Lot Number: EL9265) as single dose for COVID-19 immunisation. Within 12 hours of vaccine (on 22Feb2021) the patient developed symptoms of fatigue, malaise, headache (HA) and severe and near syncope. She visited the emergency department (ED) the following day. Work up at that time including blood work and no imaging. She was treated with IVFs and discharged. Symptoms of malaise, fatigue and HA persisted for > 1 week. A computerized tomogram (CT) of the head was performed on 05Mar2021, this CT showed the following: acute subarachnoid hemorrhage involving both hemispheres; acute on chronic right subdural hematoma up to 7 mm thick; 2X3 left front hemorrhagic contusion with edema. The events required emergency room visit and physician office visit. Therapeutic measures were taken as a result of the events and includes conservative measures (as reported). The patient outcome of the event was recovered with sequel.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of reported events cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the |

| 1373710 | 6/4/2021 | CT | 53 | F | 5/14/2021 | 5/15/2021 | <p>completely passed out; she was going to pass out; chills; headache; nausea; feeling very sick; She states it felt like she had the COVID virus again; This is a spontaneous report from a contactable consumer (patient). A 53-years-old female patient received bnt162b2 (BNT162B2), dose 1 via an unspecified route of administration, administered in Arm Left on 14May2021 16:30 (Batch/Lot Number: EW0176) as SINGLE DOSE for covid-19 immunisation. Medical history included asthma, she was diagnosed as a child, she was in treatment because her pulmonologist said the airflow in her lungs were very low; this was before she got COVID in February and before she got the vaccine. She was in treatment for her asthma since Dec2020; Vasovagal syncope, she explained she has always had this problem, but she didn't know what it was, she was diagnosed around 10 years ago because it kept getting worse and worse; Covid-19 from 12Feb2021 to an unknown date, she passed out at home and she went to the hospital; acid reflux; she had regular allergies from trees and stuff; she was suffering from allergies 2 weeks before the shot, She went to take the COVID shot and she was sneezing, and had a sore throat. She asked everybody if it was okay to take it and everybody said it was fine so she took it. She was not sure if it has anything to do with it, but she was already suffering from her allergies with the sneezing and sore throat when she took the COVID shot. Concomitant medications included fluticasone furoate, umeclidinium bromide, vilanterol trifenate (TRELEGY) taken for asthma from Dec2020 to an unspecified stop date; Montelukast, taken for asthma from Dec2020 to an unspecified stop date; salbutamol (ALBUTEROL HFA) taken for asthma from Dec2020 to an unspecified stop date; famotidine taken for acid reflux from Dec2020 to an unspecified stop date; colecalciferol (VITAMIN D3 1000) taken for an unspecified indication from Dec2020 to an unspecified stop date; prednisone taken for asthma from Dec2020 to an unspecified stop date, and antibiotics taken for asthma from Dec2020 to an unspecified stop date, she confirmed these medications were before the vaccine, she wasn't taking the antibiotic or Prednisone at the time of the vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. She had the vaccine last Friday, 14May2021. The patient woke up feeling very sick the next day, 15 May 2021. She spent all day in bed</p> |

VAERS_ID RECVDDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

with chills, headache, nausea. Around 11:00, her husband had to call 911 because she completely passed out. She went to the hospital. She explained now, she was feeling much better, but she was still feeling like her body wanted to still go to bed. On 15 May 2021, she woke up thinking she was going to pass out. Her husband tried to help her; she didn't want to go to the hospital. The whole day she was going downhill. She spent all day in bed with chills, headache, and nausea. She stated it felt like she had the COVID virus again. She felt like she has improved. She still had a little bit of a headache, and she still felt like her body wanted to stay in bed, but she doesn't feel as bad as she did on Saturday. She was taken to the Emergency Room (ER) around 12:30AM Sunday morning, 16 May 2021. She confirmed she was never admitted into the hospital, she was only seen in the ER. She left the ER at 5:00 AM. Her second dose is supposed to be on 04Jun2021. Right now, she was afraid to get her second shot. Patient wanted to know was there any other risk with getting the second shot. The outcome of the events was recovering.

| 1374361 | 6/4/2021 | NE | 12 | F | 6/3/2021 | 6/4/2021 | Patient awoke the morning after her 1st COVID vaccination. Reported she slept well. Her arm was sore from COVID shot. She was up for approximately 20 min and had brushed her teeth and did her hair. She was going to get dressed for the day and states she got a sudden pounding headache and felt nauseous. She was on her way out to the kitchen to tell us she didn't feel good when she blacked out. She face planted, hitting her forehead on the hardwood floor witnessed by both parents. She was out for approximately 30 seconds. Her blood pressure was 90/60, HR 120, O2 on rm air was 98%. She has no previous history of syncope. After spell heart rate ran in the 100-110s for about 30 min and then normalized around 88-95. Was tired and sleepy for 2 hours after. (No post ictal sx to suggest seizure) Patient also received Tdap and meningococcal vaccine in other arm at the time of 1st Covid vaccination. The night of her COVID shot patient had normal appetite and activity level. |

| 1373746 | 6/4/2021 | IL | | F | | | blood sugar was 500/high blood sugar; fainted because of hypoglycemia; fainted because of hypoglycemia; This is a spontaneous report from a contactable physician. A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration on an unspecified date (batch/Lot number was not reported) as single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. Caller mentioned her oncologist who stated that his wife didn't have diabetes. Ten days after his wife (patient) got the second dose of the Covid Vaccine her blood sugar was 500. Caller stated that her oncologist wife was placed on medication for the high blood sugar and then fainted because of hypoglycemia. She says the wife was taken back off of the medication and was fine. Outcome of events was unknown. No follow-up attempts are needed; information about lot/batch number cannot be obtained.; Sender's Comments: Based on available information, a possible contributory role of BNT162B2 vaccine can not be excluded for the reported events of blood sugar increased due to temporal relationship. The events 'fainted because of hypoglycemia' were associated with blood sugar medication and unrelated to BNT162B2 vaccine. Case will be re-assessed upon the additional information provided. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate. |

| 1371279 | 6/3/2021 | IL | 34 | F | 5/28/2021 | 5/31/2021 | At 1:30pm on Monday 5/31 I started to feel cramps in my pelvic area. I had gotten my period 2 days early, and was bleeding heavier than normal and had surprising diarrhea. I took 600mg of Advil and texted a friend at 2:10 that: "the womanly cramps are ripping up my insides and making me so sick." Still I though this was an incredibly painful but normal mensural cycle. By 2:45 when the Advil normally would have kicked in and made the cramping almost disappear, I had gotten much worse. I was spending the day with a friend who is an internal medicine doctor and so she monitored me closely. I had extreme chills and was very cold to the touch but was profosely sweating. I was unable to drink or eat anything due to the nausea. Sharp and constant pain radiated from my mid-pelvic area down to my knees and up to my chest. On a fairly consistent bases my legs contorted in involuntary cramping. I felt like I was bleeding heavily (turns out I was not) and we attempted to go to the bathroom. I just the act of gently standing up I fainted and my friend caught me, gently returning me to the ground. When I became conscious she had my legs up and we went to the ER. |
| 1371286 | 6/3/2021 | NC | 48 | M | 1/27/2021 | 1/28/2021 | I had the vaccine and I had fever, chills, achy and weak, I almost felt like I had Covid. Then about 3 or 4 days after I continued to remain sick and I passed out on the kitchen floor, my wife called the ambulance and they took me to the ER. They gave me some fluids and ran an EKG on my heart. I was observed for a few hours and released to go home later. They did not give me any medications. |
| 1371293 | 6/3/2021 | MO | 18 | F | 6/3/2021 | 6/3/2021 | Patient received J&J vaccine and walked to sit down for her post injection wait time. Patient had previously fainted after a vaccine so she was suppose to sit for 30 minutes anyway. Patient immediately after sitting down got extremely light headed, pale, and dizzy. We immediately moved her to the floor and put her feet up. After approximately 3 minutes, patient regained color and was feeling a lot better. EMS was called but father who was with her called to cancel and refuse after patient felt better so quickly. Patient had history of anxiety with shots and it seemed to be truly an anxiety issue. |

| 1370544 | 6/3/2021 | NV | 52 | M | 5/15/2021 | 5/15/2021 | dizziness; nausea; He did not feel well at all and was not able to feel well enough to stand up.; definite lack of coordination; he vomited on himself; his cholesterol was high at 208.; had very little strength; started feeling like something was wrong; just had sort of a feeling like being really drunk; passed out (fainted) in his car 3 times; He was told he had a vasovagal reaction; This is a spontaneous report from a contactable consumer (patient). A 52-years-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left on 15May2021 10:50 (Lot Number: EW0173; Expiration Date: 31Aug2021) as 1ST DOSE, SINGLE DOSE for covid-19 immunisation. Medical history included vasovagal reactions in high school. No other vaccinations within four weeks prior to the first administration date of the suspect vaccine. The patient's concomitant medications were not reported. Within 2 minutes of receiving the Covid 19 vaccine he started feeling like something was wrong. He pulled to the side in the parking garage and as soon as he stopped the car he passed out. He woke back up and was able to put the car in park and he passed out a second time. He woke up again and his foot was on the gas pedal and he tried to roll down the window. He was able to roll down the window but he wasn't able to get anyone's attention. He passed out a third time. When he woke up again he wasn't able to get the door open and he was nauseated. He basically had nausea, dizziness, and a definite lack of coordination. He just had sort of a feeling like being really drunk. He doesn't drink. He had very little strength but he was able to push his car horn. He was out of it. He could see someone in his car mirror a little ways behind his car and the horn didn't get the person's attention so he honked a second time and someone came to help him, maybe from the fire department and maybe some emergency medical technicians. He was placed on a golf cart or ATV to be transported downstairs to a waiting ambulance and while on the ride he vomited himself. He mentioned that the EMTs called it a vasovagal reaction. He was brought to the hospital in which he had a lot of tests done. He did not feel well at all and was not able to feel well enough to stand up. He had tests done at the hospital, a chest x-ray and his blood was drawn. He had a cardiac ultrasound later in the afternoon the next day |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

on 16May2021. The doctor's didn't find anything wrong other than his cholesterol was high at 208. He was admitted to the hospital on 15May2021. He continued to have his blood drawn through the night and the next morning, on 16May2021, he had a CAT scan. For his cholesterol he was told to eat better and maybe follow up with a doctor in a couple months to check his cholesterol again. No one had any answers to the effect of what happened to him. Everything was fine, his tests were normal. He was told he had a vasovagal reaction. He's had vasovagal reactions before and he can tell this was much different than the vasovagal reactions he's had before. In the past when he's had vasovagal reactions the world went black like looking through a small circle, his vision got blacker and blacker and then he'd pass out. He did not have this feeling with the Covid 19 vaccine. He can only describe this feeling that he had like an occasion in his past when he's drank to much and he's stumbling around. He may have passed out briefly to someone helping him move to a bed and his arms are weighted and he can't lift them and he's disoriented but still has a sense of what's going on but he feels like he could vomit at any second. He's comparing his experience to the Covid 19 vaccine to drinking to much alcohol and then falling asleep or passing out. He was pretty much out of it for 5 hours. Between the fourth and fifth hours after receiving the Covid 19 vaccine he was comfortable enough to stand on his own for brief moments. He was feeling better and was able to use the restroom. By the next day, around the 24 hour period after the vaccine he was feeling almost normal. He was released from the hospital the next day, 16May2021 at around 4:00PM. He was maybe in the hospital for about 27 to 28 hours. At the hospital he had all these tests and he was found to be healthy with no problems. He also had a Covid 19 virus test, he never asked what the results were but he's going under the assumption that if he was Covid 19 virus positive the hospital staff would have told him. Passing out, nausea, dizziness required a visit to Emergency Room. The outcome was unknown.

A 75-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, solution for injection, Batch/Lot Number: EN9581, expiration date not reported), via an unspecified route of administration on 15Mar2021 as 2nd dose, single and first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, solution for injection, Batch/Lot Number: EN6202, expiration date not reported) intramuscular, administered in Arm Left on 23Feb2021 as 1st dose, single both for covid-19 immunization. Reportedly, adverse events following prior vaccinations arm hurt, headache, leg cramps like electricity going through veins and toes, joint pain comes and goes in his back, knees ankle and toes, leg muscle pain part of thigh and knees comes and goes, most of time it is in his calf. The patient medical history included high blood pressure and arthritis. The patient concomitant medications were not reported. There were no other prior vaccinations (within 4 weeks) prior to the first administration date of the suspect vaccine. On 15Mar2021, the patient experienced electricity feeling in his legs felt like electricity going through his veins down to his toes and comes back up. On 16Mar2021 leg cramps, headache and muscle and joint pain. Patient stated that after he got his second dose on 15Mar 2021 the electricity feeling in his legs began that night. Patient stated it felt like electricity going through his veins down to his toes and comes back up. Patient stated it does not happen 24/7, it comes and goes. Patient reported the leg cramps, headache and muscle and joint pain, started the next day. Patient stated the muscle and joint pain are not 24/7 either, it comes and goes. Patient stated he was able to move around but felt it when he walks around. Reportedly, patient received his second dose of Pfizer COVID vaccine and had the same symptoms as the first dose, however, from his first dose, his symptoms went away 7 to 8 days after. Patient confirmed that they did go away and he was fine. On his second dose, which he received on 15Mar2021, he was still experiencing symptoms today on 09Apr2021. Patient was asking if his |

| 1371090 | 6/3/2021 MA | 20 M | 5/9/2021 | 5/13/2021 | <p>symptoms will go away. Patient stated next Thursday will be a month since he took the second dose and the feeling comes and goes. Patient stated he has a headache and muscle pain that was still going on and cramps in his legs. Patient reported that it was (second dose) originally scheduled sooner than that but due to snow and bad weather it was rescheduled for the 15Mar2021. Patient wanted to know if this was something that he was going to have to deal with for the rest of his life or would it go away. Patient also stated, saw on the news people taking the Johnson and Johnson vaccine and fainting. Patient also added that he also saw on the news that a lot of doctors and nurses are refusing to take the COVID-19 shot. Therapeutic measures were taken as a result of adverse events. Patient stated he has been taking extra strength Tylenol three times when it first started, and now he was taking it 2 times a day. No relevant tests were done. The outcome for all the events was not recovered as reported. No follow-up attempts are needed. No further information is expected.</p> <p>Site: Pain at Injection Site-Mild, Systemic: Dizziness / Lightheadness-Mild, Systemic: Fainting / Unresponsive-Mild, Systemic: Flushed / Sweating-Mild, Additional Details: patient nodded off into a faint when I went to get him a snack, he remained in his chair but dropped his water. Patient said he was feeling sweaty and seeing black. He rested with head down & on the floor. Had some water and a snack. Side effects lasted 5-6 min, patient remained in pharmacy for an additional 15 min without any further events.</p> |

| 1370538 | 6/3/2021 | VA | 59 | F | 4/13/2021 | 4/14/2021 | I passed out; This is a spontaneous report from a contactable consumer (patient). A 59-year-old female patient received BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: ER 8737), administered in right arm, on 13Apr2021 at 14:30 (at the age of 59-years-old) at unknown, single for COVID-19 immunisation. The patient was not pregnant at time of vaccination. Medical history included known allergies to sulfa. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient had not been tested for COVID-19. Concomitant medications included paroxetine, ciclosporin (RESTASIS), fluticasone propionate (FLONASE), vitamins nos (MULTIVITAMIN); all reported as other medications the patient received within 2 weeks of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient previously took codeine and experienced allergies. The patient passed out on 14Apr2021 at 03:00. The event was reported as non-serious, required emergency room/department or urgent care. Therapeutic measures were taken as a result of the adverse event and included treatment with intravenous fluids. The patient was recovering from the event. |
| 1371238 | 6/3/2021 | NJ | 27 | M | 6/3/2021 | 6/3/2021 | Approximately 1 minute after administering vaccine, patient asked for water with complaints of lightheadedness. As he walked up to pharmacy door for water, he collapsed to the ground. He went in and out of consciousness while laying on the ground for about ten minutes. He had no other complaints other than lightheadedness. He did not eat any food today. He said in the past he had fainted after getting a numbing injection for a dental procedure and believes it may be a similar reaction. The paramedics were called and evaluated him. His blood pressure and HR were within normal limits. He refused to be taken to the hospital for further evaluation. |

| 1372138 | 6/3/2021 | TX | 55 | F | 1/22/2021 | 1/23/2021 | The next day, I felt so nauseous; I had gotten up to go to the bathroom to vomit and I passed out and hit my head on the bathtub. I got some medication to help with the nausea. I slept all day. I felt a little better the next day after. I had a headache, feeling weak and not back to par. On February 2, my blood pressure was so high that I just wanted to lay down; I came home early from work. My chest started feeling tight. I went to Urgent Care. My blood pressure had been 185 over something. and it came down to 130s. The doctor there started me on Propanol. Later, I saw my PCP on March 3, 2021 - She started to change my meds on that date and I saw her a couple of times - April 16, I think was the next time. I saw her again on May 14th. My PCP took me off of that and increased my Locinaprol and she added HCTZ , a diuretic and Carvedilol- and doubled dose on that. With those meds my high blood pressure is back under control. Probably Mid-April by the time all of that started to feel better. The blood pressure is back to being controlled. |

| 1371888 | 6/3/2021 | PA | 24 | F | 1/31/2021 | 1/31/2021 | So at around 9pm the evening of my shot, I started feeling feverish so I went to the other room to get my temperature and while I was waiting for my temperature to be recorded, I started to feel lightheaded and I called out for help. I woke up on the floor, I woke up to my roommate and boyfriend standing over me. They were on the phone with 9-1-1. I was out for about a minute and unresponsive. According to them, my arm was flailing and seizure-ish. I went to the ER, I was taken by EMS services. They gave me fluids and ran bloodwork and monitored me. They sent me home, I did have another episode of what I think was an episode of memory loss/passed out. I just remembered waking up in a room alone. I was at the ER for about 4-5 hours. They gave me IV fluids and I don't remember what else, some sort of supplement. It was magnesium oxide they gave me. When I left the ER I was really exhausted, and feverish and gross and I was pretty sick for the remaining two days. I didn't sleep well that night, I had a fever the following day and into the second day upon returning home as well. |
| 1371607 | 6/3/2021 | MD | 66 | M | 3/31/2021 | 4/8/2021 | he felt achey and weak for a day or two then had syncope then he had syncope again this morning. found to have NSTEMI. received PCI with a DES x1. recovered and discharged home |
| 1371822 | 6/3/2021 | AL | 18 | M | 6/3/2021 | 6/3/2021 | Approximately 5 minutes after receiving the vaccine, the patient passed out and his eyes rolled back (possible seizure activity). This activity lasted for approximately 1 minute. Patient also felt dizzy, sweaty, nauseous, and became pale. Patient was given a cold ice pack to lower his body temperature. Patient was also given crackers for nausea, and a bag just incase he had to vomit. Patient's mother was also here to tend to the patient. The mother also gave him clear fluids (sprite) to help with the nausea. After approximately 10 minutes, the patient was able to stand without feeling dizzy. He left the store with his mother to be watched closely (His mother is a nurse.) They also refused emergency medical services. |
| 1372299 | 6/3/2021 | WI | 21 | M | 6/3/2021 | 6/3/2021 | before the shot, the patient reported that he has a history of fainting. Patient fainted shortly. was given ice pack, and recovered over about 20 minutes. |

| 1369954 | 6/2/2021 | TX | 41 | M | 6/1/2021 | 6/1/2021 | I felt completely fine for the first 5 minutes. I left the store. After 5 more minutes I started feeling bad (I was seated). My whole body was sweating and my vision was affected (everything was bright). I was able to return to the store but was close to passing out. I sat down for about 10-15 minutes while the symptoms persisted and I was not able to see well. After that time the sweating stopped and my sight was no longer affected. This was not anxiety and I have no history of fainting with shots. This was a reaction to the shot. After about an hour I felt fine except for muscle soreness at the injection sight. If the reaction was any worse I would have passed out or asked for help. I am hesitant to get a second dose out of concern that the reaction could be worse. |
| 1368644 | 6/2/2021 | WA | 29 | M | 5/31/2021 | 5/31/2021 | This description was reported to this writer. The patient had just arrived and sat down in the post vaccination area. He was sweating profusely on his head. The patient was assisted to the floor by the nurse. The patient did say to the nurse that he was "feeling lightheaded". He stated that he had a needle phobia. Patient denied a history of fainting and of diabetes. Vital signs were taken. EMTs were notified to attend to patient. Patient was assisted to a chair. Encouraged to drink fluids. Patient was released by EMTs after 30 minutes. |

| 1366969 | 6/2/2021 | FL | 44 | F | 2/2/2021 | 2/2/2021 | left arm was stiff this morning; injection site pain; she just realized the Arnicare Gel was expired, saying she was surprised the Arnicare Gel still worked; has a charley horse pain in her left arm; This is a spontaneous report from a contactable consumer or other non hcp. A 44-years-old female patient received bnt162b2 (BNT162B2, Solution for injection, Batch/Lot Number: EN5318), via an unspecified route of administration, administered in Arm Left on 02Feb2021 as 1st dose single for COVID-19 immunization. Medical history included microcytic anemia and thalassemia from an unknown date and unknown if ongoing. Restless legs syndrome from 2015 to an unknown date Verbatim. Concomitant medications included cyanocobalamin, biotin and folic acid taken for microcytic anemia from an unspecified start date and ongoing. Ethinylestradiol, norgestimate taken for hormone therapy from Oct2020 and ongoing. She said she started taking Estarylla 0.25mg/0.035mg oral birth control pill for hormone regulation in Oct2020, saying she has been taking the Estarylla for 4 months steady now. The patient previously took ropinirole for Parkinson's disease and experienced syncope from an unspecified date. Reported she tried the Parkinson medicine, Ropinirole, and that the Ropinirole knocked her out, and she didn't like that, so she stopped taking the Ropinirole 2 years ago. On 02Feb2021 patient experienced has a charley horse pain in her left arm, injection site pain and she just realized the Arnicare gel was expired, saying she was surprised the arnicare gel still worked. Left arm was stiff this morning on 03Feb2021. Stated she has a bad left shoulder, saying she thinks she has a pinched nerve, so she asked to get the vaccine in her left arm. She said her left arm pain has improved on 03Feb2021. Therapeutic measures were taken as a result of he has a charley horse pain in her left arm and left arm was stiff this morning. Treatment received with Arnica gel to help with the left arm muscle soreness. She said the Arnica gel helped. The outcome of the events was recovered, whereas injection site pain was recovering. Follow-up attempts are completed. No further information is expected. |

On 27-Jan-2021 at 10:29 AM, the patient experienced HYPERVENTILATION (hyperventilation) and TREMOR (shaking of arms and legs). On 27-Jan-2021 at 10:40 AM, the patient experienced PALPITATIONS (heart racing). On 27-Jan-2021, SYNCOPE (Faint after covid vaccine on awakeing,Vasovagal, Passed out) and PANIC ATTACK (panic attack) had resolved. At the time of the report, PALPITATIONS (heart racing), HYPERVENTILATION (hyperventilation) and TREMOR (shaking of arms and legs) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 27-Jan-2021, Blood pressure measurement: 148/88 mmHg (High) 148/88. On 27-Jan-2021, Heart rate: 100 (normal) 100. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Concomitantly the patient was taking medications for birth control (unspecified). The patient received treatment with oxygen via NRB @15L. It was reported that patient approximately had 3 episodes. She reported no loss of consciousness and no loss of bladder or bowel control. Patient used pulse oximeter Based on the current available information and temporal association |

| 1366794 | 6/2/2021 | CA | 56 | F | 4/1/2021 | | <p>ARTRIAL FLUTTER (HEART RATE HIGH, HEART PALPITATIONS, FELT FAINTING, DIZZINESS); SHOULDER PAIN; SORE ARM; NAUSEA; INJECTION SITE PAIN; CALF SWELLING; This spontaneous report received from a patient concerned a 56 year old female. The patient's height, and weight were not reported. No past medical history or concurrent conditions were reported. The patient was previously treated with influenza vaccine inact sag 3v for prophylactic vaccination. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 041A21A, and expiry: UNKNOWN) dose was not reported, 1 total, administered to left arm, on 05-APR-2021 for prophylactic vaccination. No concomitant medications were reported. On 05-APR-2021, at 18:00, vaccination provider gave shot on side way as she could find the muscle, immediately felt at 3 sites severe pain, at injection site, front and back of the shoulder, top of the shoulder. On the same day, after taking shot, around 14:30 minutes, patient had nausea, dizziness, and felt fainting. The vaccination provider gave her some orange juice and after 2-3 minutes later after drinking orange juice, patient felt better. Patient reported that arm remained sore for two weeks and had no other symptoms. Patient usually wore sock during night on a daily basis. On an unknown date in APR-2021, in the morning, patient noticed swelling (calf swelling) up to the sock at the line where elastic, around mid-calf area. On 28-APR-2021, at evening, patient felt heart beating out of rhythm, heart palpitation, and unusual feeling in the chest. On 29-APR-2021, she went to urgent care at 8:00. Patient was checked with electrocardiogram (EKG) machine, took blood test. Physician Assistance advised patient to go to emergency room (ER). On the report, it said vital signs noted as afebrile and cardio no rubs, no peripheral edema, heart rate was showing a normal rhythm with a rate in the 150s. They gave IV (intravenous) and bunch of fluids. On the same day, patient went to emergency room around 10:00. Patient was connected with EKG machine, had blood test and covid test, and monitored heart around 11:00, arterial fluttered atrium beating 2 times faster than ventricles high based on chest and no other issue. Patient was mildly sedated and was performed cardio version. Patient woke up around 13:30 and did not feel heart beating unusual</p> |

| | | | | | <p>way. Patient was discharged on same day from emergency room referred to cardio electro physiologist. Patient was given prescription medication metoprolol tartrate 25 mg take 1 tablet 2 times a day dispensing quantity 30, blood thinner xeralto 20 mg take 1 tablet by mouth once daily 30 tablets but patient did not buy medication. Physician said patient had risk of clotting. Laboratory data included: Blood test (NR: not provided) Unknown, COVID-19 virus test (NR: not provided) Unknown, Cardiac monitoring (NR: not provided) Arterial fluttered Atrium beating 2 times faster than ventricles high, EKG (NR: not provided) 150, and Vital signs measurement (NR: not provided) afebrile. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from sore arm on APR-2021, and injection site pain, and the outcome of nausea, calf swelling, artrial flutter (heart rate high, heart palpitations, felt fainting, dizziness), shoulder pain was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: 20210557841-covid-19 vaccine ad26.cov2.s-artrial flutter (heart rate high, heart palpitations, felt fainting, dizziness). This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s).</p> |
| 1366577 | 6/2/2021 IL | 14 F | 6/1/2021 | 6/1/2021 | <p>Patient felt dizzy immediately after the shot was given. She said she was going to pass out, and did for about 10 seconds. She was sitting up in a chair during this time, with her mom holding her up. She came to, the about 20 seconds later, she passed out again for another 10 seconds. She came to, and was given some water to drink, but 20 seconds after that she threw up the water. I took her blood pressure, and it was 60/40, with a pulse of 60. She was very pale. After resting in the chair and taking deep breaths, her color returned and she felt much better. she also said her vision wasn't blurry anymore. Ten minutes later, she left with her mom, feeling ok. She was very anxious about getting the shot, and told me she had passed out in the pass after giving blood.</p> |

| 1368542 | 6/2/2021 | NM | 35 | M | 6/2/2021 | 6/2/2021 | Patient passed out, after vaccine. Patient complained about sever back pain before vaccine, but insisted on recieving the vaccine on 6/2/21. Patient was transferred to clinic, and placed under care and then transported by ambulance from pharmacy. |
| 1368395 | 6/2/2021 | TN | 18 | F | 6/2/2021 | 6/2/2021 | Patient received the first dose Moderna she was a little scared but she was ok. She got her shot and was told to stay around for 15 minutes, she starting walking with her mom, when she told her mom she felt dizzy, then she passed out unto her mom's arms, her mom put her on the floor, did not heart her head. Mom helped her to get up and came back to the pharmacy, sat her down again. We called 911 for help, patient asked for water, while her mom went to get her some water, pharmacist was watching her when she had a short convulsion for about 2 to 3 seconds, she stretched her body to the back. When 911 came, she had already recovered her color, her vitals where ok, she was breathing normal. Patient refused to get on the ambulance, signed her release and left. Emergency personel advised her to follow up with her doctor. |
| 1368407 | 6/2/2021 | | 23 | F | 5/26/2021 | 5/27/2021 | Syncope, several events with associated severe headaches and fatigue. |
| 1368409 | 6/2/2021 | NC | 26 | M | 6/2/2021 | 6/2/2021 | Approximately 60 to 90 seconds after administering vaccine to patient, the patient experienced a vasovagal syncope episode. The patient briefly lost consciousness. The pharmacist was able to catch the patient as he lost consciousness and prevent him from falling and further injuring himself. The patient was then moved to a mat on the floor to rest and recover. The patient regained consciousness as he was being moved to a mat on the floor. The patient then maintained consciousness and recovered fully from the event after approximately 20 minutes. The patient was monitored for 30 minutes prior to leaving the pharmacy. He also had a family member (his father) who accompanied him to the appointment and was the patient's driver to and from the pharmacy for his vaccination. |

| 1368574 | 6/2/2021 | FL | 39 | F | 3/8/2021 | 3/8/2021 | Immediately I started to feel a warm sensation like a wave come over my body. My heart started racing and I told the woman who administered the vaccine. I started to feel like I was going to faint so I sat in a chair with my legs up on another chair. The hot wave feeling kept getting more intense and so did the feeling like I was going to faint. I never fainted but the feeling kept coming on strong then going away. The woman kept telling me I was ok because I didn't have hives or trouble breathing. At one point she walked away from me and I had a started to shake uncontrollably. I called paramedics because my heart was racing and the shaking got even worse. At this point I laid on the ground because I couldn't sit in the chair from the shaking. The paramedics were very dismissive and asked if I had a history of panic attacks. I repeatedly told them and the woman who administered the vaccine that I was not having a panic attack and that I felt fine before the vaccine and that I do not have a fear of needles. They took my blood pressure and pulse and said I was fine. I didn't feel fine and kept shaking throughout the examination (on the floor). I was unable to stand up for 2 hours. It was awful laying on the floor of a grocery store for that long and feeling so terrible. The shaking lasted 2 hours but the rapid heartbeat and feeling of waves of heat lasted days. |
| 1368591 | 6/2/2021 | MO | 16 | F | 6/1/2021 | 6/1/2021 | Pt had loss of consciousness x 2 immediately after injection. , shaking of extremities described. Lasting approx 1 min each. return to baseline after . Differential was seizure vs. more likely vagal syncope |
| 1367888 | 6/2/2021 | CA | 22 | F | 6/1/2021 | 6/1/2021 | Systemic: Fainting / Unresponsive-Medium, Additional Details: Patient received first dose of vaccine with her mother. Prior to administration, patient mentioned she was anxious receiving shots having a history of fainting. Immediately after administration, patient stated that she was relieved. About 2 minutes later, patient's mother called for the pharmacist for help claiming patient was having convulsions and was unconscious. Paramedics were called. Patient regained consciousness after 20 secs with nausea & no recollection of loss of consciousness. |

| 1367223 | 6/2/2021 | NY | 52 | M | 5/8/2021 | 5/8/2021 | feels like there are little tiny baby hands pinching his internal organs throughout his abdomen; Eyes swollen and his vision was diminished; Eyes swollen and his vision was diminished; On his injection arm- 2 inches away from the injection site appeared a size of a gigantic golf ball/A huge lump appeared a few inches from injection site; Numbness from his ankle to his feet and from his knees to his feet/numbness in legs and feet; feels like it's cold and tingly; feels like it's cold and tingly; ringing ears; pressure in his neck to his injection site; back pain/pain in back; vision is blurry; throat was swollen.; Toes locking up; Really dizzy and really lightheaded; Mind has been foggy; Glands were swollen; Arm soreness; Nose is bone dry; tiredness/tired; injection site pain/injection site soreness; This is a spontaneous report from a contactable consumer (patient, self-reported). A 52-years-old male patient received first dose of BNT162B2 (PFIZER-BIONTEC COVID-19 mRNA VACCINE, Solution for injection, lot number: EW0173 and expiry date was not reported), via an unspecified route of administration, in Arm Left, on 08May2021 at 02:38 PM, as a single dose for COVID-19 immunization. The patient did not receive any other vaccine in four weeks. The patient's medical history included Bug bite (happened 5 days prior to 30Apr2021 and regimen of an antibiotic). He was completely done with the rotation for at least 8 days before he got the vaccine. It might have something to do with this. concomitant medication included dicloxacillin (started it on 30Apr2021 and it was for 5 days. He did not know what it did was). The patient reported that on 08May2021, day one, he experienced, tiredness and injection site pain. On day 2, until now side effects which had not gone away. It hadn't gotten worse, but it was not any better. The patient felt like congestion, but his nose was bone dry, like crusty dry. It hurts a little bit because it was so dry and he had arm soreness, nothing out of the ordinary. The arm soreness was just normal injection stuff. At first it was a little tender on the injection spot. It went away after about a day. On 10May2021, the patient felt like there were little, tiny baby hands pinching his internal organs randomly throughout his abdomen. It was not a sharp pain, more like a little squeeze all through his abdomen. It felt like his whole throat was swollen. It was not visually swollen, it more felt like a football in his neck. Stretching it was helping. His |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

toes have been locking up like a pre-clamping. He had numbness from his ankles to his feet for 8 days, and now he has numbness from his knees to his feet. It was not completely numb, but it was not normal. The feeling of baby hands pinching his internal organs started the second day after the vaccine and has stayed consistent. The patient's eyes swollen, and his vision was diminished. Day 2 through today, it felt like his eyes were swollen, his vision was seriously diminished, he had a golf ball sized welt on his arm not at the injection site but 2 inches from it, and he was really dizzy and really lightheaded and almost fainted at the corner store. The feeling like his eyes were swollen started on day 3 after the vaccine. The crease of his eye below the eyebrow and on top of the socket got red and puffy and looked like sunburnt skin does. It was at the point that now it feels swollen all the time almost like he had pink eye and his vision has been diminished about 30%. He had a test done yesterday and his vision was 20/25. Some-times he could not even read a text and had to stare at his phone for 10 minutes to make out words. He did not have these issues before. The feeling of his eyes being swollen was a little better in the mornings and about 1300 it gets worse when he gets lightheaded to where was when it started. His vision became diminished about day 3 after the vaccine. It was a little better in the morning, but in the afternoon, it goes to exactly the same as when it started. He noticed the golf ball sized welt on his arm about 3 days ago. The doctor seemed to think a drop of the injection might had travelled from the injection site and his body was creating a defense to it. It was scary to take a shower and then see that. It didn't hurt. It was not painful, but it was a weird foreign entity. The cramping in his toes started probably day 3 and was consistent. The numbness started on day 2 after the vaccine, and up until 3 days ago it was just his ankles and feet. 3 days ago, it got to the point where it was from his knees to his feet. It has gotten worse since it was now travelling up his legs. On his injection arm- 2 inches away from the injection site appeared a size of a gigantic golf ball - when asked with his doctor he said that he thinks that a drop of the vaccine travelled and his body building a reaction to it and it was very abnormal. The patient also had numbness from his ankle to his feet worsened and from his knees to his feet- almost feels like it was cold and

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

tingly. The patient also had dizziness and lightheaded about day 2 after the vaccine and it was the same. It came in waves but was consistent throughout the day. He would be fine then had a wave of dizziness. He has been laying down so much because he was so tired, ringing ears, felt like his glands were swollen, pressure in his neck to his injection site, and back pains. The patient stated that his doctor was only form urgent care. The patient Felt like whole throat was swollen, toes locking up, really lightheaded, mind has been foggy, and arm soreness. The patient had bizarre side effects from the Covid Vaccine for 11 days now. He thought it was the smart thing to report them to Pfizer. He didn't like to give personal information. He declined to give his mailing address or his email address. He hated when asked for race, but he guessed it might be important. He did not have a mailing address, phone number, or email address handy for his physician. He went to Urgent Care yesterday to have it checked and they did an EKG and said he had to be sent by ambulance to the ER. The doctor did bloodwork, and she said everything looked alright and to rest a few more days and keep hydrated. The patient underwent the lab work and procedures which included chest X-ray with unspecified result. He thinks it was on 18May2021. His mind has been foggy with all of that. It was yesterday or the day before. He could not be sure. He has been sleeping so much and was in a complete daze. The fogginess he had the whole time as his other symptoms, and it was the same. He has been eating well and hydrating and taking a multivitamin and Gatorade, all the things' people say to do. He asked if Pfizer has heard of this before. He was panicked it might be chronic, and he worries about the safety of the second shot for him. He was sure many people haven't reacted, but these are freaky side effects. He asked for advice and if Pfizer had heard of this before or if he was some weird anomaly. On his way to get the vaccine he asked 2 people at the city health line if they had taken it and they both said no. He asked 3 other patients and they said they took the Pfizer. One woman said she will take it when they make her. The guy who gave him the shot lied and said he wasn't eligible. It might have been his way of not having to discuss it. The events resulted in doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. The patient

| 1368062 | 6/2/2021 | OH | 16 | M | 5/28/2021 | 5/30/2021 | Patient received second dose of Pfizer COVID-19 vaccine on 5/28/21. Within 12 hours patient experienced chills and subjective fever. The follow day patient reported developing fever. The day prior to admission (admitted 5/31/21) patient developed chest pain but worsened to 8-9 out of 10. Pain described at pressure in the center/sternal area of chest or like bricks on his chest. No pleurisy or radiation of pain, pain worsened when supine. Negative for shortness of breath, syncope, palpations. Did no improve with acetaminophen or ibuprofen at home. Patient presented to outside hospital where troponin was 0.37 and EKG showed ST abnormalities. Patient received 30 mg of ketorolac and 4 mg of ondansetron and was transferred to this facility. In our ED, pain improved to 4-5 out of 10. Diffuse ST elevations on EKG, troponin elevated to 7.38. Chest X-ray and rapid covid test were negative. Patient was started on naproxen sodium 500 mg enteral BID 5/31/21 through discharge on 6/2/21. |

| 1368103 | 6/2/2021 | MN | 27 | M | 6/1/2021 | 6/1/2021 | Patient received a vaccine and was told that he needed to stay in the store for 15 minutes. He went to purchase a water about 5 minutes after vaccine in a different register and was feeling lightheaded. After the transaction he fainted with the back of his head fell on the hard floor. He was being assisted by the store staff as well as a pedestrian who claimed to be a health care professional. He was given an orange juice, one water and a battery powered fan to provide cool air. He also requested to lay down on the floor, and he ended up laying on the floor for about 30 minutes. After that he stood up and regained color on his face. He then walked out of the store. Staff asked him if he wanted the ambulance to be called and he declined. Pharmacist called patient the next day to check on patient, and was unable to reach the patient. |
| 1368126 | 6/2/2021 | NC | 24 | F | 6/2/2021 | 6/2/2021 | Pt had received her first vaccine and was in the observation area. She was seen to have slumped in her chair, preceding a syncopal episode. The patient remained in her chair during the episode. Pt informed us after the syncopal episode that she had felt as if she fell asleep. She has no medical history of seizures or syncope in the past. She did have limb movement during the period of syncope. The episode seemed to last no more than 15 seconds. The patient quickly woke and began speaking to us. She was clammy and sweaty, vitals were completely normal as taken by the RNs. She was observed in the private area for > 15 minutes, given drink and crackers, tolerated well. She ambulated well and had her fiancé pick her up. She will follow up with her PCP this week. vitals: BP: 120/80, P 72, O2 98% |

| 1363718 | 6/1/2021 | ID | 43 | M | 3/17/2021 | 3/17/2021 | <p>Syncope; Fall; Head injury; Hyperhidrosis; This regulatory authority case was reported by an other health care professional and describes the occurrence of SYNCOPE (Syncope) in a 43-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 031A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 17-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 17-Mar-2021, the patient experienced SYNCOPE (Syncope) (seriousness criterion medically significant), FALL (Fall), HEAD INJURY (Head injury) and HYPERHIDROSIS (Hyperhidrosis). At the time of the report, SYNCOPE (Syncope), FALL (Fall), HEAD INJURY (Head injury) and HYPERHIDROSIS (Hyperhidrosis) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 17-Mar-2021, Vital signs measurement: consistent with fainting episode (abnormal) Vital signs consistent with fainting episode and stabilized within fifteen minutes.. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. No concomitant medication use was reported. Treatment information was not reported. On 17Mar02021, it was noted by the reporter that the patient was observed kneeling by a chair as diaphoretic immediately post vaccine. The reporter asked the patient if he would lie down to be assessed. The patient then fainted and fell to the floor, hitting the back of his head on the floor. The code team was called for immediate assistance. The patient's head and neck were supported. The patient's vital signs were consistent with fainting episode and stabilized within fifteen minutes. The patient was transferred by EMS to the hospital for evaluation of head injury. It was noted by the reporter that the initial assessment showed no immediate neurological deficits and no superficial bleeding at head impact location on the patient. Further clinical course is unknown/not reported at this time.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of these events, a causal relationship cannot be</p> |

G17-C21A and G26-B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Smoker (30+ years of smoking.) and Vapor cigarette smoker (vaping the past two years.). Concomitant products included BENZTROPINE [BENZATROPINE], FLUOXETINE, TAMSULOSIN, CLONAZEPAM, AMLODIPINE and LURASIDONE HYDROCHLORIDE (LATUDA) for an unknown indication. On 05-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 03-May-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 12-Apr-2021, the patient experienced LOSS OF CONSCIOUSNESS (Passing out, dry cough so bad that he would faint) (seriousness criterion medically significant), FALL (Stood up to cough, passed out, and fell and his head hit the concrete), HEAD INJURY (Head hit the concrete floor, hitting head on floor) and COUGH (Bad, dry cough). On 12-May-2021, LOSS OF CONSCIOUSNESS (Passing out, dry cough so bad that he would faint) and COUGH (Bad, dry cough) had resolved. At the time of the report, FALL (Stood up to cough, passed out, and fell and his head hit the concrete) and HEAD INJURY (Head hit the concrete floor, hitting head on floor) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In April 2021, SARS-CoV-2 test: negative (Negative) Went to get tested for COVID-19 due to dry, bad cough and came back negative. The patient stated that approximately one week after the first dose, he was having a bad dry cough. The dry cough was so bad that when he was sitting on recliner he would cough so bad, he would faint and pass out. One time the patient stood up to cough, passed out, and fell and his head hit the concrete floor. He went to emergency department</p> |

VAERS_ID RECVDDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

three times because of this cough. On 12 MAY 2021, the patient stopped experiencing coughing and passing out. The patient also stated that he has no other side effects and that his healthcare provider thinks this experience was attributed to the first vaccine. Patient was prescribed an "inhaler" from his healthcare provider to help with "lungs and stuff." The patient also has an appointment with a pulmonologist in June. Action taken with mRNA-1273 in response to the events was not applicable. Head injury was due to fall and thus cannot be directly associated with mRNA-1273 use. The other events are temporarily associated with the product use and a causal relationship cannot be excluded. This case was linked to MOD-2021-138832 (Patient Link).; Sender's Comments: Head injury was due to fall and thus cannot be directly associated with mRNA-1273 use. The other events are temporarily associated with the product use and a causal relationship cannot be excluded

| 1363779 | 6/1/2021 | MA | 60 | M | 4/1/2021 | | <p>FAINTING SPELL; PASSED OUT; This spontaneous report received from a consumer (wife) concerned a 60 year old male of unspecified race and ethnicity. The patient's height, and weight were not reported. The patient's concurrent conditions included Crohn's disease (diagnosed years ago), bee stings allergy, non smoker, non alcohol user, and marijuana abuse. The patient did not have primary care provider (PCP) and had not been to the doctor for 35 years. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 042A21A, and expiry: unknown) dose was not reported, 1 total administered on 01-APR-2021 to right arm for prophylactic vaccination. No concomitant medications were reported. Five or ten minute after vaccination patient's eyes rolled back and he passed out at the vaccine centre. Reporter was not sure if he fainted or had a seizure. He came back for a bit but then started having the fainting spell again. The patient taken by the ambulance to the hospital. In hospital, did a few tests which included blood pressure, blood sugar, electrocardiogram (EKG) but everything came back fine. He had not eaten before getting the vaccine. Healthcare professional (HCP) could not find any reason for his symptom. He had not eaten before getting the vaccine but it was nothing unusual. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from fainting spell, and passed out on 01-APR-2021. This report was serious (Other Medically Important Condition).; Sender's Comments: V0:20210546973-covid-19 vaccine ad26.cov2.s-Fainting spell, passed out. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s).</p> |

| 1364315 | 6/1/2021 | | | F | 4/1/2021 | 4/1/2021 | Syncopal Episode; hit her head; Malaise; Felt weird; Feeling a little flat; She "passed out"; Syncope; This is a spontaneous report from a contactable consumer (patient). An unspecified year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: not reported, Expiration date: Unknown), via an unspecified route of administration in the left arm on 01Apr2021, as a 1ST DOSE, SINGLE for COVID-19 immunization. The patients medical history and concomitant medications were not reported. The patent stated that on an unspecified date (9 days later) in Apr2021, she had a syncopal episode while she got up to go to the bathroom and passed out in the morning after waking. She hit her head and ended up in the hospital. She had undergone blood work and said because this event was 9 days after the vaccine, it was probably not related to the vaccine. The patient has been feeling a little flat since the first shot. She experienced syncope, malaise, felt weird, Syncopal Episode, Feeling a little flat. Patient was just feeling the general malaise since the first shot. Patient had a syncope, day nine after the first shot. The outcome of all the events were Unknown. No follow up attempts are needed. Information about lot/batch number cannot be obtained. |
| 1364713 | 6/1/2021 | CA | 19 | F | 5/30/2021 | 5/30/2021 | PATIENT PASSED OUT. SHE LOST CONSCIOUSNESS. THOUGH HAD NORMAL PULSE AND BREATHING. BUT WE GAVE SOME COLD WATER AND JUICE FROM THE MOM, USED COLD ICE PACK ON THE FACE AND NECK AND WE LAY THE PATIENT DOWN IN A SUPINE POSITION, MAINTAINED AIRWAYS AND RAISED HER LEGS. WE CONTINUED TO CHECK PULSE AND BREATHING WHICH WAS NORMAL AND WE FANNED THE PATIENT SO SHE CAN GET SOME VENTILATION. SHE GOT REVIVED IN ABOUT 20-25MINUTES |

I went over after was alerted and flipped patient from her face. She was awake but confused at what happened. I sat with her while she came to and our front store manager got her water. She was breathing well and was starting to become aware, and she refused an offer to call an ambulance. We sat until she felt comfortable to get up and the store manager walked with her. She reported to him that was not the first time she had passed out that day |
| 1364494 | 6/1/2021 | NC | 54 | F | 4/13/2021 | 4/14/2021 | I had, chills, fainting, left eye dropping, headache and body ached. |
| 1364595 | 6/1/2021 | WI | 17 | F | 5/27/2021 | 5/27/2021 | received the Covid 19 Pfizer vaccine and passed out approximately 2 minutes after the vaccine. Was seated at the time. Physical support until patient regained consciousness approximately 30 seconds after. Assisted via wheelchair to cot to lay down and water provided. Mother with. Instructed to lay down for second dose of vaccine when receiving it. Left with mother ambulatory in stable condition approximately 30 minutes after dose administered. |
| 1364654 | 6/1/2021 | CT | 61 | F | 6/1/2021 | 6/1/2021 | Syncope. Her face was pale. Within 10 mins she was normal after we apply cold compress. |
| 1364694 | 6/1/2021 | PA | 81 | F | 2/1/2021 | 3/1/2021 | A whole-body rash was evident 2-3 weeks after the first vaccine dose. Subject was unsure at the time if it was vaccine related. Severe swelling of hands and legs began the same day after the second vaccine dose with general malaise and concerns about fainting. Oral steroids were prescribed for 2 weeks, and progression of the symptoms seem to stabilize during steroid treatment. After steroid treatment, the symptoms resumed at full strength with swelling in the hands and legs causing the superficial skin to peel off and split down into the dermis with bleeding and pain. Joints in the hands and legs were painful. Severe swelling and pain in the hands and legs persisted for at least 6 weeks after the second vaccine dose. A diuretic was prescribed at about 4-5 weeks after the second vaccine dose. The subject is currently reporting improved symptoms. |

The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 21-Apr-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 21-Apr-2021, the patient experienced INSOMNIA (had a hard time sleeping at night because her entire body ached) and MYALGIA (entire body ached). On 22-Apr-2021, the patient experienced BURNS THIRD DEGREE (third degree or full thickness burn on her right upper thigh) (seriousness criteria hospitalization and medically significant), BURNS SECOND DEGREE (second degree burns on her left breast and underneath her right breast) (seriousness criterion hospitalization), CELLULITIS (Subsequent cellulitis in right thigh and left breast) (seriousness criteria hospitalization and medically significant), LOSS OF CONSCIOUSNESS (Passed out) (seriousness criterion medically significant) and NAUSEA (nauseous). The patient was hospitalized from 22-Apr-2021 to 25-Apr-2021 due to BURNS SECOND DEGREE, BURNS THIRD DEGREE and CELLULITIS. At the time of the report, BURNS THIRD DEGREE (third degree or full thickness burn on her right upper thigh), BURNS SECOND DEGREE (second degree burns on her left breast and underneath her right breast) and CELLULITIS (Subsequent cellulitis in right thigh and left breast) had not resolved and LOSS OF CONSCIOUSNESS (Passed |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

out), INSOMNIA (had a hard time sleeping at night because her entire body ached), MYALGIA (entire body ached) and NAUSEA (nauseous) outcome was unknown. No concomitant medications were reported. The patient had a hard time sleeping during the night she received her second vaccine because her entire body ached. On the next morning, she was nauseous so she got out to make herself some tea. While standing at the stove waiting for the water to boil, her nausea got worse. As she was pouring hot water from the kettle into her cup, she passed out, spilling the boiling hot water on herself and woke up as her father was picking her up from the floor. She sustained third degree or full thickness burn on her right upper thigh and second degree burns on her left breast and underneath her right breast. Subsequently, she had cellulitis in her right thigh and left breast. As a result, she was admitted to hospital with unspecified intravenous antibiotics and was hospitalized for three and half days. At the time of this report, she was at home and had a follow up appointment with plastic surgeon for debridement of her wounds. She did not have daily medications, but had continued pain in her right thigh and under right breast that is tolerable. | 1366332 | 6/1/2021 | NJ | 44 | M | 4/13/2021 | 4/20/2021 | 1st shot 4/13, no issue with injection site. About a week later had trouble breathing, chest pain, felt like lungs were hurting in my back, weak, tired, couldn't catch my breath when i went upstairs and almost passed out. 2nd shot 5/04, felt pain at injection site (that was expected), that night started to get a bad headache and got worse and worse. Next morning, whole body aching, upper body, lower back, bad headache, Left underarm (lymph) swollen. 2nd day slight headache, neck ache, left underarm swollen. That night had rash on arms, chest, and stomach. 3rd day, nighttime rash arms, chest, stomach. Still red where band aid was over injection site. Over a week later still have redness shape of band aid, Seems I have sensitive skin since the 2nd covid shot. 10 days after 2nd shot I still have redness the shape of the Band Aid on my left arm. Got a red spot on my nose (looks like Rosacea). 4 weeks later, still have a red spot on my nose. I have itchiness between fingers left hand, on my face left side, neck, arms (left wrist, right arm in places) redness on chest, and rashes on back, left buttocks, and itchiness on legs. i noticed that it gets worse at night. As far as i know i did not get the Covid Virus, i did the rapid test and regular test and both were negative. But i was very sick with my stomach and had issues breathing in late 2019 and again early 2020, took medication (antibiotics) both times. I had to write on this form over and over again kept getting frozen with error from the PDF. Even if I hit OK, it keeps popping up and does not let me finish, so I can imagine that lots of people gave up, like I may. Pfizer 4/13/2021 EW0162. After 5pm Pfizer 5/04/2021 EW0170. After 2pm |

| 1365519 | 6/1/2021 | | 38 | M | 5/1/2021 | 5/26/2021 | 5 minutes after receiving the J&J vaccine, I went lights out. As I was sitting in the monitoring area, I was completely fine and then a wave came crushing down on me and I was out for about 5 minutes. The nurses said it looked like I was having a seizure. The EMTs called it a syncope event. I am a member of the military and have been pumped full of vaccines. I get my annual flu shot every year. I have survived 6 rounds of Anthrax vaccines and every other vaccine the military has pumped into me. This is the First Time I have ever REACTED this way. It was CRAZY! |
| 1365749 | 6/1/2021 | AZ | 16 | F | 5/31/2021 | 5/31/2021 | Pt passed out. Experienced extremely low blood pressure. Pulse couldn't be detected for a couple of seconds. Pt woke and was clear and coherence. Paramedics saw pt and provided IV fluids. Pt left under own power. |
| 1365509 | 6/1/2021 | CA | 63 | F | 5/26/2021 | 5/27/2021 | I wasn't feeling too ill the day of the vaccination and only had a sore arm when going to bed that first night. However, when I woke up the next day, I was quite ill. I never ran a temperature but I had diarrhea and vomiting and could not keep any liquid down. As I was kneeling beside the toilet to vomit, I completely lost consciousness, fainted, and bruised a rib on the fall. I finally was able to get Gatorade to stay down. The arm of the vaccination site doubled in size due to edema and my arm was red from the top of my shoulder to the bottom half of my arm. It was also very itchy. Completely out that first day, just sleeping and laying on the couch downstairs. Four days out, the arm was still ballooned up and red. Five days out, the redness started to disappear. Still some edema and redness on the sixth day out, still fatigued, but gaining a little more normalcy. Huge bruise from faint on my left rib cage. Appetite now back to normal. |

| 1365908 | 6/1/2021 | CA | 18 | F | 6/1/2021 | 6/1/2021 | While we were observing patient for 15 minutes after the vaccination, patient fainted and hit her head on the floor on 6/1/21. |
| 1365910 | 6/1/2021 | | 16 | M | 5/31/2021 | 5/31/2021 | Patient fainted and had convulsions for 5-10 seconds. He came to and was just fine. |
| 1366129 | 6/1/2021 | AL | 69 | F | 2/1/2021 | 5/14/2021 | Abrupt syncope with cessation of pulse and respirations at 11:15AM at main office. CPR was started by the workers present. 911 activated and code was activated by EMS and continued during transport and arrival at ER. All resuscitation efforts failed to restore breathing and cardiac activity. A large amount of blood was encountered upon intubation, so Dr. informed next of kin that cause of death was likely a large pulmonary embolus. |
| 1366158 | 6/1/2021 | FL | 30 | F | 6/1/2021 | 6/1/2021 | Patient received the covid19 vaccine at about 940am on 06/01/21 - dose 1 by Pfizer. Less than 5 minutes later, patient came to me saying she wasn't feeling good. I was still sitting at the immunization table. She sat down and said she was feeling very tired. I asked if she wanted me to call 911 and she said no. She just wanted to rest. She then slumped over and fainted. I was able to hold her in the seat while carefully supporting her head. I loosened her mask and she was breathing normally, but just fainted. About 2 minutes she woke up and then proceeded to vomit. I sat with the patient about 15 minutes or so. The color returned back to her lips and we called her roommate. When he arrived, the patient got up and started walking and began to feel better. Patient went home. |
| 1366338 | 6/1/2021 | CA | 26 | M | 6/1/2021 | 6/1/2021 | Patient just got the shot and immediately feel a weird sensation. He sat on the chair to be observed and passed out almost immediately. We rushed to him and called out for him. He opened his eyes and slowly told us that he thinks he fainted. I helped him elevated both legs on the chair and talked to him if he's hurt or any other weird feeling. He told me he's feeling fine again. I have him lay down with his legs elevated for another 5 minutes and helped him sit up. He was able to get up by himself and sat back on the chair. A couple minutes later, I took his blood pressure and it was 129/85 and pulse was 61. |

| 1365701 | 6/1/2021 | NY | 29 | M | 6/1/2021 | 6/1/2021 | 5 minutes after receiving vaccine patient "zoned out" and felt like he could not move. Looked like he was on the verge of fainting or blacking out but never lost consciousness. Patient was sweating after as if he fainted or had a panic attack. This event only lasted 1 minute and patient denied an ambulance. |
| 1365707 | 6/1/2021 | CO | 17 | F | 6/1/2021 | 6/1/2021 | Patient was very anxious and breathing heavy. About 5 minutes after the vaccination they started to hyperventilate and ended up throwing up. After letting them sit and relax for 5 minutes, the patient then had to throw up again and told their mother they felt like they were going to faint. Mother and myself stood by, while patient did end up fainting. We slowly lowered them to the ground, and on the way down their body got stiff and patient had uncontrollable movements and was hardly responsive. Mother and myself finally got her safely to the floor as they came to and was responding to verbal ques and stimulation from mother. Mother went to get water and i stayed with the patient to ensure no other things happen. Patient ended up doing alright after relaxing for a few and then i walked them and mother to their car and ensured they were feeling good enough to go home. I then advised the mother to seek medical attention. |
| 1365431 | 6/1/2021 | CA | 16 | F | 5/13/2021 | 5/14/2021 | Syncope x 3 in the early morning hours (around 3am) about 14-15 hours after vaccine. She had had headaches that is intermittent, throbbing, phonophobia but no photophobia, from back of head to top of head and behind eyes, taking Advil or Excedrin intermittently with relief for a week prior to covid19 vaccine. Syncope, longest lapse was two minutes, her sister found her. She went to Medical Center ER at 0400, was assessed and scanned, neg CT scan of head, and was discharged home. Has felt some fatigue today due to not sleeping early the night before, has returned to school since concussion, with normal learning, and denies any exertional physical activity due to pre-existing torn ACL, torn medial meniscus L knee. After evaluation by ER, was given IV fluids, determined cause to be dehydration. |

| 1365334 | 6/1/2021 | CA | 44 | M | 4/27/2021 | 5/19/2021 | Would occasionally have difficulty catching my breath while not doing anything. I occasionally felt my heart flutter or it would possibly skip a beat. Mild chest pain below above the sternum but I get that feeling from my Eosinophilic Esophagitis. I've become more concerned recently as I almost fainted once on 5/19 while working at my computer. I've had two other instances of feeling faint, most recently occurring on 5/27. I historically have had no heart issues and can ski and hike all day and feel great so this recent change has been concerning. After reading articles on the covid vaccines I realized that my symptoms are similar to the heart related issues and took ibuprofen when I felt additional chest pressure. That has helped to alleviate the pressure at least. |
| 1365336 | 6/1/2021 | | 28 | F | 5/4/2021 | 5/4/2021 | Pain in the arm where I got the shot about 2 hours after receiving the vaccine, Chills after 10 hours, Fever and Headache after 12 hours, Tiredness and Fainted on the 2nd day |
| 1365380 | 6/1/2021 | NY | 38 | M | 5/25/2021 | 5/26/2021 | The morning after receiving the shot, I woke up at roughly 9am with a High fever (100+), headache, and general felt very sick. Upon getting up and going to the bathroom, I fainted while peeing (standing up). Upon waking up on the floor of the bathroom, I got up, was light headed, took 4 steps to the bathroom door, and fainted a second time. Upon waking up the second time, I made it to bed and fell back asleep until 11:30. I took my temperature at 11:30 and found it was 99.9 degrees. I was feeling cooler (less fevered) than I had been at the time of the fainting incident. I called a nurse through my insurance company, who instructed me to go to the ER. I waited 3 hours in the ER waiting room, and then received Fluids, A CT head scan, an ECG 12 lead, and blood work. All normal. I felt better, if banged up, by the time I left the ER. I hit my head and Left shoulder in the fall. |

| 1365524 | 6/1/2021 | MN | 13 | F | 6/1/2021 | 6/1/2021 | Prior to the vaccine patient and parent were given teaching about concerns for fainting. She was questioned if she had something to eat and drink prior to coming to the clinic and both indicated that she had. It was volunteered that patient has never had a fainting spell from receiving injections/vaccines. She was administered 0.3 ml of the Pfizer vaccine at 4:47 p.m. while seated securely in a chair. At about 4:50 p.m. she lost consciousness and assumed a prone position. She was held by both the R.N. and her mother and never fell or injured herself. She was unconscious for approximately 8-10 seconds and regained consciousness. She was alert and oriented. She was reassured and given some apple juice and a graham cracker which she consumed. Charge nurse and nurse manager appeared on the scene. EMT was summoned who brought a wheel chair and patient was transported to the observation area in the wheel chair. She was conversing and appeared oriented prior to going to the observation area. |
| 1365409 | 6/1/2021 | MA | 64 | M | 3/6/2021 | 3/7/2021 | I started feeling bad the first night. I woke up with energy @ 1am and then later that day I started feeling extremely drain and exhausted and very tired and weak. I woke up @ 11:30pm and I passed out and hit hit the floor, face first and my wife don't know how long I was passed out up to 30- to 60 mins. I had to put frozen meat on my face. I felt like I was about to pass out again. Felt like my legs was giving out. I do have a spinal disease and it felt worse then that. Then it took my headache away. I felt like a different person. |
| 1365215 | 6/1/2021 | VA | 18 | M | 6/1/2021 | 6/1/2021 | about 5 minutes after patient received shot , he came to pharmacy counter to say he felt light headed, as I (the pharmacist) headed out to have him sit down, dropped to a sitting position on the floor, I was able to get him up to a chair and was fanning him and we got him some water. he the passed out and his head lobbed backwards, I got behind him so he did not hit his head and he went into a mini seizure which only lasted about 5 seconds and then he came out of, he was in sweats and we called 911. He declined to go to hospital and his mom came and picked him up |

| 1365477 | 6/1/2021 | TX | 29 | F | 6/1/2021 | 6/1/2021 | Patient was getting their 2nd covid immunization. They marked that they once had fainted from a previous immunization and had needle anxiety. I asked her if she had fainted anytime recently or during the first covid vaccine and she said no. Gave her the vaccine and let her remain in the chair. She then had gotten a little dizzie for a moment, and then told us she had just fainted. We called store management code white. We got her history, some soda, and ice pack. She didn't fall out of the chair but thought it would help her feel better. She stated she hadn't eaten much today and just got done working out at the gym and had low blood sugar. We checked her pulse O ₂ and heart rate and everything was within normal limits. We had her remain to she felt comfortable to leave. She didn't have any HX of seizures and no signs of allergic reaction. Staff Said when she was here first time she had immunization anxiety and hung out for 40ish minutes but didn't faint first time. |
| 1365398 | 6/1/2021 | KY | 18 | M | 6/1/2021 | 6/1/2021 | Pt received 1st Moderna covid vaccine at approx 10:25am with no apparent issue. He was sitting outside pharmacy in observation area playing on cell phone and approximately 10 minutes after receiving vaccine fell in the floor, hitting his head. EMTs were called immediately as a precaution. He was conscious when pharmacist reached his side. He reported remembering a buzzing in his ears and then woke up in floor. Pt reported no hx of seizures or fainting. He remained in floor for several minutes, reporting his head hurt, but was able to tell his name, location, and date with no issue. |
| 1365565 | 6/1/2021 | MN | 16 | F | 6/1/2021 | 6/1/2021 | After receiving the injection the patient fainted. Patient was offered juice and after taking a sip she had a small amount of emesis. A cold towel was placed on patient's forehead and then observed by EMS. |

| 1362488 | 5/31/2021 | NV | 36 | F | 5/28/2021 | 5/28/2021 | patient felt light headed and a person standing by notified pharmacy. I, staff RPh, assessed patient quickly and helped her to a supine position on the floor with legs elevated. Patient fainted as she was being helped to the floor. Patient's eyes was dilated, we called 911 and I grabbed the BP unit and checked pulse. Pt regained consciousness after about 7 to 8 seconds. Pt was able to identify herself and answer all questions. We grabbed an orange juice for the patient as she had not had anything to eat and had just worked out. Pt's BP was 108/90 and remained around that range for about 5 or so readings. PT drank and was encouraged to lie in supine position with legs elevated for 15 more minutes even though she stated she thought she was fine. Pt waited until 12:55pm and also stated she had fainted with a past blood draw. Pt appeared fine by 12:55pm, bp still around 100/80, pupils is back to normal. 911 was cancelled per patients request shortly after regaining consciousness. |
| 1362471 | 5/31/2021 | CA | 32 | F | 5/19/2021 | 5/23/2021 | Moderna COVID-19 Vaccine EUA. About 3-4 days after the second dose, I experienced off and on moderate chest pain for about 1.5 weeks, so far. Symptoms seem to be declining now. It was a moderate aching in the center of my chest up to my left pec and shoulder. I also experienced off and on heart pounding (not necessarily elevated heart rate, and not necessarily concurrent with the chest pain). No fainting, mild headaches. *I also experienced off and on heart pounding 12-72 hours after the first dose, but no chest pain. |
| 1362408 | 5/31/2021 | NY | 24 | F | 5/31/2021 | 5/31/2021 | patient fainted within minutes of vaccine; recovered after being laid on floor and legs elevated |

| 1362310 | 5/31/2021 | NJ | 45 | F | 4/9/2021 | 4/10/2021 | I had a completely normal evening after receiving the vaccine. I woke up the next morning and didn't feel quite well. I started washing my hands and I woke to my husband calling an ambulance. I had passed out. I refused to go to the hospital per their request because of worries about COVID. I called my PCP and I discussed the situation with him and he told me to get rest and stay hydrated. I met him a couple days later for a virtual appointment. At this point the vaccine had been paused and I was very concerned about the potential of blood clots. I was still feeling fatigue after my episode, but I was feeling better. He told me to take a baby aspirin, once daily for a month, to help prevent any blood clots. After 5-6 weeks of receiving the vaccine, I started coughing, gagging and choking and had to get my daughter to get my husband. My husband gave me an alavert and I was able to breathe better around 10 minutes later. We think it was a severe reaction to possible pollen, or something in the air, but that has never happened before. |
| 1362392 | 5/31/2021 | WA | 45 | F | 4/10/2021 | 4/17/2021 | I suddenly felt very lightheaded and weak. I thru up and passed out. Then I went to sleep. It happened again a couple of weeks later, and I went to the ER room. The doctors have not found out any correlating event that would make sense yet. I was told to follow up with a cardiologist, I haven't done this yet. I am not sure if this is from the shot or not. |

| 1361880 | 5/30/2021 | KY | 14 | F | 5/30/2021 | 5/30/2021 | Patient fainted after vaccine given and fell from the exam table onto the floor landing on her left side bumping the left side of her head and left shoulder. An ambulance was called. She quickly regained consciousness after approximately 10 seconds. She was alert and oriented to place, date and her birthday. She was able to move all extremities with 5/5 strength; no misalignment, asymmetry, or defects noted in head, neck, spine and major joints. She had full range of motion in all extremities and neck . Pupils equal and react to light. Left side of head above ear was slightly tender without any defects. Left shoulder was slightly tender to palpation anteriorly without difficulty with full range of motion. There were no bruises noted. She denied any difficulty breathing. BP was 88/60 and HR 125. After evaluation and assessment, patient was stable and the ambulance was cancelled per father's request. Patient remained in clinic and drank approximately 8 oz of water without difficulty. Patient's blood pressure was checked standing after 45 minutes and patient became slightly light headed again. Patient was instructed to remain in the clinic for 15 more minutes. Patient's blood pressure was re-evaluated and was 84/60 after standing for 2 minutes; she was asymptomatic and denies feeling like she would faint. HR 100. Discussed signs and symptoms of a concussion, warning signs to monitor (sleepiness, difficulty moving, headache, or vomiting), and when to go to ER. Father verbalizes understanding. Patient was able to walk out of the clinic with father and brother in a stable condition. Patient instructed to f/u with doctor in two days or ER sooner if worsening |

| 1360592 | 5/29/2021 | CA | | F | 5/4/2021 | 5/5/2021 | cold and clammy; is not energetic like normal; she is feeling a little bit anxious and she feels like her strength is not yet fully recovered.; she is feeling a little bit anxious and she feels like her strength is not yet fully recovered.; passed out; Vomiting; tired; This is a spontaneous report from a contactable consumer (Patient). A 63-years-old female patient received second dose of bnt162b2 (BNT162B2, Solution for injection, Batch/Lot Number: ER8733), via an unspecified route of administration, administered in Arm Left on 04May2021 as 2nd dose, single for COVID-19 immunization. Historical vaccine of BNT162B2 was administered as first dose on 12Apr2021. Patient was not ill at the time of vaccination. The patient medical history and concomitant medications were not reported. She says well the first one is just the start, where it has the first dose. She clarifies she received the product so that her husband would be safe since he had his vaccine she figured she would get it too. He has a lot of health issues so she figured she should get it, now she wishes she had not but it is okay. She confirms for COVID 19 prevention. She says she takes no medications other than just Tylenol if she has a headache. On 05May2021 patient experienced passed out at 08:30AM, vomiting at 01:00 and tired. She would say the vomiting stopped at 5 am on 05May2021. This started 05May2021 for sure. The tiredness is ongoing, because last night she went to bed at 7, she is not doing half of what she used to do. It is awkward she does not know what else to blame but the vaccine. She is not energetic like normal, she is a healthy person. The tiredness has improved but she still has it. Also experienced cold and clammy, is not energetic like normal, she is feeling a little bit anxious and she feels like her strength is not yet fully recovered (anxiety and asthenia) on an unspecified date. Time the Vaccination Was Given as her appointment was at 10 so it was within 20 minutes. She would say it was 10:20 AM or so and then she had to wait 15 minutes. Her husband, when she came to, he wanted to call the paramedics she said no, she was fine. He called the Paramedics and they took vitals, they checked blood sugar, checked oxygen, EKG, blood pressure, O2 and everything was okay, all her vital signs were okay. They wanted to take her to the ER but since her vitals were okay she did not want to go into the ER with all the sick people so she had to sign a waver |

| 1360496 | 5/29/2021 | OH | 16 | F | 5/5/2021 | 5/6/2021 | <p>passed out; BP was 70/44; could not sit or stand; EKG-Potential abnormal Twave; Calcium was low; This is a spontaneous report received from two contactable consumers reporting for her daughter. A 16-years-old female patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), vaccinated at the age of 16 years old, via an unspecified route of administration, administered in Deltoid Left on 05May2021 15:00 (Batch/Lot Number: ER8735; Expiration Date: 31Jul2021) as single dose for covid-19 immunisation. Patient received the first dose on unknown date. Her daughter had no reaction from the first one that was three weeks prior. The patient medical history included Attention deficit hyperactivity disorder. Concomitant medications included lisdexamfetamine mesilate (VYVANSE) taken for attention deficit hyperactivity disorder, start and stop date were not reported. Last Wednesday, at 3 pm, caller's daughter received the second vaccine. Her daughter had no ill effects. Her daughter got up the next morning, 18 hours after administration, and passed out. Caller states that they called the squad and her daughter's BP was 70/44. They pushed an IV, transported her daughter, and they were in the ER for 10 hours. The local hospital gave her daughter 2 1/2 bags of fluid and transported her daughter to Hospital. Caller adds that there were 4 liters of fluid given, and her daughter could not sit or stand without her blood pressure dropping for about 8 hours after the incident. There were 2 transports and 2 ER's. Caller asks why were they not told that this is a symptom. She was grateful that she could catch her daughter before she hit her head, but what about parents who leave their kids alone. Last Wednesday, caller's daughter received the vaccine 05May2021 at 3 pm and passed out 06May2021 in the morning. It was the only time she passed out and caller states she saw her daughter's head drop and then was trying and caught her. She was trying to talk to her and her eyes were in the back of her head, and was trying to arouse her. She was out for over a minute. She went to Emergency Room in. They were there for 6 hours. Then, when she could not sit up and her blood pressure was dropping, they recommended Hospital. She was there, this all took place, on Thursday from 9 am or around 8:50 am when she passed out and then they were discharged after 9 pm. It was a 12 hour</p> |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

situation where they were transported and she spent 12 hours in 2 emergency rooms. The only one she had at time was vyvance but she did not take this before passing out. The last time that she took this would have been nine hours before administration of the vaccine on 05May2021. She did not take it on 06May2021 when the incident happened. She was just getting up. She had only been on this for about a week. It is a stimulant drug but it is out of the system in the evening so people can sleep. She asked each doctors if this had any role in it and they said no. They told her to take it again which they have not started back yet. She has no other medical conditions. Investigations: caller does not provide dates or specific test results. The first ER did bloodwork, urine, chest x-ray. They wanted a CAT scan of her head but caller declined because she thought it was unnecessary. They did an EKG at first in the ER. Nothing was abnormal. She did have some things out of range in bloodwork which is not surprising because she was taking in fluids. Her calcium was low. Nothing was way out of range, nothing was abnormal. The second ER did a follow up EKG but no other tests or bloodwork. According to three physicians, the EKG was fine. A cardiologist reviewed the 2nd EKG and she got a phone call that they wanted her to follow up because of potential abnormal T waves which could have been a result of that much fluid intake and electrolytes being out of sync after that much fluid. They are following up on this. Her father has as vasovagal response hat he has experienced 4-5 times in his lifetime. He has never passed out following a vaccine. Caller had no idea that was even a response to vaccine. He has passed out after giving blood, with severe pain, coming out of anesthetic, and with severe stress. He has never had an extended period of time where his blood pressure was low. She, they could not get, her blood pressure up with fluid after fluid which is why she was transported to the second ER because they thought they did not know what was going on there. Caller states does she think that there may be some relationship and her daughter has this tendency to vasovagal - yes. Was it brought on by the vaccine? Yes. She has never fainted in her life. Caller adds she can see how some many say this may not be related to the vaccine but 18 hours after administration, they can not get her blood pressure up and were in the ER for 12

| 1359871 | 5/29/2021 | MN | 15 | M | 5/21/2021 | 5/23/2021 | On 5/23 two days after vaccine he was irritable, tired, fatigued, not sleeping well. He could not complete his track meet . He had abdominal pain, felt bloated, and he felt this nausea & discomfort. He thought he might be constipated, so he took MiraLAX and then he had diarrhea all day yesterday. on 5/26 he had a temperature of 99.2, he had acute chest pain retrosternal and feeling of compression on the chest, head fullness as if he is going to explode. He had nausea, insomnia. Ibuprofen was given to him by his mother and this helped a lot But he woke up on morning of 5/27 , but the chest pain returned with increased pressure, very nauseous, agitated, unable to be comfortable. No fever., the pain was a sharp pressure. He had no syncope or chest shortness of breath He was seen at Hospital ER where a chest x-ray was normal. Echocardiogram was done, ,noted to have EKG changes. Troponin was elevated. He had a cardiac catheterization done emergently at hospital through the right radial artery and was noted to have normal coronaries. He also had a chest x-ray done which was negative for pulmonary lesions, and his abdominal pain he says was relieved after the MiraLAX and the diarrhea. His twin sister who received the vaccine 15 minutes after him is completely asymptomatic. |
| 1359891 | 5/29/2021 | CA | 40 | F | 4/17/2021 | 4/17/2021 | Within 10 minutes of injection vasovagal syncope occurred in vehicle while parked in observation area. Due to being in seat was not able to prevent syncope and nurses had to treat for 15 minutes until symptoms subsided. Blood pressure was monitored and dropped to 50/20. Finger pulse oximeter would not register. Nurses provided ice packs, alcohol wipes for smelling, and water. Unable to lay flat and extend legs so episode lasted longer than expected. |
| 1359896 | 5/29/2021 | CA | 50 | F | 5/24/2021 | 5/25/2021 | First I felt weak, difficult to breath, fast but weak heart beats, then I had sudden extensive sweating from all over my body, then I fainted for maybe half a minutes. I started to regain consciousness after that. My son helped me to lie down in the sofa, and I was able to recover slowly after that without treatment. My heart beat also gradually slowed down after that event, but it was still about 108/minute when I was in bed at around 5pm that day (about 5 hours after I fainted). |

| 1359909 | 5/29/2021 | OR | 49 | F | 1/29/2021 | 1/30/2021 | Loss of consciousness; Dizziness; Ear discomfort; Pain; Headache; Nausea; This case was received via VAERS on 18-May-2021 and was forwarded to Moderna on 18-May-2021. This regulatory authority case was reported by an other health care professional and describes the occurrence of LOSS OF CONSCIOUSNESS (Loss of consciousness) in a 49-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Traumatic brain injury and Dizziness. Concurrent medical conditions included Allergy to grains, Fistula (TBI w bilateral perilymph fistula causing gluten issue was reported.) and Gluten intolerance (TBI w bilateral perilymph fistula causing gluten issue was reported.). Concomitant products included VIT D [VITAMIN D NOS]. On 29-Jan-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 30-Jan-2021, the patient experienced LOSS OF CONSCIOUSNESS (Loss of consciousness) (seriousness criterion medically significant), DIZZINESS (Dizziness), EAR DISCOMFORT (Ear discomfort), PAIN (Pain), HEADACHE (Headache) and NAUSEA (Nausea). At the time of the report, LOSS OF CONSCIOUSNESS (Loss of consciousness), DIZZINESS (Dizziness), EAR DISCOMFORT (Ear discomfort), PAIN (Pain), HEADACHE (Headache) and NAUSEA (Nausea) had not resolved. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. Treatment information was not provided by the reported. The patient received both scheduled doses of mRNA-1273 prior to the event; therefore, action taken with the drug in response to the event is not applicable. Patient passed out 8n bathroom from lain and nausea. She could left bed till 4pm that day due to body pain, chills and headache. 72 hours later still she had left ear full, very dizzy and slight nausea.; Sender's Comments: Very limited information regarding these events has been provided at this time. The events are probably related to the patient's comorbidities, further information required. |

This regulatory authority case was reported by an other health care professional and describes the occurrence of SEIZURE LIKE PHENOMENA (Seizure like phenomena) in a 49-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 011A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Vagal reaction (patient stated he has experienced vagal responses to injections in the past). On 02-Mar-2021 at 5:46 PM, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 02-Mar-2021, the patient experienced SEIZURE LIKE PHENOMENA (Seizure like phenomena) (seriousness criterion medically significant). 02-Mar-2021, the patient experienced BREATH SOUNDS ABNORMAL (Breath sounds abnormal), DIZZINESS (Dizziness), DYSKINESIA (Dyskinesia), EYELID FUNCTION DISORDER (Eyelid function disorder), FALL (Fall), HYPERHIDROSIS (Hyperhidrosis), HYPOPNOEA (Hypopnoea), HYPOTONIA (Hypotonia), MUSCLE TWITCHING (Muscle twitching), PALLOR (Pallor), PRESYNCOPE (Presyncope), RESTLESS LEGS SYNDROME (Restless legs syndrome) and TREMOR (Tremor). At the time of the report, SEIZURE LIKE PHENOMENA (Seizure like phenomena), BREATH SOUNDS ABNORMAL (Breath sounds abnormal), DIZZINESS (Dizziness), DYSKINESIA (Dyskinesia), EYELID FUNCTION DISORDER (Eyelid function disorder), FALL (Fall), HYPERHIDROSIS (Hyperhidrosis), HYPOPNOEA (Hypopnoea), HYPOTONIA (Hypotonia), MUSCLE TWITCHING (Muscle twitching), PALLOR (Pallor), PRESYNCOPE (Presyncope), RESTLESS LEGS SYNDROME (Restless legs syndrome) and TREMOR (Tremor) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 02-Mar-2021, Blood pressure measurement: 120/72 (normal) 120/72 mmHg. On 02-Mar-2021, Heart rate: 64 (normal) |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

64 beats per minute. On 02-Mar-2021, Oxygen saturation: 99 (normal) 99%. On 02-Mar-2021, Respiratory rate: 20 (normal) 20 breaths per minute. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. No concomitant medications were provided. The patient remained in the vaccination chair for 5 minutes after injection and he reported feeling well and moved to the observation chair without any problems [~10ft]. After being in the observation chair the patient stood up and took 4-5 steps toward the wall and sat down on the floor. The patient stated he felt dizzy and then became limp and slumped to the right side, his eyes remained open with dilation of pupil fixed at 2mm with no blinking noted. The patient's breathing pattern became shallow and snoring sounds were noted. The patient did not respond when spoken to nor did he respond to soft shaking of the shoulders. The patient began to demonstrate large jerky body movements similar to seizure activity. The seizure like activity continued for 3-4 minutes before the patient was able to become aware of surroundings and answer orientation questions. The patient was diaphoretic, pale, shaking of hands and arms, restlessness of lower limbs with frequent repositioning/twitching of legs. EMS (emergency medical services) arrived to find the patient regaining stability. The patient reported to EMS that he is familiar with this type of response and declined to be taken anywhere. Treatment medications were not reported. Based on current available information and the temporal association between product use and the start date of the event a causal relationship cannot be excluded. The Company believes the event of Restless leg syndrome is not supported in the source documents and should be delete.; Sender's Comments: Based on current available information and the temporal association between product use and the start date of the event a causal relationship cannot be excluded. The Company believes the event of Restless leg syndrome is not supported in the source documents and should be delete.

This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of LOSS OF CONSCIOUSNESS (passed out 4 times) in an 81-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 013A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 01-Apr-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 02-Apr-2021, the patient experienced PERIPHERAL SWELLING (Swollen arm), FOOD REFUSAL (Stopped eating), RETCHING (dry heaving 3-4 times/day) and NAUSEA (Nausea). On 23-Apr-2021, the patient experienced LOSS OF CONSCIOUSNESS (passed out 4 times) (seriousness criteria hospitalization and medically significant), DIZZINESS (He is still experiencing dizziness and too weak to get out of bed) and ASTHENIA (Weak). On an unknown date, the patient experienced GENERAL PHYSICAL HEALTH DETERIORATION (Withering away and is dying/wont live long enough) and WEIGHT DECREASED (lost 20 pounds). The patient was hospitalized until 23-Apr-2021 due to LOSS OF CONSCIOUSNESS. At the time of the report, LOSS OF CONSCIOUSNESS (passed out 4 times), GENERAL PHYSICAL HEALTH DETERIORATION (Withering away and is dying/wont live long enough), WEIGHT DECREASED (lost 20 pounds), PERIPHERAL SWELLING (Swollen arm), FOOD REFUSAL (Stopped eating), DIZZINESS (He is still experiencing dizziness and too weak to get out of bed), RETCHING (dry heaving 3-4 times/day), ASTHENIA (Weak) and NAUSEA (Nausea) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. No</p> |

patient's primary care provider was writing a doctor's note recommending that she not receive the second dose based on her reaction to the first dose, and the PCP recommended that the mother call Pfizer as well.

passed out; not breathing; shaking; not awake; not coherent; not feeling good; arm was aching a little bit/her arm was hurting and her arm was achy; This is a spontaneous report from a contactable consumer (patient) and patient's mother. A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on 13May2021 20:30 (Batch/Lot number was not reported) as single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. Patient got to work on 14May2021 at 08:00 and the manager let her go home because her arm was hurting and her arm was achy, and she was not feeling good, but she was feeling fine when she got home. At 11:00 AM, she came home and went into the house and came back outside. The patient's mom said that they were on the front porch and her daughter passed out and looked like she was having a seizure kind of thing (shaking really bad), she was not awake, not coherent and not breathing. They got her into the house once she came to, they cooled her off and let her sleep for about 45 minutes. Patient said that she felt like she went to sleep and what she remembered next she felt like she was waking up. She said that she slept and nowshe feels fine. Outcome of events was recovered. Information about Lot/Batch number has been requested.

| 1360481 | 5/29/2021 | CA | 21 | F | 5/13/2021 | 5/14/2021 | I started to lose my sight, at first it was my entire peripheral vision and it looked like I was looking through a black holed telescope and then I completely lost sight; Crashed into a stand and passed out; I got really dizzy; I sat in a chair where I became incredibly hot; Sweat through all my clothes; Immediately extremely cold; crashed into a stand; This is a spontaneous report from a contactable consumer (the patient). A 21-year-old non-pregnant female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: EW0173) via an unspecified route of administration in left arm on 13May2021 18:00 at age of 21-year-old at single dose for COVID-19 immunisation. Prior to vaccination, the patient diagnosed with COVID-19. No known allergies. No other medical history. Concomitant medication included: the patient received birth control medication within 2 weeks of vaccination. The patient previously took the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EP7533) via an unspecified route of administration on 19Apr2021 01:15 PM at age of 21-year-old for COVID-19 immunization. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient had not been tested for COVID-19 since the vaccination. The patient got really dizzy, then as she tried to walk away she started to lose her sight, at first it was her entire peripheral vision and it looked like she was looking through a black holed telescope and then she completely lost sight. She became very dizzy and crashed into a stand and passed out. While she was passed out on the floor she uncontrollably defected. Once someone helped her up, she sat in a chair where she became incredibly hot, sweat through all her clothes and then immediately extremely cold. The events onset date reported as 14May2021 09:00AM. No treatment received for the events. The outcome of the events was recovering. The report was non-serious. |

| 1360956 | 5/29/2021 | MA | 14 | M | 5/25/2021 | 5/27/2021 | <p>Patient received 1st dose Pfizer COVID vaccine at a store/pharmacy on 5/25/21. Presented to ED with chest pain on 5/28. Diagnosed with myocarditis and admitted to the hospital. ED attending note: Patient presents with acute onset of chest discomfort in the sternal area 2 days after the first dose of Covid vaccine. Patient's not had any fevers. No respiratory symptoms. No difficulty with respirations or any pleuritic chest pain. Denies any cough. No chest wall trauma. No back pain. No palpitations or syncope. No orthostasis. No peripheral edema. On physical exam he was mildly tachycardic in the 80s to low 90s with no murmur and no gallop. No JVD. Clear lungs. No rub. Bedside ultrasound performed by HCP had bilateral lung sliding and normal gross function based on 2 views. No pericardial effusion. EKG had ST changes. Chest x-ray was obtained without any effusions or pulmonary infiltrates. Normal cardiac silhouette. Troponin sent elevated. Cardiology consulted for possible postvaccination myocarditis. Child remained stable. Resting heart rates in the 70s and low 80s. Cardiology came to see the patient. Plan to admit to cardiology service. Presumed diagnosis of myocarditis. Cardiology admitting note: Pt. is an otherwise healthy 14yM who presents with acute onset atraumatic chest pain i/s/o recent covid vaccine, found to have mildly elevated inflammatory markers and troponin with borderline ST changes on EKG most consistent with mild peri/myocarditis at this time given overall well appearance on exam without hemodynamic or respiratory compromise and grossly normal function on POCUS, though plan for formal echo in AM. EKG w/ non-specific ST-T wave changes in precordial leads, no evidence of strain or block. Admitted to the cardiology service for serial troponins, ECHO, and close monitoring. HPI per cardiology consult note: "Patient is a healthy 14 year old with a history of alopecia who presented to the ED with mild chest pain 4 days following his first Covid vaccine (Pfizer). He had no symptoms in the days immediately following vaccine, and played basketball the day following with no symptoms, but after waking up today began having dull mid sternal chest pain. It was a 4/10, worse with lying down, non pleuritic, not sharp, and not radiating pain and not associated with any other symptoms including SOB, numbness, GI pain, cough, or anything else. Has not taken any meds for the</p> |

| | | | | | | pain. Has not exercised today. Felt "warm" this AM, but didn't check temperature and felt better throughout the day. No palpitations, dizziness. Denies ever having chest pain before and no recent illnesses or sick contacts. No notable hfx of cardiac disease. In the ED, troponin mildly elevated to 0.12 ng/mL and CRP 5 with low ESR and BNP. Bedside point-of-care US reportedly showed no clear effusion with grossly normal function. HR mainly in 70s in ED and normotensive. EKG with borderline nonspecific ST elevation in V3-V6.~~ | |
| 1360962 | 5/29/2021 | CA | 32 | M | 5/28/2021 | 5/28/2021 | Patient was tense and nervous to get his COVID-19 vaccine (Pfizer) after seeing another patient feeling light-headed after his respective vaccine. The patient was pacing back and forth deciding if he should get his vaccine or come back another day. He decided to get vaccinated. Immediately after the vaccine was administered the patient, while still sitting down, passed out and leaned forward falling on the floor. As the intern reached down to help the patient he came to and was able to get back on the chair on his own. At that point the PIC and the intern remained with the patient for observation and provided water. The patient remained under observation for about half an hour and expressed he felt well enough to go home. |
| 1361062 | 5/29/2021 | VA | 30 | M | 4/28/2021 | 4/28/2021 | Patient fainted after about 10 seconds of Covid-19 Moderna (2nd dose) administration. Patient reported to lose consciousness for about 10 seconds. Patient was then helped getting back to his chair staying that he was feeling fine. I sat with patient for about 2 minutes and noticed that he was a little pale and sweating. I asked patient if he wanted to lie down and he refused. I told patient to remain still while I was getting help and called 911. I again fainted and I put patient down on the floor and monitored his breathing, heart rate. I gained consciousness back after 10 to 15 seconds. Store manager arrived. Patient drank some water. Patient seems to be aware of surroundings. EMTs arrived soon after. During the time that EMTs were monitoring patient. Patient fainted again and was taken to hospital. |

| 1361266 | 5/29/2021 | CA | 22 | M | 5/29/2021 | 5/29/2021 | Patient fainted shortly after receiving the vaccine. He was instructed to go have a seat in our observation area and wait for 15 minutes and I believe he fainted before he even sat down. As I approached him he was already conscious again and i had him stay put just to make sure he was ok before getting back into the chair. He was given water and he was closely monitored until his 15 minutes was up. A family member came to take him home just to be safe. While he was waiting he said it wasn't a seizure and he probably fainted because of his fear of needles. He mentioned it has happened multiple times before whenever he gets tattoos. None of this was indicated when he filled out his vaccine consent form. |
| 1360963 | 5/29/2021 | TX | 17 | F | 5/29/2021 | 5/29/2021 | Syncope approximately 3 minutes after shot with resulting head injury. Pt conscious on paramedic evaluation with hematoma on forehead. Unable to walk without assistance. Pt's mother chose to drive her for follow up at ED against recommendations of reporter. Fire Department wheeled pt to personal vehicle. Unknown dispositions/outcome. |

| 1357812 | 5/28/2021 | | 22 | M | 3/19/2021 | 3/20/2021 | <p>Chest Pain, Myopericarditis; From EPIC: From cardiologist healthy man who comes to the ER with left anterior chest discomfort for the last 36 hours or so. Symptoms are made worse by deep inspiration. Were improved following self administration of 600 mg of ibuprofen earlier today. 2 days ago he received his second COVID-19 vaccine (Pfizer). Following day he experienced arm pain muscular aches and pains severe discomfort of the right arm (injection site) later in the day there was nausea and vomiting on one occasion (nonheme). By last night he was able to eat dinner but subsequently felt short of breath with worsening chest discomfort morning the left arm continued to ache with musculoskeletal pains. Developed more discomfort in the left anterior chest radiating to the throat made worse by deep inspiration. Does not describe typical sharp catching pain of pericarditis. No cough sputum bruising bleeding abdominal pain change in color or character of bowels. Sign in the emergency room he was hemodynamically stable, in sinus rhythm with a normal EKG. Torrey work-up notable for an initial troponin of 1.28 and a follow-up troponin of 2.14. Chest x-ray perfectly normal. Elevated d-dimer. CT angiography negative for pulmonary embolism vascular injury, cardiomegaly, pericardial effusion but the radiologist did note thickening of several right posterior and lateral axillary lymph nodes raising a question of recent right-sided vaccination or injury/infection to the right arm. Presently he is perfectly comfortable able to take a deep inspiration with mild chest discomfort, breathing easily. I met him in July 2018 He came to the emergency room with a 3-day viral syndrome manifested as headache nausea vomiting diarrhea and abdominal discomfort and then developed chest discomfort. He was found with diffuse mild J-point elevation on EKG consistent with a viral type pericarditis with troponins which rose to a maximum of 10.4. Work-up for myocarditis was negative. Echocardiogram perfectly normal. Symptoms responded to a course of nonsteroidal anti-inflammatory agents and colchicine. Seen in follow-up of repeat echocardiogram was perfectly healthy. Our diagnosis was myopericarditis. There is no history of shortness of breath dyspnea on exertion decrement of exercise capacity peripheral edema orthopnea PND palpitations lightheadedness syncope or collapse. No ill contacts. He works in a high security</p> |

| 1357979 | 5/28/2021 | CA | 22 | M | 5/27/2021 | 5/27/2021 | Client received his first dose of the Pfizer Covid-19 vaccine (Lot # EW0185 Exp. 08/2021) on 5/27/21 at 1036 AM. At approximately 1045 the client walked up to the EMT asking for water and stating that he felt lightheaded. " Client was a 22-year-old male alert and tracking with his eyes and beginning to stumble. The client had a chief complaint of syncope. EMT managed to assist the client to the observation bed while an additional EMT and RN arrived for further assistance. The client was positioned supine on the cot and proceeded to lose consciousness. The client did not fall or injure himself in any way. He regained consciousness after approximately 15 seconds. He was alert and oriented to person, place, time, and situation immediately upon regaining consciousness. Client stated that he did not have anything to eat or drink before arriving at the vaccination site. The client had no known allergies and denied any medical history. The client was negative for hives, swelling, discoloration, signs or symptoms of shortness of breath, or other signs of anaphylaxis. The client's airway, breathing, and circulation were intact. The first set of vital signs were taken at 1045 and are as follows: blood pressure 110/76, pulse 52, O2 saturation 96%, skin pale, sweaty and hot. The client consented to stay an additional 30 minutes after his initial vitals were taken and his vitals were reassessed every five minutes until his symptoms resolved. After approximately 10 minutes, the client was fully pink in his face and denied any further lightheadedness. At 1051 the second set of vital signs were: bp 122/82, p 56, O2 96%, skins pink, normal, and warm. Client was assisted to an upright seated position and was given Pringles and juice. At 1059 clients vitals were - 124/84 BP, 74HR O2 99%, Resp 16. At 1109 vitals: bp 122/82, p 68, O2 97%, skins pink, normal and warm. At the completion of his additional 30-minute observation, the client stated that he was feeling better. All pertinent information was given to client by EMT and RN and he was encouraged to follow up with his primary before his next dose. The client was also instructed to call 911 if a severe allergic reaction occurred later in the evening and was reminded to eat before his next vaccination. RN educated client about the possible signs and symptoms of an allergic reaction. The client at 1115 in positive disposition with his mother. |

| 1358138 | 5/28/2021 | IA | 13 | F | 5/28/2021 | 5/28/2021 | RN reported that patient became flaccid after her vaccination, then became rigid, crossed her legs, and lightly slammed her head back against the wall. He reports that she fainted but had some seizure-type activity, but minimalized. She was monitored by both RN and myself. She was lowered to the floor to lay on the floor, was fanned, and her BP and pulse were monitored by RN. She was accompanied by her mother, and her mother declined having EMS contacted. Once patient regained consciousness, she was alert, laughed and talked to us, and regained a sitting position. We then gave her cold water to drink, and she was able to get up into a chair. After sitting for several minutes, she was able to walk out of the room and into one of our monitoring cubicles for an extended monitoring timeframe. We kept her here for 30 minutes for further observation, then left accompanied by her mother. Due to RN's report of the seizure-type activity, mom is going to contact patient's pediatrician to see if further treatment is needed. |
| 1358161 | 5/28/2021 | NM | 38 | M | 5/27/2021 | 5/27/2021 | I nearly fainted. Had about 3 different moments of heart flutters (not sure how else to describe it) My vision was half blackened. I was light headed and had a little bit of breathing weirdness. It probably only lasted about 2 minutes. I laid down and all symptoms went away in about a minute. The only other time I fainted in my life it was from seeing blood shoot out of my body but it wasn't accompanied by heart flutters. |
| 1358171 | 5/28/2021 | NV | 28 | M | 4/7/2021 | 4/8/2021 | Fatigue w/in 12 hrs that lasted more than 2 days, after which fatigue continues even now. We believe he fainted while operating a scooter which resulted in an emergency room visit. Complains of chest pain. Concerned this could be myocarditis- he?s on government insurance so medical access is limited. |

| 1357360 | 5/28/2021 | | | F | | | faint; This is a spontaneous report from a contactable consumer or other non hcp. This consumer (caregiver) reported for a 13-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Batch/Lot Number: Unknown), via an unspecified route of administration on an unspecified date as single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. On an unspecified date, the patient got fainted (syncope) (medically significant). Reporter considered the event as serious. Caller is asking if there would be a component that would cause her daughter to faint a few minutes after getting the first dose of the Pfizer BioNTech Covid-19 Vaccine. Caller wanted to know if fainting is a reported side effect after getting the first shot of the Pfizer BioNTech Covid-19 Vaccine. The outcome of the event was unknown. Information about lot/batch number has been requested. |
| 1357093 | 5/28/2021 | NJ | | F | | 5/1/2021 | LEG CRAMPS; STOMACH PAIN; ALMOST FAINTED AT WORK; This spontaneous report received from a patient concerned a female of unspecified age. The patient's height, and weight were not reported. No past medical history or concurrent conditions were reported. The patient received covid-19 vaccine (suspension for injection, route of admin not reported, batch number: 1808609 and expiry: UNKNOWN) dose was not reported, administered on 20-MAR-2021 for prophylactic vaccination. No concomitant medications were reported. On MAY-2021, the subject experienced leg cramps. On MAY-2021, the subject experienced stomach pain. On MAY-2021, the subject experienced almost fainted at work. The action taken with covid-19 vaccine was not applicable. The outcome of the leg cramps, stomach pain and almost fainted at work was not reported. This report was non-serious. |

| 1357110 | 5/28/2021 | MI | 24 | M | 5/11/2021 | 5/11/2021 | <p>passed out; dizzy; moaning; gasping; foaming in the mouth; headache; tired; This spontaneous case was reported by a consumer and describes the occurrence of LOSS OF CONSCIOUSNESS (passed out) in a 24-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 002C21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 11-May-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 11-May-2021, the patient experienced LOSS OF CONSCIOUSNESS (passed out) (seriousness criterion medically significant), DIZZINESS (dizzy), MOANING (moaning), DYSPNOEA (gasping), FOAMING AT MOUTH (foaming in the mouth), HEADACHE (headache) and FATIGUE (tired). At the time of the report, LOSS OF CONSCIOUSNESS (passed out), DIZZINESS (dizzy), MOANING (moaning), DYSPNOEA (gasping), FOAMING AT MOUTH (foaming in the mouth), HEADACHE (headache) and FATIGUE (tired) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 11-May-2021, Vital signs measurement: normal (normal) normal. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. The patient had a severe reaction when he was getting in the car to leave. He was dizzy first then had a blank stare. After that he started moaning and gasping and foaming in the mouth then passed out. They called the paramedics. Vitals were normal and the patient was given the choice to go to the hospital but declined. Patient felt very tired and had a headache later. No concomitant medications were reported. No corrective treatment was provided. Company comment: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. However, medical history and concomitant medication details are required for further evaluation. Most recent FOLLOW-UP information incorporated above includes: On 18-May-2021: Follow up included correct DOB was confirmed; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start</p> |

| 1357221 | 5/28/2021 | IL | 57 | M | 4/22/2021 | 4/1/2021 | <p>passed out; blood pressure is low/blood pressure was 80 something over 50 something; white blood count is high; dehydrated; not feeling well; This is a spontaneous report from a contactable consumer (patient). A 57-years-old male patient received bnt162b2 (PFIZER COVID 19 VACCINE, Batch/Lot Number: EW0169), via an unspecified route of administration, administered in Arm Left on 22Apr2021 08:00 (57-years-old) as 1st dose, single for COVID-19 immunization (his cardiologist recommended him to get it and signed him up for it). Medical history included ongoing coronary stents (Has 18 coronary stents in total. The last three stents were put in 2018), burning of nerves in the back from Apr2021 (The burning of nerves was done through injection), underlying heart issue, neuropathy, diabetes, blood pressure, Cholesterol. Concomitant medications included metformin taken for diabetes from an unspecified start date and ongoing; pantoprazole from an unspecified start date and ongoing; lorazepam from an unspecified start date and ongoing; gabapentin like a nerve block for neuropathy and diabetes from an unspecified start date and ongoing; isosorbide taken for slow release nitro for heart from an unspecified start date and ongoing; carvedilol taken as beta blocker and helps blood pressure and stuff from an unspecified start date to 10May2021; rosuvastatin taken for cholesterol from an unspecified start date and ongoing; ticagrelor (BRILINTA) taken as blood thinner; losartan taken for blood pressure from an unspecified date and unspecified date; acetylsalicylic acid (ASPRIN, Bayer) from an unspecified start date and ongoing; magnesium from an unspecified start date and ongoing; furosemide taken as water pill from an unspecified date and unspecified date; metoprolol from 10May2021 to an unspecified stop date; amlodipine from an unspecified date and from May2021; chlorthalid tabniva taken as water pill (25mg at night at the time of the shot, couple of days ago he had to start cutting it in half, now he is only taking 12.5mg at night). The patient previously took Plavix (Brilinta replaced Plavix to keep his stents open. He was on Plavix over 6 years ago), Fentanyl, and Versed. The patient experienced passed out (hospitalization) on 04May2021, blood pressure is low/blood pressure was 80 something over 50 something (hospitalization) on 01May2021, not feeling well on Apr2021, white blood count is high on an</p> |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

unspecified date, dehydrated on an unspecified date. The patient was hospitalized for passed out and blood pressure is low/blood pressure was 80 something over 50 something from 04May2021 to 05May2021. The patient underwent lab tests and procedures which included blood count: 13 on 12May2021. The patient received Pfizer COVID vaccine and reported after 1st dose received on 22Apr2021 he is not feeling well, he has an underlying heart issue and a history of stents placed, white blood cells are high and has a low blood pressure. His Dr. asked him to call Pfizer to ask if this could have been reported as side effects from vaccination. He was asking if he should get the second dose. He had Pfizer shot and has got to get the second one on Saturday. He doesn't know if it is related or not. He has been going to the doctor. He has underlying conditions and takes heart medications and has stents. He has not been feeling good since getting the shot. He is not sure if it is affiliated. His white blood count is high and he has to go to the doctor. His doctor is advising him to hold off on getting the second one and told him to call and ask if anyone else has had side effects like that. He clarified shot as COVID19 Vaccine. He saw his cardiologist yesterday and they thought it was interesting that he started having problems. They wanted him to call the phone number and see if he can postpone the second one. He is not sure if it is related to the shot. His blood pressure has been really low (01May2021) since taking the shot. He takes a ton of medications and they are having to adjust his medications since. Not been feeling good is ongoing. It started 3 to 4 days after getting shot. White blood count is high information reported as he was in the hospital and they didn't say anything about his white count. They did his blood count yesterday and they said it was 13 and want him to see his primary care. He just found out about that yesterday. He is going to see his primary care today. He was in the hospital from 04May2021 to 05May2021 because he passed out because his blood pressure was 80 something over 50 something. Blood pressure is low has improved but they have adjusted his medications to help it improve. COVID19 Vaccination Card: it says first dose COVID19. It doesn't have how much was administered. There is a number 42221 on the vaccination card, but he is not sure what it is. At first caller had said he got the vaccine on

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

24Apr2021, but then clarified that he got the vaccine on 22Apr2021. The patient went to Emergency Room. His wife had to call the ambulance because his wife thought it was his heart. They took him to the ER. They were treating him for his heart and then realized it was his blood pressure was extremely low. Prior Vaccinations (within 4 weeks): No vaccine, but he did have burning of nerves in the back at Pain Clinic done in Apr2021. The burning of nerves was done through injection. He has had it done many times. They give him a local anesthetic when they do it and also Fentanyl and Versed. He has had Fentanyl and Versed many times, due to having stents. Family Medical History Relevant to AE: No. His sisters have gotten it and they are fine. His brother has gotten it and he is fine. Patient did not wish to do a report about his siblings experience with the vaccine. His brother has issues like caller and takes medications, but he hasn't had any side effects from the vaccine. The outcome of the event blood pressure is low/blood pressure was 80 something over 50 something was recovering, not feeling well was not recovered, while for other events was unknown.

| 1357282 | 5/28/2021 | NY | 52 | F | 4/26/2021 | 4/26/2021 | <p>couldn't even function; I have been having really bad breathing problem; Loss of appetite; I just got bruised; double vision; couldn't stand; couldn't even focus; her eyes could not focus; could not see to drive, all of sudden my vision was gone away; diarrhea; blurred vision; vertigo; continuous dizziness; This is a spontaneous report from a contactable consumer. A 53-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 2 via an unspecified route of administration on 26Apr2021 (at the age of 52 years-old) (Batch/Lot Number: EW0169; Expiration Date: Aug2021) as 2ND DOSE, SINGLE for covid-19 immunisation. Medical history included syncope Unspecified syncope, migraine Chronic Migraines, concussion history of severe chronic migraines and unspecified syncope due to have a concussion 3 times. The patient received first dose BNT162B2 for COVID-19 immunization on 06Apr2021 at the age of 52 years old. Caller said that since the second dose she has diarrhea that is coming and going, but she has been having it for 2 weeks and is treating it with Imodium AD. She has been having blurred vision, vertigo, and dizziness continuously. She has never had this before. She said that within an hour of getting the second dose, she was taking her dog for a walk and only made it a block before she had to come home because she thought she was going to fall. She states on Mothers Day she felt like she could not get her bearings and states it was "very, very scary." She said that she cant even walk down her staircase or drive her vehicle. Consumer further stated, I have been having a loss of appetite too not feverish or anything and you know I had the shot, I had no reaction there. I just got bruised and I had no hurt or anything. I have been having symptoms. I had several symptoms from Pfizer but the second vaccine I had been having sever symptoms, they haven't gone away. I was vaccinated for second vaccination on second dose was on 26Apr2021. I am pulling it on my screen here because I have a V-safe. I have been having really bad breathing problem. I have brain situation that my neurology check. I have underlying medical conditions. My pulmonologist asked me to get the Pfizer so that's what I did. I had the first dose 06Apr2021, I had the second dose 26Apr2021. Now basically just the second dose, I started having visions problem really bad and dizziness, it's kind of little</p> |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

vertigo. I had severe diarrhea for at least I guess I am still having it little bit. So it was really severe for about a week or so. But I have it, I am having it still couple of days, 3 weeks still, 3 and a half days and week. The vision on modern days I had like double vision and dizziness and I got vertigo, the whole day. So my brother left with my granddaughter. I had to hold on to the banished couldn't stand. I couldn't even focus. I have unspecified think to the give more and I have a severe chronic migraine (Intent: History) since I am 4 years old but I have never had this happened to me until after I took the Pfizer second vaccine. The day that I took the Pfizer second vaccine, I went with my dog outside I only was able to walk a block and a half and then I had to walk back home because I felt dizzy. Now this is about an hour after I took the second vaccine. Also the next day I drove my car to the park, this is about maybe 10 minutes away and I was getting home run around the park and about an hour after that I had going to car and and surrounded and could not even get my barrig's. She states the next day she took her dog to the dog park and experienced the same thing so she had to lay down in her car and states she "couldn't even function." She states that when she was driving later, she states her eyes could not focus and she could not see to drive. As she was driving home, all of sudden my vision was gone away, from what happen was is I had to call my son. Then I started to cry because I couldn't able to see. Now this has been continuing since the vaccine. Therapeutic measures were taken as a result of diarrhea. The outcome of the events was not recovered. No follow-up attempts are needed; information about lot/batch number cannot be obtained.

A 39-year-old female patient (not pregnant) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose via an unspecified route of administration, administered in arm left, on 07May2021 16:00 (at the age of 39-year-old, not pregnant at time of vaccination) (Batch/Lot number was not reported) as single dose for covid-19 immunisation. Medical history included migraine, hypothyroidism. Concomitant medications included escitalopram oxalate (LEXAPRO); imipramine; levothyroxine; meloxicam. The patient received them within 2 weeks of vaccination. The patient previously took topiramate (TOPAMAX), rizatriptan benzoate (MAXALT), flu vaccine, nitrofluorontin, neomycin, and had known allergies. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. On 07May2021 16:15 (as reported), the patient experienced nausea, severe abdominal pains, racing heart and feeling like she was going to pass out when upright in the first 24hours post shot. Passed out if upright for too long. Racing heart would calm down after laying back down. No treatment received for all events. Events outcome was recovered in May2021. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information available and a close temporal association, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported events of loss of consciousness and other. The case will be reassessed once new information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Committees, and Investigators, as appropriate</p> |

she would faint; sick and she thought that she was going to die; hit her head and injured her head; could of fell and hit her head on the floor that is hard; dizzy; didn't feel good / horrible feeling; weak; diarrhea; feeling of vomiting; arm pain; feeling unwell; severe allergic reaction; This is a spontaneous report from a contactable consumer (patient). A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), dose 1 via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as 1ST DOSE, SINGLE DOSE for covid-19 immunisation. The patient's medical history and concomitant medications was not reported. Patient says that on Monday she went to go get the COVID vaccine and then Tuesday she called Pfizer and told them that she had a severe reaction and she told them all of her symptoms. But then on Wednesday, yesterday, she went to work and she was fine and then all of a sudden she was in the gallery, she is a security officer, and everything went dark and she was getting dizzy. It was a horrible feeling. She called her supervisor who came and the Patient said that she didn't feel good and she thought that she would faint. Her supervisor told her to sit down and put her head down so she did and that had calmed her down but she was still so weak. She said that she has got to go home and they asked her if she needed an ambulance and she said no and she walked to her car. She probably should of asked for someone to go with her for her to lean on but she guesses that she was so involved with what was going on that she didn't tell them that she needed that help. That is the reaction that she got yesterday so she called right away to her provider and told them what happened and she talked to the registered nurse there who said that the Patient didn't need to go to work today either because the side effects usually last 3 days. She also informed the Patient that if she is still feeling like this the next day, Friday, then she needs to go to the emergency hospital. The Patient mentioned that someone else called her yesterday but she doesn't remember the phone call because she was so out of it. So she went through all of that. After her COVID vaccine, she had diarrhea as soon as she got home 2 hours later. She has also had the feeling of vomiting the day before yesterday and she had arm pain, she was feeling unwell and she had that severe allergic

5/27/2021

reaction. She just wanted to let Pfizer know all of this because the COVID vaccine got her sick and she thought that she was going to die. She could of fell and hit her head on the floor that is hard and something could of happened but God took care of her and put an angel there and she had reacted so fast but she could of hit the floor. She wanted Pfizer to know that because she needs money and she shouldn't of even gotten the COVID vaccine. Now she has got to get the second one since she had the first and she is scared to get the second one thinking that the same thing may happen. Also, as she was reading about it and this vaccine doesn't even help you, you can still have the virus from what she is reading and this vaccine is also unapproved. She says that she think that she has already spoke to someone about this, but as she was reading it she saw that really it is saying that it is an unapproved vaccine. She has to go Monday and Tuesday to her doctor, a specialist, and tell them what she went though which was horrible. She did have a severe reaction to this because she got so sick and she could of hit her head and injured her head but God put an angel there. She said she felt like she was fainting and that is why she called her supervisor right away. She said that when she woke up she said she wasn't going to come in to work today because the registered nurse said to go home and relax because it can take 3 days for the side effects to go away. She has been okay for right now. She has had a lot of fluids to drink since the nurse told her to do that and she has chicken noodles because she feels so weak. She is just concerned about the second one, it scares her. Why are they giving this Pfizer COVID vaccine. Is that the only one in the world. She is just curious. Patient declined to complete a full follow up report and said that she just wanted to let Pfizer know what she went though and if she would of gotten hurt then who knows what, but thank God nothing happened and an angel was there protecting her. Right now she just feels so weak. The outcome of event weak was not recovered. The outcome of other events was unknown. Information on the batch/Lot number has been requested.

| 1357348 | 5/28/2021 | GA | | M | | | <p>Passed out; This is a spontaneous report from a contactable consumer. This consumer reported for a male patient (nephew) reported that. A 30-years-old male patient received first dose of bnt162b2 (Pfizer covid vaccine, Solution for injection, Lot number was not reported), via an unspecified route of administration, administered in Arm on an unspecified date as 1st dose, single for covid-19 immunization. Medical history included allergy (to an unknown medication). The patient's concomitant medications were not reported. On an unknown date the patient experienced passed out. It was reported that the patient suddenly passed out and was rushed to the hospital after the first dose of the Pfizer covid vaccine. The patient is healthy and has an allergy to an unknown medication. The patient went to get the shot and then passed out. The patient passed out at the facility where he received the vaccine and was then rushed to the hospital and hospitalized. The caller is unsure when this event happened or the dates that the patient was hospitalized. The patient was released from the hospital the same day he was admitted. The caller mentions that the patient did not eat anything the day of the vaccine, prior to receiving the vaccine. The reporter asked Should the patient get the second dose of the vaccine. Is there any data on not eating all day and if that was an issue. The hospital ran all sorts of test on the patient and everything was fine. He had one shot he had one. And reporter wondering about getting the second one. The reporter stated, Okay, so I have a question about the Pfizer vaccine, so his 30 year old pretty much healthy nephew took the Pfizer vaccine and he passed out and they took him to the hospital (not clarified further if hospitalized or not, hence not captured in event tab) and ran bunch of test, he was fine, but he didn't eat all day. Do they have any data that shows if you don't eat all day you could have that kind of a reaction? Because the thing you know if is going to end up in the hospital I hate for him to have a second one you know what I mean, but if it is related to him not eating then that's another story. Well, I am wondering if they had data on anyone who had not eaten all day and whether or not there were reactions of that. Reporter was sure they tested every possibility when they tested this Pfizer vaccine. The patient underwent lab tests and procedures which included investigation: everything was fine. The event's</p> |

| 1358728 | 5/28/2021 | CA | 35 | M | 5/28/2021 | 5/28/2021 | Patient had fainted after receiving the vaccine and when I came to see him, he was back on the chair. He said he felt faint. I asked if his breathing was alright, his sight and hearing was ok; he said everything was fine, but he still felt faint. Then I saw his eyes closing again and he slouched down on the chair and became unconscious. I helped him onto the ground, where he started shaking, so I rolled him onto his side. He felt clammy. It was a few seconds before he stopped shaking and opened his eyes again. I asked him to stay laying on the ground and asked him again regarding his breathing, hear rate, vision, how he felt. He asked if he passed out again and I told him yes and we're going to keep him on the ground until paramedics arrive. He said he felt better; his breathing and speech was fine, there wasn't any sound of shortness of breath, but he was sweating in cold sweats and he asked us to fan him. He said that he felt better and that he has a big phobia of needles, which his wife who was there, confirmed. He informed me that he's fainted several times at doctor's office and hospitals when they stick a needle in him. When the fire fighters arrived, they spoke to him prepared to get a EKG on him, to which he immediately told them that he doesn't want them to stick any needles in him and he became frightened that the EKG pads were needles. When paramedics came, they determined that they had to take him to the hospital because they said he wasn't able to stand up on his own without falling over and his heart rate was increasing. |

| 1358757 | 5/28/2021 | CA | 15 | F | 5/28/2021 | 5/28/2021 | Approximately 10 minutes after the 1st dose, the patient fainted in the store and hit the back of her head. She regained consciousness immediately. She was alert but pale and complained of pain on the back of her head. |
| 1358779 | 5/28/2021 | AL | 14 | M | 5/28/2021 | 5/28/2021 | patient received vaccine and immediately passed out and hit the floor. he woke up soon after and we gave him some water and crackers and he felt better. we called the ambulance and they came and checked him out and he was fine so he and his mom went home. he walked out on his own and was fine. no issue at the injection site, etc. i think he just passed out from nerves and not eating all day. |
| 1358795 | 5/28/2021 | TN | 22 | M | 4/1/2021 | 4/5/2021 | A few days after being vaccinated, I had experienced dizziness, fainting while at physical therapy. When laid on the table, I noticed I had tightness in my chest, like I couldn't catch my breath. They took my blood pressure, and it was 136/88 pulse rate of 88. These issues continued to persist. I went to the doctors to discuss the issue with a PA. She took an EKG, and found no abnormalities, although I wasn't having an episode at the time. I later felt palpitations in my chest. (my heart would race spontaneously at times for no longer than a few seconds.) The PA as well as my Doctor, had confirmed I had high blood pressure. I began to eat healthier and lose weight in order to change the blood pressure issues. The first appointment, I was 284. The second appointment which was in late April, I was 264, and my blood pressure was in the mid 120's over upper 70's, with my pulse rate in the 70's. The most recent appointment, I became more liberal with my diet and gained weight, weighing 268, but my heart rate continued to lower to a normal point, regardless (low 120's over 68, Pulse rate in the 60's.) Dr. and I had discussed possible causes, and I still have a cardiology appointment to follow up with, and we agreed that with the recent notice of myocarditis in vaccinated young adults and kids, it's a strong possibility the vaccine may have caused my issues, although I am to follow through with the cardiologist to confirm these suspicions. |

| 1359307 | 5/28/2021 | CA | 50 | F | 5/23/2021 | 5/24/2021 | ~~Pfizer-BioNTech Covid 19 vaccine EUA": About 24 hours after my second shot, I felt strong nausea, losing control of the environment, feeling very unwell, weak, blood pressure must have dropped, my vision had darkened, I was about to collapse on the floor had I not reached my bed quickly. Couple of minutes later I had the urge to vomit but nothing came out, and then I had a normal bowel movement. After all that, I felt like the pressure had been released, took 1 tylenol, and went back to bed to rest. It's been 4 days now since the fainting symptoms, and I've been fine so far. The scary part was really the fainting symptoms, I wasn't expecting that. |
| 1359529 | 5/28/2021 | WA | 20 | F | 5/26/2021 | 5/26/2021 | About 5 min after giving the vaccine, patient complained of not feeling well. Symptoms included headache, loss of sensation in arms, light headedness. Patient appeared pale, and confused. Attempted to have patient stand up and walk to counsel room opposite where she was sat. After standing, she immediately sat down, and fainted while she was seated. Pharmacist supported her head, and her boyfriend/significant other prevented her from falling off the chair. Patient was momentarily unresponsive for about 3 seconds. During this time her eyes remained open. Once patient regained consciousness, walked her to counsel room and had her lie down on her back with her legs elevated on a chair. Blood pressure was within normal limits. Patient was feeling better in about 10 minutes, and continued to monitor for another 5. Gave water to sip on, and no additional adverse effects noted. |
| 1359534 | 5/28/2021 | NM | 64 | F | 5/28/2021 | 5/28/2021 | Patient Fainted for few minutes and looked like she was seizing. Few minutes she was back up to normal and stated that she fainted every time after a shot |
| 1359541 | 5/28/2021 | TX | 16 | M | 5/28/2021 | 5/28/2021 | About 10 mins after shot, fainted with eyes rolling back in head, convulsions for a few seconds. Patient helped to lay on floor. Showed confusion for a few seconds and then came to. EMTs checked vitals and blood sugar levels and said things were normal. Visited urgent care facility a few hours later where physician said episode was likely vasovagal syncope. |

| 1358311 | 5/28/2021 | MI | 16 | F | 5/27/2021 | 5/27/2021 | Patient received the Pfizer vaccine. Patient left to sit in out waiting room after vaccine. Patient's mother informed in a few minutes that the patient was not feeling well. She stated that the patient felt hot. I grabbed an ice pack on my way out to her. I put the ice pack behind her neck. Patient passed out within a minute of me getting to the patient. She came back to quickly and stated that she was having a hard time seeing and hearing. She then again passes out. At this point I made the decision to call 911. I delegated to my tech to call 911. She called 911. I asked my other tech to come help me thinking the patient my have needed to be lower to the ground. The patient again regained consciousness. At this point I asked tech to call our Store Director and inform them. I also asked that she get me a water for the patient. The patient was feeling better and drank some water. She then again passes out. This time we were struggling to get her to regain consciousness. I used sternal rubs to help the patient regain consciousness. I was having a hard time finding her pulse. This lasted for a minute or two and then she started responding. Right then EMS arrived and took over. I gave them the information I had and they took her vitals. EMS decided that she was stable and could go home to be monitored by mom. I did call the Mother the next morning to check on the patient. The patient did well last night and was feeling good this morning. |
| 1358328 | 5/28/2021 | MA | 12 | F | 5/14/2021 | 5/14/2021 | Within 3-5 minutes, she was asking for water and feeling hot. Her back was sweaty. Her eyes looked like they were glazed- not responding; didn't look bright. She got some water and an ice pack on her back and removed her shoes and put her feet up. After drinking the water and keeping the ice pack on for the rest of those 15 minutes. Nurses were there watching her. And she was able to walk out of the clinic on her own power. It had looked like she maybe would have passed out without the intervention of water, ice pack and getting her feet up. She had muscle pain in her arm (of injection site) that day and into the next day. The muscle pain in her arm lasted for about 24 hours. |

| 1358643 | 5/28/2021 | FL | 31 | F | 5/3/2021 | 5/4/2021 | On May 4th, I fainted shortly after waking up. Light headed and unable to sit upright, stand, or walk. Had a fever. Called out of work. Headaches, chills, nausea, pain at injection sight, bedridden for most of the day. Around 3/4 in the afternoon I called the doctor's office (phone kept ringing) so I called the nurse through the insurance company. Nurse advised me to stay home for now but to seek medical care if symptoms persisted for more than 3 days. Symptoms continued but were less severe on Wednesday May 5th causing me to miss another day of school. On Friday May 7th at about 12:50 AM I awoke to severe abdominal pain-the kind the pharmacist had warned me of when getting my vaccine. I could not stand or move. I never take aspirin and yelled for a family member to give me Tylenol. I called the nurse from my insurance company and she asked me a series of questions and advised me to seek immediate medical attention. My family called 911 and an ambulance was sent to the house. They checked my vitals and suggested a family member take me to the ER. My family took me to the Emergency Center. I was wheeled into the ER. ER did test but put "Abdominal Pain, Unknown Cause, (Female) on my paperwork. I missed another day of work due to my ER visit. Symptoms lessened but persisted for several days. |
| 1358367 | 5/28/2021 | CA | 19 | M | 5/28/2021 | 5/28/2021 | Pt has syncopal episode 14-15 minutes after vaccine. Pt sitting in chair during observation and suddenly passed out. Pt was able to come out of syncopal episode within a few seconds (10-15 s) after RN approached him. Pt states he felt dizzy for 30 seconds and passed out. Pt was dazed /confused and pale when awoken. Pt states he did not have breakfast this morning and last had a meal yesterday evening. Pt denies having syncopal episode in the past related to blood draw or vaccines. Vital signs taken initially (at 1041) after syncopal episode were as followed: BP 84/47, HR57, SpO2 97%, pt given granola bar, ice water, and ice pack applied in back of head. After patient was able to regain skin color back, drink full cup of ice water, and eat whole granola bar, vital signs were taken again as followed at 1052 105/50BP, HR71, spO2 97%. Pt placed in gurney to be taken to treatment room. RN gave report to treatment room RN. Pt AOX4 when, able to follow commands. |

| 1358613 | 5/28/2021 | WA | 21 | M | 5/28/2021 | 5/28/2021 | Patient got vaccinated and was walking over to observation area. Before he sat down, he passed out, hitting his face on the ground. |
| 1358396 | 5/28/2021 | IL | 67 | F | 3/16/2021 | 3/18/2021 | On Thursday, 3/18, I woke up at 3:30 am extremely dizzy with everything moving around me. Sitting up was better but upon laying down, the extreme dizziness returned. I was still dizzy when I finally fell back asleep. In the morning, I nearly passed out & was in a cold sweat when I got up. Gatorade helped. My PCP's office said it was probably a vaccine reaction. I continued to feel rather light headed & neck pressure & by Tuesday, 3/23, I had a lot of body aches, diarrhea, I was definitely light headed & felt like I could pass out. Over the next days, my blood pressure was very unstable. This random blood pressure issue continued & then the Premature Ventricular Contractions (PVC's) began to increase in spite of the Metropolol. They became very frequent causing light headedness & neck pressure. On 4/12, I went to the ER because my blood pressure was 185/50, heart rate 92. Every 3rd beat was a PVC. The cardiologist changed me to Verapamil 120 mg/day. My condition deteriorated especially in the 3 days prior to the ablation. I was short of breath with weak extremities. The ablation was done on 5/25 & the Cardiologist said I was having PVC's every 2 seconds. I am currently recovering from the procedure. Prior to the 2nd vaccine shot, my PVC's were well controlled by Metropolol to 18% from the 21% in February 2019 prior to taking Metropolol. My blood pressure was consistently normal as well. |

| 1358443 | 5/28/2021 | PA | 19 | F | 5/28/2021 | 5/28/2021 | Mother alerted pharmacists before administration that their daughter experiences syncope with needles. The mother sat by her side as I administered the vaccine. The patient said that the vaccine hurt and sat there for about 5 minutes. At that time the patient said she did not feel well and laid on the ground. It is unclear if patient passed out for a few seconds. I spoke with patient to make sure she was conscious and then monitored her to look for signs of anaphylaxis. Her symptoms appeared to be related to anxiety rather than anaphylaxis. The pharmacy did call 911, but the patient and her family turned down the emergency service. I sat with patient for about 45 minutes to monitor her condition. When she improved they decided to leave that pharmacy. I did suggest they be looked at by a physician. We also called and check on patients well being and she seems to be doing fine. |
| 1358480 | 5/28/2021 | VA | 31 | F | 5/17/2021 | 5/17/2021 | passed out in my car while i was driving on the highway. woke up in my car in the ditch |
| 1358513 | 5/28/2021 | NY | 17 | F | 5/18/2021 | 5/19/2021 | She had been bleeding since May 2. We took her to Hospital Pediatric ER on Thursday, the ambulance took her in because she had a seizure on Wednesday (the Ambulance - they stabilized her that day and took her vitals and was sure she was okay - they knew we had an appt to go in the next day at 10:00 am for tests (previously scheduled); Thursday morning she had another seizure - we gave her seizure meds and she came out that - she ate breakfast after and then took her regular meds and the next thing we know, 50 minutes later, her head drop forward and her arms go completely limp and there was no response. She was breathing but she was out. I called the ambulance. And they took her in to ER. What they put in the paperwork was that she had a seizure and they wrote that she had had syncope episode - it took 20 minutes to come out of it. Which she has never had anything like that. We were in the ER for 7 hours. Was admitted to Hospital -from 24th -28th. |

| 1358551 | 5/28/2021 | AZ | 24 | M | 5/28/2021 | 5/28/2021 | Patient reported dizziness 5 minutes after he was administered the vaccine and then was reported by his sister he was fainting. Call 911, patient was monitored while waiting for EMS arriving to the store. Patient get his consciousness back, response to our questions. His breathing was normal, skin looked pale. Patient felt better after EMS came, got monitoring for more than 30 minutes and then went home. |
| 1358559 | 5/28/2021 | PA | 58 | M | 5/18/2021 | 5/19/2021 | Hx of COVID in Feb 2021. Hospitalized Days 8-10 (No vent). Day 8 had high fever, dehydration, syncope and delirium. Vaccinated with dose 1 of Moderna on 5/18/2021. Next day had high fever (102.8), dehydration and altered level of consciousness. Taken to ER. Improved with IV fluid, observed and discharged. Physician does not recommend dose 2. |
| 1356510 | 5/28/2021 | WA | 47 | F | 5/17/2021 | 5/17/2021 | During shot administration (which was angled from the bottom, up rather than straight in), I felt burning. The injection site bled, and the nurse had to staunch it a bit. Injection site burned/stung as I drove away to wait in line in the parking lot and for a few more minutes. Then my arm swole up around the injection site to a size of about a silver dollar and maybe 1 cm high. Four nurses monitored me, including the one who gave the shot, but she did not talk and stood slightly behind my driver's side window. They let me go after maybe 25 minutes of monitoring and making sure I was OK, and what seemed like the head nurse gave me her phone number and asked me to report in in 24 and 48 hours to let them know how I was doing. I reported 24 hours later that I developed a 99* to 100* fever, chills, and slightly achy joints over night and experienced that for one day. I texted again around 48 hours to let her know those symptoms were gone, I felt a little dizzy now and again, and I developed a bruise around the injection site. I took a photo and texted that to her. She was very kind in asking me to report my adverse effects and get care if needed. As of this typing, 10 days later, I still have a slight bruise, and I have experienced heartbeat lapses once or twice a day. Yesterday (9 days after shot), I was sitting on the toilet resting (not exerting) and felt my heart beat hard four times slightly faster than it was at resting pace. I've experienced minor dizziness off and on but not fainted or blacked out. |

| 1355009 | 5/27/2021 | | 42 | F | 5/23/2021 | 5/23/2021 | Charge nurse called to attend to patient after receiving her second Pfizer vaccine. Family members reported she was anxious since yesterday about receiving her second Pfizer vaccine today. It was reported by patient that she had symptoms of nausea, dizziness and anxiousness today. As per her family same thing occurred with her 1st Pfizer vaccine. She denied any significant Medical hx , other than decreased vision, which she does not take any medication for. Charge nurse and vaccinating nurse, moved her to a private tent to vaccinate her and to be monitored. Charge nurse and myself elevated her feet, and had her take sips of water. Wet cool cloth was applied to the back of her neck. She confirmed she felt better after the cloth. She was left in stable condition with vaccinating nurse. I was called back at 1330, because she felt with SOB and more anxious. She did not have any emesis at any point while she was at vaccination site, and no syncope occurred. She was more relaxed after breathing exercises. She was walked over in stable condition closer to EMT to be monitored closely. Vitals were taken. At this time, she was more relaxed and denied any nausea, headaches, SOB or any other symptoms. Family members continued to give her water and she was able to sustain without any emesis. Pt left with family members at 1400, in stable condition. |
| 1354771 | 5/27/2021 | CA | 30 | M | 5/26/2021 | 5/26/2021 | Per patient, he has a history of fainting with immunization. Pt felt dizzy after shot was given. Pt was given water and snack to eat while being monitored. Heat may have been on contributing factor. Patient felt nauseous and threw up about 15 minutes after shot was given. Patient stated he felt better as soon as he threw up. Patient was accompanied by spouse. After more than 30 minutes of being monitored, patient was able to go home to rest. |

| 1354731 | 5/27/2021 | TN | 12 | M | 5/26/2021 | 5/26/2021 | Called out to vehicle by Covid staff that a patient had passed out. Upon approaching vehicle, patient is in passenger side of his mothers van, with mother in driver seat, and is awake. Patient is very pale and is sipping on Powerade. Mother reports that patient passed out for about 10 seconds about 3 minutes after receiving Covid vaccine. She also reports that patient does this every time he gets any type of injection. Blood pressure at this time 118/60. Patient is becoming less pale and reports he is starting to feel better. Patient reports that he hasn't had anything to eat or drink all day. Patient and mother deny the need to call the ambulance for evaluation. Patient continues to be less pale and feeling better. Encouraged patient and mother to always eat and drink before receiving an injection and to wait at least 15 minutes and to make sure he is feeling completely back to normal before leaving. Patient and mother report good understanding. |

| 1354643 | 5/27/2021 | CA | 39 | F | 5/18/2021 | 5/18/2021 | Immediately after receiving the second dose of Pfizer on Tues May 18, I felt prickly sensations throughout my body. After sitting for the recommended 30 minutes (due to known allergies to previous medications), I began to feel dizzy. They monitored me in the tent for several minutes and checked my vitals, which were fine. The nurse thought I may have hyperventilated. I thought I must have just had a mild panic attack. But the attacks did not stop. Rather, the first three days post vaccine, I had several panic attacks a day, even being woken from sleep because of them. It's not fear or a racing mind but a constant racing heart, weakness, feeling faint. I feel prickly sensations and sensation of heat, which are common in panic attacks. But even after three days, they were not letting up. In addition to the attacks, I felt lightheaded, weak and extremely fatigued, even at rest. There is also constant pain and tightness in my neck and jaws. Thursday evening (May 20), I had an episode where I nearly passed out. Once I got seated, my body froze. I was unable to get my words out clearly. Instead of saying the full sentence in my head, I could only get a word or two out. Instead of being able to lift my arm to eat, I couldn't move. The episode lasted about 15-20 minutes. I had several of these episodes on Saturday, two on Sunday and one on Monday. Thinking it was purely anxiety, I reached out to my psychiatrist who prescribed Klonopin to ease the symptoms. I took 0.5mg on Friday afternoon (5/21) and 0.5mg on Saturday morning (5/22). Realizing the Klonopin was likely making my symptoms worse, I have not taken any since Saturday morning (05/22). Most of the day I am breathless, weak, feel faint doing nearly nothing. I have an hour or so a couple of times of day where I'm more functional but still have to move very slowly. Otherwise, I'm either like a zombie or unable to speak clearly, stuttering when I speak, and unable to operate without feeling faint. |

Initially skin on face slightly pale, sweaty arms -improved after lying down on bed. Oriented X3, BP 95/57 O2 sat 99% HR 61, was offered apple juice and peanut butter crackers, left ambulatory with his mom, asymptomatic at time of discharge. |
| 1354683 | 5/27/2021 | MN | 15 | F | 5/27/2021 | 5/27/2021 | Patient fainted at check out desk. All necessary precautions were utilized. Patient walked to check out desk and started to fall forward. Desk staff and mom caught patient and lowered her to the floor. Patient became conscious and sent over to observation area and was monitored for 30 minutes. No injuries sustained during fall and was able to leave with mom. |
| 1354739 | 5/27/2021 | | 17 | M | 5/22/2021 | 5/22/2021 | After 10 minutes of administration the patient fainted. He was lowered to the floor and awakened almost immediately. BP was 127/65, pulse was 63. He was pale. A physician was in attendance the entire time. Once he was better he was transferred to a stretcher. Mother stated he had been at an overnight sleep over, she had picked him up from there and came directly to the clinic. He stated he had nothing to eat or drink that morning. he was given water and some snacks.. MD released him when he appeared to be back to baseline. He was seen in the pediatician's office on the 5/24/21 as a followup at the parent's request at which time no issues were found. Patient's father had asked the pediatician's office to see the patient following the innoculation that day which the office deferred as an MD was attending this patient in the clinic. |

| 1355604 | 5/27/2021 | CO | 28 | M | 5/27/2021 | 5/27/2021 | Administered 1st Pfizer dose to patient. Requested that patient wait 15-20 minutes in waiting area after vaccine. After 10 min, Patient signled me (the pharmacist) that he wasn't feeling well. As I approached, he stood up and started walking towards me. I took his arm, we took two steps and he fainted. I laid him to the ground while supporting his head. He regained consciousness quickly, but was disoriented. NP assisted by taking vitals/911 called. Paramedics arrived and then took over evaluation. Pt was taken to ambulance for further evaluation, as he still could not walk to diziness. |
| 1355765 | 5/27/2021 | MD | 13 | F | 5/20/2021 | 5/20/2021 | Before I administered the vaccine, the mother stated that she sometimes has an issue with fainting, but mainly at the doctor's office out of fear. She assumed that since this was a different environment, she would be okay. After giving her the shot , she fainted. The mom called 911. I waved an ammonia inhalant under her nose, and she was revived. Her twin brother informed me that she has been in an ambulance 4 times prior after getting shots. Had I known she had a history of fainting, I would have suggested that she receive the vaccine at the pediatrician's office once it becomes available. The mom refused to go to the hospital once paramedics arrived. She sat for 15 minutes, I applied a cool cloth, she drank water and was able to walk out on her own. |
| 1355777 | 5/27/2021 | CA | 14 | F | 5/27/2021 | 5/27/2021 | Pt fainted/syncope s/p vaccination. No head injury. Experience nausea. symptoms self-resolved and pt discharged home in stable condition with family. BP 93/56 HR 76 RR 16, unlabored SpO2 99% RA |
| 1355575 | 5/27/2021 | MA | 26 | F | 5/27/2021 | 5/27/2021 | syncope for few minutes, was able to communicate and was taken to Er for observation |
| 1355807 | 5/27/2021 | OH | 18 | F | 5/27/2021 | 5/27/2021 | Patient was administered Pfizer COVID-19 vaccine and fainted during her 15 minute observation time. Mother alerted pharmacy staff. Pharmacist observed patient regain consciousness. Patient reported feeling warm, was sweating, and saw spots of light. Patient was given a bottle of water and and instant cold ice pack. Patient observation time was continued. After fifteen minutes patient was feeling better and left pharmacy with mother. |

| 1355569 | 5/27/2021 | CA | 18 | M | 5/26/2021 | 5/26/2021 | Patient is a 18 y.o. male who witnessed syncopal episode at 1605 yesterday s/p COVID vaccine. Patient says that he received a COVID vaccination yesterday at 1601. Per mother, the patient had a syncopal episode at 1605, he was sitting down and slid out of his chair with full extension of bilateral arms and legs, lasting about 30 seconds. Witnesses deny headstrike or shaking during syncopal episode. The patient denies pain. He states that he only ate cereal yesterday morning and has experienced similar symptoms in the past while receiving other shots. Patient denies recent trauma or fall. HA, confusion, changes in vision/speech, changes in gait, fever, chills, n/v, abdominal pain, chest pain, SOB, palpitations, cough, hemoptysis, back pain, neck pain, dysuria, hematuria, recent sick contact or travel. Otherwise has no complaints at this time. Patient was discharged at 16:54 and given educational materials on understanding vasovagal syncope |
| 1356047 | 5/27/2021 | NM | 26 | F | 5/27/2021 | 5/27/2021 | Pt had reported to us that she once fainted in her doctor's office when she was pregnant and receiving the Tdap vaccine. We watched her closely, encouraged her sit in pharmacy waiting area and eat and drink. Pt reported that she felt dizzy even after eating a sandwich and drinking some. I gave her an ice pack to put on her head. When I came back to check on her, her brother who came with her, had laid her down on the floor. She had fainted but did not fall or injure herself. We called 911 and for management. EMTs arrived on scene and took vitals, offered to take her to the hospital but she declined. EMTs walked with her to her car. I called the patient this evening before the closed but she didn't answer so I wasn't able to confirm how she was doing. |
| 1356062 | 5/27/2021 | CO | 17 | F | 5/27/2021 | 5/27/2021 | Patient fainted and felt hot. Patient fainted within 10 seconds of receiving vaccine. Once patient came to, she sat down for about 15 minutes and felt better. Patient stated she did not eat anything before. |
| 1356064 | 5/27/2021 | CO | 18 | M | 5/27/2021 | 5/27/2021 | Patient experienced syncope episode 6 minutes after vaccination and lost consciousness for a few seconds. Patient was taken to the hospital for further evaluations. |

| 1356065 | 5/27/2021 | PA | 19 | F | 5/27/2021 | 5/27/2021 | After administration the patient stated that "it felt weird". She moved her arm around a little and said she was afraid to move it too much. A minute later she said she felt like she was going to pass out. She leaned against the wall and her eyes started to close. I noticed that she was starting to break out into a sweat. I asked if she was having trouble breathing, if her throat felt like it was swelling or if she felt nauseous. She said no, just dizzy and really thirsty and asked for some water. I asked again if she was having trouble breathing or was nauseous and she said no, then passed out. I took her blood pressure, which was normal. After a couple of minutes she started to wake up, although not fully, and asked what happened. I told her I had given her a COVID vaccine and asked if she remembered that. She said yes then seemed to pass out again. I then decided to call 911. A minute later the patient woke up. I asked how she was feeling and she said better. After a minute she asked if she could sit up and I said yes, as long as she felt she could. I took her blood pressure a second time. By the time EMS arrived the patient was fully alert, we were having a conversation and she said she felt fine. EMS checked her over but she refused to go to the hospital. I had her sit a few more minutes while I filled out her immunization card. When she left she said she felt completely fine. |
| 1356074 | 5/27/2021 | WA | 18 | M | 5/26/2021 | 5/26/2021 | Patient experienced syncope upon exiting pharmacy after vaccination. He was assisted to a nearby chair before falling and sustained no injury. Patient and father declined emergency medical services to be requested. After an additional 15 minutes of monitoring, patient reported feeling well and was permitted to leave. |
| 1356311 | 5/27/2021 | MI | 21 | F | 5/22/2021 | 5/22/2021 | Was extremely lightheaded right afterwards. Passed out during the 15-minute observation. Was lightheaded the next couple of days, passed out twice more that day. Was really sick to my stomach for 3 days after, with on and off dizzy spells and lightheadedness. |

| 1355390 | 5/27/2021 | IL | 15 | F | 5/26/2021 | 5/26/2021 | Pt came in to pharmacy with her mom for her 1st dose Pfizer vaccine appointment at 2pm on 5/26/21. We checked her in and (pharmacist) gave her shot with her mom present at 2 10pm and she was fine with no issues. Within 2 minutes in of her observation period, she started fainting and having seizure like for about 10 seconds, and regained conscious and said she felt dizzy and then blacked out. She was pale and sweating and asked for water. Our shift lead happened to be closed by her chair where she was sitting so she prevented pt from falling down from the chair and called pharmacist for help from inside the pharmacy. Pharmacist rushed to the patient and asked shift lead to call 911. Pt was conscious, but lethargic, she could breath normally, no sign of obstruction airway. Pharmacist lift her legs up to opposite chair and started to take BP. Paramedic arrived within minutes and took her vitals which was normal. Mom agreed for paramedic took her out in stretcher to hospital for check up. |
| 1355403 | 5/27/2021 | NE | 26 | F | 5/27/2021 | 5/27/2021 | Pt feeling faint and dizzy. Pt felt nasal congestion Pt felt chest heaviness for a short period of time. Pharmacist tried to get her to lay down with her feet up but pt refused. Pt was given water and Sprite to drink due to dizziness and feeling "off". Was sitting on a chair for fifteen minutes after vaccination and said she was dizzy and about to fall off the chair. Had the patient sit on the floor. Pt currently awake and talking fine. No fainting episode of any sort. No s/s of allergic reaction. For treatment pt held cold compress instant packs on neck and wrists. |
| 1355527 | 5/27/2021 | OR | 40 | F | 5/27/2021 | 5/27/2021 | After receiving vaccination, patient was reported to have fainted, with a potential seizure, and fallen over resulting in injury to head and laceration to forehead. Pharmacist was notified in which patient was immediately placed in laying position with elevation to her head and support to neck. Patient reported nausea, confusion, attempted to vomit without success. Patient was able to report name when prompted. 911 was called, fire service and ambulatory service arrived for further assessment. Patient was deemed safe without necessity of going to emergency room. |

his chin, the left upper and lower jaw wet numb as well as his left ear, which was the same side as his injection; he almost passed out; felt a lump on the bone of the upper jaw on the inside; upset; This is a spontaneous report from a contactable consumer (parent). A 40-years-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection, lot number and expiry date not reported), via an unspecified route of administration on an unspecified date in 2021 as first dose, single for covid-19 immunization. The patient's medical history and concomitant medications were not reported. Patient previously took procaine hydrochloride (NOVOCAIN) and experienced numb. Patient previously had a flu shot last fall (28Sep2020) which was influenza, inactivated split 4V (QUADRIVALENT INFLUENZA VACCINE; Lot number PLOOZZ9091 or PLOOZZ7091. Manufacturer), and experienced face went numb. Patient received the vaccine yesterday (date unspecified in 2021) at 6pm. He waited for 30 minutes at the vaccination site and then left. An hour to an hour and a half later his chin, the left upper and lower jaw wet numb as well as his left ear, which was the same side as his injection. His hearing was okay. He said it was like getting Novocain. He went back to the ER and was told since the vaccine people were already gone they couldn't help him unless he wanted to be checked into the ER or he could go home. He hung out in the waiting room for 3 hours incase something else went wrong and then went home. This morning he felt a lump on the bone of the upper jaw on the inside, way above the cheek and he was still numb. Patient told that he almost passed out-because he freaked himself out, not from the vaccine. She said he had a similar experience with a flu shot last fall - face went numb on the same side for four hours Quadrivalent Influenza vaccine on 28Sep2020. Reporter wanted to know what ingredients could be causing this reaction. Reporter asked if there was something in this like sulfur/nickel, mercury, sulfur, sulfates, sulfites, nickel, thimerosal that could cause this reaction. She wanted to know if the company had anyone else that has had these symptoms. It was reported that when patient got the flu shot he also had the numbness in his jaw, with the flu shot it lasted for about 4-5 hours but now he has had the same experience this time with the COVID 19 vaccine but it was worse and now he also fekt a lump in his upper

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

jaw on the inside. They were trying to figure out what is in the vaccines that could make his jaw go numb. He reported through the thing, she told him to scan the paper, he scanned it and he put in his symptoms yesterday so he should be starting to get text messages about it. The lump was in the inside of his jaw, it did not hurt but there was a lump on the bone and he was upset (2021), he almost passed out and he was going to go to the doctor and he just wanted to find out if he was the only one getting these symptoms and what he needed to be aware so he does not go and do it again next flu season like he can go with different brand or something because his jaw was going numb. The outcome of the events was unknown. Information about lot/batch number has been requested.

| 1353541 | 5/27/2021 | NM | 56 | M | 4/7/2021 | 4/1/2021 | couple pains in the left chest area behind the breast; his stomach was feeling sick and his body was hurting; His whole torso hurt and his stomach; The pain now is not like where it hit him with the back. He has back pain every day but more than he used to. the back pain was just the one day.; his arm was a little sore; He was lethargic and had no energy; He was lethargic and had no energy/weakness; diarrhea; Responding strangely to people/but is still there and is so weird; dizzy; getting really irritable; Slept all day for several days; Arm started hurting where he got the shot; been sick pretty much everyday; not feeling good in his stomach; he passed out for 2 days; breathing hard; wouldn't feel good; a fast heartbeat; chills; nausea; headache; he gets really short and impatient; forget a little something still, but just once in a while; This is a spontaneous report from a contactable consumer (patient). A 56-years-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left on 07Apr2021 14:30 (Lot Number: WR8783) as 1ST DOSE SINGLE for covid-19 immunisation. Medical history included ongoing sciatica, back problems, stomach was sensitive, lower back pain, bone spurs down his spine. He was a medical marijuana patient, he had Shigella when he was a baby. He was 2 or 3 and almost died but came out of it; His mom had cancer from smoking, he got the worse flu sick of his life. His stomach was sensitive all of the time. If he was too happy or too nervous get upset. He can eat spicy food, not super hot, but he can eat anything and it doesn't go crazy. He has a little bit of a sensitive stomach sometimes. He can't take a multivitamin or supplements because he would get sick to his stomach, this was before the vaccine. He was getting that same sick feeling now that he would get if he was taking a multivitamin. He had his blood drawn a week before he had the vaccine to check his kidneys with the pills he is on. It was perfect and normal, and he has had nothing since then. In his 20s he had the flu vaccine, and he had never had the flu in his life. That year he got the worse flu sick of his life. He never got the flu vaccine or other vaccines after that. That was probably between 1987 to 1990. His folks passed away. He had been in the hospital when he was little. Concomitant medications included acetaminophen taken for back pain, sciatica from an unspecified start |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

date and ongoing; nabumetone taken for sciatica, back pain from an unspecified start date and ongoing. The patient experienced he passed out for 2 days (medically significant) on Apr2021 with outcome of unknown, been sick pretty much everyday (non-serious) on 07Apr2021 22:00 with outcome of not recovered, not feeling good in his stomach (non-serious) on 07Apr2021 with outcome of not recovered, slept all day for several days (non-serious) on 08Apr2021 with outcome of unknown, responding strangely to people/but is still there and is so weird (non-serious) on 12Apr2021 with outcome of not recovered, his stomach was feeling sick and his body was hurting (non-serious) on 15Apr2021 with outcome of not recovered, his whole torso hurt and his stomach (non-serious) on 15Apr2021 with outcome of unknown, diarrhea (non-serious) on 12Apr2021 with outcome of not recovered, getting really irritable (non-serious) on 09Apr2021 with outcome of not recovered, he had no energy (non-serious) on 12Apr2021 with outcome of recovering, he was lethargic/weakness (asthenia) (non-serious) on 12Apr2021 with outcome of not recovered, dizzy (non-serious) on 10Apr2021 with outcome of not recovered, couple pains in the left chest area behind the breast (non-serious) on 17Apr2021 with outcome of not recovered, breathing hard (non-serious) on Apr2021 with outcome of not recovered, wouldn't feel good (non-serious) on Apr2021 with outcome of not recovered, arm started hurting where he got the shot (non-serious) on 08Apr2021 with outcome of not recovered, headache (non-serious) on Apr2021 with outcome of unknown, his arm was a little sore (non-serious) on 13Apr2021 with outcome of unknown, a fast heartbeat (non-serious) on Apr2021 with outcome of unknown, chills (non-serious) on Apr2021 with outcome of unknown. Patient got sick around 10:00 at night. He was supposed to get his second dose but he was so sick and they said lets give it a week. Then he talked to his doctor and he said to wait 2-3 weeks to make sure he is back to normal. So he is scheduled for the second dose next week at 6 weeks. He asked if it was okay that the shot was given in the sunlight. He stated that he saw that it was in an ice chest but the person had to walk it over to him 20 feet and deal with his sleeve for a second or two so it was in the sun. He said all that walking it was 100% in the sun and he has read that it should not be in the sun. He asked if this

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

could have caused bacteria and caused his symptoms. He stated his doctor was only concerned about giving him antibiotics for bacteria if it was in the sun and if that was a problem. He just read from CDC, once mixed the vaccine can be left at room temp for 6 hours and mixed vaccine does not need to be protected from light. So it sounds like his first shot was good. He had gotten the shot at about 1430 in the afternoon. He was like he is going to get the shot and everything will be great. He didn't think there would be an effect. Then strangely enough at about 2200 he was about to eat dinner and he got to not feeling good in his stomach. It had been close to 8 hours. The next day he slept all day, got up and had coffee, and Saturday he was in the chair in the living room. He is never in the chair during the day because he works. He slept all day and all night and the next day. He was responding strangely to people, and he was in and out of it. He had the shot on Wednesday and then his stomach was feeling sick and his body was hurting. He has back pain anyway and bone spurs on his spine. He was telling his wife whatever pain he is normally in was enhanced. His whole torso hurt and his stomach. The following Monday he had diarrhea. Then he started getting really irritable and didn't want to talk and was impatient. He was lethargic and had no energy. That was the second week. By the end of the second week he had a couple pains in the left chest area behind the breast. He thought it was a heart attack, then thought it was just pain not a heart attack. Every time he wouldn't feel good he would start breathing hard. Once in a while he gets pain through his chest area. His stomach would start and he would breath hard every time he didn't feel good. The third week he was supposed to get the second shot. He called the department of health for New Mexico. The nurse called back and said not to do the shot that week but to wait a week. He rescheduled for a week later. By the third week he was still not feeling good and called the doctor. He asked about the pain in his chest 3 times and he said it seemed to be okay. His arm started hurting where he got the shot in the second week. He still had no energy and he told the doctor this. Patient started taking 2 extra Tylenol during the day for pain. Lately he has been good until one little thing and then all of a sudden his stomach is hurting and he is holding his stomach. He was good today, all he did was eat a cookie and he didn't

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

get sick. He was worse for a little while in the first or second week, he was really bad. It came and went over the next 2 weeks and now it is coming and going less frequently. He slept through 2 or 3 days. Thursday, Friday, and then Saturday he was in and out. He woke up to take the garbage out on Friday then saw he already took it out and forgot it was out there. And it was Saturday. He was kind of out of it. When he would respond strangely he would respond with a question he just asked and someone answered. It is like brain fog or like he is on something. It started after the weekend, more on 12Apr2021. Once in a while he will forget a little something still, but just once in a while. He would walk and hold his rib cage with both arms when he was hurting. He wrote down that it felt like somebody had hit him in the back with a bat in the lower back. One day it was that bad. His back pain was on Thursday 15Apr2021. The pain now is not like where it hit him with the back. He has back pain every day but more than he used to. The sore like he was hit in the back pain was just the one day. He had diarrhea 12Apr2021, 13Apr2021, and 14Apr2021 then it left for probably a week. Then it came back last week one day. Instead of every day it was every 3 or 4 days. He has not had it in the last 4 days. He hopes it is done. He noticed any time he has salad or lettuce he feels bad in the morning so he stopped eating those. He felt irritable more when he started not feeling good. The last 5 days or so more towards the evening at 1800 or 1900 he starts not feeling good and gets irritated. His wife will ask him something and he gets really short and impatient. He felt irritable more when he started not feeling good. The last 5 days or so more towards the evening at 1800 or 1900 he starts not feeling good and gets irritated. His wife will ask him something and he gets really short and impatient. The irritable feeling started right away the Friday of the week he got the shot. He is still struggling some, it will come and go. Yesterday he was zonked. With having no energy it is a big thing. He has to do something instead of what he would be doing. He works all day and takes long orders and stuff. Now he does like one order when normally he did 10. One for him is a huge little sore so he will lay on his right side. His left arm still hurts like a pulling hurt from his neck to his arm. It has been every day from 13Apr2021. It is much better and he will move

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

and it will relax a little bit. It was really weird. The whole time he held the phone with his left hand up until one second he moved his phone and it was the same pain. At night the left side where he had the injection pulls on his neck muscle coming from his arm. He was actually taking two Tylenol in the morning and two at night when he went to bed. With the pain he takes 2 during the day, 650mg each. He was just taking 500mg and then his wife said take these. It seems to have gotten a little better. He always took them 2 times a day and now he takes them 3 times a day. After the first dose he experienced difficulty breathing dizziness, weakness, a fast heartbeat, chills, nausea, headache, he passed out for 2 days and has been sick for 5 weeks. He started having some dizziness a couple of days later and reports, it's like I would stand up too quickly and get a head rush, that kind of dizzy feeling. He confirmed that his dizziness did not start until a couple of days after he received his first dose.

| 1353523 | 5/27/2021 | FL | 28 | F | 5/7/2021 | 5/7/2021 | After leaving the facility ended up passing out in the car; caller's arm was bleeding; feeling kind of dizzy; the administering person didn't check the syringe before administering; This is a spontaneous report from a contactable consumer (patient). A 28-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration, administered in left arm on 07May2021 (Between 1830 and 1900) (Lot Number: EW0182) as single dose for COVID-19 immunization. Medical history included Covid Virus in Dec2020 (had the Covid Virus but received the vaccines to prevent if it were to happen again). The patient's concomitant medications were not reported. The patient previously received the first dose of BNT162B2 (lot number: EW0161) on 16Apr2021 (Between 1830 and 1900) in left arm for COVID-19 immunization. Patient went to Pharmacy to receive her second dose Pfizer Covid Vaccine. Thought there was a mistake coming from the person who gave the vaccine. After the administering person supposedly gave the patient her second dose Pfizer Covid Vaccine, the administering person started making some faces like she was concerned. The patient asked three times, what was going on and the administering person would not tell the patient. The patient asked to please tell her what was going on, the administering person's face was very concerned. The administering person finally told the patient, she wasn't sure, it just felt weird when injecting the second dose Pfizer Covid Vaccine. Patient asked the administering person what she meant by it felt weird and the administering person stated she thought the syringe was empty. The patient stated the administering person was scared. The patient looked at her arm and it was bleeding quite a bit. Patient thought the injection was weird, usually injections in muscles can hurt but this just felt different. Patient stated it felt like the injecting needle was dull, like it had already been used. The administering person thought the syringe was empty so the patient thought was that someone else's syringe that had already been used and the administering person didn't pay attention. Patient is not sure if she received the second dose Pfizer Covid Vaccine. The administering person got up and was about to walk out the door and saw the patient's arm was bleeding. The person said she would clean it up and she did. The administering person |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

stepped outside and asked whoever pulled the vaccine to see if the syringe had the vaccine in it prior to administering to the patient. The patient stated the administering person didn't check the syringe before administering the second dose Pfizer Covid Vaccine to the patient. Otherwise, the administering person would have known if the syringe was full or not. The administering person came back in after she had stepped out for two or three minutes. The administering person told the patient she was good and did receive the second dose Pfizer Covid Vaccine. Patient asked how did the person know, if the administering person had said the syringe felt empty. The administering person said no, the patient did receive the second dose Pfizer Covid Vaccine. The administering person sat next to the patient and the patient asked are you sure, administering person said yes. At this time, the administering person had a 3cc syringe in her hand with something in it and she threw this syringe away. Patient asked the administering person again if she was certain patient received second dose Pfizer Covid vaccine and the administering person said yes. The administering person was still playing around with the syringe the patient supposedly received the second dose Pfizer Covid Vaccine with, like the administering person was doubting herself. Patient was concerned now, if the administering person did in fact use a syringe that was previously used by someone else. Patient didn't know if the person who previously utilized the syringe had something or not. After leaving facility the patient ended up passing out in the car. Some random person in the parking lot got someone from inside the facility. The facility cashier came to see the patient. The patient stated no Pharmacist came outside, just the cashier. After 20 minutes or so, patient 's parents ended up showing up to make sure the patient was okay. The patient got home and a Pharmacist called and basically said how the patient probably passed out because she hadn't eaten. The patient stated she had eaten just not within an hour or two prior to receiving the second dose Pfizer Covid Vaccine. The patient stated the pharmacist was giving a lot of excuses and saying that the patient passed out probably because she didn't eat. Patient asked the pharmacist why no one came out to make sure the patient was fine. The pharmacist said they were changing persons in rotation. Patient stated this hasn't

VAERS_ID RECVDDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

happened before. This may have occurred due to stress and patient getting scared due to the administering persons concern and facial expression and what the administering person said to the patient. The patient got really scared. The patient didn't know if that had anything to do with passing out. Patient didn't think the administering person gave the patient the second dose Pfizer Covid Vaccine at all. As the patient was leaving the facility, patient was getting closer to the car and started feeling kind of dizzy. Patient opened the car door and ended up passing out. Patient stated this occurred this one time, patient was recovered completely. Right before patient was almost passed out entirely, patient had gone to get somebody in the parking lot and asked the person to get someone from inside. Patient asked the Pharmacist if the person who administered the second dose Pfizer Covid Vaccine to the patient, was the person who drew up the patient's vaccination into the syringe. The pharmacist said yes, (name) drew up the vaccine into the patient's syringe. Patient stated the Pharmacist was lying to the patient, (name) told the patient she was not the person who drew up the vaccine into the syringe and went to check to see who had drawn up the vaccine into the syringe after the patient received the second dose Pfizer Covid Vaccine. The Pharmacist changed the subject entirely. The patient underwent lab tests and procedures which included Covid Virus: present in Dec2020. Outcome of the event passed out was recovered on 07May2021, of the other events was recovered on an unspecified date.

| 1353497 | 5/27/2021 | AL | 70 | F | 5/7/2021 | 5/7/2021 | she passed out; diarrhea; stools are black in color; This is a spontaneous report from a contactable consumer(patient). A 70-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 in Arm Left on 07May2021 (Lot Number: EVL8737) as 1ST DOSE, SINGLE for covid-19 immunisation. The patient medical history and the concomitant medications were not reported. She had her first dose of Pfizer COVID vaccine on 07May2021, between 11 and noon, after receiving the vaccine, she experienced diarrhea, stools are black in color; as well as that same night she passed out and it's the first time this happens to her. The outcome of Diarrhea was recovered on 08May2021, of Black stools was not recovered, of Passed out was unknown. The Diarrhea started right after when she got home that evening. For the diarrhea, it started last Friday to early Saturday morning. Saturday 08May2021 morning she had about 2 bowel but its now checked itself (means it stopped). She had the Kaopectate. Then Sunday 09May2021and Monday 10May2021 she had no Diarrhea, no bowel movement but then today 11May2021, she had one bowel movement, there was no diarrhea but her stool was black. Her stools have been black in color since Friday 07May2021. She has never had black stools. The Kaopectate was started after the vaccine. Kaopectate is over the counter. She bought it for the diarrhea and upset stomach. Friday night she also passed out and that has never happened before. She is concerned about Friday night because she went to the bathroom at 2-3 at night and she passed out in the bathroom, she didn't feel faint or anything, she just passed out, she woke up on the bathroom floor. It happened just the one time on Friday night. She was scheduled for the second dose on 01Jun2021. |

This consumer reported for herself that the 64-year-old male patient received second dose of bnt162b2 (BNT162B2, Pfizer COVID 19), via an unspecified route of administration, administered in Arm Left on 31Mar2021 12:30 PM (Batch/Lot Number: ER8730) as 2nd dose, single for covid-19 immunisation. Medical history included high blood pressure from an unknown date and unknown if ongoing , drug hypersensitivity from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. The patient previously took first dose of bnt162b2 (BNT162B2, Pfizer COVID 19), via an unspecified route of administration, administered in Arm Left on 03Mar2021 11:30 AM (Batch/Lot Number: EN6202) for covid-19 immunization. The patient experienced passed out (medically significant) on an unspecified date with outcome of unknown, aches and pains and severe reduction in range of motion in all of my joints and muscles on 07Apr2021 with outcome of not recovered , aches and pains and severe reduction in range of motion in all of my joints and muscles on 07Apr2021 with outcome of not recovered , aches and pains and severe reduction in range of motion in all of my joints and muscles on 07Apr2021 with outcome of not recovered , dizzy on an unspecified date with outcome of not recovered , cannot raise my arms above my waist on an unspecified date with outcome of not recovered , neck is stiff on an unspecified date with outcome of not recovered , limited rotation of my head on an unspecified date with outcome of not recovered , tired on an unspecified date with outcome of not recovered. The patient underwent lab tests and procedures which included blood pressure measurement: unknown results on unknown date, electrocardiogram: unknown results on unknown date, sars-cov-2 test: negative on 21Apr2021. Therapeutic measures were taken as a result of the events. Facility where the most recent COVID-19 vaccine was administered was Clinic. The patient did not receive</p> |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

any other vaccines within 4 weeks prior to the COVID vaccine. List of any other medications the patient received within 2 weeks of vaccination. The clinical course was reported as follows: I have aches and pains and severe reduction in range of motion in all of my joints and muscles. I also got dizzy one day and passed out. I have been put on a 6 -day steroid pack twice already. The steroids help greatly but once the pill pack was complete the symptoms came back. I cannot raise my arms above my waist. My neck is stiff and I have limited rotation of my head. I'm tired most of the time. I have had many blood tests, (2) EKG tests and my blood pressure is being monitored. So far nothing. My doctor is going to send me to see a rheumatologist. I was very healthy before receiving my 2nd shot of the vaccine. The adverse event result in Doctor or other healthcare professional office/clinic visit. The adverse event resulted in Emergency room/department or urgent care. Treatment was received for the adverse event included Put on a 6-day steroid pack twice so far. Prior to vaccination, was the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. Batch/Lot number has been obtained. Further information has been requested

| 1353458 | 5/27/2021 | IL | 50 | F | 4/18/2021 | 4/1/2021 | <p>pain in her arm in the muscle where the needle was placed; pain in her arm in the muscle where the needle was placed; she almost fainted; had so much tightness in her throat; couldn't swallow; the other arm pain; 8-10 days late for her period; This is a spontaneous report from a contactable consumer (patient). A 50-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: ER8731 and expiration date not provided), via an unspecified route of administration, in arm left, on 18Apr2021 09:30 (at the age of 50-year-old), at single dose, for COVID-19 immunization. Medical history reported as no. Concomitant medications were not reported. No prior vaccinations within 4 weeks. Patient was scheduled for the second dose on 09May2021 but she had doubts because of her reaction to the first dose. The patient experienced 8-10 days late for her period in Apr2021; pain in her arm in the muscle where the needle was placed on 18Apr2021; almost fainted on 18Apr2021; had so much tightness in her throat on 18Apr2021;couldn't swallow on 18Apr2021; and the other arm pain on 18Apr2021. Patient stated this was not an allergic reaction and the vaccination provider was about to administer the epi-pen but then she did not. Patient would like to know if her side effects are normal and if she should receive the second dose. Patient got the first shot on 18Apr2021 and she was scared of needles so she just didn't look at them but this one... Patient stated as soon as she got the shot, she had pain in her arm in the muscle where the needle was placed. Patient stated it's not a big deal. Patient stated the pharmacy said it's ok to feel pain and told caller to go sit down and they would be with her in half an hour or so. Patient stated she didn't even make it through the door, she almost fainted and could not hear what she was saying, she had so much tightness in her throat and she couldn't swallow. Patient stated it lasted about 2 to 3 minutes (also reported "lasted for 3-4 minutes"). Patient stated they called an ambulance but it took them 15 minutes to get there and she felt better by then. Patient stated because they told her to wait and she couldn't even get through the door so she just laid on the floor and her throat got so tight, she was frightened. Patient stated it lasted about 5 minutes, actually. Patient confirmed her symptoms began and ended on 18Apr2021. As for "hurting in her muscle; arm</p> |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

pain", patient stated she had the arm pain for two days but then her whole arm started hurting in that arm, but that was a different pain. Patient stated she got the shot at 09:30 in the morning and by 16:00 afternoon she started feeling the pain. Patient stated the pain from the needle when she got the shot, that pain lasted 5 to 6 hours or maybe she would say less. Patient stated after 16:00, then the other arm pain started. Patient stated she was putting ice on and off it for arm soreness overnight and into the next day. Patient confirmed her arm pain ended 19Apr2021. Patient confirmed she had recovered completely from all symptoms. Patient stated she didn't have any pains or anything so she would think she has recovered. Patient stated she went to her physician and the doctor suggested that she should take the second shot. Patient stated she also was 8-10 days late for her period. Patient stated something happened and she said she couldn't do it because she was going to get her period and then it didn't come and days passed by. Patient stated she was supposed to get it 21Apr2021 or 22Apr2021, supposed to get it between 21Apr2021 and 25Apr2021 and she got it yesterday, 04May2021. Patient stated as soon as it passed 26Apr2021, but she was also 51 and menopausal so it might be that, but she doubts it. No emergency room or physician office require for events. Treatment received for event "the other arm pain" included putting ice on and off. The outcome of the event "8-10 days late for her period" was recovered on 04May2021; of "pain in her arm in the muscle where the needle was placed/ almost fainted/ had so much tightness in her throat/ couldn't swallow" was recovered on 18Apr2021, of "arm pain" was recovered on 19Apr2021. No follow-up attempts are possible. No further information is expected.

| 1353322 | 5/27/2021 | | | F | | | This is a spontaneous report from a contactable consumer (patient herself). A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Batch/Lot number was not reported), via an unspecified route of administration on an unspecified date as 1ST DOSE, SINGLE for covid-19 immunization. The Patient's medical history included anxiety and is also under doctor supervision for anti-anxiety meds. On an unspecified date, the patient experienced heart racing after first dose of COVID-19 vaccine, heart racing lasted for 3-4 days, slow at first and more at night that woke her up at night, feeling of almost fainting because she felt out of control and feeling out of breath. It was reported that, event took place after use of product. The patient underwent lab tests and procedures which included EKG (electrocardiogram): normal on 24Feb2021, heart rate: racing lasted for 3-4 days, slow at first and more on at night on an unspecified date. The outcome of the events was recovered on 24Feb2021. No follow-up attempts are possible; information about lot/batch number cannot be obtained. |
| 1353753 | 5/27/2021 | MN | 26 | F | 5/26/2021 | 5/27/2021 | After standing up from the toilet early in the morning, fainted and fell on bathroom floor. No injuries were sustained. After regaining consciousness less than 1 minute later, sat up and breathed and focused for about 2 minutes until mentally clear. Relocated with assistance to couch, drank water, ate a slice of toast. |

| 1354485 | 5/27/2021 | CA | 38 | F | 5/25/2021 | 5/25/2021 | Client stating she was dizzy and turning pale. EMT and Lead RN made contact with client who stated she was feeling dizzy and nauseous, client denied any other symptoms such as chest pain, shortness of breath, and tingling of mouth, tongue or lips. EMT provided client with an emesis bag and bottle of water. Client's skin turned ashen and then client had a loss of responsiveness. RN applied a sternal rub to client who regained responsiveness in <30 seconds. Lead RN applied an instant ice pack to the back of client's neck and instructed client to take deep breaths. Client was Alert & oriented x4 following loss of responsiveness. At 1230 baseline vitals taken with client sitting in folding chair at vaccination table: blood pressure (BP) 138/78, heart rate (HR) 44, Respiratory rate (RR) 14, skins pale, cool and clammy. Client stated she has a history of fainting with every injection or blood draw and that she failed to mention this to RN when she was asked how she does with shots. Ancillary brought the zero gravity chair to the table for client to recover in. Client denied any history of allergic reaction to meds/foods/environment. Denied any other medical conditions or medications taken. Continued complaint of lightheaded/dizziness and nausea. Clients skins remained pale, cool and clammy. At 1235 HR 76, RR 16 client was given a juice box. At 1240 client's skins returned to normal color for ethnicity and were warm and dry, she was alert and oriented x4, she was able to walk to observation area on her own where she was placed in the zero gravity chair and a second set of vitals were taken while sitting: BP 120/88, RR 16, HR 80. At 1250 EMT took a third BP 118/70. Client stated symptoms were fully resolved, skins normal for ethnicity, warm and dry, alert and oriented x4. At 1325 client was finished with observation, denied any other symptoms and walked away from the observation site with a steady gait |
| 1354507 | 5/27/2021 | MO | 52 | F | 4/9/2021 | 4/21/2021 | I broke out in hives from head to toe, couldn't breathe, fainted, couldn't walk or move. Went to ER, BP was 60/40. Was given epi shot and Benadryl and some other meds I don't have the names of. |

| 1353223 | 5/27/2021 | | | F | | | Severe headache; This is a spontaneous report from a contactable consumer. This consumer reported for a female patient (reporter's sister-in-law). A female patient of an unspecified age received first and second dose of BNT162B2 (PFIZER-BIONTEC COVID-19 mRNA VACCINE, Solution for injection, lot number and expiry date were not reported), via an unspecified route of administration, on an unknown date, as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter (67-year-old) reported that the reporter received the first dose of the Pfizer COVID vaccine on 28Jan2021 at 10:45 am. Yesterday at 3:15 pm the reporter practically passed out and couldn't stand up. The reporter was pretty healthy and didn't drink anymore. Things like that used to happen when the reporter drank but not now. The reporter hope it wasn't something neurologic going on with the reporter's body. The reporter also reported that the patient (reporter's sister-in-law) just got her second shot yesterday. On an unknown date, she had a severe headache 5 days after getting the first dose of the vaccine. The reporter asked was it possible to have a side effect from the vaccine that many days later. The reporter just wanted to thank Pfizer for coming up with this medication to help millions of people and was looking forward to getting second dose. Outcome of the event was unknown. Information on lot/batch number has been requested. Follow-up attempts are completed. No further information is expected. |
| 1354428 | 5/27/2021 | NY | 43 | F | 5/27/2021 | 5/27/2021 | Patient received vaccine and was in the pharmacy waiting area for observation. Within minutes (~7min), patient came to counter to let the staff know that she wasn't feeling good. Staff told her to go sit back down and the pharmacist will be right out. She explained that she felt very nausea and wanted to vomit. She also explained that she felt lightheaded and faint. We made sure she was sitting down and protecting her in case of fainting. Other symptoms were shaking, sweating and difficulty swallowing. She was breathing fine but explained that it felt like there was something in her throat that was making it difficult to swallow. Ambulance was called (~9min) and she went to the emergency room for observation (~16m). |

| 1353077 | 5/27/2021 | IN | 66 | F | 5/4/2021 | 5/4/2021 | passed out; very bad infection from the Diverticulitis in the bowel; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of LOSS OF CONSCIOUSNESS (passed out) and DIVERTICULITIS (very bad infection from the Diverticulitis in the bowel) in a 66-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. No medical history reported by the reporter. Concomitant products included LISINAPRIL for Blood pressure, POTASSIUM and OMEPRAZOLE for an unknown indication. On 04-May-2021, the patient received dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 04-May-2021, the patient experienced LOSS OF CONSCIOUSNESS (passed out) (seriousness criterion medically significant) and DIVERTICULITIS (very bad infection from the Diverticulitis in the bowel) (seriousness criterion medically significant). On 04-May-2021, LOSS OF CONSCIOUSNESS (passed out) had resolved. At the time of the report, DIVERTICULITIS (very bad infection from the Diverticulitis in the bowel) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 04-May-2021, Blood potassium: Low. On 04-May-2021, Blood pressure measurement: Low. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown) was unknown. Events included some other issues. Patient was treated with 2 unspecified antibiotics. Company Comment: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. |

| 1354426 | 5/27/2021 | OR | 47 | M | 5/13/2021 | 5/16/2021 | HPI/Subjective: is a 47 year old male with minimal past medical history who presents in consultation. He was hospitalized with myocarditis. The patient presented to PWF 5/16 with CP, fatigue and elevated HR. He had received his second dose of the Moderna COVID-19 vaccine 3 days prior. The initial ECG showed nonspecific ST abnormalities. HS-troponin 1,438 -- > 5,951. Echo showed ejection fraction of 35% with global hypokinesis, akinesis in inferior and inferoapical segments, and mild right ventricular hypokinesis. He was subsequently transferred to PPMC and underwent coronary angiogram on 5/18/21 which demonstrated normal coronary arteries. In consultation with Dr. , he was discharged on losartan 25 mg/day and metoprolol succinate 50 mg BID for outpatient follow-up. Cardiac MRI 5/19 showed T2 signal abnormality and LGE involving the subepicardium of the lateral wall, inferior wall, as well as septum c/w acute myocarditis. LVEF 53%. Dr. submitted his case to the VAERS site. reports feeling much improved. He denies fatigue, dyspnea, palpitation, or presyncope. He has noted fleeting chest discomfort. No fevers or chills. |
| 1354364 | 5/27/2021 | CA | 41 | M | 5/22/2021 | 5/22/2021 | Systemic: Fainting / Unresponsive-Mild, Additional Details: Pt recovered in less than 1/2 hr. Checked his BP and pulse- normal. Pt and his cousin said he fainted after getting the first dose on 4/24/2021. He promised he'll see his PCP. |

| 1354352 | 5/27/2021 | NJ | 17 | F | 5/26/2021 | 5/26/2021 | Patient upon seated for the 15 minutes post-vaccination fainted. When she was coming through, she started shaking as if she was having a seizure. When I reached the patient, she was shaking and then came through and stopped shaking. Patient was still pale, sweating, and didn't feel okay. 911 was already called once the patient was shaking. As I am checking in on the patient, the mom discloses that she has fainted at least twice before and when she comes through she shakes but it is not seizures. However, during the screening process, patient and mom stated the patient never had any problems when getting vaccinated. I got her BP checked and it was 102/61 and HR of 92. We had the patient sit still and drink water. When EMS arrived within 5-10 mins, they took her vitals and it was 112/70s and HR of 84 with 98% O2 sat. Patient and mom decided to be taken to the ED to make sure she is okay. |

| 1354446 | 5/27/2021 | OR | 37 | M | 3/29/2021 | 3/31/2021 | From f/u note 5/18/21: HPI/Subjective: patient is a 37 y.o. male with above past cardiovascular history who presents today for follow-up. He was hospitalized at hospital from 4/1/21 to 4/2/21 after presenting to ED with 12 hours of chest pain, found to have markedly elevated troponin (9,142). Of note, he received 2nd COVID vaccine a day before symptoms began. CT coronary scan showed calcium score of 0. Cardiac MRI on 4/2 showed myocarditis, with anterior and lateral subepicardial enhancement as well as abnormal T1 and T2 signal. He was started on colchicine x 6 months. Today, patient reports improvement in chest pain since discharge. He reports rare episode of chest pain with last episode ~3 weeks ago. He denies participating in very rigorous exercise, but did complete 20 mile bike ride recently. Denies palpitations, dyspnea, orthopnea, PND, abdominal distention, LE edema, fatigue, lightheadedness, dizziness, syncope or near syncope. Cardiovascular Problem List: #Myocarditis o 4/1/21. Echocardiogram: EF 60% o 4/1/21. CT coronary: Calcium score 0 o 4/2/21. Cardiac MRI: myocarditis, with anterior and lateral subepicardial enhancement as well as abnormal T1 and T2 signal. Assessment/Plan: #Myocarditis: During admission, echocardiogram was normal with EF 60% and CT coronary angiogram showed Agatston score of 0. Cardiac MRI showed myocarditis, with anterior and lateral subepicardial enhancement as well as abnormal T1 and T2 signal. Of note, he received the second Moderna COVID-19 vaccine the day prior, so - Monitor, will consider repeat MRI at follow up (more for activity recommendations given age) - Continue colchicine for total of 6 months (until Oct 2021) |

| 1350637 | 5/26/2021 | VA | 16 | M | 5/23/2021 | 5/24/2021 | <p>Previously healthy 16 year old male presenting to hospital as a transfer for chest pain and elevated Troponin levels concerning for myocarditis. Patient has otherwise been healthy. Two days ago he received his second dose of COVID vaccination. He initially felt fine, but later that day had some body aches. The next day he felt feverish off and on and had dull left upper sternal border chest pain intermittently. Today, he reports sharp 7/10 mid sternal chest pain, lightheadedness, sweating, chills, and intermittent non-productive cough. He presented to original hospital for evaluation. The patient admits to tactile warmth since Sunday with no documented temperatures. He recently received his second dose of Pfizer just before onset of these symptoms. He reports difficulty sleeping since Sunday, but no shortness of breath, rashes, syncope, nausea, or vomiting. He has not had any other recent illness, fevers, or known COVID-19 exposures. He denies any history of prior cardiac disease and there is no known family history of cardiac disease, arrhythmias, or sudden death in the child or adolescent period. He denies illicit or recreational drug use. In the ED, he was well appearing with pain now 1 out of 10. POC troponin was 16.8 ng/mL. He had labs pertinent for ESR 10, CRP 3.0, BNP 24. RP2 PCR was negative. UDS was negative except for opiates (s/p morphine). IV was placed and patient was started on IV fluids. EKG was obtained and showed questionable left atrial enlargement per ED read. Cardiology was consulted and performed Echocardiogram in the ED at bedside and was within normal limits. Cardiology resident team contacted for admission. Past Medical History: No major medical diagnoses Past Surgical History: Orchiopexy, T&A Family History: No cardiac family history Social History: Lives at home with mother. Has two healthy siblings not living at home Immunizations: Up to date Medications: None Allergies: NKDA Etiology of likely myocarditis remains unclear at this time. In his age group, this would most likely represent a viral myocarditis. He would likely benefit from cardiac MRI during this admission for further evaluation of myocarditis. His EKG findings with his age group are unlikely to be secondary to myocardial infarct. No arrhythmias or heart block noted on EKG at time of admission or telemetry in ED. There is no family history of autoimmune disease or cardiac disease to suggest an</p> |

| 1350634 | 5/26/2021 | MI | 16 | F | 5/17/2021 | 5/17/2021 | autoimmune component or genetic etiology. Patient sat about 2 minutes after getting vaccine and started to walk away to sit in our designated area. She immediately turned around to sit down again. She then proceeded to start falling to her right and passed out. I was able to catch her and then she started shaking as if having a seizure. This lasted about 5 seconds. She stopped and then it happened again for about 5 seconds. When she came to, she tried to walk away again and had to return to sitting. Then she vomited twice. Upon checking her blood pressure after about 30 minutes, it was 97/66. She sat for a total of about an hour before feeling good enough to leave. She was nauseous for the remainder of the day and the next day as well. |
| 1350576 | 5/26/2021 | MA | 41 | F | 5/17/2021 | 5/17/2021 | Within 2 mins of receiving injection, I experienced full body sweats, deadening of sound, blackness in eyes, lightheaded, unable to hold things in my hands, uneasy stomach, very pale all over, especially face. Talked/deep breathed my way out of fainting. Within 10 minutes all the above symptoms started to lessen. 15 minutes after receiving the injection, the near fainting experience was over and I was comfortable leaving and driving. But the 10 minutes were terrible and I came very close to passing out. My husband experienced the exact same symptoms 2 days later. I will be reporting that immediately following this submission. |

| 1351928 | 5/26/2021 | CA | 31 | M | 5/25/2021 | 5/25/2021 | I experienced a fever going to sleep at 05/25/21 at 2300h. My temperature reading was 97 F. I woke up on 05/26/21 at approximately 0120h feeling the need to urinate and was very sweaty, hot and thirsty. I sat down to urinate, and I felt dizzy standing back up. I was feeling very thirsty so proceeded to walk to get some water. I fainted after walking about 10 feet. I regained consciousness, and I drank water and ingested an Advil with the help of my wife. I felt a lot better after drinking the water, but still had a mild throbbing headache. I went back to sleep, and the fever symptoms came and went which affected my sleep quality. I drank more water any time I woke up. I took 2 more Advil as well at one time waking up. I woke up around 1300h on 05/26/21 feeling a lot better and a little more well rested. My fever symptoms are gone, but I am still a little sensitive to cold and feeling a little weak. |

| 1349493 | 5/26/2021 | MO | 45 | F | 5/3/2021 | 5/3/2021 | nausea; vomiting/almost threw up with severe; almost threw up with severe,frightening, severe, heartburn, felt like esophagus was going to burst it hurt so bad; almost threw up with severe,frightening, severe, heartburn, felt like esophagus was going to burst it hurt so bad; fever of 101 all day; Caller almost passed out at one point; feeling terrible; dizzy; weak after second dose; chills/got really bad chills; arm started hurting all at once; This is a spontaneous report from a contactable consumer (patient). A 45-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in left arm on 03May2021 10:00 (Batch/Lot Number: ER8731) as 2nd dose, single for covid-19 immunisation. Medical history included she was very sensitive to medications and had a heart burn before. The patient's concomitant medications were not reported. The patient previously had a flu shot more than a month ago and experienced pain in joints for like a couple of weeks. The patient received first dose of bnt162b2 on 12Apr2021 (Lot: ER8734; left shoulder at 10:00) for COVID-19 immunization and experienced chills for like a week after the first dose, arm was sore and numbness inside mouth and face. Patient reported that she had no side effects occurred after second dose of the vaccine until about 2300, 12 hours after caller received the second dose. On 03May2021, 23:30, she was dizzy, and was weak after second dose. What started it was she got really bad chills, she tried to get up and was dizzy, felt like she couldn't stand up without holding onto something. The dizziness was ongoing maybe a little bit, probably related to the fact she can't eat more than the vaccination itself. She stated the dizziness was probably a lot less, and she was able to walk around now. Her bad chills were not ongoing and didn't last all that long. It lasted an hour that night of 03May2021 and she had chills again yesterday, 04May2021, when fever was going back up. They were really not that bad and stated that chills were gone now and recovered completely. On 03May2021, 23:30, her arm was sore; she reported that it started hurting all at once 23:30 on 03May2021. It was pretty severe, felt like entire arm it went through, it wasn't just like it went through to inside of her arm. It was where lymph nodes were and partially across chest. It was still sore but definitely not anywhere near the degree it was Monday |

night, 03May2021. She stated that it has improved. On 04May2021, around 18:00, the patient experienced nausea and vomiting but this was different, hasn't thrown up, almost threw up with severe, frightening, severe, heartburn, felt like esophagus was going to burst it hurt so bad. Patient reported that she has had heart burn before but she doesn't typically suffer from it and this was beyond, extremely painful. The events lasted about an hour. She immediately took some antacid tablets, but they did not work. Her husband got her Tagamet, by the time she took it she felt a lot better. The patient guessed that she recovered with lasting effects. She tried to drink plain broth with nothing, no noodles. This was why she called because acid started jumping up into her throat from drinking that. She was afraid to eat, and she was going to have to eat at some point. On 04May2021, the patient almost passed out at one point, felt like she was going to pee her pants because of the pain, and it hurts so bad. She was close to calling 911 it was scaring her that much. This occurred after she had just eaten a small roll with butter on it. She also had fever of 101 all day, Tuesday (04May2021). She doesn't know when this began, and she finally took temperature mid-day, husband bought a new thermometer and she didn't realize she had a fever. She was taking Tylenol every 8 hours. She wondered if the Tylenol bothered her, she doesn't usually take Tylenol and she was told not to take Ibuprofen by the lady who gave her the second dose vaccination. She did take one Ibuprofen last night because she was feeling terrible and she felt a lot better. The events did not required a visit to the emergency room or physician office. Outcome of event almost passed out at one point, fever of 101 all day, weak after second dose was unknown; nausea, vomiting/almost threw up with severe, almost threw up with severe, frightening, severe, heartburn, felt like esophagus was going to burst it hurt so bad was recovered with sequel; dizzy, arm started hurting all at once and feeling terrible was recovering; and chills/got really bad chills was recovered on an unspecified date.

| 1350802 | 5/26/2021 | NM | 18 | M | 5/26/2021 | 5/26/2021 | 18 year old otherwise healthy male, with mild asthma, and history of vasovagal syncope with prior vaccinations, IV's and any type of injection on multiple occasions. He has no history of prior seizures or seizure disorder. He received his vaccine at about 9 AM and walked to our 15 minute observation area. Within 5 minutes of sitting down, he stated he was not feeling well, became unresponsive, and had a series of 3 very brief, witnessed tonic clonic seizure activity, each lasting 5 seconds or less, with only a few seconds between. Following this he was minimally responsive, still sitting up, eyes opened, and only mumbled in response to questions. He was pale, confused, mildly diaphoretic, BP was 119/99 pulse was 61, O2 sat was 96% and resp rate was approximately 20. He was NOT incontinent of stool or urine. He was fully conscious and oriented to person place time and situation within 5 minutes. He soon regained his color and vitals continued to be stable. He does have a history of "low blood pressure" per his report. He was feeling well, but because of the history witnessed seizure activity the decision was made to transport to hospital. He was transported by Ambulance Service to Hospital. Prior to vaccination today was feeling well. He was accompanied by his girlfriend. Diagnosis per supervising MD, was Post vaso-vagal syncope seizure activity. Or seizure activity related to vaso-vagal syncope. |

| 1349440 | 5/26/2021 | GA | 39 | F | 3/26/2021 | 3/26/2021 | could not sleep at all; fainted; felt worse fainted and almost felt passing out; multiple panics attacks during the day; sensitiveness to salty food; palpitations/heart palpitation 138 "bps"; heart raised really quick; felt difficulty breathing; This is a spontaneous report received via COVID-19 Vaccine Adverse Event Reporting System (COVAES). A contable consumer (patient) reported a 39-year-old female patient received dose 1 of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; lot number EN6207) via an unspecified route of administration on 26Mar2021 at 10:00 (at the age of 39-years-old) as a single dose in the left arm for COVID-19 immunization. Medical history included non-alcoholic steatohepatitis (NASH) and pre-diabetic. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the vaccine. The patient was not diagnosed with COVID-19 prior to the vaccine. Concomitant medications included multivitamins. The patient did not have any allergies. On 26Mar2021, ten minutes after the vaccine (also reported as 10:15) the patient experienced heart raised really quick and felt difficulty breathing but calmed down and left the site. The next day (27Mar2021) she drank coffee like every morning but noticed palpitations, noticed sensitiveness to salty foods after ingestion felt palpitations but was not concerned as she thought it was a side effect. On 31Mar2021 she suddenly woke up at 05:00 with heart palpitations "138 bps." She thought it was going to go away but she felt worse, fainted, and almost "felt" passing out. Paramedics showed up and her heart rate was 115 but nothing serious, suspected panic attack. She never had before so she thought it was going to go away but she had multiple panic attacks during the day and night, could not sleep at all for 3 consecutive days. The patient visited a doctor as a result of the events. She was prescribed trazodone "one at night." The patient also saw a cardiologist for the palpitations and was treated with metoprolol 25 mg twice a day to control palpitations but the meds gave her intrusive thoughts and deep depression with suicidal thoughts. The outcomes of heart raised really quickly/palpitations, difficulty breathing, sensitiveness to salty foods, fainted, almost "felt" passing out, and panic attacks were recovering. No follow-up attempts are possible. No further information is expected. |

daughter, who was a nurse. On re-checking the patient's blood pressure, it got improved to 117/60. The patient was scheduled to be seen with her primary care provider on 26-Feb-2021 to verify that the patient was stable. Company Comment: Very limited information regarding these events has been provided at this time. No further follow-up information is expected.; Sender's Comments: Very limited information regarding these events has been provided at this time. No further follow-up information is expected.

weakness generalized; . This is a spontaneous report from a non contactable other health care professional, the patient. A 40 year old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EN6205) via an unspecified route of administration, and anatomical site as 2nd dose, single, on 16MAR2021 (at the age of 40-years-old) for COVID-19 immunization. Patient past drug history include BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: not known) via an unspecified route of administration, anatomical site as 1st dose, single, on unspecified date for COVID-19 immunization. On 16MAR2021 after vaccination, during her 15 minute waiting period after the injection, the patient began to experience generalized weakness, need for a quick snack. She denied rash, shortness of breath, difficulty swallowing or syncope treatment included: snacks. It was reported that follow up response to treatment was good. Patient discharge: stable to go home. Clinical outcome of the event generalized weakness was reported as recovered .No follow-up attempts are possible. No further information is expected.

| 1350294 | 5/26/2021 | ME | 22 | F | 5/25/2021 | 5/25/2021 | Episode of apparent vasovagal syncope a few minutes after receiving the vaccine. This was witnessed by myself. She appeared to have loss of consciousness and collapsed onto the pavement striking her posterior head on the pavement (fortunately, she did not strike it with great force). She regained consciousness within 2-3 seconds. She had a small "knot" on her posterior scalp, but no break in the skin. No other apparent injury. She initially complained of a headache, but this resolved over the course of about 10 minutes. She initially was mildly diaphoretic and had a rapid pulse and mild hypotension, but these also resolved over the course of several minutes. A chemical ice pack was applied to the posterior scalp and neck. She had a completely normal neurologic and musculoskeletal examination. She was provided oral fluids (water and kool aid) and a snack (chewy granola bar) and kept under close observation by medical personal for about 30 minutes. Transport to the emergency room via ambulance was offered, but declined. Her boyfriend was called and came to drive her home after she had made an apparent complete recovery. Both he and she were extensively counseled regarding signs and symptoms to be on the lookout for that would indicate the need for further medical evaluation and they both expressed complete understanding and agreement. Of note, she reported that she has had episodes of syncope in the past when having blood drawn for laboratory tests, but decided not to disclose this to on site personal prior to the vaccination thinking she would probably not have a problem. |

| 1349620 | 5/26/2021 | MN | 28 | F | 5/6/2021 | 5/7/2021 | lost consciousness/fainted; Feeling feverish; feeling lightheaded/dizzy; drenched in sweat; This is a spontaneous report received from a contactable consumer (the patient). A 28-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number not provided), via an unspecified route of administration in the right arm on 06May2021 16:30 (at the age of 28-years-old) as a single dose for COVID-19 immunization. The patient had no medical history. The patient had no known allergies. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient was not pregnant at the time of vaccination. Concomitant medication included: ethinylestradiol/ norethisterone acetate (LARIN 1.5/30) and multivitamin. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number not provided), via an unspecified route of administration in the right arm on 15Apr2021 16:30 (at the age of 28-years-old) as a single dose for COVID-19 immunization. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient woke up at 03:00 on 07May2021 (also reported as 03:05), the night after receiving her second dose of COVID-19 vaccine, feeling feverish and dizzy. She got up to urinate. While she was on the toilet, she started feeling lightheaded and lost consciousness (07May2021 03:00). The next thing she remembered was coming to on the bathroom floor, drenched in sweat (07May2021 03:00). She had been unconscious for two minutes. This was the first time that she had ever fainted. A doctor or other healthcare professional office/clinic visit was involved. No treatment was received. The outcome of the events was recovering. It was also reported that since the vaccination, the patient had not been tested for COVID-19. Information about lot number has been requested. |

| 1348983 | 5/26/2021 | FL | 83 | M | 2/27/2021 | 2/27/2021 | <p> Syncope; Injection site pain; Injection site swelling; Nausea; Vomiting; This case was received (Reference number: 1063219) on 11-May-2021 and was forwarded to Moderna on 11-May-2021. This regulatory authority case was reported by an other health care professional and describes the occurrence of SYNCOP (Syncope) in an 83-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 001A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Hyperlipidemia, Diabetes mellitus, GERD and Hypertension. Concomitant products included ATORVASTATIN CALCIUM (LIPITOR), FLUTICASONE PROPIONATE (FLONASE ALLERGY RELIEF), AMOXICILLIN TRIHYDRATE, CLARITHROMYCIN, ESOMEPRAZOLE MAGNESIUM (NEXIUM 1-2-3), METFORMIN, LISINOPRIL and ACETYLSALICYLIC ACID (ASPIRIN 81) for an unknown indication. On 27-Feb-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 27-Feb-2021, the patient experienced SYNCOP (Syncope) (seriousness criterion medically significant), INJECTION SITE PAIN (Injection site pain), INJECTION SITE SWELLING (Injection site swelling), NAUSEA (Nausea) and VOMITING (Vomiting). At the time of the report, SYNCOP (Syncope), INJECTION SITE PAIN (Injection site pain), INJECTION SITE SWELLING (Injection site swelling), NAUSEA (Nausea) and VOMITING (Vomiting) outcome was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. </p> |

| 1351676 | 5/26/2021 | GA | 13 | M | 5/26/2021 | 5/26/2021 | Patient became nauseous 15 minutes after receiving vaccine, then vomited, then fainted. We lowered him to floor with legs raised. He regained consciousness after a few seconds, but was still not clear-headed. He was very anxious and shaking and pale. 911 was called. He was taken to ER, but was clear headed, with heart rate slightly elevated. |
| 1351711 | 5/26/2021 | MI | 40 | M | 5/26/2021 | 5/26/2021 | Patient experienced syncope after receiving 2nd Pfizer Covid-19 vaccine. He sat in the waiting area for approximately 2 minutes before coming back and knocking on the consult room door. When we opened the door he said he felt like he was going to pass out and then fell to the floor, hitting the left side of his head against the wall. He quickly regained consciousness after only a second or two and was able to scoot into the consultation room where we had him lie on his back and elevate his legs. We also gave him a cold compress for his head. We paged department and when AP arrived he contacted EMS to come check him over. The patient did not lose consciousness again and was able to hold a conversation with us while waiting. EMS arrived and checked his vitals and came to the conclusion that he did not need an ambulance. After EMS left the patient drank water and orange juice and sat in the consultation room with me for 20 more minutes before leaving. Patient has no previous history of vaccine reactions or history of fainting. He had no reactions to his first dose other than a sore arm. |

| 1351723 | 5/26/2021 | NH | 18 | F | 5/26/2021 | 5/26/2021 | Immediately after vaccination was administered the patient fainted but stayed in the chair. After she came to in about 10 seconds I offered her a cold compress for her head. After a couple of minutes the patient felt good enough to move to observation area. I started getting a vaccine ready for another patient and this patient saw the needle and fainted again. I rushed over to her chair and kept her from falling. After she came to in about 10 seconds I offered to call 911 but the patient refused. Her brother came over from shopping and after a couple more minutes they decided to leave together. |

| 1351725 | 5/26/2021 | NY | 20 | F | 5/26/2021 | 5/26/2021 | Patient received Janssen covid19 vaccine, she was sitting in post-vaccination waiting area, when she became little headed. Patient closed her eyes and slumped over in chair and fainted. We brought patient to the floor and she came to. Patient stated this commonly happens after vaccines or giving blood as she has anxiety of both. She also stated she did not eat anything all day. Patient was given ice pack and remained in post vaccination waiting area for 30 minutes. Patient stated she felt fine shortly after laying down on the floor. |
| 1351850 | 5/26/2021 | CT | 46 | M | 5/19/2021 | 5/19/2021 | Within 2 minutes of receiving shot, overwhelming deadening of sound, blackness in eyes, full body sweats, full body discomfort, very close to fainting for first 6-8 minutes. As those symptoms started to diffuse severe muscle cramping started in opposite arm of shot, moved thru body. Within 15 minutes the only symptoms left were the muscle cramps. Those continued for several days. Still lingering today, a week later. |
| 1351869 | 5/26/2021 | MI | 20 | M | 5/26/2021 | 5/26/2021 | Patient begin to feel faint about 5 minutes after receiving vaccine. He became very pale and fainted briefly (less than 2 minutes). Patient sat and waited at the facility for about 30 minutes after regaining consciousness. He regained his color and was able to leave. |
| 1351880 | 5/26/2021 | CO | 14 | M | 5/26/2021 | 5/26/2021 | patient fainted within 1 minute of getting vaccine. Came around very quickly, about 10 seconds. We got him to lay down, rest with legs on chair, felt better in 30 minutes with water and cookies. this is a known issue with patient and vaccinations |
| 1351576 | 5/26/2021 | | 55 | M | 5/22/2021 | 5/23/2021 | first day: fever 100.7, fatigue, extreme thirsty second day: fever 100.8, very disoriented, extreme fatigue, I passed out and was unconscious for atleast 2-3 minutes 911 was called. |

| 1352528 | 5/26/2021 | CO | 13 | F | 5/1/2021 | 5/22/2021 | Patient fainted immediately after receiving the Pfizer vaccine. She regained consciousness immediately as soon as patient was placed on her back on the floor with feet elevated. Her blood pressure was normal and she was kept under watch for 20-25 mins after receiving the vaccine and she left the clinic after we observed her for 20-25 mins and she was doing absolutely fine. Followed up with the parent on Wednesday 5/26/21 at around 7:45pm. Mother reported patient is doing absolutely fine. I told patient's mom, fainting can be caused due to nervousness and drop in oxygen levels to the brain. However, this adverse effect will be reported to patients doctor and also to the VAERS for Pfizer covid-19 vaccine. |
| 1352150 | 5/26/2021 | WA | 14 | M | 5/26/2021 | 5/26/2021 | 5/25/21 @ Approximately 12:03 pm, 14 year old Patient fainted while waiting in vaccination waiting area after his first COVID-19 vaccination (Pfizer). Patient stated that he started to have ringing in the ears and some blurred vision. Patient's father instructed patient to lay down on the three chairs in vaccination waiting area. At this time store employee came out to assist patient and patient's father. I (employee) came out to assist moments later when I saw what was happening (I had just finished a consultation with another patient). We elevated patient's legs, put and ice pack under his neck, and called 911. Patient was awake but not very talkative. Patient was very alert and talkative in Clinical Service room at the time of immunization, which was a big change from how he was immediately after fainting. Patient appeared sweaty and pale in color. Patient's blood pressure was taken at 12:09 pm and was 88/51 pulse 53 (patient was still laying down at this time). Respiration rate was 20 breaths per minute. At 12:12 pm blood pressure was taken again as patient appeared more responsive and talking more. His BP was 101/63 and pulse 63. Immediately after second blood pressure reading, EMS arrived and they took over. Patient was responsive and drink water and sitting up at this point. EMS checked patient out and was cleared shortly after. EMS stated that this will not defer patient from getting his second COVID vaccination. Before patient left he was continuing to drink water and was eating some crackers. |

| 1351883 | 5/26/2021 | OH | 45 | M | 5/26/2021 | 5/26/2021 | Patient left the pharmacy area following the vaccination and headed to the employee breakroom to wait the required 15 minutes for observation. He reached the breakroom and sat down. He then became pale and passed out for a few seconds. |
| 1352144 | 5/26/2021 | CA | 22 | M | 5/26/2021 | 5/26/2021 | At 2:15pm patient was seated in the observation area after receiving vaccine. Patient was observed while his head fell back and appeared to have fainted. Patient stated he had not eaten since yesterday. Vital signs were taken blood pressure noted at 117/56, pulse 62, O2 sat 99%. Patient was given a snack and verbalized he felt better. Vital signs were taken again fifteen minutes later and were noted at blood pressure 118/70, pulse :82, O2 99%. Patient was driven home by a friend. |
| 1351884 | 5/26/2021 | FL | 30 | F | 5/24/2021 | 5/25/2021 | I had a fainting spell, confused, fatigue, not oriented x3. Soreness all over my body and needed to be hospitalized for stroke like symptoms. |
| 1352127 | 5/26/2021 | CA | 17 | F | 5/25/2021 | 5/25/2021 | Pt fainted several minutes following vaccination. Pt's mother was vaccinated, then patient, then patient's sister. Pt left vaccination chair following vaccination to allow her younger sister to sit. She stood for several minutes, leaning against wall/counter but immediately after her sister's vaccine she fainted. She slid down the counter but her mother and the vaccination caught her before she landed on the floor. She lost consciousness for approx. 30 seconds, regaining it slowly. While no health conditions were reported on the VAR form the pt appeared to possess traits of a developmental difficult such as Down's syndrome. While she awoke she didn't want to speak and appeared nervous. After approx. 2 min the patient spoke voluntarily. After several more minutes of deep breaths, patient sat up and answer questions regarding the time and place and personal history. She moved to another area to sit, was given water, and after approx. 25 min, left with her family. |

| 1351271 | 5/26/2021 | PA | 66 | M | 5/12/2021 | 5/19/2021 | ED to Hosp-Admission Current 5/20/2021 - present (6 days) Last attending ? Treatment team Syncope and collapse Principal problem History of Present Illness a 66 y.o. yo male presenting to the ED with syncope. Patient is diagnosed with COVID-19. He has passed out twice today. He feels lightheaded and nauseous prior to passing out. He wakes up feeling diaphoretic. Denies chest pain. Admits to shortness of breath and the feeling of difficulty getting a deep breath in. Patient denies history of blood clots, recent unilateral leg swelling or edema, hemoptysis. |
| 1351273 | 5/26/2021 | IN | 63 | F | 5/23/2021 | 5/24/2021 | The morning after I received my second vaccine I began feeling nauseated, then I started sweating profusely, and as I started to get a wash cloth to try to cool myself, I passed out. I came to shortly thereafter, but was weak the rest of that day. The second day after the vaccine I did go to work, but I battled my asthma all day. I had to use my emergency inhaler twice, and at one point thought I was going to have to go to the ER before getting it under control, but I did not have to. |
| 1351588 | 5/26/2021 | HI | 15 | F | 5/15/2021 | 5/15/2021 | Prior to arrival, the patient received her first COVID vaccine at the clinic, after which she suddenly felt dizzy, described as lightheadedness, and felt warm. She was noted to be hypotensive with SBP at 67. She subsequently drank water with some improvement. No syncope, severe headache, numbness, tingling sensations, or focal weakness. Mother was concerned and brought the child to the ED for further evaluation. Currently the patient feels better. No similar symptoms in the past. The patient denies any chest pain or pressure, shortness of breath, or abdominal pain. No recent fever or cough. She is otherwise healthy and has a normal cardiopulmonary exam and reassuring EKG. The description of her symptoms and the environment which happened is very consistent with vasovagal syncope and she does not have any stigmata, and acute neurologic or cardiac emergency. I believe she is safe and stable for discharge home and she was discharged with return precautions and follow-up instructions. |

| 1351456 | 5/26/2021 | VA | 24 | M | 5/26/2021 | 5/26/2021 | patient fainted immediately after for about 1 second, his head dropped but then he woke back up. right after the dose he began breathing quickly, so i instructed him to take his mask off and lay back if he needed. i grabbed him a water and took his blood pressure/hr. EMS was called, patient denied care. HIS BP WAS 104/73 AT 12:53 PM AND HIS hr WAS 72 BPM. I did notice some mild seizure like physical symptoms as he woke up - arms and shoulders jerked a little for a few seconds. he said that the same, but worse, reaction happened after his first dose. |

| 1351319 | 5/26/2021 | MD | 24 | M | 5/8/2021 | 5/25/2021 | <p>MYOCARDITIS. I experienced extreme chest pain, tightness, shortness of breath, painful heart beats, I could feel each beat. I hunched over in my bed groom grabbing my abdomen and fell onto my bed and almost passed out from whack I?d assume is lack of oxygen. I could barely breathe for about five minutes and felt relatively severe pain particularly in the right side of my chest. I could feel every muscle, tendon, and artery inflamed, enlarged, and hurting. My chest felt like it filled up with a balloon. Heart rate went up too. I have NEVER EVER felt ANYTHING like this in my LIFE. Not even close. It was a brand new sensation to me first time I?ve ever felt anything like this at all, and very intense and frustrating. Keeping in mind I am in perfect health. I am a body builder with a perfect physique. I work at a high end restaurant and have an extremely good diet. I have a normal sleep and sexual routine, I don?t use any medications whatsoever even Tylenol or ibuprofen. I have no pre existing conditions. I have no history of heart or cardio problems. My family has a history of low blood pressure. I have next to no stress or anxiety in my life. I am 24 years old I work out and run miles, five to six days a week. I don?t use nicotine, tobacco, and I haven?t had a drink of alcohol in ten years (14yrs old). I smoke marijuana on a daily basis. After about ten minutes the incident went down and I was able to breathe a little better but still had pain and tightness in my chest. I have had shortness of breath ever since. This is being written the day after the event about 26 hours later. I ran a mile last night and went to the gym it seemed to help both my breathing and the pain and tightness but it has not fully gone away. I feel my heart straining somehow as I am typing this. One thing to note is I did not want to get vaccinated but was pressured to do so, and before getting it I was very nervous and honestly upset. The woman administering it was not helpful at all and actually mocked my unsureness and was very rude and unprofessional. She didn?t answer any technical questions I had. During my interaction with her between my nerves and her behavior I?m absolutely certain my heart rate was elevated at the time of getting the shot. I have only had one shot. The episode of myocarditis occurred two weeks after my first shot. Two days after my scheduled second shot, which I missed because of work and was going to reschedule before this occurred. I am not going to be getting the</p> |

| 1351425 | 5/26/2021 | MI | 64 | F | 3/3/2021 | 3/31/2021 | <p>second shot. Will be following up with my primary care doctor as soon as possible. Haven?t had time.</p> <p>4/1: Woke up very sick fatigued, dizzy, sweaty, in bed for 24 hours. 4/2: aforementioned symptoms improved and could get out of bed but dizzy and ?off? feeling persisted 4/6: increased dizziness throughout day to point fell when walking out of work (did not follow up with blood pressure or anything at this point). 4/16: Dizziness and ?off? feeling continued to progress over past 10 days and fell when bringing in the groceries. 4/17: woke up feeling heart palpitations when at rest in much. Also much more dizzy to point where could not walk also. Husband recommended taking BP which measure 178. Called PCP who recommended go to hospital. Admitted to hospital and BP erratic. Performed nuclear stress test which was negative and prescribed losartan 25 MG did a nuclear stress test 4/18: discharged from hospital and proceeded to take BP three times a day. Values continued to be erratic also still feeling dizzy (to a lesser extent thought) Approx 5/3: called the doctor to inform of continued erratic BP. He prescribed a new blood pressure medicine- LISINOPRIL 10 MG?s. Despite medication change Bp remained erratic and dizziness persisted 5/18: dizzy woke up on dizzy similar to presentation 4/17 blood pressure 159/98. Proceeded to work and dizziness progressed to point where almost passed out and had to lay head on desk. EMS was called and BP measuring 169. Admitted to hospital took off BP medication and Echocardiogram, CT and MRI of brain all performed- all negative. BP running lower than normal at certain points during hospitalization (as low as 109). Cardiologist prescribed medication for low blood pressure and dizziness (have not filled this medication) 5/20- 5/22: (discharged from hospital) dizziness still more than normal and BP still up and down but better than prior to hospitalization 5/23- current: dizziness but not limiting function and BP remains erratic but still lower than prior</p> |

| 1351411 | 5/26/2021 | NY | 16 | F | 5/24/2021 | 5/25/2021 | This patient received the Pfizer vaccine on 5/24/21 at 4:30pm and was feeling fine until the next morning at 5:30am when she felt dizzy and passed out. She then was able to get back up and passed out again. Her guardian states that she was gray in color and was very weak. She was able to communicate but was very tired and stayed at home for 2 days. Today she is feeling fine and guardian was asking if she should get the 2nd dose. I said that she should contact her physician. |
| 1351383 | 5/26/2021 | CA | 33 | M | 5/20/2021 | 5/22/2021 | He had black stool on the night of 5/22/21 and on 5/23/21 starting having copious bloody diarrhea, passed out. Went to the ER on 5/23/21 was given blood transfusion and IV because hemoglobin dropped from 9.1 to 7.1 after one bowel movement. He had endoscopy and colonoscopy on 5/25/21 and was diagnosed with a colon ulcer which they cauterized and he was discharged in the afternoon due to hemoglobin being stable at 8. The next morning on 5/26/21 he woke up to use the restroom, defecated brownish-black-red stool and almost fainted and couldn't get up from the floor. I called Dr. (gastroenterologist) who told me to take him to the ER immediately. My husband, is currently back at hospital getting evaluated. |
| 1351346 | 5/26/2021 | OH | 34 | U | 5/26/2021 | 5/26/2021 | Patient received vaccine and was fine then transitioned to another chair, after a couple of minutes he passed out in the chair, his wife was able to shake him and he came back after a minute. The patient stated that he usually passes out after all vaccines due to a severe fear of needles. After he came to it he stated he felt fine. We provided the patient with water and an ice pack to place on the back of his neck. He stayed at pharmacy for additional 15 minutes and when he left he felt fine and his wife was going to be with him for the rest of the day. |
| 1351342 | 5/26/2021 | NC | 15 | M | 5/26/2021 | 5/26/2021 | After receiving patients first Pfizer Covid shot patient passed out twice. EMS was contacted at this time. Patient regained consciousness each time. He then passed out a third time after EMS arrived at the scene. Due to this he was transported to nearest hospital ER for further testing |

| 1351925 | 5/26/2021 | WI | 23 | F | 4/10/2021 | 4/10/2021 | The day I got the vaccine I had been having health problems. I had been having withdrawal from one of my medications and I had lost weight. Right away after the shot I passed out and when I came to, I threw up a couple of times. I was taken to the ER and I had low potassium levels were low, but all other tests were normal. I had some aches pains and feverishness for a couple of days. Five days after the vaccine I had bad diarrhea several times a day. I was nauseous and feeling bad. I had an appointment with my GI doctor a week later but I had to go to the ER before that. They did not find anything in most tests. The next day I tested positive for CDIFF. I was prescribed antibiotics. I went back to the ER a third time because the Vancomycin prescription had caused severe nausea. I am still feeling bad after six weeks but it has gotten better. |
| 1347348 | 5/25/2021 | CA | 46 | F | 5/24/2021 | 5/24/2021 | The patient experienced an episode of syncope approximately 10 minutes after receiving the first dose of the Moderna vaccine. The patient lost consciousness for less than 45 seconds and was then coherent and responsive. Paramedics were called to the scene due to the brief loss of consciousness. Medics took vitals and performed EKG and cleared the patient to return home without needing to seek further medical treatment or monitoring. |

General symptoms, dull headache, stomach upset, weak, jittery feeling, heart pounding. After 2nd shot - waves of malaise come and go - generally feel poor in every way. Dull headache, stomach upset, jittery. mild dizziness, weakness, feel faint. |
| 1347392 | 5/25/2021 | NY | 40 | M | 5/25/2021 | 5/25/2021 | Patient looked normal and relaxed before and during vaccination. About 5-10 minutes after vaccination, patient passed out (fainted) while sitting down in a chair. Moved patient on to floor lying down flat and observed him for a few seconds. Patient was un responsive and appeared to struggle to breath. Asked my staff to call 911 for emergency services, and to bring an Epipen just in case, and started to perform CPR on the patient. The patient gained consciousness in about 15 chest compressions and became responsive. He answered the questions like his name, where he lives etc. As the patient became conscious, responsive and appeared to breath normally, I did NOT administer Epipen. Kept patient in observation and kept him engaged in talking until EMS personnel have arrived. They checked his vitals and blood glucose. In the conversation with EMS personnel, they said he is hypertensive and hyperglycemic. Ems took him to the ambulance by walking him (stretcher wasn't necessary) |

| 1347113 | 5/25/2021 | PA | 64 | F | 5/23/2021 | 5/24/2021 | On Sunday May 23, 2021 I received the 2nd dose at 3:50 pm. By 7pm. I was experiencing extreme fatigue. Slept until 6am. Mon. May 24, 2021. Felt fine upon arising with just a mild headache, ate normally and was doing light household activities when suddenly I experienced a very intense headache, with nausea and fainted. I don't know how long I was unconscious. When I came out of it, it was very hard to sit up. My hands and feet felt numb, my body felt very heavy, bad headache and nausea. After a period of time I was able to get up. It took about two hours before the headache and nausea subsided enough that I could function. Tues. May 25, 2021 I am still experiencing a bad headache and mild nausea with all over muscle pain and fatigue. Motrin is dulling it enough that I can function. |

| 1347231 | 5/25/2021 | PA | 25 | F | 5/24/2021 | 5/24/2021 | Patient is a 25 year old female. She presented to the clinic for her second dose of Moderna LOT #003C21A. According to patient's husband she has no significant past medical history but has "passed out" with vaccines. No reaction noted with her first COVID vaccine. Approximately 10 minutes after receiving her injection today she told her husband that she wasn't feeling well. She said was light headed and nauseated. Patient then proceeded to become nonresponsive. Her eyes deviated upward and her whole body became stiff. Her skin had notable pallor. She was lowered to the ground by staff, myself, and her husband, and put in a supine position with her legs elevated. 911 was called. This episode lasted approximately 40-60 seconds when she became responsive and cried out for husband. Her muscles relaxed and she became notably upset. She kept saying she wasn't able to see or feel her extremities. Her lack of vision resolved within 10-15 seconds. She had weakness in her arms and legs but was able to squeeze her hands on command. She was alert and oriented X3. BP was 130/90. The patient was stable when the ambulance arrived to transport her to Hospital. |

| 1347147 | 5/25/2021 | NC | 38 | M | 3/3/2021 | 4/6/2021 | More than 30 days after receiving the Janssen vaccine, I tested positive for COVID-19. Symptoms began as runny nose, sneezing, and sinus pressure/burning on April 6, 2021. Tested for COVID-19 on April 11, 2021 (nasal swab, PCR test) after a family member tested positive. Symptoms worsened on April 12, 2021, including shortness of breath, chest pain, complete loss of taste and smell. Sought treatment for breathing difficulty at ER on April 13, 2021 (Vidant Medical Center and was instructed to rest at home. Sought treatment for breathing difficulty at PCP on April 14, 2021 (Medical Center) and prescribed Prednisone. Symptoms worsened on April 15, 2021, including shortness of breath, chest pain, numbness in face/arms/legs, dizziness, loss of balance, memory and speaking difficulty, near fainting. Sought treatment at ER on April 15, 2021 (Vidant Medical Center, Greenville, NC). Held for three days, treated with Remdesivir (3 doses) and supplemental oxygen. Discharged from hospital on April 18, 2021. Symptoms did not improve following discharge. Sought treatment for ongoing symptoms at ER on April 21, 2021, instructed to rest at home. Symptoms continued to worsen on April 24, 2021, including shortness of breath, chest pain, numbness in face/arms/legs, dizziness, loss of balance, memory and speaking difficulty, near fainting, and slurred/incoherent speech. Sought treatment at ER on April 15, 2021, admitted to hospital on April 25, 2021 diagnosed with probable TIA. Treated with Optiflow high-flow oxygen therapy, nebulizer, and steroids. Received a variety of tests and scans of head, neck, spine, chest, heart; none showed signs of any serious cardiac, vascular, or neurological problems. Transferred to in-patient rehabilitation on May 1, 2021 for physical and occupational therapy. Discharged from in-patient rehabilitation on May 6, 2021. Prescribed out-patient physical and occupational therapy to resolve remaining dizziness, balance, and endurance deficits. |

| 1348489 | 5/25/2021 | CO | 63 | F | 4/20/2021 | 4/21/2021 | Woke up at 5 AM shivering uncontrollably, weak, unable to move, sweating, feeling feverish, whole body aching. Needed to use heating pad for cold relief (no fever on thermometer). Took Tylenol; symptoms lasted 36 hours; passed out 2x upon standing up to use toilet. Dizzy, nauseous, blurry vision, headache, unable to eat, thirsty, very sleepy; took Tylenol every 6 hours for slight relief. Sick for 2 days but symptoms lessened after 36 hours. Terrible experience. Site of shot was the size of an orange, rash-wise, and very painful for 3 days. |
| 1348077 | 5/25/2021 | WA | 26 | M | 5/25/2021 | 5/25/2021 | 2:01P PT RECEIVED VACCINE. 2:02P PT MOVED TO LOBBY AND SAT AT BP MACHINE. STATED HE FELT DIZZY AND LOST CONSCIOUSNESS AND FELL TO THE FLOOR. REGAINED CONSCIOUSNESS BY 2:04P ASKING WHAT HAPPENED, STATED HIS WRIST HURTS. ACKNOWLEDGED HE ALWAYS FAINTS WITH VACCINES/NEEDLES. BY 2:08PM PT REPORTED FEELING BACK TO BASELINE BESIDES HIS WRIST. EMS ARRIVED BY 2:18PM. WHEN GETTING HIM TO SIT UP HE FELT DIZZY AGAIN AND LIED BACK DOWN. WAS ABLE TO SIT THEN STAND BY 2:25PM. DUE TO THE DIZZINESS AND FAINT FEELING LASTING GREATER THAN 10 MINS, EMS RECOMMENDED AMBULANCE TRANSPORT TO HOSPITAL. PATIENT REFUSED STATING HE FELT EXACTLY AS HE HAD IN THE PAST WHEN HE HAD FAINTED PREVIOUSLY FROM VACCINES. NO REDNESS/ITCHING/SWELLING/PAIN AT SITE OF INJECTION. DECLINED TRANSPORTATION TO HOSPITAL. ONLY COMPLAINT WAS WRIST PAIN WHICH WAS A RESULT OF FALLING. |
| 1348079 | 5/25/2021 | CT | 65 | F | 5/25/2021 | 5/25/2021 | patient had fainted about 5 mins after the vaccine but then she woke up in about 2 mins . Her husband had laid her flat on the ground. She seem to feel better as she was laying on the ground. at that time the ambulance was en route . i had checked on her pulse/bp . the ambulance had arrived but she refuse to go to the hospital . she had felt better . she did walk out of the pharmacy on her own. |
| 1348094 | 5/25/2021 | OH | 19 | M | 5/25/2021 | 5/25/2021 | Pt was sitting in chair after vaccination and passed out |

| 1348284 | 5/25/2021 | NJ | 18 | M | 5/25/2021 | 5/25/2021 | After vaccination, patient fainted and by the time got over to him he was alert. He was able to sit up and then was able to get into the chair. While in the chair he appeared to faint again (looked like he was asleep in chair) and 911 was called. Patient states he had not eaten today and this was late afternoon. He also said he was nervous. EMS arrived and he agreed to go get checked out. |
| 1348311 | 5/25/2021 | PA | 29 | M | 5/19/2021 | 5/19/2021 | Patient had Moderna vaccine administered at 7:16pm and become unresponsive and began convulsing at 7:27pm. When patient came back around, he was disoriented and didn't know where he was. Patient blood pressure was 131/93 with a pulse of 89. Patient did remember where he was and that he had received his first covid vaccine. He knew the month, day and some other basic questions. The patient stated that before he become unresponsive that he started to feel very lightheaded and woozy. 911 was called and transported the patient to the local hospital for additional testing and evaluation. Upon further discussion with the ER physician, patient was diagnosed with syncope and low potassium. |
| 1347568 | 5/25/2021 | OR | 27 | M | 5/21/2021 | 5/21/2021 | Patient presents with a potential reaction to the COVID19 vaccine. The patient was evaluated in his vehicle as a passenger. He was responsive. He presented with signs and symptoms consistent with vasovagal syncope. He was placed supine with legs elevated and given oral hydration. Vasovagal syncope with rapid return to baseline with repositioning and hydration. Returned home with mother as the driver. |

| 1348485 | 5/25/2021 | MI | 48 | F | 3/23/2021 | 3/23/2021 | At 1615 (3/23/21), experienced left leg heaviness, intermittent chest pain, body aches, fever 102.5, headache, chills, rigors, and tachycardia - most symptoms lasted only 36 hours. Left leg heaviness persisted and is still present. Intermittent chest pain x 10 days. Near syncope lasting from days 4-11 post vaccine - with one syncopal event occurring on day 5. Tachycardia and palpitations persist. April 14 - chest pain returned. On April 15 - Went to Emergency Department for heart rate of 172, shortness of breath, and palpitations. Persistent left leg heaviness since vaccination. Evaluated for potential pulmonary embolism, myocardial infarction, DVT, and post Covid vaccine infectious pericarditis, Admitted to Hospital overnight. Tested negative for Covid-19. Left leg heaviness persists. Intermittent tachycardia persists. May 10 developed a cold sore 1 day post sun exposure (normal for me). Evening of May 11 - fever, tachycardia, body aches, headache, chills. May 11 - negative Covid test May 20 - message from CDC requesting I fill out a VAERS. |
| 1348023 | 5/25/2021 | RI | 41 | M | 5/20/2021 | 5/20/2021 | Patient passed out after the vaccine....He had mentioned a history of vaso-vagal response when he got a shot as a teenager. He was sitting for about 5 minutes then told us he didn't feel well, then passed out. However, he came to very quickly. He was given a cold compress, some water and was sitting with legs up. We observed him for 45 minutes until he felt well enough to leave. I don't think this was a problem with the vaccine due to a similar history while receiving a different vaccine in the past. |
| 1348498 | 5/25/2021 | FL | 56 | F | 4/10/2021 | 4/17/2021 | Patient stated that she has been suffering from Altered Mental Status, General Malaise, Near Syncope, Weakness |
| 1348625 | 5/25/2021 | CA | 33 | F | 5/25/2021 | 5/25/2021 | Patient fainted after several minutes receiving the 1st dose of Moderna vaccine. |

| 1348637 | 5/25/2021 | | 15 | F | 5/25/2021 | 5/25/2021 | Female 15-year old client received her first Pfizer shot (Lot# EW0185) at 15:02. She was accompanied by her mother and 12-year-old sister, who was also vaccinated at the same station with her. Client received her shot first and waited while her sister received her shot. After both girls were vaccinated, they were walking with their mother down the hallway to the observation room. RN1 stated that from the opposite end of the hallway she saw client?s knees buckle. RN1 walked toward client to ask if she was OK. Client straightened herself out, slumped onto her mother?s shoulder, and rolled onto her mother, who guided client to the floor. At 15:09 Lead RN heard client fall to the floor, went out to the client, and radioed for EMT assistance. Client was conscious and turned her face up. Client?s mother stated client passed out for 2-3 seconds and that her head did not hit the floor. Client?s mother stated that she cushioned her fall. Client was breathing adequately, appeared pale in face and lips, and stated she was OK. Lead RN and RN1 kept client lying on the floor and elevated her legs on a chair. EMT1 & EMT2 arrived at 15:10 and checked client?s pulse (HR: 74). Client denied head, neck, and back pain. Client was alert & oriented times 3 (person, place, & event). Client stated she was OK to stand up and sit in a wheelchair. Wheeled client to extra vacant breakroom where client vitals were taken by EMT2 at 15:17 (BP: 124/60, HR: 96). EMT1?s assessment found the client exhibited good circulation, sensation, and motor function in all 4 extremities. Client denied chest pain, shortness of breath, and nausea & vomiting. Client was leaning forward in the wheelchair resting her elbows on her lap. She stated she does not remember becoming nonresponsive and that she felt dizzy when lying her head back. Client stated she has a history of anxiety and panic attacks and is currently taking Prozac. Client stated she felt hot. Client?s mother stated client ate a full lunch at 12:35. At 15:20 Lead RN provided client with a bottle of water. Lead RN & EMT also observed client?s color returning to her face at that time. Client sat upright and stated that she felt better and was alert & oriented times 4. Client and mother declined going to the hospital and calling 911 for evaluation. At 15:23 client was wheeled to the observation room with her mother and sister where she remained seated in the wheelchair for 30 minutes for additional observation by EMT1. At 1600 |

| 1348643 | 5/25/2021 | MA | 41 | F | 4/19/2021 | 4/22/2021 | <p>EMT1 took client vitals while she was seated (BP: 116/82, HR: 68, RR: 16). EMT1 took client vitals again while having client stand (BP: 120/86, HR: 72, RR: 16). Client and mother stated they were OK to go home. Client and mother were instructed by Lead RN to follow up with HCP if client experienced any additional symptoms after going home and to call 911 if client experienced SOB or any difficulties breathing. Lead RN and EMT observed client leave the facility walking with a steady gait with her mother and sister.</p> <p>The left side of my face began to go partially numb on occasion and at times would spread to the right side of my face. The Sunday after the shot which was my 2nd dose, I passed out and paramedics were called. I didn't go to the hospital then but the following Wednesday I felt my face go very numb again so I went to the hospital. They ran a CT scan and blood work & everything looked normal. I followed up with my PCP that week per instruction of the er and as my face was still getting numb and my left leg and hand began periodic jittering. As the day I passed out I had used marijuana, poppy tea and kratom for endometriosis pain, I stayed away from everything to make certain the vaccine was causing the side effects and not the substances. Even without using anything for days and ultimately weeks, the numbness and tingling continued and at times would last for hours. When I first had the initial shots, it jumpstarted my period both times by 2 weeks and I started the same day as the vaccine each time. I was okay with that side effect but these were more worrying. I have more tests scheduled including wearing a heart monitor for 48 hrs, a dental checkup to make 100% sure nothing abnormal there is causing the effects and a neurologist appt lastly if nothing is uncovered otherwise. An appointment for my heart monitor is already scheduled in early June</p> |

| 1348822 | 5/25/2021 | NV | 27 | F | 5/22/2021 | 5/22/2021 | Around 10pm (almost 12 hours after I got my 2nd dose), it started with nausea and malaise. Within 10-30 minutes, I got very very dizzy and there was pain (but I can't remember where, maybe it was a headache). Soon after, I fainted for a few minutes and when I woke up, I felt VERY nauseous. I ended up vomiting 5-10 minutes after. Twice. Then I think I had a fever and chills so I proceeded to sleep it off. It was hard to sleep because my head just felt off (not sure how to describe it). The following days have been better, but still not feeling 100%. Head feels a little weird, but for the most part, feeling okay. |
| 1348823 | 5/25/2021 | CA | 18 | M | 5/25/2021 | 5/25/2021 | Patient received vaccine and fainted several minutes after receiving dose. When patient retained consciousness he was having difficulty speaking and was having difficulty breathing and kept repeating that he couldn't breath, a dose of epinephrine through an Epi pen was administered 911 was called the patients vitals were checked and he chose not to leave in an ambulance and left |
| 1348339 | 5/25/2021 | NJ | 14 | F | 5/25/2021 | 5/25/2021 | Patient while sitting in the post-vaccination are, fainted in her chair. Upon my immediate arrival, I tapped the patient and she was coming to consciousness. Patient upon awakening, felt nauseous and wanted to vomit, but barely did. I gave the patient water and sports drink and the patient was regaining normalcy. Both the patient and her guardian reported that she did not eat or drink anything prior to coming to the vaccine appointment and that she was very nervous and worried prior. Patient denied history of fainting. I recommended to have the patient sit for at least another 15-20 minutes, but the parent stated his daughter was fine and decided to leave. |
| 1347839 | 5/25/2021 | MA | 64 | M | 5/3/2021 | 5/20/2021 | Syncope on 5/20, found to have acute myocarditis with acute systolic heart failure |

| 1347643 | 5/25/2021 | PA | 30 | F | 5/25/2021 | 5/25/2021 | The patient received the vaccine in her left deltoid. Immediately following the vaccination, the patient stated that her body felt numb. She became sweaty and said she was having difficulty breathing. She fainted and then was responsive to ammonia inhalant. Due to her difficulty breathing, the paramedics were called and responded. Her blood pressure and oxygen levels were normal. The patient refused additional medical treatment. She remained in the pharmacy for about 45 minutes after her vaccine and said she felt better. |
| 1347689 | 5/25/2021 | NC | 12 | F | 5/25/2021 | 5/25/2021 | Patient was given vaccine and felt fine right after. After awhile a customer came back and alerted the pharmacy that she had fainted and was in one of the aisles with her mom. she did not injure herself in the fall. We had her lay on the floor and took her blood pressure which was slightly low. We had her stay laying down until she felt better and her blood pressure increased. After about 25 more minutes she felt well enough to leave the store with her mom. |
| 1347694 | 5/25/2021 | | 84 | M | 2/15/2021 | 2/17/2021 | 2/17, admitted 2 days after covid vaccine with syncope/rhabdo. Patient admitted for mild rhabdomyolysis after a noncardiac syncopal episode that was thought to be related to recent Covid-19 vaccination. Troponin is elevated 0.25, lactate is elevated at 5.5. BMP shows elevation in glucose and BUN. PT/INR is elevated. VBG is unremarkable. CBC shows a macrocytic hyperchromic anemia. Patient's CK came back significant elevated likely indicating rhabdomyolysis. Admitted for cardiology consult. Patient was treated aggressively with IV fluids. Patient had multiple reevaluations given his history of congestive heart failure. After evaluation- not sure what caused the patient to collapse, but the etiology does not appear to have been cardiac. The patient thinks it may have been due to a reaction to the COVID vaccine. |

| 1347920 | 5/25/2021 | OH | 21 | M | 5/25/2021 | 5/25/2021 | <p>Patient received Janssen COVID19 vaccine (LOT#201A21A) in his left arm at approximately 14:43 on 5/25/21. During the 15 minute observation period, he expressed "I don't feel well" and endorsed dizziness/ lightheadedness, slight tingling feeling in fingers, and nausea. Shortly thereafter at approximately 14:50, he started to slouch and appeared faint while sitting in a chair with eyes closed. He did not fall or hit any part of his body. He was easily aroused with a touch on his arm and responded to verbal questions immediately. He denied trouble breathing, chest pain, palpitations, headache, muscle weakness, vision changes, skin reactions, swelling. He was oriented x3 and not exhibiting verbal or swallowing problems. His vitals were normal- HR 80 bpm and BP 105/80 mmHg. He was offered a receptacle to vomit in if needed; however, he did not vomit. This initial reaction was consistent with potential vasovagal reaction/ near-syncope after vaccination. Patient was encouraged and instructed to sit on the floor to prevent injury in case of fall but he refused. Staff offered him water, a fan, and opened windows while monitoring. Later while waiting for a ride at around 15:10, he endorsed headache (first above his eyes and then toward the back of his head) and clarified this did not feel like a typical migraine that he has had before. Then at around 15:20 he endorsed vision changes in his right eye- he could not see a portion of vision out of that eye except peripheral vision and described not being able to see writing on the right side of a whiteboard in front of him in the room. Later he described a resolution of that gap in vision but then had blurry vision out of that eye. He denied any vision changes in the left eye. Due to alarming symptoms of vision changes and onset of headache, patient was recommended to go to ER for further observation and evaluation. He was not in urgent distress and patient did not wish for EMS to be called but agreed to go to ER when his emergency contact picked him up. Patient's emergency contact came to pick up patient at approximately 15:40 and was recommended to take him to the ER. Patient and emergency contact were amenable to this plan. He was able to stand up and walk to the car without issues.</p> |

| 1347921 | 5/25/2021 | OR | 53 | F | 5/20/2021 | 5/20/2021 | Patient had syncope within 15 minutes following vaccine. Loss of consciousness <15 seconds, recovered quickly. |
| 1347600 | 5/25/2021 | OR | 34 | M | 5/22/2021 | 5/22/2021 | As a clinical monitor, I was called over to assess a driver slumped over in his seat. He had just received the second dose of the Pfizer vaccine approximately 10 minutes earlier. The passenger (his fiance) said he was acting normal until she heard him grunt and then realized that he was passed out. While attempting to lay flat, I performed a jaw thrust that yielded a stridulous inspiration but was still unresponsive. He did not have a palpable carotid pulse. Paramedics was summoned emergently. Within 30-45 seconds, he awoke but was confused and amnesic to the event. He had no physical complaints and no significant medical or allergy history. I auscultated his larynx (no stridor) and his lungs (CTA). His initial vitals: BP 90/51 HR 61 VR 16 SaO2 100% An electrocardiogram demonstrated a sinus rhythm without ischemic changes or evidence of conduction delay. His glucose was 119. Over the next 30 minutes, he was able to drink two bottles of water and some orange juice. That said, he still said he "felt off." Repeat vital signs: BP 118/62 HR 69 SaO2 100%. The medics advised him to follow up with his doctor, preferably today. His fiance agreed to drive him to an ED near their home for a more thorough evaluation. I provided her my phone number to provide to the ED for any questions. His clinical syndrome was consistent with a syncopal episode associated with orthostatic hypotension. Low suspicion for anaphylaxis. |
| 1347767 | 5/25/2021 | MI | 29 | M | 5/21/2021 | 5/21/2021 | Approximately 5 minutes after receiving his first dose of the pfizer covid vaccine, the patient began feeling faint and ended up fainting while sitting down. He laid his head on his girlfriend's shoulder and fainted. He was alert and conscious within 2 minutes. At that time, the patient said he does suffer from vasovagal syncope and frequently passes out when his anxiety is high. He denied our attempts to call for 911. After 30 minutes, the patient left under his own strength. His girlfriend drove them both home. |

| 1345841 | 5/25/2021 | GA | | F | 12/30/2020 | 12/31/2020 | Blacked out; Fainted; This spontaneous case was reported by a patient and describes the occurrence of LOSS OF CONSCIOUSNESS (Blacked out) and SYNCOPE (Fainted) in a female patient of an unknown age who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 026L20A and 028L20A) for COVID-19 vaccination. No Medical History information was reported. On 30-Dec-2020, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 27-Jan-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 31-Dec-2020, the patient experienced LOSS OF CONSCIOUSNESS (Blacked out) (seriousness criteria hospitalization and medically significant) and SYNCOPE (Fainted) (seriousness criteria hospitalization and medically significant). On 01-Jan-2021, LOSS OF CONSCIOUSNESS (Blacked out) and SYNCOPE (Fainted) had resolved. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. No concomitant medications or treatment information was provided. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Very limited information regarding the events have been provided at this time. No further information is expected at this time.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Very limited information regarding the events have been provided at this time. No further information is expected at this time |

| 1345896 | 5/25/2021 | MS | 65 | F | 1/20/2021 | 1/20/2021 | Hips were sore and achy.; Hips were sore and achy.; She was exhausted; Restless sleep; Diarrhea; Felt a little different; her cheeks were the reddest red she has ever seen; top of her head felt like a plate was on it; This is a spontaneous report from a contactable consumer (reported for himself). A 65-years-old female patient received first dose of bnt162b2 (BNT162B2, solution for injection, Batch/Lot Number: EL8982) administered in left arm via intramuscular route on 20Jan2021 at 09:20am as SINGLE DOSE for covid-19 vaccination. Medical history included family history of Asthma, Thyroidectomy in 2008, Parathyroid disorder. Concomitant medications included Levothyroxine (LEVOTHYROXINE) (100mcg by mouth in the morning) from 2008 as ongoing, Calcitriol (CALCITRIOL) (0.5 mcg daily by mouth) 2008 as ongoing, Calcium Citrate (CALCIUM CITRATE) (1000 mg once a day by mouth) as ongoing. It was reported that parathyroid never returned and patient has to take calcitriol. On an unknown date, the patient experienced hips were sore and achy, she was exhausted and restless sleep. The outcome of the events was unknown. On 20Jan2021, the patient cheeks were the reddest red she has ever seen and top of her head felt like a plate was on it and Felt a little different. The events were recovered on 21Jan2021. On 21Jan2021, the patient had diarrhea. The event diarrhea was recovered in Jan2021. It was reported that the patient received her first dose 20Jan2021 at 9:20am, about 10 hours later at 7:30pm patient reports that the top of her head felt funny, don't know how to describe it. Patient felt like a lid was on head and she would not describe it like a headache. Patient also had flushing of her cheeks stating they were very red, and patient was lit up like a tree. Patient treated this with a cold rag. Patient reports that did not have any of the following event's nausea, fainting, fever, chills, swelling, or welts. Patient took 2 Tylenol to treat the redness, and had a restless night of sleep, upon waking in the middle of the night, the flushing had subsided along with the head symptoms. In the days following vaccination, patient reported 3 days of bad diarrhea. Patient also states she was relatively healthy and active, but her hips were sore and achy after vaccination, but she powered through her 30-minute walk, anyway. Patient wants to know should she receive the second dose of the vaccine as scheduled on 10Feb2021 and |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

should she expect the same AE's. How can she treat them and does she need an Epipen or should she take Benadryl. It was reported that patient received the first dose a week ago as of Wednesday on the 20Jan2021 and in 3 weeks patient was scheduled to revaccinate with the 2nd dose on 10Feb2021. Patient considers a reaction something that happens within 30 minutes of getting a medication and a side effect is something that happens after that. patient reported that she received the first dose on 20Jan2021at 09:20am and exactly 10 hours later that night, patient felt a little different and the very top of her head felt like a plate was on it. It was like a headache, stated that was a little pressure. Patient stated that her cheeks were the reddest red she has ever seen. Patient did not feel like she had a fever or was chilly. She said that her cheeks were flushed. Patient was worried about and has heard about people that have died, gotten bell's palsy, and had strokes. No further details provided. Patient said that she also had diarrhea for about 3-4 days that was pretty bad and drinks lemon water constantly anyway. Patient said that she took 2 Tylenol to treat herself and went to bed and woke up a hour to 1.5 later. The redness in her cheeks were gone. Patient said that she had no shortness of breath, no fever, and no chills. Patient was just scared what would happen next. She was exhausted and thought rest would help her. Patient reported that she still had the feeling in the top of her head at that time she did not sleep well because she was worried. Patient describe it as a restless sleep. Patient stated that the only other thing she noticed was her hip joint were achy. When she got up the next day, patient realized the top of her head and feeling different resolved on 21Jan2021. Diarrhea resolved in the last 2-3 days. Patient ate and drank a lot of liquids and takes vitamins and described them as really good liquid vitamins and she stopped taking it 2 weeks prior to the vaccine and just ate well instead. Follow-up attempts were completed. No further information was expected.

| 1345753 | 5/25/2021 | MI | 43 | M | | 5/1/2021 | <p>PAIN IN STOMACH; SWEATS; REDNESS ON BODY LOOKS LIKE SKIN IS DISCOLORED; CHILLS; FEVER; NAUSEA; BODY PAIN; MIGRAINE; EVERY BEAT OF HEART HURTS; HYPERVENTILATION; COULD NOT GET A FULL BREATH; PASSED OUT; FINGERS WENT NUMB; GOT A CHARLIE HORSE ON LEG; EVERY SINGLE JOINT AND ANKLES HURTS FOR NO REASON; This spontaneous report received from a patient concerned a 43 year old male. The patient's weight was 135 pounds, and height was 66 inches. No past medical history or concurrent conditions were reported. The patient's concurrent conditions included migraine The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 042A21A, and expiry: UNKNOWN) dose was not reported, administered, 1 total to right deltoid on 19-MAY-2021 around 10 am for prophylactic vaccination. No concomitant medications were reported. On 19-MAY-2021, around 7 pm patient started experiencing side effects. After 1 hour of shot patient had his heart hurt at every beats, hyperventilation. It lasted for 1 -2 hours. The patient also had fever, chills, nausea, sweats and had not taken any medication, as he was afraid of another side effects, had redness on his body which looked like skin was discolored and was like hives. The patient also had body pain appeared suddenly. The patient also had pain in stomach which felt like nastiest gas cramp patient had ever and it was continuous like a rock blocking in stomach, he did not know if it is pain or gas but was hurting. Patient had migraine which lasted long time and was continuous than he ever had. The patient was fine as he was speaking at the time of reporting. On MAY-2021 (dates unspecified) the patient experienced Charlie on his leg (muscle spasm) for which he stood up and didn't do anything on leg, he was passed out and fingers went numb, felt every single joint and ankle hurt with sharp pain like a stuffed knife (intermittent pain for 3-5 minutes).He could not get a full breath of air, and was breathing really fast. Then patient tried to slow down breathing as he didn't want to be hyperventilated but it happened. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient had not recovered from body pain, hyperventilation, migraine, pain in stomach, chills, fever, nausea, and sweats, and the outcome of passed out,</p> |

| 1345735 | 5/25/2021 | FL | 27 | F | | 5/19/2021 | <p>SYNCOPE; CUT ON LIP FROM THE FALL; FELL; This spontaneous report received from a pharmacist concerned a 27-year-old female. The patient's height, and weight were not reported. The patient's past medical history included syncope (when she had blood draw), and concurrent conditions included fear of syringes. Patient was not pregnant at the time of reporting. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 205A21A, and expiry: 23-JUN-2021) dose was not reported, 1 total administered on 19-MAY-2021 for prophylactic vaccination into Right Deltoid. No concomitant medications were reported. On 19-MAY-2021 HCP (Health Care Practitioner) reported that the patient experienced syncope after receiving the vaccine. Patient fell face down for about 5 seconds from a sitting position seconds after receiving the shot. HCP called 911. The patient experienced cut on lip from the fall. Emergency medical services mentioned it was syncope and patient did not need to go to the hospital as patient seemed to have fully recovered. HCP reported the patient mentioned this had happened to her before when she had a blood draw. She had a fear of syringes. Emergency medical services advised patient to lie down for blood draws and shots in the future. HCP did not administer any other medications to the patient. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from syncope on 19-MAY-2021, and the outcome of fell and cut on lip from the fall was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0. 20210540040-COVID-19 VACCINE AD26.CO2.S-Syncpoe. This event(s) is considered not related. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There are other factors more likely to be associated with the event(s) than the drug. Specifically: MEDICAL HISTORY</p> |

| 1346677 | 5/25/2021 | MN | 26 | M | 5/24/2021 | 5/24/2021 | Received shot and waited for the 15 minutes as required, feeling no good with no symptoms. While driving home after leaving the pharmacy, I started experiencing light headed ness and dizziness. This eventually turned into tunnel vision which I thought was going to result in me fainting. This led me to start pulling over, but then the tunnel vision went away. During my short 10 minute drive home, this happened to me twice. After getting home, I had about 3 similar episodes during which similar light headedness happened. These all felt like they were getting close to fainting, and at one point while walking up the stairs in my house I could not stand. All of these symptoms started approximately 20 minutes after leaving the store, and then took place in a 20-30 minute timespan. Roughly 4-5 episodes in total, including the drive home and short time spent at home. No issues after lightheadedness stopped, besides feeling tired. I do not have a history of anxiety attacks due to needles. Donated blood and plasma in college, and have recieved many vaccines and never had this happen. |
| 1346557 | 5/25/2021 | VA | 37 | M | 5/20/2021 | 5/21/2021 | Lethargy, fever, chills, body aches, headache...beginning at hour 6 and lasting until hour 24. | 1346660 | 5/25/2021 | UT | 35 | F | 5/21/2021 | 5/21/2021 | This is a 35-year-old female, G2, P1 Ab0, 23 weeks pregnant, who presents to the emergency department for chest pain. Patient reports receiving her second Madura COVID-19 vaccine yesterday at around noon. She states that later that evening, she reports onset of fatigue, and pleuritic chest discomfort. She reports increasing in discomfort into this afternoon, with shortness of breath. She also reports body aches, and bilateral lower extremity calf pain. No fevers, or chills. No nausea, or vomiting. Patient is currently being followed by doctor of OB/GYN, with whom she had a conversation with this morning. Doctor already recommended she come in for evaluation. Otherwise patient denies any vaginal bleeding, discharge. No urinary symptoms. No prior history of a cardiac or pulmonary disease. No lightheadedness, dizziness, or syncope. No prior history of DVTs, pulmonary embolisms. |
| 1344002 | 5/24/2021 | WI | 61 | M | 5/20/2021 | 5/20/2021 | Patient began sweating and feeling lightheaded shortly after vaccination at approximately 1125. Patient then fainted in his chair and was initially non-responsive to the nurse. At this time I called 911. The nurse administered a single epi pen in patient's quad and he woke up. The nurse then took patient's vitals at 1138: BP - 109/73; P-84; SPO2-99%; T-97.4; R-16. Patient stating he was still feeling dizzy and fatigued. The paramedics arrived and took patient to hospital for continued evaluation. I called patient later in the afternoon and he had already been discharged and was at home resting and feeling better. |
| 1344014 | 5/24/2021 | PA | 22 | F | 5/21/2021 | 5/22/2021 | Moderna COVID-19 Vaccine EUA Around 4am on 5/22 I developed a mild fever. Got up around 7am 5/22 and took my temperature (99.8). I walked down my stairs to make toast and around 7:20 am I fainted in my kitchen. I had eaten and drank plenty of water the night before, so I don't think I was dehydrated or hypoglycemic. No other fainting events the rest of the day but I was extremely dizzy and nauseous. |

| 1343961 | 5/24/2021 | WI | 17 | M | 5/21/2021 | 5/21/2021 | Patient fainted (loss consciousness) a couple of minutes after receiving injection. Mom caught him and called for help and reported his eyeballs rolled up and he started down when she caught him. by time Pharmacist and store staff got there (less than a minute) he had regained consciousness but very lightheaded. No breathing difficulty. So got a chair and had him sit with head down and store staff observing. After another 10min he still reported lightheaded and nausea, so ambulance was called. When they arrived and checked him out everything checked out normal and he was feeling better so they released him to his parents care. Called on 5/24/21 at 10:10am and spoke to mom who reported he was doing fine and no apparent after effects. |
| 1343946 | 5/24/2021 | MO | 28 | F | 5/24/2021 | 5/24/2021 | Patient upon registration for vaccine informed us that she typically faints when getting shots, I asked patient if she was sure this was the best setting to receive the vaccination and she said yes. I asked her boyfriend to remain with her during the vaccination and to stay with her after. I administered the vaccine to the patient whom did not pass out immediately I talked with her and she said she felt fine actually. I advised her to stay in the same chair in vaccination booth and I walked back into the pharmacy and a few minutes later noticed she was sitting on her friends lap in a chair. I went to check on the patient and she had fainted but was doing ok friend with her said. I offered water, wet towel and ice pack which patient did take. I stayed with patient for a couple minutes and then followed up 5 minutes after patient was still feeling faint. I told patient to sit as long as needed. After about 20 minutes I checked on patient again and she was feeling well. I offered to sit with her while her friend pulled up his car to the front of the store so she did not have to walk far. I told patient I will follow up with her later tonight. |

| 1344064 | 5/24/2021 | AR | 63 | M | 5/24/2021 | 5/24/2021 | Patient has severe phobia of needles. About 10 minutes following administration of Janssen vaccine, patient began turning pale and said that he felt dizzy. Moments after, patient fainted and was out for about 30 seconds. During this time, 911 was called and then patient came to but was still very pale and lips were blue. EMTs came minutes later and took patient to ambulance to be checked out. Patient was feeling better by then and did not leave in ambulance. |
| 1343842 | 5/24/2021 | CA | 17 | M | 3/19/2021 | 3/19/2021 | Syncope/fall s/p vaccine #1, abrasion under chin>ED>dc'd declined txt |
| 1345273 | 5/24/2021 | WA | 16 | M | 5/24/2021 | 5/24/2021 | patient received first dose. Left the consultation room and fainted within a few minutes. Emergency personell were called and patient taken to the ER. Patient given fluids and sent home follow up with family stated patient fine. |
| 1345247 | 5/24/2021 | IN | 30 | F | 3/13/2021 | 4/3/2021 | Started feeling faint and dizzy more often about 2 weeks after the vaccine. After almost fainting at work, the paramedics came to find out it was due to a dangerously high blood pressure of 180/110. |
| 1344914 | 5/24/2021 | TX | 68 | M | 1/15/2020 | 1/21/2020 | My husband had the shot at a center. A few days pass I noticed his strength deteriorated. By that morning he passed out with chest pains. We went to the er. Then off to the hospital. He had inflammation around his heart. 24 ounces of fluid! After being released with in a few days again chest pain back to the hospital. This time fluid around the sac of one lung. So questions were asked. Our cardiologist said she had another younger patient who got the Moderno shot as well and had the same issues. So weeks of steroids, meds to clear up the liquids as well as the inflammation. This had already caused scarring. They did a cath on him and unrelated to the reaction and inflammation and scarring. He needed a several bypasses. Because of the scarring they couldn't find arteries to get my husband back into shape. I believe this has set my husband back, on returning to the hospital and talking to several cardiologist there?s a 10% rise with patients in the hospital right now with the same issues! Why arnt you sharing this! I now feel that my husband is living on borrowed time. I wish we never got the shot! Now younger adults are having issues. |

| 1344876 | 5/24/2021 | SC | 18 | F | 5/24/2021 | 5/24/2021 | Patient frequently faints following vaccinations. About 2-3 minutes after receiving vaccination, patient fainted while sitting in a chair. Once patient began to come to, she convulsed. Pharmacist and nearby customers helped lay her on the ground. Patient came to and was given water and a glucose tablet. EMS was called at the start of the incident. Patient remained lying down until she felt ok to sit up. EMS checked her blood pressure, which was normal and she was ok to go home. |
| 1344868 | 5/24/2021 | PA | 16 | F | 5/24/2021 | 5/24/2021 | Patient was visibly nervous/anxious about the vaccination. Patient had reported syncope from a previous vaccination on their consent/screening form. Vaccine was administered as prescribed and patient initially appeared fine but lost consciousness approximately 15 to 20 seconds after. The patient's mother, who was present as her legal guardian, helped me cushion the the patient to ensure she did not fall and injure herself. Patient regained consciousness in 10 to 15 seconds but then passed out again. I was then able to elevate the patient's legs and she regained consciousness. Provided patient with chilled bottled water and allowed her to rest in the vaccination booth for 15 minutes. I stayed with the patient during that time and observed her. Afterwards she said she was feeling better and the color in her face was returning. She felt comfortable standing up and moved to a different seat in front of the pharmacy where she waited another 15 minutes. I observed her from the bench during that time. When the patient and her mother felt comfortable they left the pharmacy together. |
| 1344576 | 5/24/2021 | NJ | 19 | M | 5/24/2021 | 5/24/2021 | patient fainted and regained consciousness |
| 1344654 | 5/24/2021 | MA | 19 | M | 5/23/2021 | 5/23/2021 | Patient received vaccine. Patient fainted into mother's arms about 3-5 minutes later. Patient reported feeling light headed after getting up too fast. EMS responded. Patient vomited 5-10 minutes later while speaking with paramedics. |

| 1344212 | 5/24/2021 | IA | 17 | F | 5/24/2021 | 5/24/2021 | Patient became light headed and fainted from a seated position about 10 minutes after her first Pfizer COVID-19 vaccination. She doesn't think she lost consciousness. Her skin was quite warm and sweaty after this event. I had her remain laying down on the ground while she recovered and I assessed her symptoms. She felt better almost immediately so I had her move to the pharmacy office for observation for an additional 15-20 minutes. She then reported that she has fainted with shots before and she hadn't eaten anything today. Her mother said this has happened before and drove her home once she felt well again. |
| 1344420 | 5/24/2021 | NY | 37 | M | 5/24/2021 | 5/24/2021 | Within two minutes from getting his second shot, Pt passed out from a standing position striking the back of his head. Pt was unresponsive for 2 minutes before he was able to talk to EMS, Pt was picked up by staff and with his head supported placed on the stretcher to be take to the medical for treatment. While in treatment room, vitals and demographics were obtained. Treatment included ongoing vitals, ice pack for his head (large contusion to the right back of his head approx. 50 mm in dia. After 20 minutes of treatment and assessment, Pt tried to sit up and upon doing so became very dizzy and light headed. At this time the decision to call for a transport ambulance was made by calling 911. ambulance arrived within 10 minutes verbal report make to the medic and care was turned over at that time. |
| 1344416 | 5/24/2021 | AZ | 27 | M | 5/24/2021 | 5/24/2021 | Patient fainted following vaccine administration |
| 1344334 | 5/24/2021 | FL | 19 | M | 5/22/2021 | 5/22/2021 | Patient received the vaccine and fainted within 5 minutes after receiving the vaccine. He fell and hit his head and had a nose bleed. He was put in the Trendelenburg position and recovered immediately. The EMT was called and provided care to the patient. Checked on patient and patient said he was able to walk home on his own. |
| 1344316 | 5/24/2021 | CA | 13 | F | 5/18/2021 | 5/18/2021 | About 3 min after getting vaccinated, patient fainted Reason for visit in ER: Near Syncope Diagnosis: Syncope and collapse |

| 1343333 | 5/24/2021 | WA | 18 | F | 5/13/2021 | 5/13/2021 | Patient passed out about 5 minutes after getting the covid vaccine. Pharmacist was called right away and the patient was found lain on the floor, coherent and talking to the mother. She rested there for a few minutes, drank some water. She looked ok and refused further EMS help when EMS arrived. |
| 1343326 | 5/24/2021 | NJ | 15 | F | 5/22/2021 | 5/22/2021 | One of the physician observers wrote: From what I understand she had her shot and switched places with her sister and was standing and then just went down. I don?t believe she hit her head we didn?t see a lump. She came too right away and got nauseated and light-headed again sitting up so we took her to lay down on the stretcher. She was doing ok but laying down when I left. The nurse that administered the immunization wrote: She got vaccinated, tolerated it well. Told her sister she barely felt it and expressed relief. Sat for a minute while in handed her mom paperwork (vaccination card). Then got up, stood with mom and brother. Was standing one minute and went down without warning, standing next to brother and mom. I had just finished vaccinating the sister, I was putting a bandaid on her when it happened so couldn't have been more than a couple of minutes. Dr. observed this patient after they passed out at the vaccination clinic and subsequently released her home with the family. |

H2O daily+powerade(S/F)p * urine near clear by afternoon * using RR 3x/night, but avg 5a wake-up with severe headache & PARCHED with very dry mouth |
| 1343253 | 5/24/2021 | CA | 27 | M | 5/17/2021 | 5/17/2021 | 5 min after shot. Warming sensation spread from arm across my entire body. Felt nauseous and blacked out. Passed out face first on the floor. No fear of needles. I have records of getting previous flu vaccines without passing out. I have been experiencing hot flashes, nausea and fatigue for 6 days now. |
| 1343203 | 5/24/2021 | TX | 15 | M | 5/21/2021 | 5/21/2021 | Patient reported feeling "nauseous" about 5 minutes after having received vaccine. Patient had an episode of syncope in the restroom. Assisted patient to sitting position was A&O x4, no signs of active bleeding or cuts. O2 saturation was 99% with HR of 83. Patient was able to swallow and answer basic commands. |
| 1343140 | 5/24/2021 | NY | 51 | F | 2/27/2021 | 2/28/2021 | Since receiving the vaccine I have extreme lightheadedness requiring me to grab things to avoid falling over until it passes. I passed out once. I have chest pain and fullness as well. My doctor told me to drink juice, wear compression socks, eat salty foods and drink more water. I began tracking my BP and my diastolic is in the 40s and 50s when these incidents occur which is often. The chest pain is consistent. I saw a cardiologist who told me to drink more water and eat more salt. EKGs are fine. I'm going to the Clinic on June 2nd since we all know women's heart issues are dismissed. The pain and fullness in my chest are becoming annoying and distressing. Since taking the vaccine my exercise fell off almost completely except for pickel ball and when I did play I couldn't play as I had before at all. I've now stopped playing and I'm walking as I used to so that I keep moving. I can't run. :(|

| 1343830 | 5/24/2021 | TX | 13 | M | 5/22/2021 | 5/22/2021 | Patient (13 years old) fainted at the vaccination table after receiving his first dose of the Pfizer vaccine, while waiting for his mother as she was getting vaccinated. Patient saw his mother bleed after the vaccine and fainted in the chair, as he began to fall, the vaccinator was able to catch him and assist him to the floor. Patient was turned on his side. EMS was called at 0912 and arrived at 0919. Patient was assessed by paramedics and found to be stable. Patient's mother reported no PMH and the he doesn't usually faint after injections. Patient left accompanied by his mother. |
| 1343827 | 5/24/2021 | CO | 39 | F | 5/24/2021 | 5/24/2021 | At 10:58, patient reported feeling of "foggy ness" which she stated was "like air in my head" after receiving Janssen vaccination at 10:53. Patient was found sitting outside of vaccination bus, alert and oriented to person, time, place and event and did not appear to be in distress. Patient denied shortness of breath, dizziness, blurry vision, weakness to one side of body, feeling of syncope, and was negative to all signs of the Cincinnati stroke scale test. Patient's vital signs were monitored for the duration of event. After 15 minutes of monitoring, patient stated that her feeling of "foggy ness" had improved but that it still mildly lingered. Patient was offered a call for emergency services but patient denied them and stated that she would seek further medical help if her condition worsened, or continued. Patient stated that she was going to visit a medical facility after leaving vaccination clinic. |
| 1343823 | 5/24/2021 | NV | 17 | F | 5/22/2021 | 5/22/2021 | Systemic: Allergic: Anaphylaxis-Severe, Systemic: Fainting / Unresponsive-Severe |
| 1343820 | 5/24/2021 | NH | 55 | M | 5/1/2021 | 5/23/2021 | I received the vaccine in the right arm and within about 20 seconds I felt like I was going to faint and had rapid heart rate (pulse of 155) measured by EMT. I needed to remove the mask as I was having difficulty with the rapid heart rate and feeling of fainting. I also felt pins and needles type feeling in my legs and my face felt slightly swelled. I felt tired and that tired feeling lasted for the entire day. I stayed at the vaccination site for approximately 30 minutes at the advice of the EMT and went home. Later I had a slight headache but heart rate became more normal. |

| 1343810 | 5/24/2021 | CA | 20 | F | 5/24/2021 | 5/24/2021 | Patient did not disclose she is prone to fainting after getting shots/blood drawn. 3-5 minutes after getting Janssen vaccine patient fainted in one of our aisles. We had her sit down. We gave her some water, kiwi strawberry, and a tootsie lollipop. We monitored her for 15-20 minutes, then her mother took her out to parking lot. We asked if they needed anything else while at our store, and just re-iterated that she is okay and is prone to fainting after any kind of shots/blood drawn. |
| 1343792 | 5/24/2021 | TX | 14 | M | 5/17/2021 | 5/17/2021 | Patient (14 years old) fainted in the observation area receiving the first dose of the Pfizer vaccine. Patient fell from chair and had some scratches to right temporal region. Patient was accompanied by his mother. Patient was assisted to chair and appeared very pale and disoriented to time and place. EMS was called at 1138. Patient also stated his vision was blurred, reported nausea (emesis x1), and reported feeling very weak and ?really weird?. Patient also reported he was very sleepy and wanted to go to sleep. Patient was kept awake. Mother stated patient had history of ADHD and anxiety but no other past medical history. Paramedics arrived at 1145 and assessed patient. Blood glucose and VS were normal. Patient continued to report feeling unwell and wanted to go to the hospital but also wanted to ?stop for food?. Patient?s mother reported that patient was starting to sound like his normal self and that his color was returning. Patient?s mother agreed for the paramedics to transfer patient to ED for further evaluation. Patient left in ambulance at 1157. |
| 1343184 | 5/24/2021 | IN | 23 | M | 5/22/2021 | 5/22/2021 | Passed out in observation room approx. 5 minutes after the dose, had a mild seizure and tore up my left ear on the carpet. History of passing out in hospital settings, possible vasovagal syncope, no history of seizures. recovered on hallway bed with granola bars and sprite. Approx. 9:30 pm temperature jumped within a couple of hours to around 101, after going to bed was half-awake-half-asleep until 7 am with vivid dreams/internal dialog. |

| 1343558 | 5/24/2021 | PR | 46 | F | 4/14/2021 | 5/7/2021 | Syncopal, R25.9 Unspecified abnormal involuntary movements. R55 Syncopal and Collapse. I don't remember how it happen just collapse, ambulance took me to the hospital. |
| 1343559 | 5/24/2021 | KY | 14 | F | 5/20/2021 | 5/20/2021 | Approximately 2 hours after receiving her first covid vaccine, my 14 year old fainted. She was standing in our kitchen at home and became dizzy and started falling backwards. She said her vision was black, she was hot, her head hurt, I could see sweat on her face and chest, and she said she was having tightness in her chest/not able to get full breaths. She didn't totally lose consciousness, but she was disoriented. These symptoms lasted a few minutes, then she felt fine. |
| 1343575 | 5/24/2021 | IA | 17 | M | 5/18/2021 | 5/18/2021 | Patient reported they couldnt stand the sight of blood and had fainted during draws before. Father was present in the vaccine office as well. Immediately following the administration of the vaccine patients eyes glazed over and he fainted. A few seconds later he began to have a spastic seizure that was short in nature, followed by a voiding of his bladder before he regained consciousness. Patient was given water, glucose tablets, and instructed to lay on the floor of the room with his feet elevated while a member of the staff stayed with him to treat and watch him. Followed up with patient and doctor soon after to learn this was the only time it has happened, patient fully recovered. |
| 1343597 | 5/24/2021 | PA | 20 | M | 5/17/2021 | 5/18/2021 | In the middle of the night he stood up to go to the bathroom, turned the light on, felt dizzy and light headed. Passed out and woke up confused unable to speak correctly and unstable when trying to stand up. Eyes were dilated. After he layed down for a few minutes he was ok, could walk and talk fine. Migraine Chills Slightly warm |

| 1343598 | 5/24/2021 | MI | 28 | F | 5/22/2021 | 5/22/2021 | Patient fainted and stated troubled breathing multiple times once regained consciousness. Epi Pen administered and symptoms resolved within 10 minutes. Patient did not need further medical attention. |
| 1343678 | 5/24/2021 | AZ | 14 | F | 5/23/2021 | 5/23/2021 | Patient had episode of vasovagal syncope approximately 3 minutes after the vaccine. Pharmacist assisted dad in comforting patient. Patient was placed flat on the floor. 911 was called by technician. Patient aroused before EMS arrived on scene approximately 2 minutes after syncopal episode. Patient recovered. EMS did not take patient. |
| 1341983 | 5/23/2021 | CO | 27 | M | 5/23/2021 | 5/23/2021 | While the patient was being observed after his vaccine, he informed me after close to 10 minutes that he was starting to feel dizzy and couldn't see clearly because of the dizziness. He was moved to the floor, lying on his back, and his legs were elevated on the chair. I informed the patient to take slow, deep breaths. The patient said he immediately started to feel better once moving to the floor. He remained in this position for about 10 minutes, feeling better the entire time. He slowly sat up to a seated position for about a minute, and upon feeling fine, he stood up and felt normal. The patient informed me that he has a history of dizziness and fainting with different vaccines in the past and this is not an unusual reaction for him. |
| 1341832 | 5/23/2021 | IL | 12 | F | 5/23/2021 | 5/23/2021 | Patient fainted after receiving 1st dose of the Pfizer vaccine. Once vaccine was administered in the pharmacy area, patient moved to the waiting area near one of the aisles. She was in the aisle with her father when she fainted, and father brought her to one of the nearby chairs where she sat down. Patient was conscious and stated she was feeling dizzy, no other symptoms, and did not want us to call 911. She drank some water and remained seated for 30 minutes. Pharmacist checked on her every 10 minutes to make sure she was still feeling okay. Patient stated that she was "really nervous" to get the vaccine. She denied feeling any other symptoms, and after sitting down said she was feeling better. |

| 1341863 | 5/23/2021 | OH | 13 | M | 5/21/2021 | 5/23/2021 | My son woke up the day following his vaccine and had mild complaints of headache and ?feels like I have a touch of the flu?. He hydrated with water that day very well and I gave him 500 mg of Tylenol. On Sunday (2 days after vaccine) we were at church celebrating outdoor Mass. about 20 minutes into church my son said he didn?t feel well and needed water. He was standing at the time he said this. He had been standing under and umbrella the entire time to shade him from the sun. About 1 minute later he fainted. He visually looked very pale at the time. We treated him with by having sit down, moved him to air conditioning. It took about an hour before he felt back to baseline. |
| 1341844 | 5/23/2021 | | 18 | M | 5/22/2021 | 5/22/2021 | Dizziness, lightheadedness, nearly fainted Given crackers, water and juice |
| 1341497 | 5/23/2021 | NV | 48 | F | 2/6/2021 | 2/6/2021 | Around 2:00pm, I was feeling tired. I went home to take a nap. Upon arriving at home,, I started to feel light headed and the room began to spine,. I realized I was about to pass out. I made my last call to my daughter for help. When she came home I was unresponsive. She called 911 and started doing what the 911 operator was instructing her to do. I came to for a few seconds and pasted out again. I woke up with my sister pounding my chest area. I passed out again and work to EMTs asking me questions. I lost my bodily function when I passed out. On the way to the ambulance, I began to throw up. I passed out again and woke up on February 14. I say up work because I have no recollection of what happened to me after I got in the ambulance. I was taken to Hospital. They ran all types of tests. I know my heart was elevated. I ended up leaving the hospital on dialysis and a implanted defibrillator. I have 1342 pages of medical records that I can share. |

| 1341808 | 5/23/2021 | NY | 32 | F | 3/31/2021 | 4/19/2021 | Severe menstrual cramping. I have never experienced physical pain like this in my life. My first cycle after the Jansen vaccine, I had an acute cramp attack that lasted about 15 minutes. This was in April. I almost asked my partner to take me to the hospital. During the second cycle I had since being vaccinated, on the first day I started menstruating, I nearly fainted and was seeing stars while trying to get home. I had taken two Advil and this was not enough to help at all. I took two more shortly afterwards. The blinding pain lasted for 20-30 minutes. I can't express the severity of this pain. It was unprecedented and terrifying. The rest of my menstrual cycle is different as well. The first day was extremely heavy aside from being alarmingly painful, and then from the second day on, it was very light. I also believe that I may have developed seasonal allergies post-vaccine as I have never had them in my life. I am currently struggling with this common discomfort. |
| 1341769 | 5/23/2021 | DC | 26 | M | 4/30/2021 | 5/6/2021 | 10 days after the second dose, experienced minor chest pains, eventually almost fainted. Went to the ER and found troponin levels that peaked at 5.78, eventually trended down to 3.55 by the next morning. MRI revealed myocarditis in the left ventricle. |
| 1341680 | 5/23/2021 | CA | 49 | F | 5/20/2021 | 5/21/2021 | Patient developed fever and 3 episodes of syncope on the day following the vaccine. The third episode of syncope occurred while being driven to the hospital. She arrived at the hospital in cardiac arrest with asystole. She was resuscitated and is currently in the ICU intubated. |
| 1341606 | 5/23/2021 | TX | 18 | M | 5/22/2021 | 5/22/2021 | Systemic: Confusion-Mild, Systemic: Dizziness / Lightheadness-Mild, Systemic: Fainting / Unresponsive-Severe, Systemic: Hypotension-Mild, Additional Details: Patient went to observation area after receiving Pfizer Covid-19 Vaccine. Patient became lightheaded and faint and fell to floor. Patient was unconscious for approximately 30 sec. After being repositioned, patient did regain consciousness; however was a little confused as to what had happened. Patient did injure his lip during fall. Vitals were all within normal limits with a slightly low blood pressure reading. 911 was called immediately. Stated had not eaten today/slept night before either. |

| 1341585 | 5/23/2021 | CT | 12 | F | 5/22/2021 | 5/22/2021 | Systemic: Fainting / Unresponsive-Severe, Additional Details: upon exiting vaccination room pt fell forward. it is unknown if she fainted or tripped, mom was standing behind her and was unsure as well. pt bumped head and had a welt on her upper right eyebrow, also her nose began to bleed. ice pack was given/applied to head/eye, paper towel given to stop nose bleed. also water/starburst given. 911 was called. dispatchers came and questioned if she felt dizzy when she left room to which pt responded no, ambulance took pt. |
| 1341937 | 5/23/2021 | IL | 15 | F | 5/22/2021 | 5/22/2021 | Passed out about 5 minutes after receiving the shot. Was sitting in a chair and collapsed to the ground. She regained consciousness within 30 seconds and was sitting in a chair again 5 minutes later |
| 1341984 | 5/23/2021 | PA | 63 | F | 5/18/2021 | 5/18/2021 | The injection did hurt quite a bit more than other injections I have had in the past but it began to feel better and I sat in a chair and was on my phone to send a message, spoke to a stranger who was looking for where to go, and was ok until the feeling of fainting began 10 minutes after the shot. I put my head between my knees but it did not help so I called for help and eventually was helped onto the floor to lie down which began to help. I had vision trouble and hearing trouble and could not speak. I was told my neck became bright red as my face grew white and my hands twitched and my eyes rolled around. I found out later that I had also peed my pants. I have fainted only once before in 1989, and found this reaction pretty frightening although I do not believe it happened as a result of anxiety or fear, the adverse effect itself was frightening and unexpected- not listed on any paperwork I received and was not aware it could occur. |

| 1342095 | 5/23/2021 | CA | 78 | M | 3/30/2021 | 5/1/2021 | My uncle had a stroke almost exactly one month after second moderna shot. He is/was one of the most healthy older men I have ever known. Avid bike rider and exercise buff usually runs circles around guys half his age. I?m talking biking in the hills fit. He does have a pacemaker now and has to tame things done, but I think he got the pacemaker because he pumped so much blood through that thing doing all those hills for all those years. Not on any other meds expect whatever might be expected for the pacemaker. He was at the gym on May 1 working out and sitting down doing some arm curls when all of a sudden he passed out, he regained consciousness as a couple of guys were helping him to his feet, that?s all he could remember. He managed to drive himself home and then couldn?t shake the headaches and on coming symptoms, so one of his sons took him to the emergency room. Within 30 minutes it was already determined the doctors needed to operate fast. The stroke nightmare and recovery has process has been ongoing ever since. He was transferred to a rehab on May 19th where it looks like he will stay for at least a couple weeks, hopefully. He looks like he aged fifteen years, speech is ok, but he?s slow almost as if he is not hearing me? I think his hearing is fine but it seems like he works to formulate the thought of what he wants to say as I write this summary on May 23rd. He?s got two staples in his head, one pretty much top center and the other just a little off to his right. Drain blood I assume as I?ve never seen a post stroke victim up close like that. Our family do not get strokes! Maybe too much tequila and stuff like that, but my huge family usually all live into their 90?s and a few into their 100?s like my grandparents and my 104 year old great grandma. But of course they did not grow up with flu shots and vaccines. My grandparent grew a substance and stored in jars of olive oil or canola oil and rubbed that stuff on their our bodies if ailments go really bad. Other than that it?s highly concentrate oil of oregano. Couple drops on your tongue will set your mouth on fire. That?s the concentration we are talking about! Anyhow, my uncle hasn?t done vaccines or flu shots in the past, but all this gloom and doom from the mainstream media convinced him to get the shot. This now make the second person to stroke out after these unicorn shots. Yeah thanks big pharma and you scandalous mainstream media for just |

| 1340358 | 5/22/2021 | MI | 51 | F | 4/19/2021 | 4/19/2021 | nearly passed out; the shoulder where she got her injection started hurting really bad; getting hot; sweating; thirsty; Her blood pressure dropped; couldn't breathe; arm hurting really bad; got very weak; turned gray, like an elephant; felt floaty; This is a spontaneous report from a contactable consumer (patient). A 51-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration at left shoulder (Arm Left) on 19Apr2021 10:00 AM at age of 51 years old (Batch/Lot number was not reported) as 1ST, SINGLE for covid-19 immunisation. The patient's medical history was reported as just told her blood pressure dropped on an unknown date, hooked patient up to a bunch of wires and stomach, monitoring her on a machine. The last couple of time patient had blood drawn, the one last time, she went into shock and passed out. This wasn't quite the same thing with this time. This was maybe 2 years before unspecified date. One time it was pretty bad and patient fell down, get the doctor and hook patient up to all that stuff. Didn't quite feel the same way as this time. She didn't get hot and sweaty. Patient was not taking any pills. The concomitant medications were not reported. After first dose of the Pfizer covid vaccine. After the injection on 19Apr2021, patient sat for 15 minutes (wait for 15 minutes) and the shoulder where she got her injection started hurting really bad. Arm hurting really bad, walked across the hall and sat in the chair, maybe 2 minutes later. Then started tearing her mask off because she couldn't breathe. Patient started getting hot, sweaty and thirsty. Patient was sweating, started getting hot and thirsty and then got really sweaty and super hot. Got really thirsty and was given water. She was trying to grab a bottle of water and she didn't have the strength. She got very weak, turned gray, like an elephant and her blood pressure dropped, and nearly passed out. It lasted maybe 10 or 15 minutes. They called the ambulance. By the time they got there, she was feeling more back within herself and it was pretty much done and was totally better, maybe 90 percent. She just wanted to go home and did not go in the ambulance. She felt floaty but did not pass out. With the first one, she had a reaction and is wondering if she should even take the second one. Therapeutic measures were taken as a result of thirsty included water. Treatment for other event was reported |

| 1340164 | 5/22/2021 | TN | 30 | F | 1/19/2021 | 1/19/2021 | Seizure; Syncope; Diarrhoea; Chills; Vomiting; This case VAERS (Reference number: 0989940) on 11-May-2021 and was forwarded to Moderna on 11-May-2021. This regulatory authority case was reported by an other health care professional and describes the occurrence of SEIZURE (Seizure) and SYNCOP (Syncope) in a 30-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Epilepsy. Concurrent medical conditions included Drug allergy (sulfa). Concomitant products included LAMOTRIGINE, PHENYTOIN SODIUM (DILANTIN D.A.) and LEVONORGESTREL (MIRENA) for an unknown indication. On 19-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 19-Jan-2021, the patient experienced SEIZURE (Seizure) (seriousness criterion medically significant), SYNCOP (Syncope) (seriousness criterion medically significant), DIARRHOEA (Diarrhoea), CHILLS (Chills) and VOMITING (Vomiting). At the time of the report, SEIZURE (Seizure), SYNCOP (Syncope), DIARRHOEA (Diarrhoea), CHILLS (Chills) and VOMITING (Vomiting) had resolved. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Patient experienced profuse vomiting and diarrhea, syncope, chills, seizures. Emergency room visit received 3 bags of lactated ringers, 12 mg of IV zofran, 12.5 mg of IV Phenergan. Full blood work and 2 computerized tomogram (CT) scans but results were not provided. Based on the current available information and temporal association between the use of the product and the start date of the events of chills, vomiting, and diarrhea, a causal relationship cannot be excluded. Causality for the events of seizure and syncope are probably related to the patient's medical history.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events of chills, vomiting, and diarrhea, a causal relationship cannot be excluded. The patient's height, and weight were not reported. The patient's concurrent conditions included asthma (as a child), non-alcoholic, and cigarettes smoker. The patient experienced drug allergy when treated with Tamiflu (oseltamivir phosphate). The patient received Covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: unknown, expiry: unknown, NDC number: 59676-0580-15) dose was not reported, 1 total administered on 14-MAY-2021 at 10:00 for prophylactic vaccination on left arm. The batch number was not reported and has been requested. No concomitant medications were reported. On 14-MAY-2021, as soon as the patient got the shot (within the 15 minutes of wait at the pharmacy), he had an anaphylactic reaction. It was further reported that he could not breathe, his lips and face started to swell and then he passed out. The patient was taken to ER (emergency room) and his doctor gave him EpiPen (epinephrine) shot, Medrol (methylprednisolone), Benadryl (diphenhydramine hydrochloride) and IV (intravenous) fluids. The patient's lips were drooping to the right side of his face even after taking the medications. The patient stayed at the ER for 6 or 7 hours then was sent back to home on the same day. On 15-APR-2021 (reported as Saturday), the patient had fever. On 16-MAY-2021 (reported as yesterday from the date of reporting), the patient was much better, and his drooping lips was there a little bit but not as bad. The reporter did not have patient's vaccination card (for lot number or expiration date). The action taken with Covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from anaphylactic reaction (passing out/ could not breathe/ swollen lips and face) on MAY-2021, and was recovering from fever, and lips were drooping to the right side of face. This report was serious (Other Medically Important Condition, and Life Threatening).; Sender's Comments: V0: 20210532244-COVID-19 VACCINE AD26.CO2.S-ANAPHYLACTIC REACTION. This event(s) is considered related. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and is scientifically plausible. There is no |

| 1340272 | 5/22/2021 | NY | 61 | F | 3/23/2021 | 3/26/2021 | Fell again, breaking left leg; Breaking ankle; Breaking foot; Passed out; Stroke; Fell again; Swollen arm; Did not get second Covid shot; Joint pain; This case was initially received via an unknown source (no reference has been entered for a health authority or license partner) on 28-Mar-2021. The most recent information was received on 12-May-2021 and was forwarded to Moderna on 13-May-2021. This spontaneous case was reported by a consumer and describes the occurrence of CEREBROVASCULAR ACCIDENT (Stroke), LOSS OF CONSCIOUSNESS (Passed out), LOWER LIMB FRACTURE (Fell again, breaking left leg), ANKLE FRACTURE (Breaking ankle) and FOOT FRACTURE (Breaking foot) in a 61-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 013M20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No medical history was provided by the reporter. On 23-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 26-Mar-2021, the patient experienced ARTHRALGIA (Joint pain). On 30-Mar-2021, the patient experienced LOSS OF CONSCIOUSNESS (Passed out) (seriousness criteria hospitalization and medically significant). On an unknown date, the patient experienced CEREBROVASCULAR ACCIDENT (Stroke) (seriousness criteria hospitalization prolonged and medically significant), LOWER LIMB FRACTURE (Fell again, breaking left leg) (seriousness criterion hospitalization), ANKLE FRACTURE (Breaking ankle) (seriousness criterion hospitalization), FOOT FRACTURE (Breaking foot) (seriousness criterion hospitalization), FALL (Fell again), PERIPHERAL SWELLING (Swollen arm) and INCOMPLETE COURSE OF VACCINATION (Did not get second Covid shot). The patient was hospitalized for 13 days until 12-Apr-2021 due to CEREBROVASCULAR ACCIDENT, then until 12-Apr-2021 due to ANKLE FRACTURE, FOOT FRACTURE, LOSS OF CONSCIOUSNESS and LOWER LIMB FRACTURE. The patient was treated with Physical therapy for Cerebrovascular accident; Physical therapy for Lower limb fracture; Physical therapy for Ankle fracture and Physical therapy for Foot fracture. At the time of the report, CEREBROVASCULAR ACCIDENT (Stroke), PERIPHERAL SWELLING (Swollen arm) and |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

ARTHRALGIA (Joint pain) outcome was unknown, LOSS OF CONSCIOUSNESS (Passed out), FALL (Fell again) and INCOMPLETE COURSE OF VACCINATION (Did not get second Covid shot) had resolved and LOWER LIMB FRACTURE (Fell again, breaking left leg), ANKLE FRACTURE (Breaking ankle) and FOOT FRACTURE (Breaking foot) was resolving. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. No Concomitant product use was reported. Treatment medication included Benadryl. Very limited information regarding these events has been provided at this time. This case also refers to an incomplete schedule of vaccination. Further information has been requested. Most recent FOLLOW-UP information incorporated above includes: On 12-May-2021: Case upgraded to serious (Hospitalization), Added Additional events experienced, Events description, and updated Treatment information.

| 1340320 | 5/22/2021 | KS | 17 | F | 4/19/2021 | 4/26/2021 | White papule; Scab; This is a spontaneous report from a contactable other hcp (patient's mother). A 17-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EW0162), dose 2 intramuscular, administered in right arm on 19Apr2021 09:15 as 2nd dose, single for covid-19 immunisation. Medical history included vaso vagal syncope. The patient's concomitant medications were not reported. The patient previously received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: ER8733,) intramuscular administered in right arm on 29Mar2021 16:00 for COVID-19 Immunization. On 26Apr2021, the patient developed white papule which turned into a scab approximately 1 week following second injection, roughly three inches below injection site. Seriousness criteria-Congenital anomaly/birth defect: Yes. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. There is no list of any other medications the patient received within 2 weeks of vaccination, no known Allergies. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The outcome of the vents was resolved with sequel. Information on Lot/Batch number was available. Additional information has been requested.; Sender's Comments: Based on temporal association, the contribution of the suspect drug to the onset of events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate. |

| 1340335 | 5/22/2021 | | 57 | F | 3/24/2021 | 3/24/2021 | Passed out for 1 minute; Near syncope; Felt dizzy; Epigastric pain x3 days w/N/V; This is a spontaneous report from a non-contactable Pharmacist. A 57 years old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: ER8727) intramuscular at single dose for COVID-19 immunisation on 24Mar2021. Relevant history included Pancreatitis, Abdominal cancer and Colostomy. Prior to vaccination, the patient was diagnosed with COVID-19. Relevant concomitant drug was unknown. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient had near syncope in parking lot after COVID vaccine on 24Mar2021. When walked out of hospital entrance, she felt dizzy, sat down, and passed out for 1 minute, she was met by code team and brought to ED. The patient reported epigastric pain for 3 days w/ N/V. Relevant lab tests included POC BG: 111; A&Ox1 VS @1409: Temp 98.2F, BP 134/96, HR 67, SpO2 99%, RR 18. The adverse events resulted in emergency room/department or urgent care. Treatment therapy included ondansetron and morphine injections. The outcome of events was resolved . No follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on the available information and known product profile, the causal relationship between the reported loss of consciousness and the use of BNT162B2 cannot be fully excluded. As there is limited information available to further assess the case, the case will be assessed further upon receipt of new information. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate. |

| 1340346 | 5/22/2021 | CA | 34 | F | 5/5/2021 | 5/6/2021 | <p>passed out; loss of vision for a few minutes; Dizziness; blurred vision; Severe weakness; couldn't walk; chills; fever; Fatigue; soreness in right arm; muscle aches; This is a spontaneous report from a contactable other health professional (patient). A 34-year-old female patient (not pregnant) received bnt162b2 (BNT162B2), dose 2 via an unspecified route of administration, administered in Arm Right on 05May2021 15:00 (Lot Number: ew0161) as single dose for covid-19 immunisation. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not have COVID tested post vaccination and did not have COVID prior vaccination. The patient had no known allergies. The patient had no other medical history. Concomitant medications included ethinylestradiol, norgestimate (TRI LO MARZIA); ascorbic acid, betacarotene, biotin, calcium lactate, choline bitartrate, chromium nicotinate, colecalciferol, cyanocobalamin, dexpantenol, dl-selenomethionine, folic acid, inositol, magnesium lactate, manganese gluconate, nicotinamide, potassium citrate, potassium iodide, pyridoxine hydrochloride, retinol palmitate, riboflavin phosphate, thiamine hydrochloride, tocopheryl acetate, zinc gluconate (MULTI VITAMIN & MINERAL); probiotics (PROBIOTICS) all taken for an unspecified indication, start and stop date were not reported. The patient received first dose of Covid-19 vaccine (manufacture Pfizer, lot number ew0151) on 14Apr2021 01:00 PM in Left arm for covid-19 immunisation. The patient experienced dizziness with blurred vision / loss of vision for a few minutes, possibly passed out. Severe weakness, couldn't walk for a few minutes. Dizziness with chills/fever lasted a few hours. Fatigue for 12 hours. Soreness in right arm and muscle aches all over. Headache for 12-16 hours, all on 06May2021 06:30 with outcome of recovered. No treatment was received for the events. Information on the lot/batch number has been requested.; Sender's Comments: The causal association between the reported events passed out and loss of vision for a few minutes and the suspect drug BNT162B2 cannot be totally excluded based on a temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated a part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern</p> |

| 1340379 | 5/22/2021 | MD | 36 | F | 4/16/2021 | 4/1/2021 | identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory authorities, Ethics committees, and Investigators, as appropriate. Passed out 15 min into taking first vaccine jab; Have been dizzy ever since with palpitations; Have been dizzy ever since with palpitations; Could hardly walk few steps; Vertigo; This is a spontaneous report from a contactable consumer (patient). A 36-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Batch/Lot Number: EW0164), via an unspecified route of administration, administered in left arm on 16Apr2021 15:00 as 1st dose, single for COVID-19 immunisation. Medical history was not reported. The patient's concomitant medications were not reported. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient passed out 15 min into taking first vaccine jab on 16Apr2021. She has been dizzy ever since with palpitations. Initial 2 weeks after vaccine, her dizziness was very severe, and could hardly walk few steps. Her physician mentioned she has developed vertigo and prescribed Meclizine which made it even worse for her, so she stopped taking it. Though the dizziness was not severe right at 3 weeks, it didn't stop, and she experiences it throughout the day. The adverse events resulted a doctor or other healthcare professional office/clinic visit. The outcome of the events was not recovered. |

| 1340456 | 5/22/2021 | | | F | 4/21/2021 | 4/21/2021 | difficulty processing information/ attention deficit; Episodic HAs; earaches worst on the left and fullness/left ear pain (ear pain); earaches worst on the left and fullness/left ear pain (ear pain); Mild sore throat; Upper back muscle pain; redness around the bite; redness around the bite; low platelet volume; severe weakness; pain; nearly passed out 2 times/near syncope; Vomited; Some loose bowel movements; Myalgias/ muscle pains; sweating; feeling cold or hot sometimes; 100/60 and then blood pressure would drop and settle at 85-95/60 or low 90s/60s, hypotension; fatigue/very tired in the mornings/Extreme fatigue limiting activities; Dizziness; pain and numbness of left arm/ pain and numbness on my arms and hands; headache; upper back pain; Numbness in left arm where vaccine was injected radiating down to hand/pain and numbness of left arm/numbness on the arms and hands; Chills/body shivering; Low fever; period of rapid heart rate/episode of tachycardia; This is a spontaneous report from a contactable health care professional (patient's husband). A female patient of an unspecified age received the second dose of BNT162B2 (Pfizer-BioNTech COVID-19 vaccine, lot number and expiry date unknown), via an unspecified route of administration, administered in the left arm on 21Apr2021 at 16:00 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient previously received the first dose of BNT162b2 on 31Mar2021 for COVID-19 immunization. It was reported that immediately after being vaccinated, the patient had numbness in the left arm where vaccine was injected radiating down to hand lasting about 24 hours. Also on 21Apr2021, during the first night after vaccination, chills, body shivering for a half hour. The patient also had low fever (extremely rare for the patient) for a while and a period of rapid heart rate/episode of tachycardia while in bed lasting for 30 (as reported). The patient had hypotension, 80/58. On 22Apr2021, the patient had fatigue, dizziness, pain and numbness on arms and hands sometimes, headache, upper back pain and myalgias. On 23Apr2021, the patient was very ill most of the day. The patient nearly passed out 2 times/near syncope, vomited, some loose bowel movements (unusual for the patient), extreme fatigue limiting activities, muscle pains/myalgias, headaches, numbness, |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

sweating, feeling cold or hot sometimes. The patient's blood pressure dropped to 80/58 (usually 110/ 70). The patient lay flat on kitchen counter to avoid fainting. On 24Apr2021, the patient had fatigue limiting activities, pain, numbness, dizziness and feeling cold or hot sometimes. The patient felt a bump around her right collar bone in the evening which later turned out to be a tick. The patient's BP was measured every day which generally were initially 100/60 and then blood pressure would drop and settle at 85-95/60 or low 90s/60s, hypotension accompanied with severe weakness. On 25Apr2021, the patient had fatigue limiting activities, pain, numbness, dizziness, constant headache and feeling cold or hot sometimes. On 26Apr2021, the patient was nearly feeling normal in the first half of the day. Then severe body fatigue limiting activities, pain, numbness on the arms and hands. The patient was feeling cold or hot, sweaty at times and had persistent headache in the afternoon. The patient also had upper back muscle pain. In evening of 26Apr2021, the tick was noticed and pulled out dry with fingers and tweezers. The tick was not engorged with blood and appeared dry and dead. The patient had some redness around the bite but no target lesion. The patient was administered 200mg of Doxycycline orally. On 27Apr2021, the patient had fatigue, pain, numbness, cold or hot obviously in the first half of the day. Then feeling better (close to normalcy). On 28Apr2021, the patient was feeling much better in the first half of the day. Then, pain, numbness, feeling little cold or hot sometimes and persistent headache. That day and episodically thereafter, the patient noted left ear pain, earaches worst on the left and fullness and mild sore throat. The patient has also complained of difficulty processing information (attention deficit described in the papers) on an unspecified date. On 29Apr2021, there was severe fatigue all day. Pain, numbness, cold or hot sometimes, upper back muscle pain and sweating sometimes. On 30Apr2021 to 02May2021, the patient was very fatigued and was feeling dizzy frequently, activity was limited, a muscle pain, numbness and was cold or hot. The patient went to Urgent Care and was examined. Limited physical exam was normal. They drew blood tests which showed normal CBC on 23 machine differential both on 23Apr2021 and platelets except Low Platelet Volume on an unknown date in 2021, normal

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

electrolytes and anaplasma test, negative blood smear for Babesia and Anaplasma and neg IgM and IgG for Lyme all on an unknown date in 2021. The patient's creatinine, BUN and renal function (fx) was unknown on an unspecified date in 2021. On 03May2021 and 06May the patient had similar symptoms, lasting about half of each day. On 06May2021, the patient had a nasal swab for COVID. On 07May2021 to 09May2021 the patient was very tired in the mornings, dizziness, episodic HAS, limiting activity. The events were partly improved by rest but the patient had constant ear pain mainly on the left side. The reporter stated that he deeper dive into the literature this weekend and came up with lots of papers of which the following publications are of special interest which includes: 1. One case report of Postural Orthostatic Tachycardia Syndrome (POTS) after Pfizer mRNA vaccine showing that POTS is frequently associated with auto-antibodies to G protein-coupled receptors, particularly norepinephrine receptors, epinephrine receptors and ACE2 receptors. In addition patients have elevations in a number inflammatory cytokines (IL-1beta, IL21, TNFalpha, IFNgamma, CD30) and platelet pool efficiencies (associated with low platelet volumes, dense granules, easy bruising). By the way, one can see dysautonomic disorder like POTS but without the tachycardia. One report described 31 patients with long COVID who had autoantibodies to the G protein coupled receptors with a variety of symptoms which can act as agonists or antagonists and are associated with a variety of syndromes (see their Table 1) with prominent fatigue, dysautonomic syndromes like POTS, neurologic and pain syndromes and cardiovascular syndromes. A potential synthesis is that these auto-antibodies are fairly common after COVID- 19 and perhaps also after other severe viral infections such as mono. Influenza etc which may lead to what we have called ME/CFS. There are a number hypothesis papers that predict that the spike protein-ACE2 receptor complex would elicit auto-Ab to ACE2. Its plausible that COVID-19 vaccines, particularly mRNAs which express spike intracellularly and cause a lot of inflammation also occasionally induce the syndrome. The reporter's question was whether abnormalities should be documented thoroughly including a full COVID-19 work-up for virus and antibody, auto-antibody panel, inflammatory markers, platelet work-

VAERS_ID RECVDDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

up and a dysautonomia work-up. He added that pending the findings, the case should probably be reported. His most important goal is understanding the pathogenesis since that may lead to a logical therapeutic intervention in the event that these symptoms continue for a long time. The outcome of the events episodic HAs, period of rapid heart rate/episode of tachycardia, pain and numbness of left arm/numbness on the arms and hands, Some loose bowel movements, sweating, Mild sore throat, difficulty processing information/ attention deficit, severe weakness, redness around the bite and low platelet volume was unknown. The outcome of the events numbness in left arm where vaccine was injected radiating down to hand was recovered on Apr2021 and the events Chills/body shivering and low fever recovered on 21Apr2021. The outcome of the events fatigue/very tired in the mornings/Extreme fatigue limiting activities, Dizziness, upper back pain, headache, nearly passed out 2 times/near syncope, Vomited, Myalgias/ muscle pains, feeling cold or hot sometimes, 100/60 and then blood pressure would drop and settle at 85-95/60 or low 90s/60s, hypotension, pain, Upper back muscle pain and earaches worst on the left and fullness/left ear pain (ear pain) was not recovered. Information on the lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of event Heart attack cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

| 1340386 | 5/22/2021 | CA | 28 | F | 5/6/2021 | 5/6/2021 | ear ringing; stomach and kidney pain; stomach and kidney pain; nausea; achiness; inflammation; light headed; vasovagal response; some chest pain; collapsed/fainted; low grade fever; congestion; chills; This is a spontaneous report from a contactable consumer (patient). This consumer reported similar events for two patients. This is the first of two reports. A 28-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration on 06May2021 11:00 (Batch/Lot number: EW0170) as 2nd dose, single, at the age of 28-years-old for COVID-19 immunization. The patient is not pregnant. The patient had no known allergies. Medical history included a few kidney stones and one surgery to remove stones. She reported she was very healthy and active otherwise and hadn't had any sort of cold or illness in 2 years. The patient's concomitant medications were not reported. Historical vaccine included first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), on 15Apr2021 09:45 AM in the left arm as 1st dose, single for COVID-19 immunization. The patient did not have any other vaccine in four weeks and no other medications in two weeks. At 06May2021 9:00pm (10 hours after her 2nd shot), she started having a low grade fever, congestion, and chills. She went to sleep at 12:00am, chills and fever were more intense at this point. At 2:00am on 07May2021, she woke up with a fever of 103, no chills, but intense ear ringing (a volume of 9/10) in her left ear, extreme stomach and kidney pain, nausea, and achiness. The ringing in her ears was the worst symptom. She sat up and drank water for the next 5 hours, to try to get the inflammation down. She went to the bathroom every hour and her ear ringing started to lessen. At 7:00am she went to the bathroom for the 5th time and began to feel extremely light headed. She had a vasovagal response and collapsed/fainted (luckily, she had a family member who was monitoring her). She went back to rest and have had on and off low-grade fever, some chest pain, and aches since then. She has a twin sister, who got her shot on the same day and time, and she also had a vasovagal response, but not nearly as many of the other symptoms. The patient had no prior vaccination and was not tested for COVID post-vaccination. No treatment was received for the events. The outcome of the events was unknown. Information on |

She felt like she didn't know where she was and felt like she was going to pass out.; This is a spontaneous report from a non-contactable consumer (patient). A 65-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), dose 1 via an unspecified route of administration on 06Mar2021 (Batch/Lot Number: EN6199) as 1ST DOSE, SINGLE for covid-19 immunization. Medical history included hysterectomy (At Age: 32 and does not have a cervix), anaphylactic reaction (Anaphylactic shock to Formaldehyde), hypersensitivity (A lot of allergies: allergic to a lot of animals, cats, dogs, horses and lots of trees, grass, eggs, not shellfish), blood cholesterol increased ('little high cholesterol'), asthma, hypertension, food allergy (egg protein), Covid-19 for 5Mar 'She had covid when it first came out' and was sick 3 months (Being asthmatic, she was put on Prednisone/never hospitalized/Covid test was a false negative. They found out later it was positive) dyspnea, She took Prednisone and the second night she couldn't breathe (had Zpack in her system), rash all of the symptoms with Covid, the rash, neurological, severe headaches and cough. Being asthmatic, she was put on Prednisone. Consumer also stated Has no health issues other than being asthmatic and has a lot of allergies. The patient's concomitant medications were not reported. Past drug history includes Miralax. (allergic to polysorbate or polyethylene glycol, which is Miralax) The patient experienced burning sensation from top of her head and through her chest, arms and into her vagina and down her legs/her insides were burning, arm where she got injection was pretty dead, moment of pre syncope/pre syncope. She felt like she didnt know where she was and felt like she was going to pass out, all burnt inside: redness and dryness, all burnt inside: redness and dryness. The patient underwent lab tests and procedures which included blood test: normal on an unspecified date, body temperature: 97.2 on an |

unspecified date, chest x-ray: normal on an unspecified date, Normal. Therapeutic measures were taken as a result of burning sensation from top of her head and through her chest, arms and into her vagina and down her legs/her insides were burning, all burnt inside: redness and dryness. Clinical course was reported by the patient as follows: Within 5 minutes of getting the vaccine, the arm where she got the injection went pretty dead, she even dropped her cell phone. That passed. Had a moment of pre syncope. She felt like she did not know where she was and felt like she was going to pass out. She drank some water and did some deep breathing. The next reaction almost killed her. She had a burning sensation from the top of her head and through her chest, arms and into her vagina and down her legs. Had to call for help. They were going to give her an Epi Pen, but she did not want to do that, as she knew she would have to go to the hospital. They opted for an injection of Benadryl and she also had oral Benadryl with her. She was able to stop the reaction with Benadryl before it got any worse because if not, she was going to have the get the Epi Pen Patient mentioned she is post hysterectomy since age 32 and does not have a cervix. When she contacted the doctor she said it was all burnt inside. She asked her what happened to her. She said the Pfizer vaccine. She was given medicine to avoid bacterial and fungal infections, because of the amount of dryness and redness. She had to take Sitz baths with baking soda once or twice a day to relieve the burning. It took about 2 weeks to go back to normal. Stated It was against her better judgment to get the first one. She has a history of anaphylaxis. Has many allergies but no allergies to polyethylene glycol or polysorbate. She is not getting the second one, she was told by her primary doctor not to, as she may not live to report it. The clinical outcome of the events was unknown. No follow-up attempts are possible. Were reporter is non-contactable.

| 1340348 | 5/22/2021 | CA | 46 | M | 4/15/2021 | 4/15/2021 | <p>Almost fainting 3 minutes/Almost fainted/Really close to blacking out; Almost passed out; Nauseated/Swirling strong nausea through the body up to the chest; Rapid heart rate; Hyperventilation; Labored breathing; 5-10 minutes before able to uncramp his hands; Waves of the feelings came throughout the day; This is spontaneous report received from a contactable consumer (patient). A 46-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot number: ER8733), via an unspecified route of administration, administered in Arm Left on 15Apr2021 11:00 as single dose for covid-19 immunization. Medical history included sensitivities to ephedrine from an unknown date and unknown if ongoing. The patient had no concomitant medications. The patient experienced almost fainting 3 minutes/almost fainted/really close to blacking out, nauseated/swirling strong nausea through the body up to the chest, rapid heart rate, hyperventilation, labored breathing, 5-10 minutes before able to uncramp his hands, waves of the feelings came throughout the day, almost passed out/ really close to blacking out; all on 15Apr2021. The events were not required a visit to emergency room, nor physician office. Caller is a 47 years old patient who received the 1st dose of the Pfizer Covid vaccine on 15Apr2021. He complained of feeling nauseated, and rapid heart rate, with hyperventilation, and almost fainting 3 minutes after the 1st dose of the Pfizer Covid vaccine. This lasted approximately 15 minutes. 3 minutes after receiving a vaccine. He started to complaint about feeling nauseated. He started rapid heart rate which caused him to have hyperventilation and almost fainted. The episode last for 15 minutes and he just want to go and report it. Consumer confirmed it was the Pfizer Covid19 vaccine. The consumer wasn't still experiencing the side effects. They lasted to 5pm. I got my shot at 11am. The event was no longer persisting but he was wanting to understand the effect of the second shot, the consumer wasn't took any treatment for adverse event. Caller states that he is calling about the Covid Vaccine. Says with the first round of the vaccine he had an adverse event. He is looking to Pfizer and his doctor for some feedback to understand whether or not he should get the second dose. Says that about three minutes after the vaccine he felt a swirling, strong nausea throughout his body up to</p> |

| | | | | | | | his chest. He had labored breathing and a really fast uncontrolled heart rate for about 5 minutes. States he was hyperventilating and almost passed out. He had to sit on the ground of the parking garage where he had gotten his vaccine. About 5-10 minutes later he was finally able to uncramp his hands. States that before the vaccine he was calm and not at all in an elevated state. States he is wondering about the second dose being stronger. He almost blacked out after the first dose. States it was close to the limit of what he could tolerate. States he needs further details. He was reading about clinical trials and some doctors. States that he did not have all the symptoms of anaphylaxis that they described. Says his symptoms lasted about 5 minutes or so. About 10-15 minutes later he was recovered. Says waves of these feelings came over him throughout the day. Says they decreased each time and ended that evening around 1700. Caller says he did not go to the Emergency Room when it happened. The nurses at the vaccination site attended him. At the end of the call the caller mentions that he has a sensitivities to ephedrine. States he does not take any Sudafed or Dayquil or anything like that. States he didn't know if that was relevant to mention or if anything like that is in the vaccine to make him have the response that he did. History of all previous immunizations with the Pfizer vaccine considered as suspect (or patient age at first and subsequent immunizations if dates of birth or immunizations are not available) was none. No prior Vaccinations (within 4 weeks). No family medical history relevant to events. No Relevant Tests. The outcome of events was resolved on 15Apr2021. |

| 1341085 | 5/22/2021 | MN | 14 | F | 5/21/2021 | 5/21/2021 | Patient received 1st dose of Pfizer covid vaccine and was told to stay 15 minutes after vaccine was administered to monitor for symptoms. We were then informed she fainted at the front of the store. It was reported she was unconscious for roughly 30 seconds. When I came up to her, she was conscious on sitting on the floor. She was given cold water and an ice pack while EMTs were on their way. |
| 1341093 | 5/22/2021 | MO | 18 | F | 5/22/2021 | 5/22/2021 | Approximately 10 minutes post-vaccine, patient fainted (while sitting in chair for observation) and fell to the floor. Bystanders stop to help, and I grabbed my IMZ cart to go on scene; one bystander called 911 for EMS. Patient was breathing, conscious, and had a pulse; she was coherent and able to talk. She denied hitting her head or losing consciousness. Her mother, who was with her at the time, said the patient "shook" a little after she fell. Patient stated she had not eaten all day and thought that may have contributed to her fainting. We provided patient with water, and she was able to sit up on floor and lean against the wall. EMS arrived on scene to take over. The reported her blood sugar and blood pressure were within normal limits. This may have been a vasovagal reaction. Patient was standing after EMS evaluated her, and they approved for her to leave. The patient and her mother left the pharmacy. I told them to call the pharmacy if they have any questions or concerns and to report the event to patient's MD. |

| 1340912 | 5/22/2021 | NC | 14 | M | 5/14/2021 | 5/17/2021 | Pt received first shot of Pfizer vaccine on 5/14 - 12:30 PM EST. On 05/17 around 7:45 AM, Pt passed out/fainted. He woke up few minutes prior to the event and this event started after he passed urine. As soon as he finished Urination, he felt nauseated, dizzy and then lost consciousness thereafter. He fell backwards as a result and hurt his back as well as back side of the head. During his unconsciousness his body was completely stiff and his eyes were rolled back. For few seconds then he became completely still (it felt he was not breathing). I gave him physical stimulus (slight slaps on the face) post which he started reviving. During this time we called 911. I gave him few sips of water forcibly and he started reviving thereafter. on 5/15 and 5/16 (post vaccination on 5/14) he was feeling tired and seemed bit dull. This was unusual as Pt is a competitive soccer player and highly active. |
| 1341122 | 5/22/2021 | OK | 17 | M | 5/22/2021 | 5/22/2021 | Syncope- pale, nauseous, initially disoriented when regained consciousness, sweating. Patient was taken to ED. Escorted out by EMS. |

| 1336009 | 5/20/2021 | CA | 42 | M | 5/20/2021 | 5/20/2021 | Within 10 minutes i felt clammy and light headed. I passed out in my chair. I awoke moments later to fellow patients and staff tending to me. They attempted to move me to a place to lay down. I immediately passed out again trying to stand. I woke up covered in sweat lying flat on the concrete. Staff and customers did not let me fall so no trauma. They called an ambulance. My bp dropped fo 88/50 in the ambulance with a pulse as low as 36bpm. Chills and uncontrollable shivers started about 30 minutes in and lasted for 2 hours. By 3pm I felt better. 2 bags of IV, chest x-ray, and blood work showed everything normal. Home now and will update my report if anything changes. Feeling much better as of 7pm. I belive they called it normal Sinus rhythm with sinus arrythmia |

| 1334878 | 5/20/2021 | NC | 17 | M | 5/20/2021 | 5/1/2021 | The patient received their vaccination and before my immunizing technician could apply his bandaid he fell straight back while seated in his chair. She was able to catch his fall and lie him on the ground. I went into the immunization room to assist immediately and he was apologizing for scaring. I asked him to lie there for a few minutes and take some deep breaths. He was talking and aware of his surroundings. I asked him about his medication history which was null. I asked him if he had been nervous and he said he didn't think so. She said that he did mention he did not like needles. He had not eaten since the morning (a bage!) and it was late in the afternoon. After a few minutes I asked him if he would like to sit up so I could see how he was doing. Management arrived and observed while I went to get a cold cloth for his neck/face. Management asked him if he would like to sit in a chair. He sat in a chair and before I came back after just a few minutes, he had slumped over to the side with his eyes rolling back. Management was concerned so they immediately called 911. fire department and EMS arrived. They tested his blood pressure, etc and said they believed he had just passed out. They asked him if he wanted to go to the hospital. He declined. He called a family member to pick him up who arrived about 45 minutes after his vaccination. He was walking around and coherent when he left. |

|-----------------|--------------|--------------|----------------|------------|-----------------|-------------------|---|
| 1334945 | 5/20/2021 | CA | 16 | F | 4/30/2021 | 4/30/2021 | Fainted; Didn't know if it was a convulsion or a seizure; Shaking; was very anxious; This is a spontaneous report from two contactable pharmacists. A 16-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EW0167, expiry date: Aug2021), via an unspecified route of administration, administered in the left deltoid, on 30Apr2021 15:30, as 1st dose, single, for COVID-19 immunisation, at a pharmacy/drug store. There were no medical history and concomitant medications. On 30Apr2021 15:30, the patient received the first dose of the COVID-19 vaccine and was very anxious. She wanted her mom to be present. On the same day, 30Apr2021 15:35, five minutes later, the patient was shaking, and she fainted. The reporter did not know if she was having a convulsion or a seizure. A few minutes later, the patient was sitting and becoming more alert. The patient was given water and one dose of Benadryl. The patient's vital signs were checked (unknown result). The reporter talked to the patient's mother and contacted the patient's pediatrician. The events resulted to emergency room and physician's office visits. Later in the evening, the reporter followed up with the mother and she confirmed that the patient was doing well and better. The mother asked the reporter if the patient should get the second dose of the COVID-19 vaccine. The outcome of the events fainted, shaking, "didn't know if it was a convulsion or a seizure" and "was very anxious" was recovering. The reporter assessed the events fainted, shaking, "didn't know if it was a convulsion or a seizure" as serious (medically significant). The reporter considered that BNT162B2 has a causal effect to the adverse events. Follow-up (18May2021: New information received from a contactable pharmacist includes: reporter information, lab data, suspect drug details (vaccination site and vaccination time), event details (onset time provided, outcome updated to recovering, causality and seriousness assessment provided). Follow up attempts are completed. No further information is expected.; Sender's Comments: Based on the available information, and on a reportedly closed temporal association, the company assessed that a reasonable possibility could not be excluded that the reported events (fainted; didn't know if it was a convulsion or a seizure) were related to the suspect product BNT162b2 (PFIZER-BIONTECH |

| 1335954 | 5/20/2021 | IL | 46 | F | 2/4/2021 | 2/4/2021 | Loss of consciousness; Hyperhidrosis; Panic attack; Nausea; Vomiting; This case was received via FDA VAERS (Reference number: 1005525) on 11-May-2021 and was forwarded to Moderna on 11-May-2021. This regulatory authority case was reported by an other health care professional and describes the occurrence of LOSS OF CONSCIOUSNESS (Loss of consciousness) in a 46-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 029L20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 04-Feb-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 04-Feb-2021, the patient experienced LOSS OF CONSCIOUSNESS (Loss of consciousness) (seriousness criterion medically significant), HYPERHIDROSIS (Hyperhidrosis), PANIC ATTACK (Panic attack), NAUSEA (Nausea) and VOMITING (Vomiting). At the time of the report, LOSS OF CONSCIOUSNESS (Loss of consciousness), HYPERHIDROSIS (Hyperhidrosis), PANIC ATTACK (Panic attack), NAUSEA (Nausea) and VOMITING (Vomiting) outcome was unknown. Concomitant product use was not provided by the reporter. Treatment information was not provided. It was reported that the patient became nauseous and started vomiting approximately 20 minutes after the vaccine. She initially refused to go to the emergency room by ambulance. The vomiting continued and she then passed out and became diaphoretic. 911 was called and she was transported to the emergency room and tests were being ran. She said they did not feel it was vaccine related. Based on the current available information and temporal association between the use of the product and the events, a causal relationship cannot be excluded, although the events are likely related to the act of being injected rather than the vaccine itself |

| 1333213 | 5/20/2021 | CA | 14 | M | 5/19/2021 | 5/19/2021 | Pfizer vaccine given 5/20/2021 Per mom/ pt the shot was given at 11:02 around 11:07 he leaned forward and became unresponsive. He was slightly drooling from the mouth. Mom says that his body was tight and that he was shaking a little. His eyes were closed and did not appear to be rolling back in his head. This episode lasted for less than 1 minute. He did not remember what happened and thought he wet himself after; which he did not. About 1-2 min after that episode mom states that he appeared to "passed out" for less than a minute. The ambulance was called and he was taken to hospital. He was evaluated and appeared well at that time. No fever. EKG was done and per pt it was normal. No EEG was done. He was discharged without admit That evening he has multiple episodes of vomiting > 10 times. No diarrhea or fever. Seen today at medical office for follow up. Vaccine not given at our clinic |

History of Present Illness , Patient is a 71 yr.. male with Hx of stage IIICM Metastatic Adenocarcinoma of the sigmoid Colon, Coronary disease, Hypertension, Dyslipidemia, Chronic Renal insufficiency, presenting to the ED with chest pain. Patient notes that he woke up this morning with pain in the right side of the chest with some associated shortness of breath. Notes symptoms. Additional information for Item 18: Notes symptoms are worse when he is up trying to exert himself and gets incredibly short of breath and fatigued. States he tried to do some workout in the garage but was unable. Denies chest pain worsening with exertion, but has been fairly constant since it began. Reports it is a dull ache. Pain is dissimilar from his previous heart attack. States he has had a mild cough, but no significant production. Denies any fevers, chills. No abnormal nausea or vomiting other than typical chemo induced side effects. Given continued issues, decided to come in for further evaluation. Review of Systems; Constitutional: Positive for fatigue. Negative for appetite change, chills, diaphoresis and fever. HENT: Negative for sore throat. Eyes: Negative for visual disturbance. Respiratory: Positive for cough and shortness of breath. Negative for choking and chest tightness. Cardiovascular: Positive for chest pain. Negative for palpitations and leg swelling. Gastrointestinal: Positive for nausea and vomiting. Negative for abdominal pain and diarrhea. Genitourinary: Negative for dysuria. Musculoskeletal: Negative for back pain and neck pain. Skin: Negative for rash. Neurological: Positive for light-headedness. Negative for seizures, syncope, numbness and headaches. Problems; POA, (Principal) Sepsis, due to unspecified organism, unspecified whether acute organ dysfunction present, Yes, Essential hypertension Yes, Chemotherapy-induced peripheral neuropathy, Yes. Overview Signed 5/10/2019 2:03 PM by MD, Pins and needles and numbness in tips of finger and toes, Lung metastasis Yes. Hypoxia Yes. COVID-19 Unknown, Acute respiratory failure with hypoxia Yes, Palliative care encounter Not Applicable, Declining functional status No. DETAILS OF HOSPITAL STAY; Presenting Problem/History of Present Illness/Reason for Admission, Sepsis, due to unspecified organism, unspecified whether acute organ dysfunction present. Acute hypoxemic respiratory failure due to COVID-19, Respiratory failure. Sigmoid perforation with abscess. Hospital Course; 71-year-old male prolonged admission for acute hypoxic respiratory failure secondary to COVID-19. No history of colorectal adenocarcinoma with lung mets. Prior resection of bowel, prior chemotherapy. Required management in the ICU due to worsening respiratory failure over the time that he has been admitted to Hospital (20 days). He had remained on BiPAP therapy throughout that time, received appropriate corticosteroids, and antiviral therapies. Approximately 1-1/2 weeks ago he began to develop mild left lower quadrant abdominal pain. In the last 48 hours this is significantly worsened. CT abdomen and pelvis was obtained on Friday, which displayed pneumoperitoneum, sigmoid abscess with sigmoid perforation. There is a prior anastomotic site distal to this. Given his overall complexity he was to be medically managed to avoid the need for OR and intubation. He did well through the initial 24 hours of IV antibiotics, fluids and bowel rest. This afternoon he became increasingly dyspneic, required implementing nonrebreather mask, and subsequently developed severe rigors, tachycardia. I obtained a stat follow-up CT scan which shows similar findings of free air within the abdomen. Given signs of impending sepsis, BiPAP therapy was initiated, bolus IV fluids were given. Blood gas, blood counts, lactic acid are pending. He is receiving empiric Zosyn. I discussed this with general surgery, whom is well-known to the patient. In agreement the patient likely needs surgical intervention. However given his overall complexity and in light of the fact that this area surrounds the ureter, and

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

we do not have urology coverage. It was felt he was most appropriate to be managed in Hospital. Case was discussed with Dr. at Hospital, patient will be transferred there via air transit. At this time his blood pressure appears stable, he is tachycardia, is currently on BIPAP which will be transitioned to CPAP for transport. He has received several doses of Dilaudid, for improved pain control. No further advancement of airway was performed prior to discharge. Case was discussed with family at length, all risks and benefits of transfer were discussed with wife and patient. It is recommended to involve pulmonary critical care services including surgical ICU care as if requiring surgery he is high likelihood for prolonged vent needs. Operative Procedures Performed: Treatments: See above; Procedures: Na Consults: pulmonary/intensive care and general surgery. Pertinent Test Results: CT abdomen pelvis with contrast [3279871876] (Abnormal) Resulted: 04/25/21 1811. Order Status: Completed Updated: 04/25/21 1812. Narrative: PROCEDURE INFORMATION: Exam: CT Abdomen And Pelvis With Contrast, Exam date and time: 4/25/2021 17:36, Age: 71 years old, Clinical indication: Abdominal pain; Additional info: Sepsis, bowel perf. HX of Covid19 +, malignant colon with lung metastasis. Bowel perf. TECHNIQUE: Imaging protocol: Computed tomography of the abdomen and pelvis with contrast. Radiation optimization: All CT scans at this facility use at least one of these dose optimization techniques: automated exposure control; mA and/or kV adjustment per patient size (includes targeted exams where dose is matched to clinical indication); or iterative reconstruction. Contrast material: 350 OMNI; Contrast volume: 80 ml; Contrast route: INTRAVENOUS (IV); COMPARISON: CT ABDOMEN PELVIS W CONTRAST 4/23/2021 16:46, FINDINGS: Tubes, catheters and devices: Catheter terminates in the right atrium in satisfactory position. Lungs: Moderate airspace opacities throughout the lung bases are similar to prior and consistent with Multilobar pneumonia consistent with the history. Liver: No hepatic masses. Gallbladder and bile ducts: Cholelithiasis. Pancreas: No ductal dilation. No masses. Spleen: No splenomegaly or focal lesions. Adrenal glands: No mass. Kidneys and ureters: 10 mm benign left renal cyst, no follow-up necessary. No renal masses or Hydronephrosis bilaterally. Stomach and bowel: Redemonstration of

perforated proximal sigmoid diverticulitis. Small pneumoperitoneum is stable. Predominantly gas containing, 25 x 28 mm collection adjacent to the inflamed sigmoid colon similar to prior; a fistulous tract extends toward the midline containing gas and fluid, with suspected fistula to adjacent loops of small bowel. Moderate to severe descending and sigmoid diverticular burden. Minor right diverticular burden. No small bowel obstruction. A somewhat clumped appearance of small bowel in the right lower quadrant near the colon enteric fistula. Appendix: No evidence of appendicitis. Intraabdominal space: Mesenteric edema around the small bowel, slightly increased, however no new mesenteric collection. There is no extravasation of enteric contrast into the collection adjacent to the sigmoid colon. Vasculature: Mild aortoiliac atherosclerosis. Lymph nodes: No significantly enlarged lymph nodes. Urinary bladder: Unremarkable as visualized. Reproductive: Unremarkable as visualized. Bones/joints: Degenerative changes in the spine. Multilevel disc space narrowing. Multilevel central canal and neuroforaminal stenosis in the lumbar spine. No acute fracture or subluxation. Soft tissues: Small fat-containing right inguinal hernia. Small fat-containing left inguinal hernia. Large ventral abdominal hernia containing gas, which has replaced the previous contents of fat and bowel loops. Volume increased compared to prior. IMPRESSION: 1. Redemonstration of perforated proximal sigmoid diverticulitis. Small pneumoperitoneum is stable. 2. Similar perisigmoid collection; colon enteric fistula, probably at least subacute in duration. The perisigmoid collection is prominently gaseous and there is no frank abscess. 3. Suspected mild enteritis the small bowel loops or loops associated with the fistula. No obstruction. 4. Additional findings as described are similar to recent prior imaging. COMMENTS: Any incidental renal lesion less than 1 cm or classified as too small to characterize, or any incidental cystic renal lesion characterized as simple-appearing, is likely benign. No follow-up imaging is recommended for these lesions per consensus recommendations based on imaging criteria. Lungs: retractions and diminished breath sounds Heart: tachycardia, RR. Abdomen: Distended significantly tender in the left lower quadrant with guarding throughout. Extremities: Trace pretibial, Skin: Skin color, texture, turgor normal. No rashes or lesions or Ecchymosis areas throughout upper extremities. Neurologic: Alert and oriented X 3, no focal deficit. Discharge Instructions; Condition at Discharge, Discharge Condition: critical. Admission, Discharged 4/25/2021 - 5/1/2021 (6 days) Hospital, MD, Last attending Treatment team Respiratory failure, acute. Principal problem, Discharge Summary MD (Resident) Cosigned by: MD at 5/18/2021 1:24 PM; Final Summary for Deceased Patient, BRIEF OVERVIEW; Admitting Provider: MD; Discharge Provider: MD Primary Care Physician at Discharge: MD Admission Date: 4/25/2021, Discharge Date: 5/1/2021, Final Diagnosis, Principal Problem: Respiratory failure, acute. Active Problems: Malignant neoplasm of sigmoid colon. Sepsis, due to unspecified organism, unspecified whether acute organ dysfunction present COVID-19. Perforated viscus. DETAILS OF HOSPITAL STAY Presenting Problem/History of Present Illness/Reason for Admission Respiratory failure, acute, Hospital Course; Patient is a 71 yr.. male with history of metastatic colorectal adenocarcinoma with lung metastases, prior bowel resection and chemotherapy. The patient initially tested positive for Covid in early March. His symptoms at that time are mild and resolved. He was later vaccinated and that month. He started having severe symptoms again on 4/3 for which he presented to Hospital. Since that time, he has received full course of Remdesivir and steroids.

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

He had a CT scan performed on 4/23 which revealed pneumoperitoneum secondary to presumed perforated sigmoid diverticulitis with focal sigmoid abscess. Patient was weaned down to minimal nasal cannula settings but somewhat suddenly earlier on 4/25 patient had increased work of breathing, became tachycardia, and had rigors. Hospital ordered repeat CT scan which showed similar findings in the abdomen. Patient had been maintained on Zosyn. Repeat labs were sent which were largely unremarkable. Given concerns for worsening sepsis and potential need for surgery, he was subsequently transferred Hospital. On admission to hospital, he had a normal lactic acid and no leukocytosis. He did not have evidence of peritonitis. The decision was made to treat his diverticulitis conservatively. However, early on 4/26 the patient started to develop a lactic acidosis. An extensive discussion was had with the patient and his wife regarding surgery and the possibility the patient may never be able to separate from the vent given his worsening Covid pneumonia. The patient elected to undergo an exploratory laparotomy with with segmental resection of distal descending and loop transverse colostomy. However, as the days progressed the patient had worsening respiratory status that required deep sedation, paralytics and proning all of which were unsuccessful in maintaining his oxygen saturation greater than 88%. His wife, knowing that he would not want to have a prolonged course on the ventilator, elected for transition to palliative extubating with comfort care on 4/30 and the patient expired roughly 10 minutes after extubation.

4/6/2021

4/6/2021 When vaccine was administered, 4/6/21 - I passed out. Within 24 hours - i was vomiting and had severe nausea. I had extremely bad headaches that went away for 2 days then started up again extremely bad the Monday (4/12/21) after my vaccine. Visited my primary care doctor on Wednesday (4/14) as they wouldnt go away. advised to take motrin. On friday (4/17) they still had not gone away and went to Urgent care due to fear since the vaccine had been pulled for preventative measures. they did blood work and advised to take some decongestants as the weather had been strange (Snow and 80degrees in the same week) that helped.

| 1332356 | 5/20/2021 | CA | 47 | M | 5/1/2021 | | <p>GUILLAIN-BARRE SYNDROME; PASSED OUT; This spontaneous report received from a patient via a Regulatory Authority Vaccine Adverse Event Reporting System (VAERS) concerned a 35 year old female of unknown ethnicity. The patient's height, and weight were not reported. The patient's past medical history included thrombocytopenia, and concurrent conditions included congestive heart failure, hypertension, diabetes type 2, atrial fibrillation, and sustained ventricular tachycardia, and patient had no known allergies. Patient had no current illnesses at the time of vaccination. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, intramuscular, batch number: Unknown) dose was not reported, 1 total administered on the left arm 02-APR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On 02-APR-2021, the patient started to get lethargic. Two weeks into the shot, it was getting hard to walk and he started falling at work. The patient was out of work for a week, and couldn't get up by himself anymore, and he had to get a cane. On 28-APR-2021, he went to the doctor again with no results. On 01-MAY-2021, the patient passed out and was not able to get up. On 02-MAY-2021, the patient went to the emergency room and had a spinal tap and was diagnosed with Guillain-Barre Syndrome (also conflictingly reported as developing Guillain-Barre Syndrome on 07-MAY-2021). The patient was hospitalized from 02-MAY-2021 to 07-MAY-2021 (also conflictingly reported as hospitalized for 6 days). The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from passed out and had not recovered from Guillain-Barre Syndrome (unable to get up, unable to walk, stumbling, pain, could not get up, started falling, falling at work, lethargic). This report was serious (Hospitalization Caused / Prolonged and Other Medically Important Condition).; Sender's Comments: V0 : 20210520943- COVID-19 VACCINE AD26.CO2.S - Guillain-Barre Syndrome, Passed out. This events are considered unassessable. The events has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the events.</p> |

| 1332366 | 5/20/2021 | KY | | F | | 5/12/2021 | ARM FROM SHOULDER TO PINKY FINGER HURTS IF SOMETHING TOUCHES IT; FEELS IRRITATED; FEELS LIKE NERVE DAMAGE; FEELS LIKE THE HAIR ON ARMS HURT; PASSED OUT TWICE; SUNBURN LIKE FEELING IN VACCINE INJECTION ARM WITH NO REDNESS OR RASH; SEVERE STOMACH ISSUES FOR A WEEK; This spontaneous report received from a patient concerned a female of unspecified age. The patient's height, and weight were not reported. The patient's pre-existing medical conditions included patient donated blood and passed out twice. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unknown) dose was not reported, administered on 08-APR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. 4 days later, the patient donated blood and for the first time ever, passed out twice. The patient had severe stomach issues for about a week but that have resolved. The patient's arm that she received the vaccine in, felt like a sunburn- no redness, rash or swelling. The patient's arm didn't hurt unless something is touching it. It was not hot to the touch but felt very strange and very sensitive from her shoulder all the way to the tip of her pinky finger on the outer portion of arm. It was very sensitive even when washing the hands. The patient mentioned that it felt like nerves have been damaged. It felt like hair on arm hurt. It felt irritated. The caller mentioned that her daughter got the vaccine the same day and experienced the same thing but didn't last as long-maybe a couple of days and it was gone. On an unspecified date, the patient felt like passed out twice, sunburn but no redness, no rash and it started from the shoulder to pinky finger (coded as sunburn like feeling in vaccine injection arm with no redness or rash), arm from shoulder to pinky finger hurts if something touches it, feels irritated, feels like nerve damage and feels like the hair on arms hurt. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from severe stomach issues for a week on MAY-2021, and the outcome of passed out twice, sunburn like feeling in vaccine injection arm with no redness or rash, arm from shoulder to pinky finger hurts if something touches it, feels irritated, feels like nerve damage and feels like the hair on arms hurt |

had no covid prior to vaccination and was not tested post vaccination. No other medications were taken in two week and no allergies was reported. Seriousness assessment was reported as disability. Therapeutic measures were taken as a result of all the events. The outcome of all the events was unknown. No follow-up attempts are needed. No further information is expected.

became extremely dizzy; when I came home and passed out.; Hit my head on floor; received a concussion; cut on scalp; This is a spontaneous report from a contactable consumer (patient). A 77-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration administered in left arm on 15Mar2021 13:45 (at the age of 77-year-old) (Batch/Lot Number: en6205) as 2ND DOSE, SINGLE for COVID-19 immunisation. The patient was not pregnant at the time of vaccination. The patient had no other vaccine in four weeks. The patient had no COVID prior to vaccination. The patient had no relevant medical history. The patient had no known allergies. Concomitant medications included atorvastatin; furosemide; and calcium. Historical vaccine includes first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: e19265), administered in left arm on 22Feb2021 at 02:30 PM (at the age of 77-year-old) for COVID-19 immunisation. On 15Mar2021, the patient became extremely dizzy when she came home and passed out. She hit her head on floor and received a concussion and cut on scalp. The events caused hospitalization for 2 days. The patient was tested for COVID post vaccination via nasal swab on 22Apr2021 which was negative. Therapeutic measures were taken as a result of all events which includes computed tomography (CAT) scan and electrocardiogram (EKG) with unknown results. The patient recovered from the events on an unspecified date.

| 1332702 | 5/20/2021 | PA | 43 | F | 5/4/2021 | 5/5/2021 | fainted; hit my head; I woke up disoriented moments later; ears are ringing from my head hitting; Headache; Feel dizzy; noticed muscle aches; This is a spontaneous report from a contactable consumer (patient). A 43-year-old female patient (not pregnant) received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 2 via an unspecified route of administration, administered in Arm Left on 04May2021 11:15 (at 43 years old, not pregnant) as 2nd dose, single for covid-19 immunisation. The patient's medical history was not reported. Concomitant medications included cetirizine hydrochloride (ZYRTEC); mometasone furoate (NASONEX). The patient took Fioricet before and had allergies. The patient had her first dose of bnt162b2 vaccine on 13Apr2021 for Covid-19 Immunisation on left arm at 43 years old. All events reportedly started on 05may2021 03:00. Patient woke up in the middle of the night to use the bathroom. She thought she was feeling fine, but then noticed muscle aches as she walked. She decided to take Motrin. She walked to the sink and felt dizzy. She got so lightheaded, She sat on the edge of the tub with my head between her legs. That was the last thing She remembered. Based on the evidence the next morning, she must have stood up put Motrin in my mouth and poured a glass of water. Then she fainted and hit her head on the bathroom floor. She had never fainted before in her life. She woke up disoriented moments later with two Motrin still on her tongue and having no idea where she was. She had to crawl back to bed. The next morning, she found the spilled a glass of water and Motrin pills all over the floor. She now had a persistent headache and her ears are ringing from her head hitting the bathroom floor. She did not know that dizziness was a potential side effect or she may have taken precautions. The outcome of the events was recovering. No other vaccine in four weeks.No Covid prior vaccination.Not Covid tested post vaccination. Information about the Lot/batch number has been requested. |

| 1332840 | 5/20/2021 | NC | 18 | M | 4/22/2021 | 4/22/2021 | Fainted within 30 seconds/Passed out completely after shot; Passed out completely after shot; Some intermittent light headedness and dizziness; Some intermittent light headedness and dizziness; Irritating; scary/ fearful; scary/ fearful; This is a spontaneous report from a contactable consumer (patient's mother). An 18-year-old male patient received the first dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine, Lot. EW0169) at single dose, on 22Apr2021 at 17:30, for COVID-19 immunization. The patient had not received any other vaccines within 4 weeks prior to the BNT162B2 vaccine. Relevant medical history and concomitant medications were unknown. Patient's mother reported that her son fainted within 30 seconds of receiving the Pfizer vaccine 1st dose and since then he had experienced some intermittent light headedness and dizziness. He passed out completely after shot. Adverse events were described as following: "patient is due to get his second dose of the shot later this evening but is having periods of lightheadedness and dizziness. Patient's mother states that her son also feels like he is going to pass out. She states that this started 30 seconds after the first shot. Her son only passed out once, completely right after the shot, it was a bad experience. She's glad he actually wants the other one today, but he is concerned because he is still lightheaded and dizzy after 3 weeks. Patient's mother states that he has been trying to function, work, and live his life but its irritating to him and scary. The doctor suggested that he should get his second dose but her son is a little fearful". Physician Office Visit required. The patient did not recover from intermittent light headedness and dizziness, while clinical outcome of the other events was unknown.; Sender's Comments: Based on known drug safety profile and strong temporal relationship there is reasonable possibility of causal association between the reported events and the suspect drug. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate. |

| 1332860 | 5/20/2021 | CT | | F | 4/12/2021 | 5/12/2021 | <p>has had 4 very brief episodes of syncope in the past 4 days/ dizzy and passed out; Test: On monitor for 24hr w/ no, Result: Arrhythmia; After each episode, she consistently describes dark and blurred vision for 15 min; arm twitching; then dizzy and passed out; she felt scorching hot for a few minutes; This is a spontaneous report from a contactable physician. A female patient of an unspecified age received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, lot number: EP6955 and expiration date were unknown), via an unspecified route of administration in arm right on 12Apr2021 as single dose for COVID-19 immunisation. Medical history included anxiety , depression from an unknown date and unknown if ongoing. Concomitant medication included escitalopram oxalate (LEXAPRO) taken for anxiety, depression from an unspecified date. Previously the patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, lot number: EP6955 and expiration date: 30Jun2021), via an unspecified route of administration in arm right on 22Mar2021 as single dose for COVID-19 immunisation. It was reported that the patient who will be 20 years has had 4 very brief episodes of syncope in the past 4 days and spent 8 hours in ER Friday. Blood work, ECG, Echo, and MRI without contrast were normal. Doctors are baffled. Reporter enquired about the vaccine-related seizures 1 month after the second dose and asked for email address for a medical monitor supporting the vaccine trial. It was reported that the patient is perfectly healthy She does not drink or use any illicit drugs. She takes BCP to regulate her period and one month ago she started 5 mg/day Lexapro for test anxiety and COVID-induced depression. On Wed 12May2021 10 am while at work, she felt scorching hot for a few minutes, then dizzy and passed out; witnessed by 2 work colleagues. She will ask her colleagues tomorrow how long she was unconscious. On Thurs 13May2021 while at work she felt dizzy briefly but did not pass out. On Fri 14May2021 shortly after lunch while working in her cubicle, she woke up with computer keyboard imprint on her face. Unwitnessed, no warning whatsoever. Sat pm after dinner while in backseat of car, she felt dizzy and within a minute or so she had brief LOC lasting less than 1</p> |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

minute. Sun 16May2021 after breakfast while bathing, she passed out. Unwitnessed. Her phone was nearby so she was able to call me. After each episode, she consistently describes dark and blurred vision for 15 min. Then she feels fine. No obvious seizure activity although last night her boyfriend said her right arm was twitching. No incontinence. Seen by her PMD on Thurs 13May2021 and we spent 8 hours at the ER Friday 14May2021: PE, orthostatics, CBC, Chem 18, pregnancy test, U/A, ECG, ECHO and MRI of brain without contrast was normal. No Neuro or cardiology consult (yet). Today her doctor is recommending she be admitted for observation, consults and further testing. The patient has not received any other vaccinations prior 4 weeks and has no history of allergies. All tests done at the hospital came back normal. Daughter is currently in the hospital being discharged today 17May2021. She will wear a Holter monitor for 2 weeks to record any further events. Cardiology and neurology both conclude the adverse events were not cardio or neurological origin. Physician does not think it was seizures. She did not intend to report seizures-it was syncope. She does not have any further adverse events or history to report at this time beyond what she already reported. The patient underwent lab tests and procedures which included blood test: normal, blood thyroid stimulating hormone: normal, electrocardiogram: normal, electroencephalogram: normal, investigation: normal, investigation: arrhythmia, investigation: normal, physical examination: normal, pregnancy test: normal, urine analysis: normal on 13May2021, echocardiogram: normal, electrocardiogram: normal, full blood count: normal, investigation: normal, magnetic resonance imaging normal: normal on 14May2021. The outcome of the events was unknown.; Sender's Comments: As there is limited information in the case provided, the causal association between the events syncope, arrhythmia, dizziness, feeling hot, vision blurred, muscle twitching and the suspect drug BNT162B2 cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified

| 1332965 | 5/20/2021 | CA | 26 | F | 5/7/2021 | | <p>FAINTED POST IMMUNIZATION; CONFIRMED COVID-19 INFECTION; This spontaneous report received from a patient concerned a 26 year-old white and Hispanic or Latino female. The patient's height, and weight were not reported. The patient's concurrent conditions included needle phobia, alcohol use (Social - 1-2 drinks per week; very light drinker) and non-smoker. The product was stored in appropriate temperature conditions (it was stored properly from receipt to administration). The patient was not pregnant. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, intramuscular, batch number: unknown, expiry: unknown) administered on 07-MAY-2021 to left arm as prophylactic vaccination. The batch number was not reported. Per procedure, no follow-up will be requested for this case. No concomitant medications were reported. On 07-MAY-2021, the patient fainted post immunization. On the same day, she was feeling exhausted and had headache. On 08-MAY-2021, she experienced low grade fever and lethargy. Till 10-MAY-2021, she was feeling exhausted and had headaches. On 13-MAY-2021, she identified lack of smell while cleaning house (cleaning products). On the same day, she had positive rapid home test for COVID 19 and she tested negative at health care professional (HCP). On 14-MAY-2021, she was tested positive polymerase chain reaction (PCR) for Covid 19 (headache, exhausted, low grade fever, lack of smell and lethargy). The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from fainted post immunization on 07-MAY-2021, and was recovering from confirmed covid-19 infection. This report was associated with product quality complaint: 90000179636 This report was serious (Other Medically Important Condition). The narrative states the patient received the vaccine on 07-May-2021 and had a positive Covid-19 test on 14-May-2021 with 7 days elapsed between vaccine and test. There was not sufficient time elapsed for the patient to achieve immunity therefore this report was not considered a lack of effect. The suspected product quality complaint has been confirmed to be voided there was no PQC identified within the reported complaint. Voided based on the PQC evaluation/investigation performed"; Sender's Comments: V0:20210530216-covid-19 vaccine ad26.cov2.s-Fainted post immunisation. This event is</p> |

| 1332701 | 5/20/2021 | MI | 43 | F | 4/25/2021 | 4/25/2021 | fainting; Very intense dizziness; vomiting; headache; This is a spontaneous report from a contactable consumer (patient). A 43-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; Batch/Lot number was not reported), via an unspecified route of administration, administered in Arm Left on 25Apr2021 11:45 (43-years-old) as 2nd dose, single for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient previously took first dose of bnt162b2 for COVID-19 immunization. Patient was not pregnant. No known allergies. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. Vaccination Facility Type was Pharmacy. The patient experienced very intense dizziness, with a few seconds of fainting on the first day, vomiting, headache 10 hours following the administration of the second dose and continuously since then, for 10 days now. All events started from 25Apr2021 22:00 with outcome of not recovered. Events resulted in Emergency room/department or urgent care. No treatment was given. Information on the lot/batch number has been requested. |
| 1334302 | 5/20/2021 | CA | 52 | M | 4/23/2021 | 4/24/2021 | Within one day of receiving the 2nd shot started having heart palpitations in the middle of the night, Went to Urgent care, not help. Went back to hospital and a got a heartmonitor and wore that for a week. Thenon Friday, May 7th went to the emergency with sweats and almost passed out. They kept him there for over a day, ran tests, etc. Blood work came out fine. He was released the following day. No answers. One doctor there admitted that he believed it's related to the vaccine. Now here we are, May 20th, no answers and feeling the same, but now chest pain, shortness and breath. Never had ANY HEART PROBLEMS BEFORE THIS! |
| 1334052 | 5/20/2021 | WA | 15 | F | 5/20/2021 | 5/20/2021 | severe syncope and fainting, vomiting, lowered BP and lowered heart rate. First signs about 10 min post injection. Paramedics attending within 25-30 min of injection |

| 1334070 | 5/20/2021 | NY | 50 | M | 5/20/2021 | 5/20/2021 | Patient had syncopal episode after vaccination. Had been recently traveling (flew from Spain with minimal food and sleep in last 24 hours). Patient has history of syncope in the past with Botox injection. Patient regained consciousness spontaneously. No seizure activity or head injury. Symptoms resolved and patient discharged |
| 1334139 | 5/20/2021 | VA | 13 | F | 5/20/2021 | 5/20/2021 | Syncope immediately following vaccine administration. No loss of consciousness, oriented, alert, responding appropriately to questions. Described "seeing spots in front of eyes, cold feeling". Pt denied nausea. |
| 1334145 | 5/20/2021 | NC | 22 | M | 5/18/2021 | 5/18/2021 | Within 60-90 seconds after receiving J&J vaccine, patient became lightheaded, sat down, then subsequently passed out. Then had 2-3 jerking motions similar to seizure activity. Was lowered to the floor and called a CODE ASSIST. patient was not registered at the time, but was in a hospital. No previous reaction to injections. Patient taken to ED for workup. Patient diaphoretic and bradycardic at 36. given IV fluids and performed EKG. was later discharged from ED |
| 1334149 | 5/20/2021 | OH | 16 | F | 5/1/2021 | 5/2/2021 | Patient started experiencing numbness and tingling on her right side and then all over on Sunday evening 5/2/21. It affected her gait and the numbness and tingling in her legs caused her to have to catch herself and hold on to something to keep from falling. She described that her legs felt weak for a few seconds when walking. This sensation gradually decreased in intensity and duration. When I saw her at 5 pm on 5/3, she had normal gait and only felt the numbness and tingling very briefly. Her exam including her neuro exam was normal on 5/3 when I saw her. The sensation of numbness and tingling completely resolved by 5/4. She also experienced HA, nausea and fatigue, but did not have syncope, dizziness or fevers. |
| 1334173 | 5/20/2021 | NC | 16 | F | 5/19/2021 | 5/19/2021 | Patient fainted approx. 1 minute after getting the vaccine. Layed down on the floor with feet elevated and head supported for 15 min after, given water and cold compress for forehead. No additional care needed |

| 1334208 | 5/20/2021 | IL | 18 | M | 5/20/2021 | 5/20/2021 | Patient is 18 year old male who received his first dose of Pfizer COVID 19 vaccine. graduate intern, administered the dose and within the first minute, patient tensed up and passed out. He appeared to look like he had a seizure. Patient was passed out for less than a minute. When he came to, he said he fell asleep. He said he felt warm. We checked his Blood pressure and it 94/62 and pulse was 54. We called 911 and laid patient on a mat. He was given gatorade and a warm wash cloth. Paramedics arrived and rechecked BP. It was 110/66 and pulse was 66. They evaluated him and told him to have someone drive him home. Patient has not history of seizures and no history of adverse reaction to vaccine. He did receive a tetanus booster on 5/17/21. Only other medical history is asthma. He uses albuterol prn but has not had to use it for > 4 years. |
| 1333558 | 5/20/2021 | CA | 34 | F | 5/19/2021 | 5/19/2021 | Systemic: Dizziness / Lightheadness-Mild, Systemic: Fainting / Unresponsive-Mild, Systemic: Flushed / Sweating-Mild, Additional Details: Patient was unresponsive for 10 seconds then after she became responsive should couldn't remember today's date or where she was for about 30 seconds. Then she was ok. Talkative and could answer all of my questions perfectly. She was very sweaty and thirsty. Patient drank 2 bottles of water and was monitored for 30minutes before she was allowed to leave the store. |
| 1334255 | 5/20/2021 | WA | 12 | F | 5/18/2021 | 5/18/2021 | The patient was vaccinated and then got up to walk to observation area. While waiting for her COVID vaccination card, she started leaning on mom and fainted. Mom caught her and placed her flat on the floor. A medical professional volunteering at the clinic responded to the incident and checked her O2 levels and blood pressure. Patient cam to shortly after fainting. Vitals were good and the doctor recommended she stay in observation for an additional 10 minutes. Patient left clinic with mom after waiting and without further incident. |

| 1333981 | 5/20/2021 | TN | 27 | F | 5/19/2021 | 5/19/2021 | This is my first pregnancy. My estimated date of delivery is August 2021. I was to preface this by saying I have a history of passing out due to shots, examinations, blood tests, etc. So this might not have been because of the vaccine, but my own medical history of passing out. However, I do want to say I am 28 weeks pregnant, and ten minutes after receiving the vaccine, I fainted and then vomited. The EMT team was called, and the nurse practitioner on site examined me. They said that I was ok after monitoring me for about half an hour and checking my blood pressures four times. They also monitored my heart rate. I recovered fully after about an hour. |
| 1334326 | 5/20/2021 | OR | 22 | F | 4/8/2021 | 4/9/2021 | Fever (unknown temperature), headache, and fainted/passed out twice. |
| 1334335 | 5/20/2021 | MI | 35 | F | 5/20/2021 | 5/20/2021 | THE PATIENT FAINTED AFTER VACCINE WAS ADMINISTERED. PATIENT REGAINED CONSCIOUS BACK WITHIN FEW SECONDS. SAT DOWN AND OBSERVED FOR 30 MINS. PATIENT WAS NORMAL BY THE TIME SHE LEFT THE PHARMACY. |
| 1334385 | 5/20/2021 | IL | 70 | F | 5/6/2021 | 5/6/2021 | Passed out on a walk and broke my arm falling on the concrete. Have had stomach pains and diarrhea off and on since getting the shot.. very tired |
| 1334442 | 5/20/2021 | CO | 14 | M | 5/20/2021 | 5/20/2021 | 10 minutes after his vaccination, the patient was sitting with his mother and sister in our waiting room per protocol after a vaccine. I heard a mom scream while I was giving another patient a vaccine. I ran out with an epipen but he was awake, alert, and breathing normally. I asked what happened and she said he fainted for a second and seized or twitched a little. I did not give him any epinephrine because he was not having any issues breathing and was able to tell me he felt fine. We did call 911 per moms request and they came and checked him out. |

| 1334548 | 5/20/2021 | IL | 28 | M | 5/20/2021 | 5/20/2021 | Pt received janssen vaccine, within 5 minutes pt was seated in waiting area and fainted very briefly and fell to the ground. Fell slowly and did not hit head. 911 was called. With the help of pt's mother, pt placed on his side, appeared pale, slow to response, generalized weakness. Within 1 to 2 minutes pt become more responsive, was placed on his back and raised his feet up on a chair. An ice pack was applied to pt's forehead and was monitored until EMTs arrived and care was transitioned to paramedics. Pt was assessed and taken with paramedics to be evaluated. |
| 1334610 | 5/20/2021 | IN | 32 | F | 4/1/2021 | 4/1/2021 | 15 minutes after the vaccination I passed out and a week later I lost feeling in my leg and had to go to the ER and now I'm currently wheel chair bound with no diagnosis but all the doctors can say is it from the COVID 19 vaccine. |
| 1333922 | 5/20/2021 | NY | 30 | F | 5/20/2021 | 5/20/2021 | patient fainted within 11min during the 15min observation window. patient woke up within seconds after I approached her to see if it was an allergic reaction. EMS was called immediately. |
| 1334213 | 5/20/2021 | OH | 12 | M | 5/20/2021 | 5/20/2021 | After vaccine was administered, patient was asked to wait for 15 minutes, at which time Parent notices that child had passed out, looked pale and unresponsive to name calling. I (pharmacist) was alerted to the event and I and couple technicians went out to assist patient. I elevated child's feet, supported head, took blood pressure and pulse. Child regained consciousness and was able to respond to name in less than two minutes. Child stated that he was hot and agreed to drinking cold water. I also applied cold compress to child's forehead and wrists. Child took sips of water and BP was continuously monitored. Parents stated that child looked much better and had regained color to his face. Child was monitored to 30 mins by the pharmacy team with no event before parents took child home. |
| 1333740 | 5/20/2021 | KY | 15 | F | 5/20/2021 | 5/20/2021 | Patient passed out about 15 minutes after receiving the vaccine. She stated that she had not eaten since breakfast and is the reason she felt lightheaded. Staff provided water and a snack for the patient and sat with her until she felt ready to stand up. |

| 1330900 | 5/19/2021 | NY | 19 | M | 5/15/2021 | 5/17/2021 | <p>Patient is a 19 y.o. male with a variety of minor past medical problems but without any significant PMH who presents with 24h of acute onset chest pains. He reports yesterday morning he was woken from sleep at 3-4 am with severe substernal chest pains that radiated to his arm and neck. This was worsened by laying flat and better if he waked around/pacing. He took ibuprofen and it got better so he went back to sleep. The pain returned about 6 hours later and was getting more severe so he went to see his doctor. There an EKG was abnormal so he was referred to the ED where a work up showed ST elevations c/w pericarditis and an elevated trop I of 24. The night prior, he reported a low grade temperature. He has not had any more fevers for the past 12-18 hours. He denies any other symptoms such as palpitations, shortness of breath, cough syncope. He denies sick contacts but did have a sore throat 4-5 days ago without any other associated symptoms. He has had recent negative COVID tests while at college. Of note he did receive the 2nd dose of Pfizer on 5/15 about 24-36 hours before onset of symptoms. Of note, he does boxing at school and has been participating in work outs until about a week ago. ED course: EKG w/ diffuse ST segment elevation in V3-V6, I, II, AVF. Troponin I 24. Creatnine 1.2 with baseline of 0.5 but BUN WNL (11). CBC WNL, CRP mildly elevated to 3.1, Transferred to another ED. Second ED Course: BP 120/64 Pulse 83 Temp 36.7 °C (98.1 °F) (Temporal) Resp 18 Wt 76.3 kg SpO2 97% exam non-focal, COVID ab notable for +spike neg nuclear capsid consistent with vax but no infection, D-Dimer, procal, ESR, ferritin, Coags all WNL, Trop T elevated to 1.46., ECG with consistent diffuse ST seg elevations, seen by ped cards who did echo in ED and notable for EF ~50%, admitted to PCICU for further management and treatment Admitted to the PCICU in stable condition. Placed on telemetry monitoring for the duration of the admission. Started on IV steroids and given IVIG on hospital day 1. Continued on toradol which was switched to motrin on hospital day 2. Cardiac MRI did not show signs of fibrosis. Troponin downtrended throughout his stay. At the time of DC echo showed normal function, ekg showed T wave inverions, and troponin was down trending to 0.57. Pt to be restricted from physical activity until cleared by cardiology. Infectious workup also sent, most of which was pending</p> |

| 1330866 | 5/19/2021 | IL | 16 | F | 4/26/2021 | 5/10/2021 | <p>at time of discharge.</p> <p>is a 16-year-old female patient admitted with tachycardia. Starting 1-1/2 weeks ago, mom notes that she has had episodes where she feels her heart racing. It began 1-1/2 weeks ago with her crying and her watch that her heart rate was 208. They went to the ED, where she was given some fluids and her heart rate improved so she was sent home. She had had prior episodes of mild tachycardia up to the 140s in the past but which has always improved with fluids. Mom states that she used to have a lot of trouble maintaining her hydration and would not drink a lot of water. Since the last 1-1/2 weeks, she has been having these episodes 1-2 times a day that last about 1 to 2 minutes with a max of 5 minutes. When it comes on, she feels dizzy and lightheaded, and after the episode she feels a big rush of blood to her head. She also has some associated shortness of breath. She denies having any episodes of chest pain at all. She has never passed out, she has never felt like she was going to pass out, she has never felt like she was out of balance. She denies any nausea or vomiting during episodes. She denies any headaches during the episodes. She does have history of migraines, but has not had one in the last couple weeks. Her prior resting heart rate was in the 80s per her watch, and lately it has been in the 110s to 120s while awake in 80s while asleep. Along with the episodes, she also feels some pulsating sensation in her abdomen. She does not have any abdominal pain. Today, her heart rate was again in the 200s, but it was worse than before because it lasted about 30 minutes total. Lately they have been using an app that continuously monitors her heart rate. Since these episodes started, she has cut down on her caffeine intake and she has increased her water intake. Does not feel that this helped. She has never had syncope in the past and has never had seizures in the past. Patient was started on carvedilol which has helped control heart rate and was encouraged to drink fluids. Per primary care team, her current episode of tachycardia was not due to the vaccine.</p> |

| 1331159 | 5/19/2021 | CA | 17 | F | 5/19/2021 | 5/19/2021 | Client received 1st COVID vaccine of Pfizer (Lot# EW0185 expiration 05/23/2021). At 1347, RN assisted Client to stand up from vaccination chair. Client began to have unsteady gait. Both RN and RN assisted Client back to the gravity chair. At 1348, RN and PHN responded to the event. At 1348, vital signs are blood pressure 116/72, heart rate 64, oxygen saturation 100%. Client reported no blurry vision no headache, appearance is pale. Client is accompanied by mother. Per client's mother, Client has no medical history, allergies to dogs, and a history of syncope and lightheaded with needles/vaccines. At 1352, vital signs are blood pressure 118/82, heart rate 62, oxygen saturation 100%. Client reports lightheaded, feels tired, no shortness of breath, no headache. Supplemental nutrition and fluids provided to Client . Client accepted. At 1357, vital signs are blood pressure 116/76, heart rate 63, oxygen saturation 100%. Client reports no headache, no blurred vision, lightheaded improving, feels "sleepy", and skin tone returning to appropriate ethnicity. PHN educated client and mother ED precautions, common adverse effects of COVID vaccine, and emphasize a follow up with primary care provider. At 1400, vital signs are blood pressure 118/72, heart rate 63, oxygen saturation 100%. At 1402 Client stood up with no complains. At 1403 Client walked out of vaccination facility with a steady gait accompanied by mother. |
| 1330762 | 5/19/2021 | NY | 17 | F | 5/19/2021 | 5/19/2021 | Patient experienced syncope shortly after receiving vaccine while standing. Patient fell and remained on ground per advice of EMTs who arrived and escorted via ambulance for evaluation due to the patient experiencing nausea and vomiting upon rising back up. |
| 1330722 | 5/19/2021 | TN | 30 | M | 5/19/2021 | 5/19/2021 | The patient experienced vasovagal syncope a few minutes following vaccine administration. Patient became alert seconds after fainting and made a full recovery. |

| 1330717 | 5/19/2021 | OK | 23 | M | 5/18/2021 | 5/18/2021 | Pateint was given vaccine on 5/18/2021, soon after her injection, she passed out in the lobby. Code Blue was called. After medical team arrived, her HR= 48; BP= 89/56; O2= 100% on 3L and she responded to verbal commands. Hx of needle phobia. Not sure whether her Syncope was secondary to Vasovagal vs. J&J Vaccine vs. Seizures, therefore, we called EMS to take her for further evaluation. |
| 1330702 | 5/19/2021 | VA | 17 | M | 5/19/2021 | 5/19/2021 | After patient received the vaccine, went to sit on a chair for observation, he fainted and fall on the floor. He reported to fill dizzy and sweaty. Applied cold pack in the neck area on the back. The ambulance was called and patient was taken to the hospital for further treatment. |
| 1330667 | 5/19/2021 | OH | 52 | F | 3/6/2021 | 3/7/2021 | 14 hrs after injection I was freezing, three hrs later I was burning up this was at 3am, 4am still burning up and not able to sleep, 5am sat up and had a headache that was at least a ten on the pain scale, I went down our flight of stairs to get water and ibuprofen, I had to sit down before I could get the water, when I finally got up I went to the counter and was getting this stuff out and I started to sway and white spread across my field of vision and I grabbed for the counter to lower my self down and passed out before I could grab the counter, I laid there burning up and with a headache that was killing me. I finally got the water and 800mg of ibuprofen went back to bed and slept until 11am, got up no headache but since then I have been experiencing hot flashes daily the rest of March and into April a few in May. I realize that I am of the age to experience hot flashes heading into menopause but this was to coincidental and I had never had hot flashes before. |
| 1330624 | 5/19/2021 | FL | 25 | M | 5/19/2021 | 5/19/2021 | Within 5 min of administration, pt states ge felt lightheaded and passed out. Pt was seated and under care of RN. RN secured pt's airway and applied sternal rub to which the pt quickly revived. VS were normal. EMS was called and pt refused to go. Pt felt much improved within 45 min of the event and left the clinic w/o further incident. |

| | | | | | | | dizziness/lightheadedness upon standing from bed. Although patient has a history of A. fib but remained rate controlled during hospital stay, we held his antihypertensives including HCTZ and ARB while continued his Eliquis. I believe his syncope was likely due to dehydration with decreased oral intake in the setting of acute illness with COVID-19 symptoms. Before discharge blood pressure was rising so his ARB were restarted while decision regarding HCTZ will be made by primary care physician. In regard to his COVID-19 infection, initially was started on 2 L of supplemental oxygen but his oxygen demand decreased rapidly and most of the time he remained room air, he was not showing any dyspnea, cough, fever or any other generalized symptoms of Covid 19 infection. He did get plasma and remdesivir while inpatient, decision was made to discharge him on 3/26 as patient was symptom-free. He also had received first dose of vaccination. I believe that he would need further remdesivir. We will continue him on steroids for now after completion of dexamethasone for next 8 days he can recent resume his home medication of prednisone. |

| 1331267 | 5/19/2021 | WI | 19 | M | 5/19/2021 | 5/19/2021 | Immediately after sitting down in the waiting area after receiving the shot, the pt reported feeling a strange pressure in their arm. Following this, the patient described the sensation of "blacking out". The pt fell off their chair and lacked alert consciousness for roughly five seconds. When the pt came to, they appeared confused and twitchy, with wide eyes and an overall appearance of shock. Pt remained in their state for roughly a minute, before stating that they felt completely better. The pt had developed a sweaty back but didn't state that they felt overally hot. They didn't mention being in any pain. The local injection site appeared a bit red but nothing of significant note. Pt did bump their head on the side wall behind the chair, receiving a minor bruise. Pt was given some water to drink and was monitored for 30 minutes. They pt stated they felt fine. They had no past history of fainting with vaccines, thought pt claimed to have passed out like this before but only after suffering a head injury. After their wait, the pt was allowed to leave and assured us that they felt completely fine. |

A 26 years-old male patient received the first dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine, Lot. EW0173) in the left arm, at single dose, on 04May2021, at 08:45 AM, for COVID-19 immunisation. COVID-19 vaccine was administered at Pharmacy or Drug Store. The patient had not received any other vaccines within 4 weeks prior to the BNT162B2 vaccine. The patient had not received any other medications within 2 weeks of vaccination. Prior to vaccination, was not the patient diagnosed with COVID-19. Relevant medical history and concomitant medications were unknown. It was reported that the patient received the first dose of vaccine in left arm, then 5 minutes later, on 04May2021, lost consciousness/passed out for several minutes. Woke up feeling weak and tired on an unspecified date. Emergency Room Visit /department or urgent care required. Post the vaccination, the patient has not been tested for COVID-19. Clinical outcome of the events was unknown at time of this report. No follow-up attempts possible. No further information expected. |
| 1329881 | 5/19/2021 | CA | 25 | M | 5/18/2021 | 5/19/2021 | Waking up at 4:30 AM I went to urinate. Feeling weak I started to slouch and have trouble standing while urinating. Upon returning to my room I fainted. I suddenly lost consciousness and fell on my clothes/bed. I drank about 1.5 liters of water and felt better after about 15 minutes. |

The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 08-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 06-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 06-Apr-2021, the patient experienced HEADACHE (headache immediately). On 08-Apr-2021, the patient experienced SYNCOPE (Fainted) (seriousness criterion medically significant), CONFUSIONAL STATE (confusion), CRYING (cried), ASTHENIA (could barely function, weak), VITREOUS FLOATERS (flashes in eyes), FEELING ABNORMAL (i think i am going to die/ horrid / never felt so horrible in my life) and FATIGUE (Total and complete exhaustion/soo tired). On an unknown date, the patient experienced VITAMIN D DEFICIENCY (had severe Vitamin D deficiency) and CHILLS (Chills). At the time of the report, SYNCOPE (Fainted), VITAMIN D DEFICIENCY (had severe Vitamin D deficiency), CONFUSIONAL STATE (confusion), CRYING (cried), ASTHENIA (could barely function, weak), VITREOUS FLOATERS (flashes in eyes), FEELING ABNORMAL (i think i am going to die/ horrid / never felt so horrible in my life) and CHILLS (Chills) outcome was unknown and HEADACHE (headache immediately) and FATIGUE (Total and complete exhaustion/soo tired) had not resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In 2020, Blood test: vitamin d normal (normal) Vitamin D normal. In 2021, Blood test: severe vitamin d deficiency (abnormal) severe Vitamin D deficiency. The treatment reported was patient was prescribed Vitamin D 50,000 units once weekly and Tylenol. Action taken with mRNA-1273 in response to the drug was not applicable. This case was linked to MOD-</p> |

| 1329542 | 5/19/2021 | AR | 71 | F | 4/8/2021 | 4/8/2021 | Swelling and pain on right side of body; Swelling and pain on right side of body; Sore arm; Arm swollen; Everything in vision went white; Felt weak and sick; Felt weak and sick; This is a spontaneous report from a contactable consumer (patient). A 71-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in Arm Right on 08Apr2021 (Lot Number: BRZU13) as 1st dose, single for covid-19 immunisation. Medical history included ongoing glaucoma (she was diagnosed with glaucoma when she was 37, the glaucoma only started to really get worse over the last few years, her pressure was up pretty high and she has to go on 11May2021 to the eye doctor), ongoing rheumatoid arthritis (she has had rheumatoid arthritis for more than a couple of years, she had rheumatoid arthritis when she was diagnosed as disabled and no one bothered to tell her), ongoing hypertension (it has been 5, 6, or 7 years since she was diagnosed with high blood pressure), ongoing small cataracts (she was diagnosed with small cataracts about a year ago), ongoing severe osteoporosis (it has been a few years since she was diagnosed with severe osteoporosis, reported that some physicians didn't even bother to check to see if she had osteoporosis), ongoing Can't take statins (she can't take statins and her doctor is giving her Omega 3's instead of statins, she tried to take statins and couldn't do it), ongoing allergies (if she eats a grapefruit, her whole face and lips and eyes swell up, she had to go to the emergency room following consumption of a grapefruit, she can't eat oranges or she will have to be taken to the emergency room, she cannot wash her clothes or sleep on sheets that have been washed in certain things), reaction to polyethylene glycol (25-30 years ago, she went into the hospital to have a colonoscopy, she drank the Polyethylene Glycol, went to the bathroom, and passed out, the hospital staff had to come in and get her from the bathroom, the medical staff figured out it was the Polyethylene Glycol that caused her to pass out and made her sick, she has not had a colonoscopy since the incident 25-30 years ago), problems with her hair and scalp started about a year ago (her hair was just thinning at first, and then it went to going bald and got worse and worse. Even with Rogaine and steroids, the balding was moving to the front of her |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

head. She stopped taking the steroids because she couldn't stop eating). Concomitant medications included amlodipine taken for blood pressure abnormal from an unspecified start date and ongoing (has been taking amlodipine for a year or a year and a half); hydrochlorothiazide taken for swelling from an unspecified start date and ongoing (she retired in 2005 and may have started taking hydrochlorothiazide before she retired); dorzolamide hydrochloride, timolol maleate (DORZOLAMIDE HYDROCHLORIDE AND TIMOLOL MALEATE) taken for glaucoma from an unspecified start date and ongoing (been about a year that she has been using the Dorzolamide/Timolol); latanoprost taken for glaucoma from an unspecified start date and ongoing (has been using the Latanoprost for longer than she has been using the Dorzolamide/Timolol); acetylsalicylic acid (ASPIRIN (E.C.)) taken for an unspecified indication from an unspecified start date and ongoing (she has been taking an aspirin daily religiously for about 6 months); famotidine taken for gastroesophageal reflux disease from an unspecified start date and ongoing (has been taking Famotidine for a couple of years); hydrocodone taken for pain from 2005 and ongoing. The patient experienced sore arm on 08Apr2021 with outcome of recovered on Apr2021, arm swollen on 08Apr2021 with outcome of recovered on Apr2021, everything in vision went white on 08Apr2021 with outcome of recovered on 08Apr2021, felt weak and sick on 08Apr2021 with outcome of recovered on Apr2021, swelling and pain on right side of body on 09Apr2021 with outcome of recovered on Apr2021. The events were described as everything went white: patient reported that everything went white in her vision while she was sitting and waiting after receiving her first dose of the Covid-19 vaccine. She thought that it may have just been her glaucoma. The white out of her vision lasted for 5-10 seconds and then her vision returned to normal. Felt weak and sick: when she left the vaccination facility on 08Apr2021, the sun was beating down and she got real sick. She got into her friend's vehicle and upon arriving home, the patient was unable to get out of the car because she felt like she was about to faint. She sat in the air conditioning in her friend's vehicle for 30 minutes. She was still feeling weak and sick but she went inside her house and got into bed. Swelling and pain on right side of body: when she woke

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

up on 09Apr2021, the whole right side of her body to include her face, arm, hand, and foot, were all very painful and very swollen for about 3 days. She has had multiple surgeries on the right side of her body and all of the sites were very painful. Felt weak and sick: she started sweating a lot while she sat in her friend's truck on 08Apr2021 after the first dose of the Covid-19 vaccine. She sat in her friend's truck for 30-40 minutes with the air conditioner running full force and felt a little better. She still felt weak and sick, but she went inside because her friend needed to leave. She took off her clothes and tried to eat some soup, but just got into bed and stayed there. Swelling and pain on right side of body: the swelling and pain was really bad for 3-4 days and eventually went away. The pain and swelling gradually diminished. The bones in her hands, knees, thighs, and feet were all very painful. She has a piece of wire that holds her foot to her leg and a spot on her thigh that was affected when she was being given pain blocks and the provider kept missing the site. She has rheumatoid arthritis in her hands, arms, and shoulders as well as a herniated disk in her neck. Patient reported that all of that was hurting and hurting at the same time. Felt weak and sick: patient reported that it took awhile to start coming back to herself. It took about a week and a half until she finally felt back to normal. The patient reported that she should have gone to the doctor or emergency room when she experienced side effects following the first dose of the Covid-19 vaccine. She didn't want to go to the hospital because her immune system wasn't right and she didn't want to catch anything. Information on Lot/Batch number was available. Additional information has been requested.

| 1329514 | 5/19/2021 | MT | 43 | M | 4/30/2021 | 4/30/2021 | fainted; fell to the floor; hit his head; This is a spontaneous report from a contactable pharmacist. A 43-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), intramuscularly, administered in the left arm on 30Apr2021 at 12:15 PM (Batch/Lot Number: EW0172) as the 2nd dose, single for COVID-19 immunization. The vaccination facility type was reported as the pharmacy/drug store; the vaccine was not administered at the military facility. The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on an unspecified date. Relevant medical history included past experience with fainting on an unknown date. The patient had no known allergies. The patient's concomitant medications were not reported. The patient had vaccination on 30Apr2021 and then proceeded to the front of the store to check-out. On 30Apr2021 at 12:20 PM, he fainted and fell to the floor and hit his head. The 911 was called immediately. The reporter checked the blood pressure and gave patient some water. The paramedics arrived and took over. The patient refused paramedic transport to hospital. The patient's father picked him up from the store. It was unknown if the patient has ever had an adverse event following any previous vaccine. The patient underwent lab tests and procedures, which included blood pressure with unknown results on 30Apr2021. The outcome of the events was unknown. Information on the batch/lot number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of event Faint cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate. |

| 1329496 | 5/19/2021 | CA | 60 | F | 4/9/2021 | 4/1/2021 | I have been sick; couldn't eat anything down; lost consciousness; Trigeminal neuralgia attack; Trigeminal neuralgia attack; massive vertigo attack; eye was so swollen; This is a spontaneous report from a contactable consumer (patient). This 60-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 09Apr2021 (at the age of 60-year-old) (Batch/Lot number was not reported) as single dose for COVID-19 immunisation. Relevant medical history included trigeminal neuralgia, head injury, pulmonary problems, severe migraine and tumor in lymph node. Concomitant medications were not reported. On 09Apr2021, the patient lost consciousness; in Apr2021, she experienced trigeminal neuralgia attack, massive vertigo attack and eye was so swollen; on an unspecified date she experienced also sickness and couldn't eat anything down. The patient specified that right after she got the injection, they make you to sit there for 15 minutes to see. She lost consciousness, it was like they gave her a shot before you go on for surgery and the doctor had come over, they had to wake her up. She didn't know what happened, so that was the first thing and the doctor said that's out of all the 1000's of people they vaccinated she was the first one that passed out right after the injection. So, she thought may be that should be noted somewhere and she didn't get a headache that she has a condition called Trigeminal neuralgia which was extremely painful and it's like only 3% of the population get it and it's usually caused after major head injury, was the very next day her shot was on the Friday and then Saturday the pain was terrific and she had the trigeminal pain for a week, took a week to go away and then right after that the next week she had a massive vertigo attack. And she really didn't know all these things or side effects from her head injury. But her conditions are pretty rare, you only get them if you've got massive concussions and fractured skull and stuff like that which happened a long time ago. So she didn't know if the shot had anything to do with it. She has pulmonary problems so she was getting it no matter what because she can't go anywhere hery Pulmonologist won't let her leave the house unless she has to go to a doctor or an emergency room. And she did go to the emergency room because her pain medication wasn't working at all |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

(Unspecified medication). She used to have migraine but after the head injury the migraine went away which she was very happy because she had severe migraine. What she didn't know was this Trigeminal neuralgia the nerve pain. The consumer further specified that she was so happy with the vaccine and she mean she doesn't care what the normal side effects are, she didn't have any other side effects her arm never hurts, she never had any fatigue or headache but she didn't know it was odd, the very morning she woke up Saturday she was in excruciating pain, its nerve pain that went down to the jaw, right under her eye and over the forehead and it's the most extremely painful thing that people get. She takes medication (Unspecified medication) daily to try to control it but sometime the pain is really really bad. She had been sick for the 3 weeks, she did not think anything had to do with the vaccine except the trigeminal. But it could have caused a massive vertigo attack which lasted 8 or 9 days. Today was the first day she was eating food in a week because she couldn't eat anything down. The patient was on a lot of steroids, she was reducing but she was still very plump so she thinks it's about 270 pounds right now. At the time of the report, the outcome of the events was unknown. The information on the batch number has been requested.

The patient had no known medical history or allergies. Historical Vaccine includes 1st Dose of bnt162b2 on 11Apr2021 at 15:30 in right arm. Concomitant medications included amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (ADDERALL), paroxetine hydrochloride (PAXIL [PAROXETINE HYDROCHLORIDE]). No other vaccines were given within 4 weeks. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination the patient had not been tested for COVID-19. On 02May2021 at 02:00 the patient experienced passed out from pain, very extreme joint, muscle, organ, skin pain in every cell of body, 40 hours later, joints are still nearly unbearably sore, headache, skin pain, nausea, unable to sleep, stomach pain, diarrhea. Therapeutic measures were taken as a result of very extreme joint, muscle, organ, skin pain in every cell of body, headache. The clinical course was reported as follows Very extreme joint, muscle, organ, skin pain in every cell of body. Passed out from pain, Headache, Nausea. Pain only became slightly tolerable after taking 400 mg of both ibuprofen and acetaminophen nearly every 4 hours for the first 32 hours. Unable to sleep. Stomach pain. Diarrhea. 40 hours later, joints are still nearly unbearably sore. Continued stomach pain and diarrhea. The clinical outcome of the events was reported as recovering. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up. |

| 1329456 | 5/19/2021 | IL | 57 | F | 4/14/2021 | 4/29/2021 | <p>Bell's palsy; eyes pretty red; runny nose: second dose; eyes started bothering her, the right eye: second dose; her eye had a little burning sensation and was irritated; This is a spontaneous report from a contactable consumer (patient). A 57-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Arm Left on 14Apr2021 11:30 (Batch/Lot Number: EW0151) as single dose for covid-19 immunization. The patient's medical history included she was a breast cancer survivor, its been 10 years, all she had was radiation and she also had Tamoxifen for 5 years, had a colonoscopy a couple of months, she had seasonal allergies, adverse event following prior vaccinations: when she was young, she would get vaccines and would always get a light fever and her arm would swell and turn red. The patient's concomitant medication was not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient received the first dose of BNT162B2 (lot number: ER8733) in left arm on 24Mar2021 10:45 for covid-19 immunization and experienced fainted for just a few seconds, heart rate was very fast and headache, wasn't feeling well and lost consciousness. The patient experienced bell's palsy on 01May2021, eyes started bothering her, the right eye, her eye had a little burning sensation and was irritated on 29Apr2021, on the 30Apr2021 eye was pretty red, runny nose on 30Apr2021. The clinical course as following: This past Wednesday was two weeks and then Thursday, her eyes started bothering her, the right eye. She thought it was seasonal allergies, because she has those, that kept bothering her and and she had a very runny nose. Saturday she woke up she felt like her face was kind of numb. She called the nurse and they told her she should go to the emergency room. She was diagnosed with bells palsy and so they gave her treatment and they explained to her what it was all about. She had been working out in the yard and she came in and her eye had a little burning sensation and was irritated. She thought it was because she was outside. She also had a runny nose. She says again, she thought it was seasonal allergies because she has that. Felt weird around her mouth, felt kind of numb: second dose: This past Saturday, she woke up and stated she felt</p> |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

weird around her mouth, it felt kind of numb, it was hard for her to drink, she couldn't smile correctly, her smile was lopsided, one side was droopy. Caller states this began 01May2021. She went to the emergency room that same day and they diagnosed her with bells palsy. She was discharged from the emergency room because this time the lady doctor gave her the procedure with a stroke. The doctor could tell that it was not a stroke because of the eye, the doctor did something with her finger, they say can you see my finger, can you touch your nose. The doctor told her what she had is bells palsy and prescribed some medication. The eye is worse, but she doesn't have a runny nose anymore. With her eye, she can raise the left one, but the right one not as much. They gave her a patch for the right eye. She has to wear it in the evening, because it doesn't close anymore. She has to wear it to sleep with and during the day she has to wear glasses and if she goes outside, she has to wear sunglasses. Her eye is not really irritated, just kind of stiff, it does not really do much, she did some exercises to try to stimulate the muscles. The eye is just there, it doesn't really blink, it is beginning to blink a little bit but when she tries to close both eyes, she can close the left but it's like she can't completely close the right, she has no control of that part of the face, it's numb. She clarifies her eye started on Thursday 29 Apr because it was the first day she was outside. on the 30 Apr it was pretty red but she kept working. On Saturday morning she worked and she had a runny nose then too. Caller states they gave her some medicine at the emergency room. That night, she took Acyclovir and after she took the first one, she didn't have a runny nose anymore. Her eye is a different kind of bother now, it doesn't burn, its just there. They told her to get artificial tears and put the patch on. When asked if her eye is improved, persisted or worsened, she says the eye is not burning anymore, it's just kind of stiff. Bell's palsy: Caller states it's ongoing, when she smiles its the same. Caller states it's lopsided and when she raises her eyebrows, she can raise the left one, but the right one only goes up a little bit, but not as much. Caller states it's persisting, it's not getting worse, not getting better. Caller states she just started the medicine yesterday. Acyclovir: It was 400mg 5 times a day by mouth, one tablet for 10 days. Methylprednisolone: the other thing they prescribed me

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

was Methylprednisolone. She tried taking both the Acyclovir and the Methylprednisolone yesterday, but she had a really bad stomach ache and couldn't eat anymore. She had no appetite and her doctor, she told him she couldn't take both it is too much, so he just said she should continue the Acyclovir so she is not going to take the Methylprednisolone. The Methylprednisolone is a 4mg dose pack, 6 day thing. Yesterday she was supposed to take two before breakfast, 1 after lunch, 1 after supper and 2 before bedtime. She couldn't take all of that, it was too much. Today would have been different, it tapers off. The emergency room visit on 01May2021, they didn't do any testing, she just had observation. the doctor did this thing with her finger where she could see her finger and she pushed back and held onto the doctor's hands and showed her strength. she raised her eyes, closed her eyes, smiled, but no other testing was done. she had her second emergency room visit on 01May2021. Therapeutic measures were taken as a result of bell's palsy included Acyclovir and Methylprednisolone, for events of 'eyes started bothering her, the right eye', 'her eye had a little burning sensation and was irritated', and 'eyes pretty red' included artificial tears and put the patch on, no treatment received for runny nose. The outcome of the event Bell's palsy was not recovered, the outcome of the event runny nose was recovered on 01May2021, the outcome of the other events was recovered on an unknown date.

| 1329454 | 5/19/2021 | IL | 57 | F | 3/24/2021 | 4/1/2021 | This is a spontaneous report from a contactable consumer (patient). A 57-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left on 24Mar2021 10:45 (Lot Number: ER8733) as SINGLE DOSE for covid-19 immunisation. Prior Vaccinations within 4 weeks, no other vaccinations within four weeks prior to the first administration date of the suspect vaccine. Medical history included she was a breast cancer survivor, it's been 10 years, all she had was radiation and she also had Tamoxifen for 5 years. When she was young, she would get vaccines and would always get a light fever and her arm would swell and turn red. She verified she had this type of reaction with any vaccine she received. She also had a colonoscopy a couple of months ago. The patient's concomitant medications were not reported. She got a very bad headache on 02Apr2021, she woke up in the middle of the night and she got up, she thought her head was going to explode. She fainted on 03Apr2021 for just a few seconds, so she went to the emergency room on 03Apr2021 and they gave her a CAT scan, with dye and one without dye and everything was normal. They gave her some Advil through her IV to get rid of the headache and then she was okay. She said the night before she had a headache, she took a baby aspirin and she was better and went to sleep. Patient stated around 1 AM in the morning, she woke up and wasn't feeling well. She got up, she had a really bad headache, throbbing, seemed like it was going to explode, and she went to the bathroom. She called out to her sister, she was not feeling well and she lost consciousness there. A few hours later, her sister helped her to the living rom and she could not walk by herself, she was weak. She ate something later, she drank a lot of Gatorade and she got in touch with the nurse and the nurse told her to go to the emergency room they performed tests at the ER. She did not have any more headaches, the throbbing headache went away but the headache didn't completely go away. In the emergency room after all the testing, the doctor told her they were going to give her something similar to Advil through her IV and the headache went away. The fainting only happened that one time and ended right then and there, she thought because the headache was so bad. Patient |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

reported her heart rate was very fast. She stated they waited for her heart rate to stabilize they gave her Advil through the IV, the headaches went away and she slept and they allowed her to go home once everything was okay. Between the first and second doses patient was sensitive to hot and cold foods, she couldn't drink a hot cup of coffee. She thought she had a cavity, it was strange. She was eating everything lukewarm. She felt sharp pain on her right side. So she went to the dentist and the dentist thought it was more of a vein problem, they took x-rays and found two cavities and a cracked tooth, and they fixed it. First Visit to emergency room, CAT scan with and without dye, COVID test, EKG, Lung X-ray. Everything came back normal, it was negative. Patient has recovered completely from the headache on 03Apr2021 thanks to the Advil. She confirmed she recovered completely from the fainting on 03Apr2021. The outcome of other events was unknown.

| 1329453 | 5/19/2021 | PA | 64 | M | 4/2/2021 | 4/2/2021 | fainted; fell and hit his head; fell and hit his head; felt lightheaded/Dizziness; blood clots in his lungs; he has a spot on his lung that they are monitoring; hypoacusis and has a new hearing aid; This is a spontaneous report from a contactable consumer (patient's wife). A 64-years-old male patient received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE;), via an unspecified route of administration, administered in Arm Left on 02Apr2021 (at the age of 64 years old) (Batch/Lot Number: ER8733) as 1st SINGLE DOSE for covid-19 immunisation. Medical history included severe sleep apnea from 18Mar2021 (received a machine not long after), gout (diagnosed about four years ago) , ex-tobacco user from an unknown date to an unknown date (two pack a day smoker over thirty years). Concomitant medication included colchicine (COLCHICINE) 0.6 mg, 1x/day taken for gout, start date was not reported to Apr2021. The patient experienced blood clots in his lungs (hospitalization, medically significant) on 02Apr2021 (also reported as 02May2021). , fainted, fell and hit his head, felt lightheaded/dizziness on 02Apr2021, The patient was hospitalized from 2Apr2021 to 4Apr202. It was reported the patient experienced hypoacusis and has a new hearing aid on an unspecified date. Caller says her husband has new hearing aids, which is why he is not doing the report himself. Patient has a spot on his lung that they are monitoring on an unspecified date. The patient underwent lab tests and procedures which included blood test: results unavailable on an unspecified date , 'they did a couple tests' (details not provided) results unavailable on 02Apr2021, urine analysis: results unavailable on an unspecified date. Therapeutic measures were taken as a result of blood clots in his lungs included Thrombectomy on 02Apr2021. The clinical course was reported as follows on April 2nd her husband received his first dose of the Pfizer COVID-19 vaccine. Approximately an hour later they went to the market and he felt lightheaded, so instead of getting out of the car they sat there 20 minutes. He started to get out again then halfway out the door he fainted and fell down on the ground. She says he was out for, 5-10 minutes, clarified to not even a minute. Since he hit his head she called an ambulance, and they took him to PRIVACY in PRIVACY. They did a couple tests and said since it was so soon after getting the vaccine that they did not think |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

the vaccine had to do with his blood clots. Caller also stated he fainted because that was one of the side effects of the vaccine, but they were glad he got there since he had several blood clots in his lungs. On the same day (02Apr2021) he had a thrombectomy to remove the blood clots and put him on a blood thinner. Patient was admitted to the hospital April 2nd and was discharged April 4th. He is doing better, he is on a blood thinner now. She says there were a few doctors that had to weigh in on whether he should get the second dose, they decided it wouldn't affect it since the vaccine goes into his muscle. No other vaccinations on the same days as his Pfizer COVID-19 vaccinations or during the four weeks prior. Once they placed him on a blood thinner, they took him off Colchicine 0.6mg. He stopped taking Colchicine because they said the blood thinner doesn't work with that particular medication. It was also reported The patient is to schedule an appointment with a rheumatologist and a hematologist, they did blood work and a urine test and said he has a spot on his lung that they are monitoring. The clinical outcome of the event blood clots in his lungs was Recovered/Resolved with Sequel while the remaining events was unknown. The second dose bnt162b2 was administered on April 29th. LOT: ER8751, caller hopes that is a 5, the writing is very bad on there. The patient had no side effects from his second dose of the Pfizer COVID-19 vaccine.

| 1329435 | 5/19/2021 | NV | 19 | F | 4/23/2021 | 4/25/2021 | lost vision in both eyes; passed out; dizzy; severe nausea set in with severe body pain; severe nausea set in with severe body pain; worst migraine of my life; low blood pressure; This is a spontaneous report received from a contactable consumer (patient). A 19-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration (at the age of 19-years-old), administered in Arm Left on 23Apr2021 13:00 (Lot Number: EW0169) as 1st dose, single for COVID-19 immunization. Medical history included anxiety, and allergies to mosquitoes, hotdogs, and sausage. The patient was not pregnant at the time of vaccination. Concomitant medications included citalopram and drospirenone, estradiol (EOS), IUD, daily supplements. The patient previously took oxycodone ("oxycodone") and percocet [oxycodone hydrochloride;oxycodone terephthalate;paracetamol] and experienced allergies. The patient, 48 hrs later, lost vision in both eyes, became dizzy, passed out multiple times. Later severe nausea set in with severe body pain. Went to Urgent Care the following day and was told side effects. That night had worst migraine of her life, low blood pressure, and continued nausea. Given some meds and sent home to rest. Took 2 full days to feel okay again. Onset date and time of events reported as 25Apr2021 13:00. The adverse events resulted in Emergency room/department or urgent care. Therapeutic measures were taken as a result of the events. Treatment received for the adverse events included Toradol, Benadryl, and Reglan. The patient underwent lab tests and procedures which included sars-cov-2 test: negative (Nasal Swab) on 27Apr2021. The outcome of the events was recovered with sequelae. The events "lost vision in both eyes" and "passed out" were considered as serious (medically significant). Facility where the most recent COVID-19 vaccine was administered was Clinic/facility. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. No follow-up attempts are possible, no further information is expected. |

| 1329429 | 5/19/2021 | AZ | 33 | F | 4/10/2021 | 4/13/2021 | Nearly fainted while doing normal activity; Extreme dizziness; Leg muscle weakness; Weight on chest; Difficulty catching breath-lasting; This is a spontaneous report from a contactable consumer. A 33-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EW0155), dose 1 via an unspecified route of administration, administered into the right arm on 10Apr2021, at 16:30 as single dose for covid-19 immunization. Medical history included no significant findings. Concomitant medication included botulinum toxin type a (BOTOX) taken for an unspecified indication, start and stop date were not reported. No known drug allergies were noted. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 13Apr2021, at 19:30, the patient nearly fainted while doing normal activity, extreme dizziness, leg muscle weakness, weight on chest, difficulty catching breath-lasting were all noted. The events resulted in doctor or other healthcare professional office/clinic visit. Details were as follows: the patient nearly fainted while doing normal activity, had extreme dizziness, leg muscle weakness, weight on chest, difficulty catching breath-lasting more than seven days. Unspecified therapeutic measures were taken as a result of the events; treatment was also noted as still pending labs, to identify problem. There was no COVID-19 diagnosis prior to vaccination. Patient has not been tested for COVID-19 since vaccination. The outcome of events, nearly fainted while doing normal activity, extreme dizziness, leg muscle weakness, weight on chest, difficulty catching breath-lasting was recovered with sequelae; the patient recovered with lasting effects.; Sender's Comments: Based on chronological connection to the vaccine a causal relationship between event "Nearly fainted while doing normal activity" and BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate. |

| 1329169 | 5/19/2021 | TN | 67 | F | 3/12/2021 | 3/12/2021 | mentally overwhelmed; missed her 2nd dose; headache on and off; staggering fatigue/hard to stay awake where her eyes always wanted to close; felt uneasy; dizzy; she did not make it and urinated on the floor; passed out on the toilet; nervous; jittery feelings; Hands started to shake; This spontaneous case was reported by a consumer and describes the occurrence of LOSS OF CONSCIOUSNESS (passed out on the toilet) in a 67-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 040A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Arthritis (Left knee). Concomitant products included ACETYLSALICYLIC ACID (ASPIRIN (E.C.)), KETOROLAC and HYDROXYZINE for an unknown indication. On 12-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 12-Mar-2021, the patient experienced NERVOUSNESS (nervous), FEELING JITTERY (jittery feelings) and TREMOR (Hands started to shake). On 13-Mar-2021, the patient experienced LOSS OF CONSCIOUSNESS (passed out on the toilet) (seriousness criterion medically significant), DIZZINESS (dizzy), INCONTINENCE (she did not make it and urinated on the floor), FEELING ABNORMAL (felt uneasy), HEADACHE (headache on and off) and FATIGUE (staggering fatigue/hard to stay awake where her eyes always wanted to close). On an unknown date, the patient experienced EMOTIONAL DISTRESS (mentally overwhelmed) and PRODUCT DOSE OMISSION ISSUE (missed her 2nd dose). On 12-Mar-2021, TREMOR (Hands started to shake) had resolved. On 13-Mar-2021, LOSS OF CONSCIOUSNESS (passed out on the toilet) and INCONTINENCE (she did not make it and urinated on the floor) had resolved. At the time of the report, NERVOUSNESS (nervous), FEELING JITTERY (jittery feelings), DIZZINESS (dizzy), EMOTIONAL DISTRESS (mentally overwhelmed), FEELING ABNORMAL (felt uneasy), HEADACHE (headache on and off) and FATIGUE (staggering fatigue/hard to stay awake where her eyes always wanted to close) outcome was unknown and PRODUCT DOSE OMISSION ISSUE (missed her 2nd dose) had resolved. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

(Intramuscular) was unknown. Treatment of these events were not reported. Based on current available information and the temporal association between product use and the start date of the events a causal relationship cannot be excluded.; Sender's Comments: Based on current available information and the temporal association between product use and the start date of the events a causal relationship cannot be excluded.

F

Kidney stones/two kidney stones; Blackout; Fainting; Low blood pressure; Urinary tract infection; Tiredness; Vaccination adverse reaction/She had a slight reaction to the Pfizer COVID vaccine; Dizziness; Pinched nerve; Vomiting; This is a solicited report from a non-Pfizer sponsored program, received from a non-contactable consumer (patient). A 50-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), intramuscular on an unspecified date (Batch/Lot number was not reported) as UNKNOWN, SINGLE for COVID-19 immunisation and adalimumab (HUMIRA, Solution for injection in pre-filled pen), subcutaneous from an unspecified date (Batch/Lot number was not reported) at unknown dose for moderate to severe chronic plaque psoriasis. The patient's medical history and concomitant medications were not reported. On an unspecified date, the patient experienced kidney stones, blackout, fainting, low blood pressure, urinary tract infection, tiredness, vaccination adverse reaction, dizziness, pinched nerve, and vomiting. It was further reported that patient had two kidney stone, blackouts, low blood pressure, fainting, urinary tract infection, took adalimumab week early and was little tired, small reaction to COVID vaccine, dizziness and pinched nerve in neck. The patient stated that she made a mistake and took her adalimumab a week early and she was a little tired, but she felt fine after a day or so and now she feels better like she has more energy. She had been having fainting spells, physician thought it might be due to a pinched nerve in her neck. She had a bad urinary tract infection and in Mar2021 she had to have two kidney stones removed. She also had vomiting and low blood pressure. She had a slight reaction to the Pfizer COVID vaccine. It was unknown if she was enrolled in a COVID-19 Vaccine Trial. The reporter considered the event kidney stone as serious. The action taken in response to the events for adalimumab was not applicable. Therapeutic measures were taken as a result of kidney stones which included removal of two kidney stones in Mar2021. On an unspecified date, the patient recovered from urinary tract infection and vaccination adverse reaction and was recovering from tiredness. The patient had not yet recovered from kidney stones, blackout, fainting, and dizziness. The outcome of low blood pressure, pinched nerve, and vomiting was unknown.

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

The reporter's causality for the events of blackouts, fainting, urinary tract infection, took adalimumab week early and was little tired unknown onset, small reaction to COVID vaccine and dizziness with Humira (adalimumab) was no reasonable possibility. AbbVie's opinion was that there was no reasonable possibility that the events of two kidney stone, blackouts, low blood pressure, fainting, urinary tract infection, took adalimumab week early and was little tired unknown onset, small reaction to COVID vaccine, dizziness and pinched nerve in neck are related to Humira (adalimumab). AbbVie's opinion was that there was a reasonable possibility that the event of took adalimumab week early and was little tired unknown onset was related to humira (adalimumab). The reporter's assessment of the causal relationship of the events kidney stones, low blood pressure, tiredness, dizziness, pinched nerve, and vomiting with the suspect product was not provided at the time of this report. Since no determination has been received, the case is managed based on the company causality assessment. Information about the lot/batch number has been requested.; Sender's Comments: Based on available information and currently known drug safety profile, a possible contributory role of bnt162b2 can not be excluded for the reported events blackout, fainting, low blood pressure, tiredness, vaccination adverse reaction, dizziness, pinched nerve and vomiting. The other reported events kidney stones and urinary tract infection more likely represented intercurrent illnesses, but not related to bnt162b2. Case will be reassessed when additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and investigators, as appropriate.

| 1330351 | 5/19/2021 | IL | 22 | F | 5/19/2021 | 5/19/2021 | Patient reported before the vaccine was administered that she had a history of fainting upon receiving vaccines in the past. As predicted, she fainted within seconds of administering the Janssen vaccine. While unconscious, patient had a few mild head/neck twitches which then progressed to 2-3 full body twitches/spasms before regaining consciousness. Total time unconscious with less than 1 minute. Once fully awake and alert, patient informed me that she had a history of a seizure once before. We gently laid her on the floor and I took her vitals. Vitals were low with BP 90/49, HR 49, and O2 90%. She continued to lay on the floor for approximately 10 minutes before checking her vitals again. At that time, vitals were better with HR 60 and O2 99; I was unable to retake her BP at that time, but patient claimed that it usually was on the low side. She called her mother who agreed to come stay with her to keep watch for more events at her home. A family friend was also called to come pick her up and drive her home. Before leaving, I strongly advised patient to see a doctor to check everything out. Patient just moved here and claims to not have a primary at either location. |
| 1330314 | 5/19/2021 | CA | 15 | F | 5/19/2021 | 5/19/2021 | Pt had syncope x 1 postvaccination followed by seizure x 2. Pt recovered spontaneously after 3-5 seconds. No labored breathing. Alert and oriented x 3. Pt brought to ER. |
| 1330225 | 5/19/2021 | OH | 31 | F | 4/12/2021 | 4/12/2021 | Within 15 mins I was sweating and nausea, shaking, I passed out for less than 30 secs. I was shaking. |

| 1329929 | 5/19/2021 | NH | 27 | F | 3/21/2021 | 3/22/2021 | On March 22 2021, I had leg cramps that felt like Charlie horses, I had a fever of 102 and I missed work. On March 24 I went to my doctor because my legs were still bothering me. That same night I ended up experiencing extreme dizzy spells, I fainted. On March 25 called my doctor I told them my symptoms were getting worse, the office made me a follow up appointment for April 2 for dizzy spells and fatigue. My symptoms continued to get worse, I had a tele visit April 5. Then, I started developing a dry cough. I called again that same day 4/5 for shortness of breath and went in to my doctors office 1:10pm. They did a chest xray. April 6th I had another tele appointment for anxiety Because I started developing anxiety from all my symptoms. April 7th I called again I had blood in my urine and back pain, It was very alarming because my last period was & years ago. April 7th I went to an Urgent Care . April 8th it got really bad. I went emergency room, I felt like I had a lump in my throat and experiencing some chest tightness, my pulse was 101 beats per minute, heart 118, BP was 143/106 I presented with unspecified Right Bundle Branch block and I ended up tachycardia, they did a CT scan of my chest. the doctor gave me Valium & Hydroxyzine. At the hospital I started dry heaving and vomiting. April 9th saw a new doctor still very nauseated and I was experienced nausea and heart palpitations, and rapid heart. |

with outcome of not recovered, left arm weak (non-serious) on 03May2021 01:00 with outcome of unknown, skin is hypertensive: back of neck feels like a third degree burn: if he moves the hair on his arms it hurts (non-serious) on 03May2021 01:00 with outcome of not recovered, skin is hypertensive: back of neck feels like a third degree burn: if he moves the hair on his arms it hurts (non-serious) on 03May2021 with outcome of not recovered, left side of face is swollen (non-serious) on 03May2021 01:00 with outcome of not recovered , left side of face is swollen was reported as worsened (non-serious) on 03May2021 with outcome of not recovered. The patient underwent lab tests which included computerised tomogram (brain CT): no results, electrocardiogram (EKG): no results, both on unknown date. Reported patient was in pain and his mom and dad didn't know what to do. He had sharp pains. No bruises. He remember lowering myself to fall. He didn't fall. It was a strange thing. When he went to the ER they didn't fine anything. He was still in the same amount of pain. Caller stated her son took the vaccine on Saturday. Thirty six hours later around 1:00am he started getting extremely, burning pains across his back. The patient stated he was coming out of the bathroom and felt like he couldn't stand and he had to go to the floor. He lost consciousness for a couple of seconds. Both arms were numb. He struggled to get up. He sat on the couch and then went upstairs after being in the basement. He had a burning pain that felt like needles on his shoulder, left arm and a little on right side. His skin was sensitive. The back of his neck feels like he has a third degree burn. This morning he went to the hospital. Initially said he fainted but clarified that he was speaking about losing consciousness. He had left arm pain. He thought he was having a hard attack. While at the emergency room today he had labs, a brain CT scan and an EKG. He does not have results to provide. Caller added that his skin was hypersensitive. It was like if he moves the hair on his arm it hurts. His parents noticed he has swelling on the left side of his face. The events require a visit to Emergency Room. No Prior Vaccinations (within 4 weeks). Information on Lot/Batch number was available. Additional information has been requested.

| 1326156 | 5/18/2021 | FL | 38 | F | 4/22/2021 | 4/23/2021 | I felt like I was going to die.; Chills; headache; stomach upset; nausea; fever; fatigue; weakness; dizziness; vomiting; This is a spontaneous report from a contactable consumer (patient). A 38-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Arm Left on 22Apr2021 16:00 (Batch/Lot number was not reported), at age of 38 years old, as single dose for covid-19 immunisation. The patient was not pregnant at time of vaccination. The patient previously took dose 1 via an unspecified route of administration, administered in Arm Left on 04Apr2021 09:00 AM (Batch/Lot Number: 1 as reported) as single dose for covid-19 immunisation. Medical history was none and no known allergies. Concomitant drugs within 2 weeks of vaccination was not reported. Reported Event as reported: "24 hours after I took my 2nd dose, I felt like I was going to die. Chills, headache, stomach upset, nausea, vomiting, fever did not go away with Tylenol, fatigue, weakness and I even passed out. I alternated the use of Tylenol and Ibuprofen and it didn't work. Today (03May2021), 10 days after my second dose, i still feel weakness, fatigue, dizziness, stomach upset and nausea and I went to Emergency Room. I did bloodwork today at the and the doctor said that everything is normal in my blood test. They even tested me for the covid, but the test was negative for Covid. I was feeling very well, and healthy before the second dose of the vaccine and now I never felt well again. Terrible and weird side effects." Events onset date reported as 23Apr2021 07:00AM, AEs resulted In: Doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care. Zofran used as treatment and still feeling bad Outcome for events was not recovered. The patient was not diagnosed with COVID-19 prior to vaccination, and Since the vaccination, the patient has been tested for COVID-19 with negative result. The patient did not receive any other vaccines within 2 weeks prior to the COVID vaccine. No follow-up attempts are needed; information about lot/batch number cannot be obtained. |

| 1326677 | 5/18/2021 | GA | 54 | M | 4/19/2021 | 4/23/2021 | Woke up at 3:30am to extreme swelling in my left cheek, went to the bathroom to check it out and almost passed out. Went to the hospital and was checked for a stroke. No stroke detected. While during the exam, my tongue started to swell up and they decided to insert a tube for breathing. Woke up on Sunday after the swelling went down and the tube was removed. Was released from the hospital on Tuesday. Maintained a fever that week and on Friday, my fingers on my left hand and my left foot started to swell again, almost passed out. Went back to the hospital for observation and treatment for a staph infection from the first hospital visit. |
| 1326740 | 5/18/2021 | MN | 22 | M | 5/17/2021 | 5/17/2021 | Patient fainted after receiving his first dose of the Moderna vaccine. He was very nervous and breathing hard before the vaccine because he is afraid of needles. After receiving his vaccine he was standing in the vaccine area with the woman he was with. The woman was also receiving a vaccine. He was still very nervous about needles and I suggested that he wait in the post-vaccination area so he didn't have to witness the woman receiving her vaccine. While walking to the post-vaccination area the patient fainted. After fainting he woke up right away. Another pharmacist and a technician immediately went to check on him and assist him. Patient thinks that he fainted because of his fear of needles. |
| 1326686 | 5/18/2021 | CA | 21 | M | 5/17/2021 | 5/17/2021 | Systemic: Dizziness / Lightheadness-Severe, Systemic: Exhaustion / Lethargy-Severe, Systemic: Fainting / Unresponsive-Severe, Systemic: Hypotension-Medium, Systemic: Seizure-Mild, Systemic: Shakiness-Medium, Additional Details: Patient was immediately nauseous after vaccination, but that resolved quickly. Minutes after sitting down for the observation period, patient seemed to jerk and looked like he was seizing. He did not have trouble breathing. He was lucid after going in and out of consciousness for a minute or so. He was hypotensive and pale, but after water and some candy, patient was feeling much better. After the 30min observation period, his blood pressure was up and he was able to walk without trouble. |

| 1326237 | 5/18/2021 | CA | 66 | F | 4/27/2021 | | Faint; Heart problem; Whole left side just had pressure, pressure from all around my left breast and my back, down my arm, my ear; Headache; Don't really have the energy; This is a spontaneous report from a contactable consumer (patient). A 66-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration, administered in left arm on 27Apr2021 (Lot Number: ER8736) as single dose for COVID-19 immunisation. Medical history included thyroid, COVID (patient was almost 100 percent sure that she had COVID before but she did not know for sure because she had not been tested for antibodies). Concomitant medication included levothyroxine sodium (LEVOTHYROXINE NA) taken for thyroid. The patient stated she got the Pfizer shot on the 27Apr2021 and she had a reaction to it, heart problem and she really did not think that she might have had, she was almost 100 percent sure that she had COVID before but she did not know for sure because she had not been tested for antibodies. But she just really had a terrible effect and she did not know what was the next step. She meant her whole heart, she fainted, her whole left side just had pressure, pressure from all around her left breast and her back, down her arm, her ear. She had a headache and she gave it a couple days and she was feeling better today (03May2021) but she did not really have the energy. No treatment received. Due date for the next shot is 18May2021. Height and weight were reported as 5 (feet) 3 (inches), and 135 (pounds) (That's just an estimate per patient). Outcome of the events was unknown. |

| 1326473 | 5/18/2021 | PA | 34 | M | 5/18/2021 | 5/18/2021 | Prior to vaccination the patient reported that in the past he had passed out after giving blood. About a minute after administering the COVID-19 vaccine the patient reported feeling dizzy. He then passed out in the chair. We safely moved the patient to the floor. Then within approximately 15 seconds the patient sat up and then stood up on his own. We asked the patient to then be seated in the chair while he recovered. We called 911 as soon as he passed out. Patient was somewhat confused initially but quickly regained his bearings. He began sweating and said he was very hot. We checked his blood pressure and it was 100/80. Patient continued to recover and said he was feeling better. We had him wait until EMTs arrived. He told them he did not need any care. We took his blood pressure again and it was now 110/75. He said he felt well to go to the EMTs and pharmacist. |
| 1327185 | 5/18/2021 | NC | 13 | F | 5/15/2021 | 5/15/2021 | Patient Fainted and we called EMS. Patient was fine after resting for a few minutes |
| 1328038 | 5/18/2021 | NJ | 14 | F | 5/16/2021 | 5/16/2021 | Patient received vaccine and within 5 minutes was not feeling well. Patient fainted and then when conscious began vomiting. Patient also became very pale and clammy. Patient has experienced vasovagal symptoms before when having blood work done but not during vaccination. Patient also stated afterwards that she had not eaten any food all morning prior to receiving the vaccine. |
| 1327459 | 5/18/2021 | IA | 17 | F | 5/18/2021 | 5/18/2021 | Patient passed out as soon as she got to the waiting area post-vaccination. She was unresponsive for less than 15 seconds before waking up. She was breathing the whole time. We moved her to the ground to avoid any injury if she was to pass out again. We called paramedics who were at the pharmacy within 5 minutes. They checked vital signs and deemed she was ok. Patient walked out of the store on her own with her mother. |

| 1327049 | 5/18/2021 | MA | 51 | F | 5/18/2021 | 5/18/2021 | patient sat down after the vaccine and about 5 minutes later passed out for about 30 seconds. EMS came out and checked her out. She refused to come with ambulance and stayed in the store until a relative came in to pick her up because she was afraid to drive. She left the store thereafter. |
| 1327010 | 5/18/2021 | NV | 52 | M | 5/15/2021 | 5/15/2021 | On 5/15/21 pt was in a drive through vax site. He says immediately after he got the vax he was trying to drive away from the vax site but he has to pull over since he was passing out. He came to so put his car in park and then passed out again. He said he was nauseated, dizzy, and lightheaded. He kept going in and out. He blew the horn and got someone's attention. EMTs loaded him into an ambulance then he started vomiting. They took him to the Medical Center. They did multiple tests. He was admitted for further testing which had normal results. Pt was discharged after about 28 hours. Pt says he could stand up about 4 hrs after inj but the symptoms lasted about 18 hours total. |
| 1326882 | 5/18/2021 | SC | 55 | M | 5/18/2021 | 5/18/2021 | After 5 minutes from giving the vaccine. Patient started to say he was getting dizzy. He lost coloration at first, but could speak just fine. Then a few seconds later he appeared to lost consciousness, his head fell back, and he started to have jerking movements. He was making noises that almost sounded like a snore to me right at first, but it was more than likely him gagging on saliva. 911 was called, and his symptoms continued for roughly 30-60 seconds. EMS took him to hospital where they diagnosed it as vasovagal syncope and just gave him some fluids. |

| 1327568 | 5/18/2021 | PA | 22 | M | 5/15/2021 | 5/15/2021 | Sequence of Events re Incident * Patient made his appointment via on- line scheduler * Patient came in, filled out his paperwork, made no mention of previous vaccine issue on paperwork * I performed the usual screening of patient, and when I asked him about any previous reactions to immunizations he stated that he had an ?issue with a TdaP shot 4 years ago and passed out in doctor?s office for several minutes.? He stated the MD told him that ?he had several other issues with the shot so the MD said it was a ?bad batch??. * I made sure that the patient was comfortable about getting the Covid shot and he agreed that he was fine to get it. At that time the patient did not seem overly nervous about receiving the shot. * I administered the shot to the patient and he went directly to the seats next to the pharmacy. I asked him to stay there because he had a past issue with another vaccine. * Approximately 2-3 minutes later, the patient came back, looked troubled and said he didn?t feel well and was feeling the same way as the other shot. I brought him back into the pharmacy immunization room, sat him down and put his head between his knees. I did a quick check on him to be sure he was breathing OK and that there was no apparent allergic reaction. * After a minute I brought his head back up and put patient into regular seated position. At no point did he completely lose consciousness or faint. I asked him at that point if he wanted me to call an ambulance or a family member and he declined. He sat there in the chair for approximately 15 minutes- part of the time his head was in his hands, part of the time looking at his phone. He asked for a glass of water and I got him one (he had completely drank it by the time he left). I kept checking on him and it seemed like every time he saw me check on him he put down his phone and put his head in his hands again. He could have been embarrassed by the situation, unsure though. I tried to make him as comfortable as possible. * After 15-20 minutes I asked him if he wanted me to call someone and he said at that point he wasn?t sure he wanted to drive home so he would call his mother to pick him up, which he did. * I sat down with him for a couple of minutes and explained that this was called a vasovagal response and was quite common (I even empathized with him by explaining that I have the same response when I get blood drawn at the doctor?s office). He |

| | | | | | | | |
|---------|-----------|----|----|---|-----------|---|--|
| | | | | | | seemed to feel a little better after I explained it to him. * His mother came in 15 minutes later and I brought her back as well. She explained the same thing happened at the MD office 4 years ago and that it was the Meningitis shot, not Tdap. I explained to them going forward that it would probably be best to get his immunizations at the doctor?s office so that he could lay down after the shot and they agreed. * He and his mother then walked out of the immunization room and left the building. He left under his own power and without assistance from his mother. I gave him a business card and asked him to call me on Sunday to let me know that he was feeling ok. | |
| 1327566 | 5/18/2021 | OH | 24 | U | 5/18/2021 | 5/18/2021 | Patient experienced a brief episode of syncope immediately after receiving the Janssen Covid vaccine on 5/18/21 at approximately 1pm. Patient was seated at the time. Patient slumped over and was unresponsive for approximately 5 seconds. Patient resumed consciousness right away and blood pressure and respirations were checked by local paramedics. patient seemed alert and well when he left the store just after 1:30pm. |
| 1327559 | 5/18/2021 | OH | 15 | F | 5/18/2021 | 5/18/2021 | Patient received her covid vaccine, while waiting for 15 minutes to be observed the patient fainted. Her mom noticed her eyes rolled back and started calling for help. We called 911 . Patient was placed on the ground carefully as we awaited for EMS to arrive. The patient was breathing, but had low blood pressure when EMS arrived. EMS took the patient to the hospital. |

| 1324220 | 5/17/2021 | TX | 35 | M | 5/10/2021 | 5/10/2021 | The patient walked in to the pharmacy for a Janssen Covid vaccination along with family. Patient was advised post vaccination administration to sit in observation for 15 minutes but did not comply and as he was walking away from the pharmacy fainted. Parents reported he did not hit his head and pharmacy was alerted post fall of what had happened. We approached the patient as he was getting to his feet and we advised again for him to come back to pharmacy to sit in a chair for further observation. His parents told us he always has fainting issues post any vaccination or blood work (no prior issue reported to vaccinations on consent form). The patient continued to decline going back to pharmacy and as he walked fainted again, he was able to hold on to shopping cart which lessened severity of fall. Pharmacy staff advised him to remain on floor and after he regained consciousness he was able to answer accurately his name, where he was and what day of week it was. At that time a nurse not employed by Company was shopping near by and began to help care for the patient. The patient and his parents continued to decline calling an ambulance, and after several minutes sat against a wall. He was starting to sweat profusely and heart rate was rapid (approximately 145 bpm per nurse) so we had him remove his coat and provided a cool compress for his head and neck. He was breathing rapidly but was able to slow his respiration upon our direction. The patient did not seem to be improving and the nurse helping advised calling EMS which we did. The patient continued to lose consciousness for brief periods awaiting and during EMS aid. EMS ran the patients blood pressure, blood sugar and ran an ECG prior to taking patient away to hospital (results unknown to pharmacy as we stayed in area to provide information on patient vaccination administration but had no active assistance care at that time. |
| 1324735 | 5/17/2021 | SC | 39 | F | 5/17/2021 | 5/17/2021 | Patient passed out for a few seconds. When she woke up she broke out in a cold sweat and threw up. She said her arms tingled. |

| 1324568 | 5/17/2021 | WA | 17 | M | 5/17/2021 | 5/17/2021 | PATIENT FAINTED FEW MINUTES AFTER RECEIVING THE VACCINE. HE LOOKED LIKE HE WAS HAVING A SEIZURE. IT LASTER FOR A BOUT 15-17 IN MY ESTIMATE. HE WAS ALERT AFTER AND ANSWERING QUESTIONS ABOUT HIS NAME, DOB AND WHERE HE WAS. TOOK HIS BLOOD PRESSURE TWICE-5 MIN APART AND IT WAS LOW. 113/58 AND THEN 102/50 TO MY RECOLLECTION. PARAMEDICS WERE CALLED IMMEDIETLY AND PATIENT HAD HIGHER BLOOD PRESSURE WHEN THEY WALKED IN. IT WAS "NORMAL". PATIENT TOLD US HE HAS A HISTORY OF VASOVAGAL SYNCOPE AND HE FAINTED BEFORE WHEN HIS BLOOD WAS DRAWN. HE SAID THAT IT SEEMED LIKE A SEIZURE BEFORE BUT CHECKED WITH NEUROLOGIST AND WAS NEVER DIAGNOSED WITH EPILIPSY. PT LEFT IN A STABLE CONDITION |
| 1324547 | 5/17/2021 | PA | 30 | F | 5/17/2021 | 5/17/2021 | PATIENT RECEIVED JANNSEN COVID VACCINE. TURNED PALE. FAINTED. VOMITED. COUGHED. PATIENT CONDITION RESOLVED AFTER 20 MINUTES. ACTUAL SYNCOPE LASTED MAYBE 1-2 MINUTES |
| 1324503 | 5/17/2021 | OR | 14 | M | 5/17/2021 | 5/17/2021 | Patient passed out immediately following administration of the vaccine to the left deltoid. His head fell backwards and limp. The Rph administering the vaccine moved in front of the patient and gently moved his head into an upright position. The patient had mild muscle spasms and twitches while passed out but when he regained consciousness he immediately began talking saying he was ok. Father came into the consultation room at that point and Rph explained what had occurred. Patient looked a little pale and eyes were having a hard time staying open so with the help of his dad Rph helped him down to the ground in the corner of the room so he could have back and head support from the wall. Patient was given a glucose tablet and water, and later orange juice. Patient stayed in the consultation room for about 20 minutes before leaving on his own and saying he was feeling much almost back to normal. |

| 1324773 | 5/17/2021 | NM | 37 | M | 5/17/2021 | 5/17/2021 | Pharmacist gave a Johnson + Johnson shot to the patient. After the shot the patient got up and sat down in a "Post-Vaccination waiting area" chair. A few minute later the patient got up and walked towards the pharmacy asking for water, as he was walking to the pharmacist the patient fainted, fell to the ground and bumped his head on the counter. Patient woke up a several second later confused and laid on the floor. Code white and 911 was called. Another pharmacist grabbed an ice pack and a bottle of water for the patient. Patient said he went to the dentist office recently and received a shot in the mouth and something similar happened as well. The patient did not disclose this information to the immunizing pharmacist. Patient told us to cancel the 911 call and asked to leave, the pharmacist recommended he stay a while longer so we can monitor him. Patient said he had no history of diabetes or seizures. Patient forehead was slightly red. |
| 1324804 | 5/17/2021 | CA | 15 | F | 5/17/2021 | 5/17/2021 | client felt lightheaded after receiving 1st Pfizer Covid Vaccine. Client received vaccine at 1717 and RN kept client in chair a few mins as client stated feeling nervous. PHN brought client water. Per client had only ate snack prior to appointment. Client able to transfer by herself to anti gravity chair. 1722 vitals: blood pressure 122/68, oxygen 98%, pulse 81. Per client feeling nausea, RN gave emesis bag. Client appeared diaphoretic and pale. Per Mother only medical history is seasonal allergies and client takes Zyrtec as needed. No history of fainting with vaccines in the past or allergies. Vitals at 1728: blood pressure 118/72, pulse 82, oxygen 97%. Per client symptoms still there, but improving. Vitals at 1733: blood pressure 120/70, pulse 83, oxygen 100%. Client stated lightheaded resolved, nausea still same. Client denied blurry vision, headache, warmth feeling. Vitals at 1738: blood pressure 118/72, pulse 80, oxygen 99%. Per client all symptoms resolved. Last vitals at 1743: blood pressure 114/80, pulse 76, oxygen 99%. Mother driving client home. Advised to follow up with provider and ER precautions given. After completing 30 min observation client left facility with steady gait at 1750. |

| 1323410 | 5/17/2021 | MA | 12 | M | 5/13/2021 | 5/13/2021 | From ED Note: 12 year old male with PMH of asthma on flovent, food allergies with epi-pen (has not required this) and pre-syncope/syncope who presents with concern for loss of consciousness and possible seizure-like activity following a COVID vaccine. Mom notes that he was in his usual state of health when he presented to COVID clinic to get his first vaccine. He got the Pfizer vaccine, seconds after getting in his left arm, mom noted that he looked very "wide eyed" and distraught. She notes that he slumped forward and had lost consciousness for approximately 5 seconds. She noticed shaking movements in his right arm and bilateral lower legs. She notes that his left arm was against her and therefore cannot comment on it. She notes that his eyes were closed. No tongue biting and no incontinence. No secondary trauma. She notes that when these 5 seconds were over he then had a period for about 30 minutes where he looked pale and was breathing heavy but was alert and answering questions. She notes that he has had presyncopal episodes and episodes of feeling faint when getting flu shots in the past. However, this time she noted that he had shaking which made her nervous for possible seizure activity. Patient denies any chest pain or headache prior to the symptoms. She came via ambulance for further evaluation. On arrival, he reports that he feels 90% back to his baseline. He notes that he does not feel quite ready to run around yet however denies any pains or discomforts, headache, weakness, numbness, or tingling. He had eaten a full breakfast prior to getting the shot. He had a normal night sleep and a normal day yesterday per mom. Medical History: as above Surgical history: none Family History: Reviewed and no pertinent related family hx pertaining to this visit Social History: Lives with family Allergies: food allergies Medications: flovent, epi-pen Immunizations: Up to date Medical Decision Making 12 year old male with PMH of asthma on flovent, food allergies with epi-pen (has not required this) and pre-syncope/syncope who presents with concern for loss of consciousness and possible seizure-like activity following a COVID vaccine. On arrival, he was alert, well-appearing, in no acute distress. His vital signs were normal for age on room air. His physical exam was very reassuring as above with a normal neurologic and cardiac evaluation. Differential includes vasovagal/syncope in the setting of a known |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

| | | | | | | | |
|---------|-----------|----|----|---|-----------|---|---|
| | | | | | | stressful trigger vs seizure given report of shaking in his extremities. We feel the latter is significantly less likely given the timeline of the events. Has no known seizure activity nor any triggers per history (fever, trauma, etc.). He also has a normal neurologic assessment. At this time we will defer neurology consults given low concern for seizure. It is possible that this represents a side effect of the vaccine however we also feel that this is less likely given the fact that his symptoms have been seconds after receiving the vaccine. Nonetheless we reported the symptoms to the pharmacist who recorded it in the database. We attained an EKG showing a known incomplete right bundle branch block (unchanged from 2013) and a slightly prolonged QTC of 477 (previously 451). I encourage patient to stay well-hydrated, well rested in the setting of his suspected syncopal episode this morning. I also suggested that for further vaccinations, that he lay down on the table and drink/eat well prior. We provided strict return to ED criteria in the setting of worsening symptoms. All questions were answered at the time of discharge. Mom verbalized her understanding and agreement of the plan. He was discharged in a stable condition with mom at side. **After patient was discharged, cardiology called the follow-up team due to the prolonged QTC to ensure that we were aware. I contacted the patient's PCP to do a follow-up EKG in 1 month's time. | |

| 1322324 | 5/16/2021 | CA | 13 | F | 5/16/2021 | 5/16/2021 | client had syncope episode after receiving 1st dose Pfizer Covid Vaccine. Client received vaccine at 1336 and was standing next to vaccine station and Father as sibling was receiving vaccine. Within 3 minutes of standing client had syncope episode and hit back of head on floor. RNs responded. PHN called 911 at 1340. Per RN client collapsed and hit back of head, Father tried to hold on but was unsuccessful. As PHN was speaking with paramedics, client regained consciousness. Client stated she remembered feeling dizzy and then woke up on the floor. Client alert and oriented, pale and stated blurry vision. RN elevated legs. Vitals: blood pressure 130/90, pulse 102, oxygen 99%. Father denied any relevant medical history, medications, allergies or history of syncope. Client stated feeling dizzy, denied pain on head or rest of body. Paramedics arrived approximately 1346 and assumed care. After assessment Father signed AMA with paramedics. Client sat in anti gravity chair after paramedics left. EMT stayed with client. Vitals at 1412: blood pressure 120/80, pulse 85, oxygen 96%. Client stated feeling dizzy and head hurts when she moves. Blurry vision resolved. PHN spoke with parents to review ER precautions and advised to make follow up appointment with primary doctor. After sibling was done with observation, client left facility at 1425 with steady gait. |
| 1322279 | 5/16/2021 | FL | 12 | F | 5/16/2021 | 5/16/2021 | About two minutes after she received her shot she told us she was seeing black spots. Then she told me she couldn't see and she passed out. She started to regain consciousness and a little bit of blurred vision and then she began dry heaving. She was clammy and sweaty at that point but continued to improve after she drank some water. |
| 1322272 | 5/16/2021 | CA | 38 | F | 5/16/2021 | 5/16/2021 | patient passed out after receiving vaccine due to extreme fear of needles. 911 was called but when patient regained consciousness after 10-20 seconds, she had us cancel the ambulance. She then passed out a second time and we called the ambulance again. She regained consciousness but agreed to have them assess her. She declined to be transported to the hospital and was released after they assessed she was ok. |

| 1322151 | 5/16/2021 | VA | 15 | F | 5/16/2021 | 5/16/2021 | Pt was brought in by her father for her first dose of Pfizer vaccine. Prior to receiving the vaccine, her father asked her to let the writer know of her fear of needle and what occurs when she she has blood draws or vaccination. Patient states that she usually lays down because she feels faint and passes out at times. After she sat down, another chair was provided to rest her legs. Pfizer dose was administered and within a minute, she acknowledged that she about to passed out. She had a near syncopal episode with both arms contracting. She was carried from the chair to the floor. Her father, who was prepared for this, had ammonia with him and had the patient sniff it and she responded to it. She was observed for little over 30 minutes and walked out of the pharmacy stating that she felt well. Throughout the ordeal, she was responding appropriately. |
| 1322150 | 5/16/2021 | MI | 15 | F | 5/16/2021 | 5/16/2021 | Patient received injection and sat down in the waiting area with her Mom. Less than 5 minutes after the injection she fainted and appeared to have a small seizure , her mother shouted at her and shook her and she became conscious and vomited. 911 was called , they evaluated the patient and she went to the hospital. |
| 1322016 | 5/16/2021 | | 15 | M | 5/16/2021 | 5/16/2021 | Patient fainted post vaccine and was out for about 10 seconds, and then came to. After waiting 15 minutes, drinking some water, and eating a light snack, patient was fine. |
| 1322136 | 5/16/2021 | OH | 16 | F | 5/16/2021 | 5/16/2021 | Patient passed out within a minute of vaccination. Mother and I moved patient to a laying down position where she immediately woke up and knew where she was and what just happened. Declined any other symptoms. Mom said she passes out often after vaccinations. Patient was conscious carrying on a conversation like normal immediately after coming to. Over the next 30 minutes I tried to get patient to a sitting position to take her blood pressure but every time we tried she needed to lay back down because she felt like she was going to pass out. After trying this twice and being unsuccessful I had EMS called to check on patient to make sure nothing more serious going on. EMS came and took a couple blood pressures and pulses which were normal. Patient was starting to feel better. Walked out with EMS and planned on going home. |

| 1322120 | 5/16/2021 | CO | 13 | F | 5/16/2021 | 5/16/2021 | The patient fainted after vaccine administration. The patient was fine after about 30 minutes of sitting. |
| 1322089 | 5/16/2021 | IL | 15 | F | 5/16/2021 | 5/16/2021 | Patient received her first dose of the Pfizer COVID19 vaccine at approximately 12pm. Patient felt fine immediately after the vaccination and was instructed to sit and wait for 15 minutes. The immunizer, watched the patient sit down in a chair. A few minutes later the mother of that patient began screaming help, help. Patient had fainted, falling on the floor and hitting her head. I ran our to assist patient, I instructed my technicians to call 911. Patient was on the floor, shaking. I assisted her in rolling over. When she came to I helped her control her breathing and take deep breaths. I used I gauze pad to stop the bleeding on her head. I made sure she was lying flat on the floor. We gave her an ice pack to help with the numbness and tingling in her hands. The paramedics arrived and took patient to the hospital. |

| 1322069 | 5/16/2021 | CA | 18 | M | 5/14/2021 | 5/14/2021 | <p>Patient (DOB 05-01-2003) received his 1st COVID vaccine (Pfizer, lot # EW0182 use by 5/15/21 at 0855) at 1539. The patient became pale approximately 30 seconds following the administration of the vaccine, EMT assisted the patient to the chair as he was standing up when he became pale, the patient loss consciousness for approximately 2 seconds. RN arrived at the station and assisted the patient to the ground, where he was placed in a supine position with his lower extremities elevated. The patients face mask was removed, he was alert and oriented to person, place, time, and situation. The patients color slowly returned to his face. Vitals were taken at 1540: BP: 155/70 (R arm, supine position), HR 70, RR 16, oxygen saturation at 97%, and pupils were equal. The patient had a history of fainting x 1 and his last meal was at 0800 and he stated, " I didn't drink that much today." Denied any chronic medical conditions, was not currently taking any medications, and denied any drug allergies. The patient was moved to the anti-gravity chair and he was given pringles and Gatorade. Vitals were retaken at 1545: BP 162/80 (R arm, sitting upright), HR 50, RR 16, oxygen saturation at 97%. Denied any dizziness, headache, chest pain, or vision changes. Vitals were retaken at 1553: BP 158/72 (R arm, sitting upright), HR 52, RR 16, Oxygen saturation at 97%. The patient was advised to eat a full meal prior to receiving his second COVID vaccine dose and to receive his 2nd dose in the anti-gravity chair. Vitals were retaken at 1558, BP 152/78 (R arm, sitting upright), HR 57, RR 16, and oxygen saturation at 98%. The patient was also given a bottle of water, as he did not consume many liquids during the day. The patient's color fully returned to his face and he denied any shortness of breath, dizziness, changes in vision, or difficulty swallowing. Vitals retaken at 1603, BP 150/75 (R arm, sitting upright), HR 60, RR 16, and oxygen saturation at 96%. The patient called his mother to pick him up, as we strongly advised him to not operate machinery/ a vehicle after fainting. The patient's vital signs were taken at 1608, BP 140/75, HR 60, RR 16, and oxygen saturation at 100%. The patient was advised to drink the entire bottle of water, as his blood pressure was slightly elevated and it was most likely due to being dehydrated, as he did not consume any fluid since 0800 earlier that day. The patient drank a bottle of water and his vital signs were retaken at 1614, BP 122/68 (R arm,</p> |

sitting upright) and a respiratory rate of 15 breaths per minute. The patient's mother arrived on site around 1630 and spoke with RN and both EMT. RN instructed the patient about emergency precautions and to follow up with his primary care provider. RN also educated the patient about the importance of informing the healthcare provider about his history of fainting with the first vaccine, when receiving the second COVID Pfizer vaccine. Gave the patient V-safe information and reported the occurrence in VAERS. The patient had a steady and even gait when leaving the site with his mother at 1632.

Non-stop vomiting, fainting, I fell out of my bathtub and hit my head. The sickest I have ever been in my life. I thought I was dying. I would have never taken this dangerous life-threatening vaccine knowing this.

| 1321992 | 5/16/2021 | TX | 16 | M | 5/16/2021 | 5/16/2021 | <p>Patient was given Pfizer Vaccine on 5/16/21 at 11:00-11:10am. I read through the patient medical history through the handheld and noticed there was "yes" on seizure history. I ask the mother what happened and she told me it was from the first incident with the Pfizer vaccine. At the time of the first incident the mother stated that patient fainted and convulsed upon regaining consciousness. Patient has had no history of seizures prior to then or had any big injuries that could trigger it. Patient's mother states physicians think it's triggered by anxiety and not a true seizure, so MRI or tests was not needed. Doctor recommended patient to come back if it happens again. With the information provided I used professional judgement and was on high alert with the patient. After administrating the vaccine to the patient, I monitored patient's vitals carefully. Patient was stable and I walked with him to his seat near the wall and left him with his family. About a few minutes later the mother told me to come to her aid. Patient had a 1 time continuous seizure for about 30 seconds-1minute. After regaining consciousness the patient said he did not remember getting the vaccine. Patient's mother was very concerned and under control and did not overreact to the situation. Also, I promptly relayed to (pharmacist) to call 911 and he called a member of management. While pharmacist was on the phone with 911 the patient regained consciousness. I monitored patient's vitals while I waited for a member of store management. Store management took a little bit longer to respond (5-10 minutes) but arrived to document the whole incident. About 30 minutes after the incident patient's vitals were stable and the ambulance was not needed and the family took him to the hospital to get monitored. Patient rode the electric wheelchair was escorted out by store management to the car.</p> |

bad. It was reported that the patient received the second shot of BNT162B2 on 12Apr2021 at 10:45 am in left arm. She felt great right after she got the shot, she wasn't tired, had no side effects. Thirty-six hours later, at 22:00 the gland at the base of her neck swelled up; arm started throbbing; lymph nodes in arm pit swollen; felt like she was being stabbed; had extreme headache, really bad headache; she does not get headaches and felt like her head was going to blow off but the extreme headache was gone in few minutes. The swelling and everything else took a couple days. Those events she reported as directly from the shots. On 20Apr2021, a week exactly from when she had those effects, around 17:00 she got home from work, opened her front door and after that remembered nothing. No warning. When her awareness finally came, she was on the floor inside her house. She did not have any idea what happened. She had bump on her head, and her right hand all swelled up (she must have landed on it). She took care of herself and called her doctor the next day. Initially she didn't associate those events with the Covid-19 Vaccine right away. She had a CAT Scan (27Apr2021) and lab work (unknown date) and that all came back ok. On 28Apr2021, she went in for heart monitor. The heart monitor and testing were done to rule things out. Last night, she went to go to bed at 23:00, laid down and immediately in laying down the room started spinning; she had cold sweats; she knew she would throw up so she immediately went in the bathroom and threw up; had diarrhea; couldn't stay seated; after she got most of throwing up stuff handled she couldn't get up so she was lying on floor drenched with cold sweats; shaking; breathing heavy; still throwing up a little bit; fortunately she had a small rug on the floor where she lay until almost 03:30 until she felt enough that she could get up. She got in the tub, cleaned herself off and was in the bed by 04:00 and slept until 10:00 29Apr2021. She has never had this happen before. The last time she threw up was probably 30 years ago. The patient as not hospitalized. Outcome for loss of consciousness, vertigo, head injury, pain in extremity, cold sweat, vomiting, diarrhoea, hyperventilation, head discomfort, peripheral swelling and anxiety was unknown. Outcome for headache, lymphadenopathy and asthenia was recovered. Outcome for feeling abnormal and tremor was not recovered. The patient underwent lab tests and

procedures which included computerised tomogram: came back ok on 27Apr2021, heart monitor: unknown results on 28Apr2021, lab work: came back ok on unknown date.

passed out/Loss of consciousness resulted in concussion; concussion; became dizzy; Was experiencing body aches; increased thirst following vaccination; This is a spontaneous report from a contactable physician for a patient. A 20-year-old female patient received second dose bnt162b2 (PFIZER COVID-19 VACCINE), intramuscular, administered in Arm Right on 28Apr2021 08:30 (Batch/Lot number was not reported) at single dose for COVID-19 immunisation. The patient previously received first dose bnt162b2 (PFIZER COVID-19 VACCINE), on an unknown date (Batch/Lot number was not reported) for COVID-19 immunization. The patient medical history was not reported. The patient was not pregnant at time of vaccination. Concomitant medications (received within 2 weeks of vaccination) included celecoxib (CELEXA), trazodone, oral contraceptive nos (reported as oral birth control) taken for an unspecified indication, start and stop date were not reported. The patient got up at 2am 29Apr2021 to use restroom, became dizzy and passed out. She was experiencing body aches and increased thirst following vaccination. Loss of consciousness resulted in concussion. The adverse events result in: Doctor or other healthcare professional office/clinic visit. The events did not result in death, cause/prolonged hospitalization, was not life threatening, disabling/incapacitating, congenital anomaly/birth defect. The patient was not diagnosed COVID-19 prior to vaccination. Since the vaccination, the patient had not the patient been tested for COVID-19. The patient did not receive treatment for the events. The outcome of the event was recovering. Information about lot/batch number has been requested.; Sender's Comments: Based on the information currently available, the event Loss of consciousness is considered most likely associated with intercurrent or underlying medical conditions, appears unrelated to the suspect drug.

| 1320117 | 5/15/2021 | CA | 73 | F | 2/22/2021 | 3/31/2021 | <p>This is a spontaneous report from a contactable consumer. A 73-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL8982), dose 2 via an unspecified route of administration, administered in right arm on 22Feb2021 14:15 as 2nd dose, single for covid-19 immunisation. Medical history included hyper/hypothyroid, cardiac arrhythmia. Concomitant medications included metoprolol; acetylsalicylic acid (ECOTRIN); atorvastatin (LIPITOR); levothyroxine sodium (SYNTHROID); cetirizine hydrochloride (ZYRTEC). The patient previously took codeine, cepezine, sulfa medication, adhesives, all experienced allergies. The patient previously received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9261) administered in right arm on 01Feb2021 14:15 for COVID-19 Immunization. On 31Mar2021 (20:00), the patient awakened by upper abdominal pain, rapid pulse, and sweating, experienced diarrhea. On 01Apr2021 the patient awakened with same symptoms, plus tachycardia, shortness of breath, clammy skin, lightheadedness, what felt like acid reflux/upper abdominal pain, and diarrhea. Upon walking, almost fainted. On 01Apr2021 17:00, the patient went to Urgent Care. She had abnormal bloodwork, rapid heart beat and shortness of breath/wheezing. EKG showed irregularities. Was told to proceed to the ER for more tests. On 01Apr2021 19:00, the patient went to Hospital. She completed ultrasound of abdomen, EKG, CT Scan, and other testing. Found evidence of cardiomegaly (1st time ever), elevated blood pressure, inflammation around the heart, liver, pancreas, and stomach. Also noted pulmonary edema. Told I could travel back to CA with compression socks and pain medication and Zofran. 05Apr2021, they ordered additional tests and referral to the Cardiologist. Still experiencing extreme fatigue. Events resulted in doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. The patient received treatment (pain medication, zofran, referral to GI and cardio) for adverse event. There is no covid prior vaccination. The patient received covid tested post vaccination with Nasal Swab on 01Apr2021, result was negative. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Since the vaccination, the patient has been tested for</p> |

| 1320159 | 5/15/2021 | MI | 28 | F | 5/1/2021 | 5/2/2021 | fainted; low blood pressure; fever; This is a spontaneous report from a non-contactable consumer (patient). A 28-year-old non-pregnant female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in the left arm on 01May2021 (Batch/Lot Number: Unknown) as 2nd dose, single dose (at the age of 28-years-old) for COVID-19 immunization. Medical history was not reported. The patient did not have concomitant medications: the patient did not have any other medications the patient received within 2 weeks of vaccination. The patient received the first dose of 12Apr2021 BNT162B2 for COVID-19 immunization. The patient did not receive any other vaccines within 4 weeks. On 02May2021, around 24 hours after receiving the second shot of COVID vaccine the patient fainted due to fever and low blood pressure. The patient required emergency room/department or urgent care. The patient did not receive treatment for the events. The patient was not diagnosed with COVID-19 and since the vaccination the patient has not been tested for COVID-19. The outcome of the events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained. |

| 1320160 | 5/15/2021 | FL | 23 | M | 4/29/2021 | 4/29/2021 | Sore joints; his butt is still a little sore from falling; dizziness/ light headed; fainting; pain in upper abdomen area; Sweating; Nausea; falling; This is spontaneous report from a contactable consumer (patient). A 23-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 29Apr2021 at 1 pm (around 12:20ish as reported) (Lot Number: FN6206) (at 23-year-old) at single dose in arm right for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. No history of all previous immunization with the Pfizer vaccine considered as suspect, no additional vaccines administered on same date of the Pfizer suspect, no prior vaccinations within 4 weeks, no family medical history relevant to AEs. The patient stated he is a pretty healthy guy. All day after getting the vaccine he was fine. He got the shot at like 1 came home took a nap, ate some dinner, and was playing XBOX with the boys when this happened. At around 10:30 pm on 29Apr2021 he went to rub, his stomach just above his belly button and it hurt. He said that he read on line that that area is called the pancreas or liver, it has a lot of names for that area when looking online. He stated it's the left upper abdomen area he felt pain when he pressed on it. It radiated really fast across his abdomen while he was on the phone with mother. The more he pressed the more the pain got sharper, and it radiated right across the abdomen, mainly above belly button not too much in lower abdomen, not much in upper abdomen. It was very sensitive. He didn't have to press hard to trigger the pain. It was almost like the area was inflamed. It happened really fast and that it was his upper stomach not so much the lower part of his abdomen. He felt dizziness and nauseous and like a silly boy he tried to run to the bathroom. He stated that he fell and fainted. His butt was still a little sore from falling. He said when he woke up, he was sweating like he had been out side all day. He did not recall sweating any time he fainted in the past. The side effects were gone after about ten minutes. He was really light headed and had the crazy sharp pain in abdomen for about ten minutes and then it was gone. He had never had that kind of pain. He was laying on the floor for a couple minutes. He went to get his phone, and then sat back down and was sweating. He still had pain at that time but it only lasted |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

about 10 minutes at most. He was still a little bit sore in some joints which was not unexpected. He confirmed that he had a little bit of sweating, and he fainted a little bit. Since the episode he hasn't felt any symptoms like that before, he has not had any pain like gastritis but he has had some random gastrointestinal things before. It's also reported nausea on 29Apr2021. No required to emergency room and physician office. He was on the verge of going to the ER while the pain was there. He was going to go until it stopped and to get checked out. No relevant test. The outcome of the events sore joints, dizziness and butt sore was unknown; for other events was resolved on 29Apr2021. No follow-up attempts are needed. No further information is expected.

| 1320169 | 5/15/2021 | | 39 | M | 4/29/2021 | 4/29/2021 | Had 2 episodes of syncope; Shortness of breath; weakness; Fatigue; 80% O2 saturation on RA; Heart rate up to 180; Rash on his abdomen appeared; This is a spontaneous report received from a non-contactable pharmacist. A 39-year-old male patient received BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2, intramuscularly administered in left arm on 29Apr2021 08:45 (Batch/Lot Number: EW0172) (age at vaccination: 39 years old) as single dose for COVID-19 immunisation. Medical history included asthma from an unknown date and unknown if ongoing. On an unspecified date, prior to vaccination, the patient was diagnosed with COVID-19, unknown if ongoing. Since the vaccination, the patient had not been tested for COVID-19. He had previously received the first dose of BNT162b2 on 08Apr2021 08:00 (Batch/lot number: EWP0158) (age at vaccination: 39 years old) as single dose for COVID-19 immunisation. Concomitant medication(s) included albuterol (ALBUTEROL) inhaler, naproxen (NAPROXEN) and calcium carbonate (CALCIUM CARBONATE), taken for an unspecified indication, start and stop date were not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 29Apr2021, the patient developed shortness of breath, weakness, fatigue hours after administration of the vaccine. He had 2 episodes of syncope, 80% O2 saturation on room air (RA), heart rate up to 180. Rash on his abdomen appeared. The adverse events resulted in emergency room/department or urgent care. The patient was admitted to the hospital on an unspecified date in Apr2021. The outcome of the events was unknown. No follow-up attempts are possible. No further information is expected.; Sender's Comments: Considering a plausible temporal relationship, a causal association between the reported events and suspect drug bnt162b2 cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate. |

| 1320177 | 5/15/2021 | MN | | M | 4/30/2021 | 4/30/2021 | seizure; faint; feeling dizzy; drained again; his lips lost their color; difficulty hearing; nauseous; sweating profusely; This is a spontaneous report from a contactable pharmacist. An adolescent male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; Batch/Lot Number: Er8736), intramuscular, administered in Arm Left on 30Apr2021 20:30 as 1st dose, single for COVID-19 immunization. Medical history, none known. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The patient's concomitant medications were not reported. The patient reported no previous adverse events with prior vaccinations, specifically dizziness or fainting. After the shot he went to the bathroom, returned fairly quickly & reported feeling dizzy and quickly took a seat and thought he might faint. Soon thereafter he seemed to have a seizure. His eyes remained open but rolled back, he stayed upright but was unresponsive. They removed his mask & his mother & they kept talking to him. It ended after about 10 seconds & he asked how long he had been out. His color was momentarily better, but drained again & his lips lost their color. They asked if he had any difficulty breathing and he did not. He reported that he had difficulty hearing (like he had headphones on) & sweating profusely. His mother kept encouraging him to take deep breaths, they got him some water & asked if he had a history of hypoglycemia- he did not. They asked if they could get him a candy bar& they asked for a granola bar which they acquired. He was too nauseous to eat it & asked. The events started on 30Apr2021 20:30. No treatment was given. The outcome of the events was recovered.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the seizure and the other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including EEG and head CT/MRI, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety |

evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

passed out a total of 3 times; blood pressure went so high; This is a spontaneous report from a contactable consumer reporting for her sister-in-law's sister-in-law. An about 60-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date (Batch/Lot Number: Unknown) as unknown, single for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The reporter stated the patient's blood pressure went so high after she received the COVID-19 Vaccine, that she passed out a total of 3 times. She said she had no clue as to how patient's blood pressure was treated. The reporter thought the 3rd time of passed out from her blood pressure being high, the patient made her husband take her to the Emergency Room. She said adverse reaction occurred around the same time frame as hers, in either Feb2021 or Mar2021. The patient underwent lab tests and procedures which included body height: 5'6" or 5'7". The event outcome was unknown. Information on the lot/batch number has been requested.

| 1320209 | 5/15/2021 | FL | | F | | | she passed out; she had swelling of her lymph nodes; cold chills; cold sweats; threw up; She thought she was going to have a heart attack; This is a spontaneous report received from a contactable consumer (patient). A female patient of an unspecified age received the second dose of BNT162B2 (Lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date as single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient previously received the first dose of BNT162B2 on an unspecified date as single dose for COVID-19 immunization. The patient had minor side effects with the first COVID vaccine. With the second shot on unspecified date, the patient had swelling of her lymph nodes. A week later from the shot, she passed out. She has never passed out before in her life. This week two days ago, she had cold chills, cold sweats, and threw up. She was in the bathroom from both ends. She thought she was going to have a heart attack. She went to the doctor for a check-up. The patient had a CAT scan, and a heart monitor to rule out a TIA on unspecified date with unknown results. She cannot believe it because she is normally a healthy person. The outcome of the events was unknown. Information on the lot/batch number has been requested. |
| 1320222 | 5/15/2021 | CA | 36 | F | 5/14/2021 | 5/14/2021 | Systemic: Dizziness / Lightheadness-Medium, Systemic: Fainting / Unresponsive-Medium, Additional Details: Patient described feeling dizzy about 15 min after the vaccine. We had her lie down, offered her water & gatorade, monitored her. We took her BP and heart rate. We asked her if she could breathe- she said she could breathe ok. BP was 135/85 and heart rate was 79bpm which was normal. We had her continue lying down and complained that she was feeling worse after another 15min and wanted us to call 911. We did, 911 showed up, took her vitals again which were normal. No hospitalization reqd. |

| 1320247 | 5/15/2021 | CA | 33 | F | 4/27/2021 | 4/28/2021 | <p>passed out; Severe abdominal pain; arm was very sore from the injection site; hit my head very hard; I felt the need to vomit; woozy; bruised; This is a spontaneous report from a contactable consumer reporting for herself. A 33-years-old female patient received bnt162b2 (BNT162B2), via an unspecified route of administration, administered in Arm Left on 27Apr2021 (Batch/Lot Number: EW0165) as single dose for covid-19 immunisation . The patient medical history and concomitant medications were not reported. The patient passed out on 28Apr2021 02:30 with outcome of recovering , had severe abdominal pain on 28Apr2021 02:30 with outcome of recovering , arm was very sore from the injection site on 28Apr2021 02:30 with outcome of recovering , hit my head very hard on 28Apr2021 with outcome of recovering , i felt the need to vomit on 28Apr2021 with outcome of recovering , woozy on 28Apr2021 with outcome of recovering , bruised on 28Apr2021 with outcome of recovering. Loss of consciousness was considered an Important Medical Event. Course of the event: The patient stated: At 2:20 am I woke up with severe abdominal pain, and my arm was very sore from the injection site. I got up to take Tylenol since i hadn't taken any yet. While I was trying to read the label I got very dizzy and I tried to walk back to my bed and I passed out onto the floor. When I woke up I felt like I had hit my head very hard, I slowly went back to my bedroom and passed out again and my husband found me unconscious And called 911. When I woke up I felt the need to vomit and have bowl movements so he took me to the bathroom. When the paramedics came I was conscious but very nauseous and woozy. Now I am bruised all over, the bridge of my nose where I hit my face, and knees and elbows". Follow up information has been requested.</p> |

| 1320126 | 5/15/2021 | | | F | 4/22/2021 | 4/30/2021 | <p>passed out; Astronomical Headache; I got very dizzy and had dots; She got very dizzy and had dots; I just started spinning and broke out; I have a bump on her head; scrape on her knee; chills; Nausea; Vomiting; Diarrhea; I was severely cold; I was very sluggish; My chest feels congested; her head feels like it weighs 30 lbs; This is a spontaneous report from a contactable consumer (patient). A female patient of an unspecified age received bnt162b2 (BNT162B2 reported PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration on 22Apr2021 (Batch/Lot number was not reported) as first dose, single for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient reported that this past Wednesday (30Apr2021), she was getting severe chills, nausea, vomiting, and diarrhea. She took Dayquil because she still had the chills and she was severely cold. Yesterday (30Apr2021), she was very sluggish. She mentioned that her head feels like it weighs 30 lbs. on 30Apr2021. She added that her chest feels congested on 30Apr2021. This morning (01May2021), she was lightheaded and had an astronomical headache. She got very dizzy and had dots. She got up again to turn the tea kettle off and she just started spinning and broke out and went to the bathroom. When she went to the bathroom and went to squat on the toilet, she passed out. She doesn't know how long she was out. She has a bump on her head and a scrape on her knee. When she woke up, she was so cold, so she put on flannel pajamas. She also mentioned that she was scheduled for second one on next Tuesday (11May2021). She inquired if she can still get Covid after getting the vaccine. The outcome of the events was unknown. Information about lot/batch number has been requested.</p> |

| 1321315 | 5/15/2021 | NV | 24 | M | 5/15/2021 | 5/15/2021 | Patient stated he had no previous problems with vaccines in the past. After I gave him the vaccine, I directed the patient to sit outside and wait 15 minutes per protocol. As soon as patient got up to walk to outside of vaccination room, he fainted and fell onto the ground hitting his head as well. Patient regained consciousness 5-10 seconds later. I had him sit upright against the wall, I directed my technician to call EMS, and I gave the patient some water. EMS arrived in about 5-10 minutes and they triaged the patient for about 20-30 minutes (given anti-nausea medication, IV fluids, and some other things I didn't see). Patient's parent ended up coming to pick up him, EMS was comfortable letting him leave without going to the hospital, EMS advised patient to seek medical attention if other problem arises. |
| 1321197 | 5/15/2021 | CA | 15 | F | 5/15/2021 | 5/15/2021 | Patient fainted within 5 minutes after injection. Patient experienced a syncope event passed out. Patient regain conscious within a minute. Patient may have injure her head upon falling. |

| 1321355 | 5/15/2021 | NE | 13 | F | 5/15/2021 | 5/15/2021 | Patient was sitting with her mother in front of the pharmacy for the 15 min waiting period after vaccination, and mom alerted us to "something going on here." I (pharmacist) went over to the patient and she appeared to be having a seizure, hands clenched, eyes rolled back in head, and she shook a small amount for a short period of time, though mom believes she just passed out. Mom and I protected head and held her in place, it was over within a few seconds. A Nurse Practitioner was in the clinic next door and we alerted her. Together, we laid her down, asked her questions, took pulse with pulse oximeter and blood pressure. All seemed within normal range. We called 911 due to appearance of seizure. Rescue squad came and evaluated her. |
| 1321362 | 5/15/2021 | CA | 18 | M | 5/15/2021 | 5/15/2021 | PATIENT FAINTED A FEW MINUTES AFTER RECEIVING THE SHOT AND WOKE UP AFTER A FEW SECONDS. WE LET THE PATIENT LIE DOWN AND ELEVATED HIS LEGS. WE ALSO ASKED PATIENT TO STAY FOR 30 MINUTES FOR OBSERVATION. |
| 1321365 | 5/15/2021 | OR | 22 | M | 5/15/2021 | 5/15/2021 | Pt passed out in chair about a minute or so after administration of vaccine. He brought along his girlfriend who was in the consultation room with him. Prior to administration, pt informed me that he was afraid of needles. After administration, we discussed the type of needle that was used (vanish point syringe) and the mechanism of how it works. He seemed anxious so I advised that it was ok for them to sit in the room for a few minutes instead of getting up to wait in the lobby, I left the door open for them. I walked back into the pharmacy and his girlfriend alerted me that he had passed out. He regained conscious within a few seconds. I advised he sit with his head between his legs, as he mentioned feeling light headed, feeling hot and sweaty. he threw up a little into the trash. pt sat in room for at least 30 minutes until he felt better. was given a few cups of water while sitting. did not leave until he felt comfortable and no longer light headed. pt mentioned that his last vaccine was about 2 years ago and the same response occurred then. |

| 1321292 | 5/15/2021 | MA | 42 | M | 5/15/2021 | 5/15/2021 | PATIENT FAINTED |
| 1320970 | 5/15/2021 | TN | 16 | M | 5/15/2021 | 5/15/2021 | Within approx. 5 minutes of receiving vaccine another patient (not related) alerted pharmacy staff to a patient "having a reaction" in our waiting area. When I approached the patient, he was staring ahead at his mother while she informed me that he experiences similar reactions when at the doctors office when he receives any shot. Before I approached he was passed out, but he was coming to when I arrived. He was able to speak, look at me, and move without delay within a minute and showed no further symptoms. |

| 1320948 | 5/15/2021 | TX | 14 | F | 5/13/2021 | 5/13/2021 | Approx. 5 min after vaccination patient started to feel dizzy. Technician went to retrieve ice packs and patient fainted. Pharmacist gently moved patient to her side on the floor and brought knees up to her chest while technician called 911. Patient regained consciousness after approx. 2 minutes before EMS arrived on scene. EMS took patient's blood pressure (hypotensive), administered saline drip in ambulance onsite then released patient to parents. Followed up with parents next day, patient was monitored at home and was feeling fine. Per EMS patient most likely was dehydrated. No prior history of event post vaccine. |

| 1320991 | 5/15/2021 | LA | 18 | F | 5/15/2021 | 5/15/2021 | The patient informed me before giving the second dose of Moderna that she has fainted for every single vaccine she has ever been given including the first dose of Moderna. She stated it usually happens one to two minutes after receiving the vaccine and that she comes to within 10-15 minutes. Her father has been with her for every vaccination, and she just rests her head on his stomach. I informed the other pharmacist on duty of this and had EpiPen and smelling salts on hand just in case. We were all ready to react in case of any emergency. The patient did faint after sitting for a couple of minutes. She knew it was about to happen and her father stepped in to let her rest her head. We had her feet raised on a chair. She was still breathing the entire time, so we used smelling salts to bring her to which worked. She was out for close 10 minutes, but still breathing normally. The smelling salts enabled her to respond and nod that she was okay. When she came to, she asked for water and a sticker, which we gave her, and she acted as if nothing had happened and was all smiles. We did get a member of management to come fill out a report. |
| 1321005 | 5/15/2021 | AL | 16 | F | 5/15/2021 | 5/15/2021 | Patient fainted right after getting vaccinated - she has a history of fainting with needles |

| 1321144 | 5/15/2021 | CA | 14 | F | 5/14/2021 | 5/14/2021 | <p>Patient received the 1st COVID vaccine (Pfizer lot # EW0182 use by 5/15/2021) at 1455. The client had a history of fainting (x3) with intramuscular injections. The client reported eating lunch prior to arriving for her appointment. The client was vaccinated in the anti-gravity chair at 1455 by EMT. The client became very pale about 1 minute following the vaccination administration and she loss consciousness for 5 seconds, during this time she had 2 myoclonic contractions. RN and EMT immediately placed the patient in Fowler's position in the anti-gravity chair during the syncopal episode. The patient immediately regained consciousness and was alert and oriented to person, place, time, and situation. The patient remained in Fowler's position and vitals were taken at 1456: BP 125/95 (R arm), HR 45, RR 18, and oxygen saturation at 95%. The patient denied experiencing lightheadedness, shortness of breath, dizziness, nausea, headache, or blurry vision. The patient was given a juice box. The patient's color slowly returned. Vitals were retaken at 1505: BP 123/82 (R arm), RR 20, HR 50, oxygen saturation at 98%. The patient stated, " I usually feel really bad after I faint but this time I feel fine." Vitals at 1510 were as follows: BP 130/70, RR 18, HR 67, oxygen saturation at 100%. The patient was speaking in full sentences and laughing with her friend. Vitals taken at 1515: BP 125/ 68, RR 16, HR 68, oxygen saturation at 99%. The patient was positioned from a Fowler's position to sitting upright. The patient's color returned to her face and she denied any nausea, dizziness, blurred vision, double vision, or chest pain. Vitals were taken at 1520: BP 125/70, HR 82, RR 16, oxygen saturation at 99%. At 1524, the patient's blood pressure was 125/68 and HR was 58. The patient continued to deny any shortness of breath, dizziness, nausea, or vision changes. The patient's heart rate was taken at 1531, HR 55 and again at 1536, HR 62. The patient's mother stated her daughter was currently taking an antibiotic for acne (dosage and name unknown) and denied having any drug allergies or chronic medical conditions. RN instructed the patient and her mother about emergency precautions and to follow up with their primary care provider. RN, also educated the patient and her mother about the importance of informing the healthcare provider about her history of fainting with injections when receiving the second COVID Pfizer vaccine. Gave the patient's mother V-safe</p> |

| 1317588 | 5/14/2021 | FL | 36 | F | 5/14/2021 | 5/14/2021 | Patient had a reaction immediately after the JJ vaccine. Patient passed out for 10-15seconds, her body stiffened up, she felt hot and then cold and started sweating excessively. Patients eyes closed briefly and then opened. Patient then became conscious and was unaware what had happened. Patient is not on any medication and had not eaten all morning. After administering the vaccine a small amount of blood came out. I gave her a cotton ball to apply on the area and to hold. After 20-30 seconds she said she felt faint and hot all of a sudden. Her body then went limp and her eyes began to close. Her body then stiffened up for a few seconds. After shouting her name a few times she regained consciousness and was able to talk. she didn't realize what had happened. Her body was fine again but she had urinated during the episode. Upon speaking to the patient I learnt that she was nervous about the vaccination and she had felt dizzy in the past when giving blood. I observed the patient over the next 45 minutes. Her speech was fine, she was still a little light headed. She was in her seat for 40 minutes, then I asked her to stand and to move a little to see how she was. She was able to walk a bit but then sat down as she still felt light headed. She than sipped on water and continued talking and seemed to get some energy back. |
| 1317489 | 5/14/2021 | KS | 54 | F | 5/14/2021 | 5/14/2021 | Patient was given johnson and johnson vaccine and immediately felt lightheaded and faint. She laid down on the floor. I went to get cool wet papertowels and upon returning she was unresponsive. I immediately had staff call for an ambulance. Patient came to before needing to administer the epipen or diphenhydramine. Patient denied throat swelling or pain and was alert x3. EMS checked her out and determined it was just a fainting episode, which the patient admitted to having frequently in the healthcare setting. Patient was able to walk out of the pharmacy and is feeling fine now. |

| 1315986 | 5/14/2021 | CA | 24 | M | 5/13/2021 | 5/13/2021 | On Thursday May 13th, 2021, patient arrived to receive his first Pfizer vaccination. Patient was vaccinated and sent to the observation area. At 1342, the patient stated, " I feel dizzy, like I might pass out," to EMT observer. EMT observer immediately assisted the patient to the gravity chair. The patient's vital signs were taken: BP 110/72, HR 84, RR 15, oxygen saturation at 96% . The patient was alert and oriented to person, place, time, and situation. The patient was given water and stated, " I feel so much better after sitting in this chair." No loss of consciousness or syncope occurred. The patient was given a bottle of water. Co-lead, assessed the patient, who was alert and oriented to person, place, time, and situation, was in no apparent distress, and was speaking in full sentences. No pallor or diaphoresis was observed. Vitals were taken at 1347: BP 108/70, HR 63, RR 14, oxygen saturation at 99%. The patient took off his mask to reduce anxiety. Denied any history of fainting. or having any known drug allergies. Vitals were retaken at 1352: BP 120/68, HR 63, RR 14 ,oxygen saturation at 98%. The patient was offered a granola bar but denied it, as he ate around 1230. Patient denied any shortness of breath, blurry vision, lightheadedness, dizziness, itching, nausea, or facial flushing. The patient stated, " I feel totally fine." Vitals were retaken at 1357, BP 120/70, RR: 14, HR 63, and oxygen saturation at 98%. Notified patient to inform the vaccinator about his reaction when returning for his second Pfizer dose. Vital retaken at 1402, BP 125/ 68, RR 14, HR 63, 98% oxygen saturation. The patient felt comfortable to drive home and left the site at 1405. The patient left the site with an even and steady gait. |

| 1316184 | 5/14/2021 | CA | 16 | F | 4/23/2021 | 4/24/2021 | she fainted; hit her head; This is a spontaneous report from a contactable consumer (patient's mother) reported that a 16-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EW0171), via an unspecified route of administration, administered in arm left on 23Apr2021 (at the age of 16-years-old) as 1st dose, single for Covid-19 immunisation. The patient's medical history and concomitant medications were not reported. On 24Apr2021, she fainted and hit her head. Clinical course details was reported as the patient got her Pfizer COVID vaccine on Friday (23Apr2021), and she fainted on Saturday (24Apr2021), knocked her head on counter and was knocked out. The doctor was taking her to ER. The patient was not yet admitted to the hospital, since when the patient's mother called they were going there (hospital) now. The doctor had her blood drawn to find out what was going on. The patient underwent lab tests and procedures included weight: 58.97 (no unit), and height: 157 (no unit) both on an unspecified date. The patient was scheduled on 15May2021 for 2nd vaccine. The outcome of the events was unknown. No follow-up attempts possible. No further information expected. |

| 1316212 | 5/14/2021 | NC | 87 | F | 2/9/2021 | 2/10/2021 | left side weakness; Elevated troponin levels but no sign of heart attack; patient became so weak that she could not stand or walk , even with assistance; transient ischemic attack; gallstones; Endometrial cancer; headache; migraine; goiter; hypothyroidism; high blood pressure; Slurred speech; This is a spontaneous report from a contactable consumer (Patient's daughter). An 88-year-female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Deltoid Right on 09Feb2021 17:00 as 2nd dose, single for covid-19 immunisation. Medical history included Type 2 diabetes from 08Jan2016 to an unknown date (diabetic retinopathy). Concomitant medications included latanoprostene bunod (VYZULTA) from an unspecified start date and ongoing. The patient previously took dose 1 of bnt162b2 (PFIZER- BIONTECH COVID-19 VACCINE, Lot no Lot number : EL3247), anatomical location was left arm for Covid Immunization on 16Jan2021(Age at the time of vaccination was 87years 10 months). On 10Feb2021 at 19:00, Patient felt unwell, fainted and could not stand due to weakness. Elevated troponin levels but no sign of heart attack, 08Mar2021at 19:00, she had transient ischemic attack resulting in left side weakness and slurred speech. Endometrial cancer, gallstones, headache, migraine, goiter hypothyroidism and high blood pressure. On 10Feb2021. Patient became so weak that she could not stand or walk even with assistance and received treatment for these events. She was incapable of even holding her head up properly before hospitalization, she was basically dead weight and as treatment had IV fluids, shot to prevent blood clotting. In hindsight, patient probably experienced a transient ischemic attack on 10Feb2021. She wasn't taken to the hospital until 12 hours after the weakness started. and ER physician didn't check to see if she was weak on one side of her body. AE required to visit to emergency room. Patient was hospitalized 1st time from 10feb2021 to until 18Feb2021 and 2nd time from 09Mar2021 until to 16mar2021. The outcome for the event transient ischemic attack, slurred speech, left side weakness, gallstones, endometrial cancer, headache, migraine, goiter, hypothyroidism, high blood pressure was unknown and for the event patient became so weak that she could not stand or walk, even with assistance and elevated |

| 1316347 | 5/14/2021 | CA | | M | | 4/1/2021 | STROKE; PASSED OUT; DIZZINESS; DID NOT FEEL WELL; HEARTBURN; HEADACHE ON THE FRONT LEFT SIDE; RECURRENT SEIZURE; This spontaneous report received from a patient concerned a male of unspecified age. The patient's weight, height, and medical history were not reported. The patient received COVID-19 VACCINE AD26.COV2.S (suspension for injection, unknown, batch number: 1805029, expiry: UNKNOWN) dose was not reported once a total on left deltoid, administered on 28-MAR-2021 11:00 for prophylactic vaccination. No concomitant medications were reported. On 30-MAR-2021 patient went to the hospital because patient did not feel well and was given seasick pills. Two days later patient was still not feeling well and went to hospital, where the doctor said that patient having a Stroke, and patient in the middle of a Stroke. The doctor administered intravenous to patient .The patient was hospitalized for 3-4 days then transferred to Hospital (where patient is insured) and was hospitalized for 4-5 day. On an unspecified date in 2021, the patient had recurrent Seizure .Three days in a row and then one day rest and then it came back again, basically for the month came different times. Patient said his eyes would roll back to his head. On unspecified date in 2021, patient had dizziness and passed out and went to hospital where they said they should have never released patient. Patient was hospitalized for 2 days and did work up. Then hospital took patient back and they didn't do what hospital did. Patient mentioned feeling better at hospital with the treatment they provided him but when hospital cared for patient, they did not use the same. Patient also mentioned that he was sent to rehab to learn how to walk. Patient had experienced heartburns but they did not give him medication for heartburn. Patient was upset and got his friend to buy Antacid for him and he took it with relief. Patient used a walker/cane to get around and was perfectly fine before. On unspecified date in 2021 patient experienced headache on the front left side of the head (like someone is stepping). The action taken with COVID-19 VACCINE AD26.COV2.S was not applicable. The outcome of the headache on the front left side, dizziness, recurrent seizure, heartburn, stroke, passed out and did not feel well was not reported. This report was serious (Hospitalization Caused / Prolonged, and Other Medically |

| 1317151 | 5/14/2021 | CA | 61 | M | 4/3/2021 | 4/15/2021 | For the first two weeks, there was only mild headache and fatigue. But on day 12 (or 13) following the shot, my husband had severe abdominal pain and black, tarry poop. He passed out on the toilet in the middle of the night and hit his head, woke up in a puddle of blood (from hitting his head). He was severely lightheaded, short of breath, could not walk. He had to crawl back to bed. He continued to have severe lightheadedness, shortness of breath, muscle aches, abdominal pain, and also ringing in his ears. He called me early Saturday morning and told me what happened and that he called out from work. (We do not live together. He is 280 miles away because of his job.) That man has called out sick only one time since I've met him in 1998; so when he told me he did not go to work, I knew it had to be really bad. I drove up there ASAP the same day, and I took the pulse oximeter with me. His oxygen levels were all over the place. They were usually better (like high 70s to low 80s) while he was lying down. When he would sit up or stand up, the number would plummet, reading so low I thought he was going to die. One time his finger was so cold that it took me 4 tries to get a reading. It read at 55, but I realize that might be because his finger was too cold. |
| 1316561 | 5/14/2021 | MA | 39 | F | 5/4/2021 | 5/4/2021 | Systemic: Fainting / Unresponsive-Mild, Additional Details: Counseled patient. She said she ate very little before the vaccination. She fainted for a couple minutes and had to lie down. She informed pharmacy staff. I went over to her and offered her a bottle of water and stayed with her for approximately 10 minutes until she felt fine. She said after a couple minutes and drinking some water she felt fine. She stayed sitting in the vaccination/observation area for 10 more minutes. She was at the store for approximately 45 mins and waited 30 min after shot |
| 1316865 | 5/14/2021 | TX | 18 | F | 5/5/2021 | 5/13/2021 | 8 days after injection I had a delayed hypersensitivity reaction (?covid vaccine arm?), symptoms included firmness and a red patch on my upper arm near the injection site. The following morning, I woke up feeling well with the rash still on my arm (no change). 2 hours later I began feeling dizzy and fainted. I was unconscious for 5 to 10 seconds. When I woke up, the rash had vanished and the firmness was gone. No signs of the reaction were present after waking. |

| 1318574 | 5/14/2021 | ME | 18 | M | 5/14/2021 | 5/14/2021 | The patient fainted approximately 3 minutes after receiving the vaccine. I caught him before he fell out of his chair, and he regained consciousness within about 5 seconds of me tapping on his shoulder. We got him some water immediately and he was able to speak to me, but he continued to nod off in his chair over the next couple minutes. We got him to lay on the floor with his legs elevated and a damp cloth across his face. As soon as he made it safely to the floor he had fully regained consciousness and held a conversation with me. I had him stay on the floor in that position for about 10 minutes. When he felt like he had his full strength back he went back to his chair and sat there for another approximately 10 minutes and continued to drink his water. At that point I let him walk around the area with my supervision and he still felt strong so he left the pharmacy. |
| 1318204 | 5/14/2021 | MO | 13 | F | 5/14/2021 | 5/1/2021 | Pt exhibited an episode of syncope/lightheadedness directly after the vaccination. Counseled patient about the risks of standing after a vaccination. Immediately gave Benadryl to the patient upon initial assessment. |
| 1318245 | 5/14/2021 | ME | 14 | F | 5/14/2021 | 5/14/2021 | After about a minute or so, Pt. felt pretty warm/hot in the room and started saying that she could not see/vision was blurry and she started turning pale/yellow. The room was stuffy so we moved from the vaccination room to the waiting room but the symptoms (vassalage syncope) seemed to progress so we brought her into the pharmacy where there was enough room for her to lie down. We had a fan run directly on her & within a few minutes the EMTs were present and they checked her out initially & they decided to bring her to the ambulance & checked her vitals. They asked her mom if she wanted to bring her to the hospital as her vitals were all normal. Mom decided to bring her just in case to make sure everything was okay and get her checked again as a safety precaution/parental concern. |

| 1317734 | 5/14/2021 | IL | 12 | F | 5/14/2021 | 5/14/2021 | Patient Vomitted and Fainted for couple secs. No signs of distress or SOB observed. Patient stated "that she is ok". Patient discharged home. |
| 1318016 | 5/14/2021 | WI | 32 | M | 5/14/2021 | 5/14/2021 | Patient received a Johnson & Johnson vaccine today. Shortly afterwards while waiting in pharmacy area, we were alerted that the patient was unresponsive by his wife. Immediately responded to patient. Code white called and management responded. Tried to get him to wake up, he opened his eyes but immediately closed them again. I attempted to keep him alert and eyes open. This proceeded to go on for several minutes. Ice packs were placed on neck and wrists. Feet elevated. Once patient was alert and oriented, water was provided and patient was instructed to take small sips. Patient was kept in pharmacy area for additional 15 minutes once he was back to normal. Patient stated that when he passed out, he felt tired, couldn't see or hear. |
| 1318037 | 5/14/2021 | CA | 15 | F | 5/14/2021 | 5/14/2021 | Patient felt dizzy and fainted after 4 minutes of receiving the Pfizer COVID-19 vaccine. Pt immediately woke up, no change in level of consciousness. Patient awake, alert, and oriented to name, place, time, and situation. Vital signs were within normal limits. BP 96/54, HR 71, SpO2 99% in RA. Patient left ambulatory with mother in stable condition after 40 minutes of monitoring and observation. |

| 1313733 | 5/13/2021 | NC | 71 | F | 2/26/2021 | 2/27/2021 | <p>She got her vaccine, felt fine, the shot didn't hurt until probably about 6 hours later she began to feel not sick, but not totally well, feeling blah. Through the night, she did not sleep well, probably awake as much as sleeping. In the middle of the night her husband was up and she said she felt as if she had the virus, as well as her husband. She ate about 1/3 of a bowl of oatmeal, and it did not make her feel better. She did not have any energy and hurt as if she had had a bad fall. She had periods of her head floating away, strange feeling. She got up to move and continued to have light headed spells and felt if she held her head back she would pass out. She then walked into the kitchen as she was thirsty and her stomach unsettled, went to the fridge and then does not remember anything other than her son being at the house. Her husband called him, and it was 15 minutes while she was out before she regained consciousness. They told her they called 9-1-1 and went to the bathroom and the paramedics checked her out and recommended for her to go to the hospital. She was transported to the ER, and based on the info they had they checked her for a stroke. They sent her for a brain scan. The Dr. told her that she had a healthy brain. They monitored her and was in the ER until that evening, she was then transferred to a room and put on a motion and heart monitor to keep check on her. She did not have anymore episodes of syncope and checked her out and told her that everything was WNL. They were trying to find out what caused her blackout spell. She asked if she could take the 2nd vaccine, and he told her that she needed it. She came home on Monday evening after being discharged. She had no energy until the last week or so since that episode. She still has a brain fog, trouble just thinking and makes quilts for hospice patients and was able to complete that task last week. Her brain fog is better and her fatigue is improving.</p> |

| 1314304 | 5/13/2021 | CO | 19 | F | 3/27/2021 | 3/28/2021 | First symptoms were fever of 103.5 at midnight on the 28th. I called the RA on call in my university department and they called PD - to come and make sure I was okay. For 36 hours, I felt terrible - couldn't do anything. About 1 1/2 to 2 weeks later, I started getting really severe back pain that made it hard for me to do things - even sitting in a chair caused so much pain or walking or standing for long periods of time made me light headed because it was intense pain. There was one instance, when I nearly passed out from the pain but I didn't as I called for help for someone to catch me. It kind of moves around - the pain - sometimes it's a along my spine and sometimes it's low below my shoulder blades. I'm still having this pain. It's not on the same pain scale as it was a couple of weeks ago. It's more manageable right now. I do stretches and some medications and there are a couple of patches - Salontas - that my dad uses that he recommended I try to use for backaches. I am calling my doctor today to make an appointment. |
| 1314170 | 5/13/2021 | AL | 32 | M | 5/11/2021 | 5/11/2021 | Patient began sweating profusely approximately 10 minutes after his vaccine. He went to his parent's car and asked his father to turn on the air conditioning as he was hot. he then passed out in the back seat of the car. His mother came inside and asked for assistance. I grabbed an epi-pen and ran outside to the car. Patient was breathing and had a pulse rate of 64. He aroused shortly after I began asking him if he could hear me and asked if he could tell me his name. He was pale (notably his lips were quite pale) and confused. He could not say his name but could nod appropriately to questions when asked. We immediately called EMS for assistance. They arrived within 4-5 minutes and transported the patient to hospital. |
| 1313511 | 5/13/2021 | MA | 30 | M | 5/12/2021 | 5/12/2021 | Systemic: Fainting / Unresponsive-Medium, Additional Details: Patient has a history of fainting with medical procedures. We called 911 Paramedic responded observed patient took patient's blood pressure waited 15 minutes told patient he should not drive. Patient said he was fine declined medical transport said he was OK to walk home. |

| 1312661 | 5/13/2021 | CA | 18 | M | 5/12/2021 | 5/12/2021 | <p>Pt. received the first COVID vaccine (Pfizer, lot # EW0182 and use by date is 05/13/21 at 0930am) around 1123am. LVN, administered the Pfizer vaccine and approximately 10 seconds after the vaccine was administered, the patient became pale and the patient loss consciousness for approximately 4 seconds. LVN ensured that the patient did not fall off the chair while RN (and Co-Lead), RN (Lead Vaccinator), and EMT observer, immediately ran to assist LVN with assisting the patient to the ground. The patient was alert and oriented when the nurses assisted him to the floor and had him lie in a supine position with his legs elevated. The patient was alert and oriented to person, place, time, and situation. Vital signs were immediately taken at 1124 when the patient was supine on the ground with his legs elevated: blood pressure of 112/58 (right arm, supine) , heart rate of 48 beats per minute, respiratory rate of 16 breaths per minute, and 100% oxygen saturation at room air. The patient denied any headache, nausea, or dizziness. The patient was moved to the gravity chair and was placed in Fowler's position. The patient was given Gatorade, as the patient did not eat or drink anything prior to being vaccinated. Vitals were taken at 1131: BP 114/78 (Right arm, sitting) , 66 beats per minute, 16 breaths per minute, and 100% oxygen saturation at room air. Alert and oriented to person, place, time, and situation. Denied any history of fainting . Denied taking any medications or having any chronic medical conditions. The patient continued drinking Gatorade and was offered a granola bar, the patient did not have any known allergies to medications, foods, or dust. At 1141, vitals were retaken, BP 122/87 (Right arm, sitting), HR 63, RR 16, and 100% oxygen saturation at room air. The patient denied any chest pain, shortness of breath, lightheadedness, dizziness, or headache. The patient ate a breakfast biscuit at 1148. At 1153 the patient was positioned from a Fowler's position to sitting upright in the gravity chair. Instructed the patient to have a friend or family member drive him home, the patient then called a friend to transport him home. RN, went over the V-Safe app with the patient and instructed him to eat breakfast and drink fluids the next time he arrived for his 2nd Pfizer vaccine. RN also instructed him to inform the vaccinator the next time he is vaccinated (for his second dose), to inform him/her about his history of fainting with his first</p> |

| | | | | | | | dose. The patient's vitals were taken at 1158 when he was sitting upright, BP: 138/80 (right arm), HR 67, RR 15, and oxygen saturation at 99%. RN instructed the patient about ER precautions and to follow up with his primary care provider. The patient's vital signs were taken a final time at 1210, BP 122/78, RR 16, HR 67, and 100% oxygen saturation at room air. The patient's ride arrived on site around 1215, and the patient had a steady and even gait when ambulating to the vehicle, where he was driven home by a friend. |

| 1313254 | 5/13/2021 | WA | 87 | F | 3/29/2021 | 3/30/2021 | <p>passed out 24 hours after the first shot; heartrate went to 99; freezing; chills off and on; Wiped out, Fatigue; freezing ,chills off and on; This spontaneous case was reported by a consumer and describes the occurrence of LOSS OF CONSCIOUSNESS (passed out 24 hours after the first shot) in an 87-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 025A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No medical history was provided by the reporter. Concomitant products included TRIAMCINOLONE ACETONIDE (NASACORT), FLUTICASONE PROPIONATE (FLOVENT), LISINOPRIL, ASCORBIC ACID, ERGOCALCIFEROL, NICOTINAMIDE, RETINOL, RIBOFLAVIN, THIAMINE HYDROCHLORIDE (VITAMINS [ASCORBIC ACID;ERGOCALCIFEROL;NICOTINAMIDE;RETINOL;RIBOFLAVIN;THIAMINE HYDROCHLORIDE]) and PRAVASTATIN for an unknown indication. On 29-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 30-Mar-2021, the patient experienced LOSS OF CONSCIOUSNESS (passed out 24 hours after the first shot) (seriousness criterion medically significant), HEART RATE INCREASED (heartrate went to 99), FEELING COLD (freezing; chills off and on) and CHILLS (freezing ,chills off and on). 30-Mar-2021, the patient experienced FATIGUE (Wiped out, Fatigue). On 30-Mar-2021, LOSS OF CONSCIOUSNESS (passed out 24 hours after the first shot) had resolved. On 06-Apr-2021, FEELING COLD (freezing; chills off and on) and CHILLS (freezing ,chills off and on) had resolved. At the time of the report, HEART RATE INCREASED (heartrate went to 99) outcome was unknown and FATIGUE (Wiped out, Fatigue) had not resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On an unknown date, Electrocardiogram: result not mentioned (Inconclusive) result not mentioned. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Treatment included discontinuation of glipizide. Company comment: This case concerns an 87-year-old female with a serious unexpected event of loss of consciousness, and non-serious unexpected heart rate increased, feeling cold, and expected fatigue, chills. Based on current available</p> |

| 1313190 | 5/13/2021 | HI | 28 | F | 5/12/2021 | 5/12/2021 | <p>Patient received second covid shot from technician certified to vaccinate. Tech knocked on door, because when patient went to stand she felt like putting her head between her legs and fainting. I went in there and it looked like previous episodes of fainting I have seen so I tried to calm her and have her breath while patient was getting the blood pressure machine. Patient then fainted again a little more intensely, but still not alarming me that much. She came to and again I was talking with her to try to keep her alert. I asked her how she was feeling. She said she was extremely hot (she kept repeating this), that she had a headache, and asked for water. I told her we couldn't give her food or water until she felt better. We now had blood pressure monitor on her and it wouldn't read her pressure or pulse it kept saying error. I just used it on another patient with high blood pressure and it had been functional. I had been manually holding her pulse and it was strong and normal. Then she fainted again and started shaking. the shaking quickly stopped. She woke up and said that she couldn't see. I asked tech to call 911, while I stayed with her and kept assessing her. Tech got the headset got 911 on the phone and turned the phone over to me. I asked her to grab another blood pressure monitor. We tried again and at 3:55pm it was 88/50 and pulse of 66. I was talking 911 and responding to all questions over the phone. I had to ask the patient for the responses (many COVID related questions). I told the lady her blood pressure and the lady said I don't need to know any of that. She wanted me to keep asking the patient questions. The blood pressure was 87/49 and pulse of 65 at 3:58. Now the EMT had arrived and assessed her. They said she fainted and she said she did not want to go with them. So they left. The patient remained at pharmacy for 45 to 90 min more until she was sure she felt okay enough to catch an uber home. I called her at 8:43pm and she said she feels much better, has eaten, and is with her boyfriend in case she experiences anymore ADRS. Upon asking who her primary physician is she said she last saw a doctor in another country. She said her md only speaks another language. I asked her to call her MD and report to her in a different language what happened since I am unable to speak with her.</p> |

| 1313061 | 5/13/2021 | NY | 62 | F | 3/25/2021 | 3/25/2021 | having faint spells; blood pressure is a little bit higher than normal; Feeling kind of funny; had severe headache; This is a spontaneous report from a contactable healthcare professional, the patient. A 62-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot ER8727, second dose) solution for injection intramuscular in the left arm on 25Mar2021 (at the age of 62-years-old) as a single dose for COVID-19 vaccination. Medical history included thyroid disease (diagnosed with probably 20-21 years ago) and blood pressure increased (takes blood pressure medicine). Concomitant medication included hydrochlorothiazide for blood pressure increased began taking this 4 or 5 years ago. Historical vaccine included BNT162B2 (first dose, lot EN6200) for COVID-19 vaccination on 04Mar2021 with no adverse effect reported. On 25Mar2021, the patient was feeling kind of funny and had a severe headache. In Apr2021, the patient had faint spells and blood pressure was a little bit higher than normal at 137/80 which began after the second dose Pfizer Covid Vaccine. The patient stated she never felt like fainting before in her life. Her blood pressure was never over 150 and can't keep blood pressure under 130 for some reason. The outcome of the events feeling kind of funny and headache was unknown. The outcome of the events faint spells and blood pressure was a little bit higher was not recovered. Information on batch number has been requested.; Sender's Comments: Based on chronological connection to the vaccine a causal relationship between event faint spells and BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate. |

| 1312664 | 5/13/2021 | IL | 59 | F | 3/14/2021 | 3/14/2021 | 10 minutes after receiving injection felt body heating up like blood was boiling, sweating eventually passed out. 8 weeks later still low energy levels and lengthy sleeping times |
| 1312633 | 5/13/2021 | WA | 20 | F | 5/12/2021 | 5/12/2021 | PATIENT WARNED ME THAT HE HAS A NEEDLE PHOBIA, I GAVE HIM THE VACCINE, HE TOLD ME THAT HE DID BETTER THAN OTHER TIMES, HE STAYED SITTING ON THE CHAIR, THEN HE SAID THAT HE FEEL NAUSEATED AND WANTS COLD WATER, THEN HE FAINTED, I CALLED FOR HELP, HIS MOM WAS OUTSIDE THE CLINIC IN THE LOBBY, WE CALLED HER, WE ALSO CALLED 911. HE STARTED WAKING UP AFTER LIKE 5 MINUTES, 911 WERE HERE AND CHECKED HIM, HE WAS OK, ALL HIS VITAL SIGHNS WERE NORMAL, HE LEFT THE PHARMACY WALKING WITH HIS DAD AND MOM. |
| 1312630 | 5/13/2021 | TN | 26 | F | 5/12/2021 | 5/12/2021 | PT PASSED OUT AND FELL TO FLOOR FROM THE CHAIR SHE WAS SITTING IN. |
| 1312620 | 5/13/2021 | CA | 28 | M | 5/12/2021 | 5/12/2021 | patient felt fainting after vaccine ,was placed down on the floor and was awake until paramedics arrived and checked patient and started to feel better and left the store with a family member |
| 1314306 | 5/13/2021 | MI | 16 | F | 5/12/2021 | 5/12/2021 | The patient felt tired and describes her eyes going dark, then passed out a few minutes after vaccination. She was vaccinated and then left the immunization room to sit down for a 15 minute waiting period. When she went to sit down, she collapsed on the floor. Her mother assisted her into a chair. She continued to be incoherent and have her eyes rolling back into her head for a few minutes. We used a cool cloth on her forehead and the back of her neck. The parents requested that we call 911. EMS arrived shortly and evaluated her. Heart rate, blood pressure, pulse ox, blood sugar and chest sounds were all within normal range. The patient stated that her arm felt heavy and "funny". She then stated that her tongue felt funny. EMS evaluated her tongue and said it looked normal. To err on the side of caution, she was taken to the hospital to determine whether or not she was having a delayed onset anaphylactic reaction. This patient has no history of seizures. |

| 1314722 | 5/13/2021 | CA | 50 | F | 4/7/2021 | 4/7/2021 | <p>Within 5 minutes from receiving my J&J vaccine, I went to sit down and I started feeling very hot in my body. My heart started to race, had chest discomfort and had trouble breathing, my trachea closed up, had blurry vision and pain in my chest. I felt like I could not breathe and when the nurse came over to ask me I could not speak to her, I went into a shock and I was placed on the floor and I could not hear anything nor could open my eyes, from my hips down to my feet I could not feel anything, my legs went completely numb and I had a syncope. What I was told from the nurse that I was given an Epi-pen to help with my reaction. When I came back my body was having convulsions, felt my head spinning, had pain in my chest that so very intense and the nurse got me up and took me to a nearby ambulance and the EMT staff placed like a heart monitor because my heart was racing super fast. I also felt heaviness in my chest and inside the ambulance I was given two injections on my left arm and when I slowly started coming back, I was already at the hospital. I was at the hospital from 2pm to 4:30pm more less being monitored. At the hospital x-ray of the chest was performed as well as lab work and I was discharged home. When I got home, I still did not feel good, I felt heaviness to my chest, still have trouble breathing and get chills during the night. I also could not stand up and have a nerve sensation to my body and the chest pain to my left side is still very present. I have blurry vision, dizziness, headaches, and my heart-beat continues to race very fast. I get headaches, have abdominal pain and I peed blood few times then that's when I was able to pee, my abdominal pain was painful like having a baby. On Friday 04-08-2021, I again went to the hospital because I had fallen to the floor on my kitchen floor and my daughter took me to the hospital. I let the nurse staff know that I still have continued chest pain and pressure, difficulty breathing and headaches, dizziness and they monitored and gave me three pills as medication. I was discharged home about 5pm with a referral to see a neurologist due to my chest pain, blurry vision, dizziness and fever which I had these past three weeks. I do not know why I felt all these symptoms after my J&J vaccine.</p> |

| 1309531 | 5/12/2021 | TX | 39 | F | 2/4/2021 | 4/21/2021 | blood pressure drop; nearly fainted; chest pain; jaw pain; loss of vision; Multiple bilateral pulmonary embolisms in my lungs; This is a spontaneous report from a contactable consumer (patient). A 40-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) (at 39 years of age), via an unspecified route of administration, administered in arm left on 04Feb2021 (Batch/Lot Number: EN6202) as 2nd dose, single for COVID-19 immunisation. Medical history included MTHFR blood clotting gene mutation. Concomitant medications included citalopram, metoprolol, omeprazole and minastein fe24, all taken for an unspecified indication, start and stop date were not reported. Historical vaccine included BNT162B2 (lot number: EN9581) dose 1 on an unknown date (also reported as 04Feb2021) 01:00 PM in left arm for COVID-19 immunisation. The patient was not pregnant. The patient did not have any other vaccine within 4 weeks prior to the COVID vaccine. She was not diagnosed with COVID-19 prior to vaccination. She had not been tested for COVID-19 prior since vaccination. It was reported that 6 weeks after the second dose on 21Apr2021 12:00, the patient had a blood pressure drop, nearly fainted, chest pain, jaw pain, loss of vision. She went to emergency room (ER), they did tests and found multiple bilateral pulmonary embolisms in her lungs. The adverse events resulted in Emergency room/department or urgent care. Therapeutic measures were taken as a result of the events, Eliquis (reported as 'Eloquis') blood thinners given. The patient was hospitalized for the events for one day. The outcome of the events was not recovered. Information on the batch lot/batch number has been obtained. |

| 1309527 | 5/12/2021 | AR | 49 | M | 2/3/2021 | 2/3/2021 | <p>have some clots; Neuropathy; autoimmune disorder; Fell and hit elbow and 3 ribs on left side; lost 6 (lbs) pounds/Within 2 months, he has lost 47 lbs and eats all the time and is still losing weight; falling; felt super strong; dizziness; failed all the tests for motor skills for his arms and legs; Fell and hit elbow and 3 ribs on left side; Fell and hit head; Sensory nerves are all gone; Fatigue; scabs; delusional; tore tendons in between ribs; They are tender(ribs); hurting all over; Cannot walk or lift anything; chest pain; his arm was sore a little; Left arm injection site pain; Disoriented; This is a spontaneous report from a contactable consumer (patient). A 49-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 1 intramuscular, administered in left arm on 03Feb2021 (batch/lot number and expiration date not reported) at the age of 49 years old, as 1ST DOSE, SINGLE for COVID-19 immunisation. Medical history included COVID-19 from Dec2020 to an unknown date, vascular disease, bilateral stents placement, cataracts since he was born. Concomitant medication included gabapentin taken for an unspecified indication from an unspecified start date and ongoing. On 04Feb2021, the patient experienced left arm injection site pain. The patient experienced dizziness, falling, and couldn't go to work on unspecified date. He was treated by his (MD) physician, was given a CT scan, echocardiogram, and found to have some clots. He stated he has a history of vascular disease and had bilateral stents placed a year ago. He was placed back on an aspirin/Plavix regimen and referred to a neurologist because he has no motor skills anymore. He stated he failed all the tests for motor skills for his arms and legs. He was advised not to take the second dose of the vaccine and was diagnosed with neuropathy and autoimmune disorder (caller does not specify which disorder). He reported being positive for Covid-19 in Dec2020. He wanted to know what else he can do for his symptoms and is offering to be tested by Pfizer for treatment. The symptoms come in really hard seven days later. He actually had to go to the (ER) emergency and they worked on him and a whole string of doctors. He went to the emergency room and something was going on and wanted him to go to a family practitioner. They sent him to vascular, neurological and now they want to send him to a research center. It was a</p> |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

whole week after receiving vaccine before he began having symptoms. With the neuropathy and autoimmune, he cannot work like he did. He can hardly walk. Unspecified autoimmune was diagnosed last week. He can't remember the name of it. They told him not to take second one because the first one did what it did to him. It hurt a little and it was quick. The next day (04Feb2021), he said his arm was sore a little. He is only taking 4 medications and they looked it up. He did not think they were relevant. He was disoriented and fell and hit his head a couple of times. They ran an MRI on his head trying to figure that part out. That was done last week. He doesn't know the date and said it may have been on Friday. Results were good. The date he was disoriented was Wednesday 03Feb2021, when he took the shot. He has been disoriented and has been that way ever since. They kept him for 15 minutes to make sure no one passed out. He has been disoriented since then. He could not think clearly, and he could not do his job. He tore tendons in between ribs. He first thought he actually broke his ribs, but did not. There were two different falls. He cannot feel feet or anything. His motor skills are OK but when they did neuropathy test, they put needles in and shocked him to make his motor fire. His reflexes were really bad. He fell and hit elbow to keep from falling on face and twisted going down hitting 3-4 ribs on left side. It has been over 3 weeks now for his ribs. They are tender but they are not like the initial blow. It feels like they are healing. He fell and hit head a week ago. He was unsure of the exact date. He did not go to the emergency room with this one because the bed caught him. He fell and hit his head. All he has left is scabs. He cannot walk or lift anything (11Feb2021). That next Wednesday, he got ready to go to work and was so delusional and could not go in. He slept from 5:30 all that day and all that night. Then Thursday, he gets up and goes to work and goes slower, just to see what happened on Wednesday. He had fatigue and was disoriented. He did not provide start date or outcome for fatigue. He walked in and said either call an ambulance or he would go home. He went home and that was the last day of work. He then stated he laid in the car for 30 minutes and he said he is going to the emergency room. He went straight there that day. He had stents put in lower part of his body a year before. The neuropathy and

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

the autoimmune kicked in 7 days later after the shot. The reason he went to the ER is because he thought it was his stent. He had bilateral, 4 of them. He was having chest pain and hurting all over on 11Feb2021. He thought he was having a heart attack. He was seen in the emergency room and released. It depends on how far he goes, how the chest pain worsens. Right now, he is ok, but when he gets up and moves around, it does the same thing. Within 2 months, he has lost 47 lbs and eats all the time and is still losing weight. He was about 200 something and was kind of built and now is skin and bones. He lost 6 (lbs) pounds within a week and is eating like crazy. Sensory nerves are all gone. If hit with a baseball bat and he would not feel it. It came on slowly almost that he did not know it was happening. That is why they want to send him to Privacy for a research center and he does not want to go. He never had this happen before. ER or physician's office required: 1st date was on Thursday, 11Feb2021, when he went to Privacy. He was having chest pain and hurting all over. He thought he was having a heart attack. He was released. The patient stated he wanted to change the information he had provided since he was not in his right mind since he had taken the wrong medication dose than the doctor had given him. He stated the medication dosage he wanted to change was for Amiripyin. He stated he wanted to say he told the representative the symptoms he had experienced was enhanced which they were yesterday because he was trying to fight everything and stay awake. COVID 19 vaccine: he stated the doctor did not want him to take the second dose of the vaccine. He stated one of the symptoms he had experienced after the vaccine that he wanted to change the outcome for is the neuropathy. He stated he is back to where he used to be and yesterday it was bad he could hardly walk or talk. He stated also the other symptoms he wanted to change the outcome for is the autoimmune. The patient has not recovered from neuropathy, autoimmune disorder, disoriented, can't walk or lift anything, chest pain, and sensory nerves all gone; while outcome of the remaining events was unknown. Information on the lot/batch number has been requested.

| 1309381 | 5/12/2021 | MN | 18 | M | 5/10/2021 | 5/11/2021 | Patient stated that at 3am the following day he was cold, sweating and weak. He got up and fell on the floor twice and passed out twice. The whole episode lasted 5 to 10 minutes. The rest of the day he was tired, but not to the extent of the 3am episode. |
| 1309308 | 5/12/2021 | UT | 18 | F | 5/3/2021 | 5/3/2021 | passed out; Anxiety; right now she has trouble breathing; nauseous; This spontaneous case was reported by a non-health professional (subsequently medically confirmed) and describes the occurrence of LOSS OF CONSCIOUSNESS (passed out) in an 18-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 007C2LA) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No medical history was provided by the reporter. Concomitant products included FLUOXETINE for an unknown indication. On 03-May-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 03-May-2021, the patient experienced LOSS OF CONSCIOUSNESS (passed out) (seriousness criterion medically significant), ANXIETY (Anxiety), DYSPNOEA (right now she has trouble breathing) and NAUSEA (nauseous). On 03-May-2021, LOSS OF CONSCIOUSNESS (passed out) and NAUSEA (nauseous) had resolved. At the time of the report, ANXIETY (Anxiety) and DYSPNOEA (right now she has trouble breathing) had not resolved. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Treatment of events at was reported as medic was about to give oxygen. The patient did not know if it was her oxygen or heart rate that was low but she became conscious. Patient is worry about taking second dose. She asked if something bad will happen if she stopped at first dose. |

| 1311012 | 5/12/2021 | FL | 57 | F | 4/8/2021 | 4/8/2021 | 15 to 20 minutes after the shot I got very hot/clammy, weak and confused the employee health nurse came to check on me and told me to come to her office and I passed out. I was taken to the ER and kept there approx. 5 hours. I was extremely weak, could not lift my head and had trouble forming thoughts and words. They gave me medication via IV's and observed me. I started to feel better after about 4 hours after the vaccine, but have had more headaches than usual after receiving it. I still have some issues with being upset and anxious about the reaction and if it will have long term adverse effects on me. I will never get another vaccine of any type again. |

| 1311467 | 5/12/2021 | PA | 80 | F | 3/9/2021 | 3/10/2021 | Patient received Moderna COVID-19 vaccine #1 on 02/09/2021. Patient received Moderna COVID-19 vaccine #2 on 03/09/2021. Patient admitted to hospital 03/10/2021 through 03/11/2021 due to syncope on 3/11/2021. Patient had gotten up out of bed to go to the bathroom, called out to her husband then had syncopal episode and fell to the floor. According to husband, she had loss of consciousness for 5 minutes. Per husband and EMS, she then had another syncopal episode after taking a few steps and then collapsed. No urinary incontinence. Syncope occurred day after receiving 2nd dose of COVID-19 vaccination. CT brain as well as CT cervical spine negative for acute abnormality or cervical fracture. Hemodynamically stable. Cardiac enzyme negative x 2. EKG negative for acute abnormality or arrhythmia but with baseline abnormalities. Suspicion was that symptom was due to vasovagal reaction to 2nd dose of COVID19 vaccine. Notably husband also reported that on 02/23/2021 patient was showering, and he then heard her calling out. He found her undressed and wet in the living room area confused. She did not know where she was. Patient also with history of TIA in 05/2020. patient with history of mild dementia. |

| 1306113 | 5/11/2021 | PA | 49 | F | 5/1/2021 | 5/8/2021 | I have had 4 terrible days after the vaccine that I had to spend in bed. I had horrific severe headaches at the front of my head and at the back starting in less than 24 hours after the vaccine. On the next day I had a fever added to these headaches. I couldn't open eyes and light hurt my eyes. I had a loss of appetite and huge weakness. I couldn't walk and had literally to crawl to the bathroom. When I stood up from my bed I almost fainted. After 96 hours after vaccine I still have nausea and headaches that diminished a bit. Fever disappeared only after 96 hours. Still I'm very weak, have nausea and can't really do anything except being in bed. I have never had anything like that in my life after a vaccine. and I'm in perfect health and don't smoke, don't drink any alcohol, doing regular gym and my BMI is normal |
| 1305693 | 5/11/2021 | CT | 48 | M | 4/23/2021 | 4/24/2021 | passed out; felt dizzy; Felt fatigue; headache which lasted about 10 hours; This is a spontaneous report from a contactable consumer report for self. A 48-year-old male patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: EW0170), via an unspecified route of administration, administered in left arm on 23Apr2021 08:30 as single dose for covid-19 immunisation. None Medical history reported. No covid prior vaccination. No other vaccine in four weeks, no Other medications in two weeks. Patient received first dose of bnt162b2 (Lot number=ER8733) on 26Mar2021 03:30 PM in left arm. About 20 hours (on 24Apr2021 04:00 AM) after injection felt dizzy, passed out. Felt fatigue and headache which lasted about 10 hours. No treatment received, Patient recovered from the events. Patient has not been tested for COVID-19 Since the vaccination. |

| 1305643 | 5/11/2021 | NY | 39 | F | 4/24/2021 | 4/25/2021 | <p>passed out; ran a fever fluctuating between 103F and 106 F (measured on three different thermometers) from 700 to 1030; severe nausea; dizziness; headache that made it impossible to sit up without vomiting; headache that made it impossible to sit up without vomiting, could not keep down liquids other than water; This is a spontaneous report from a contactable consumer or other non hcp. A 39-year-old non-pregnant female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) (Batch/Lot Number: ER8735), dose 2, via an unspecified route of administration in the left arm on 24Apr2021 at 16:30 (at the age of 39-years-old) as a single dose for covid-19 immunisation. Medical history included asthma from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. No other medications were received within 2 weeks of the vaccination. The patient did not receive any other vaccines within 4 weeks prior to the vaccination. The patient previously received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) (batch/lot number: Unknown), dose #1, via an unspecified route of administration on an unspecified date as a single dose for COVID-19 immunization and experienced no adverse effects. Prior to the vaccination, the patient was not diagnosed with COVID-19. On 25Apr2021, the patient ran a fever fluctuating between 103F and 106F (measured on 3 different thermometers) from 0700 to 1030. She experienced severe nausea, dizziness and a headache that made it impossible to sit up without vomiting. The patient could not keep down liquids other than water. She passed out at 1030 and woke at 1400. Her fever was then at 100.1F at 1400 to 1830 and would not drop further despite cold showers and Tylenol. The patient called urgent care once she could sit up at 1830 and increased the Tylenol dosage. She stated she never had this high of a fever for this sustained time period in her life. The adverse events resulted in an emergency room/department or urgent care visit via Telehealth. The patient underwent lab tests and procedures which included body temperature (25Apr2021): fluctuating between 103F and 106F from 0700 to 1030 and body temperature (25Apr2021): 100.1F at 1400 to 1830. Clinical outcome of events ran a fever fluctuating between 103F and 106F (measured on 3 different thermometers) from 0700 to 1030. She</p> |

The occurrence of additional non-serious events is detailed below. The patient's past medical history included COVID-19 (Patient spent 50 days in the hospital) from October 2020 to 04-Dec-2020. On 24-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 21-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 22-Apr-2021, the patient experienced SYNCOPE (Fainted) (seriousness criterion medically significant), CHEST INJURY (Left rib cage injured) (seriousness criterion medically significant), BONE PAIN (Aches in the bones), ILLNESS (Ill), FALL (Fell face first into the floor, fell on my hands), CONTUSION (Bruised his hand), FACE INJURY (Face injured), JOINT INJURY (Left hip and knee is injured), NAUSEA (Nausea) and ARTHRALGIA (Aches in the joints). At the time of the report, SYNCOPE (Fainted), CHEST INJURY (Left rib cage injured), BONE PAIN (Aches in the bones), ILLNESS (Ill), FALL (Fell face first into the floor, fell on my hands), CONTUSION (Bruised his hand), FACE INJURY (Face injured), JOINT INJURY (Left hip and knee is injured), NAUSEA (Nausea) and ARTHRALGIA (Aches in the joints) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 22-Apr-2021, Cardiac function test: normal (normal) normal (heart was ok). No relevant concomitant medications were provided. On 22 Apr 2021, patient experienced aches in his joints and bones, he was becoming ill and had nausea which triggered emergency and needing to go to bathroom. He was heading to the bathroom, he fainted and fell face first into the floor. He injured his face, fell on his hands. He had bruised his hand. His left rib cage and left hip and knee was injured. He went to the Emergency Department |

| 1305769 | 5/11/2021 | NY | 56 | F | 4/22/2021 | 4/22/2021 | she thinks may be blood clot or a muscle but not really sure; passed out; very anxious and nervous; her heart is beating fast and she is nervous.; burning sensation in her ear; tiredness; headache; heaviness on her back and chest on the left side; heaviness on her back and chest on the left side; no appetite; nauseous; diarrhea; throbbing is almost like a band-aid is too tight. If she rubbed her hand across her thigh she could feel crushing and throbbing; her heart is beating fast and she is nervous.; sharp pain in her thigh/pinching sensation on inner thigh; sick; throbbing; muscle pain; weird sensation; throbbing sensation to the left side of her belly button/It was like at her stomach; fever of 100.3F; had a feeling of heat on her neck, face, and ears; redness and itchiness at the injection site; redness and itchiness at the injection site; the injection was large, red, hot, and itchy; the injection was large/ the swelling went down; dizzy; This is a spontaneous report from a contactable consumer reported herself. A 56-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 22Apr2021 (Batch/Lot number was not reported) as 1st dose, single for covid-19 immunisation. Medical history included disability, obese, covid-19 when she was sick with COVID last year, she has never been that sick. she thinks she made it through because she owns a nebulizer and can say her lungs have never felt like they were full of fluid. If anything, they felt heavy. It was heavy in her back and chest. She also had a fever. She guesses she would be considered obese. Concomitant medications included paracetamol (TYLENOL). The patient received the first dose of the Pfizer COVID vaccine last week and she has experienced several side effects and is very anxious and nervous. She experienced redness and itchiness at the injection site, pinching sensation on inner thigh that she thinks may be blood clot or a muscle but not really sure, fever of 100.3F from 24Apr2021, burning sensation in her ear, tiredness, headache, heaviness on her back and chest on the left side, no appetite, nauseous, diarrhea, had a feeling of heat on her neck, face, and ears, throbbing sensation to the left side of her belly button from 26Apr2021 and she felt dizzy from 22Apr2021. The patient stated there was a bad connection and she was having difficulty hearing. The patient was a little nervous. Maybe this was a |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

psychosomatic issue and she was thinking of things too much. She was sick for 5 weeks. She was never in the hospital or intubated. The site where she had the injection was large, red, hot, and itchy. It was from 22Apr2021 (Thursday) for the next maybe 3 days. Now the color is diminishing, the color is going down more like to pink and smaller and it not itching anymore. Once in a while she got a pinching sensation on her inner thigh ever since she had the injection. In the last couple days, she has been feeling a that a little more. She wanted to make sure it was not a symptom of a blood clot. She doesn't feel short of breath. She was nervous talking the call handler so that is why she is talking fast. She doesn't want to feel so sick like she did last year when she had it in March or April. She wanted to know that it's not a symptom of a blood clot. It was a throbbing pinching pain that goes and doesn't come back for a little bit, but it might come back a little bit later. It happened when she woke up. She has no swelling in her legs or thighs or anything else. She says she would not be talking this fast, but her heart was beating fast and she was nervous. She tended to be an anxious and nervous person. The patient never had blood clot issues. She wanted to make sure with everything that she has heard about Pfizer she hasn't heard of anyone having blood clot issues. She had to read to calm herself down a bit. It is a sharp pain with throbbing that comes and goes. She didn't read where it could be a blot clot, she just wanted to know. She is horrible at running to the hospital when she feels something because she gets so nervous and she thinks knowing is better because she's a realist. It takes her a minute to go to the hospital to figure it out. If she continues to feel like this she and her daughter will go to the emergency room. It is 5 blocks away. It is a small little hospital and they will be able to ease her mind. It could be her nerves getting to her too. Her fever got up to 100.3 and that was only on Saturday, 48 hours after the vaccine. Once she took Tylenol it was gone and didn't return again. She took her temperature; it was a beeping one. She always says she would take like 2 out of 3, and every time she took it went up. She felt a weird sensation of burning in her ears, the same as when she first had Covid, feeling like a fever. It brought her back to a bad place and it freaked her out. She is on disability and has people go to the store for her. She did that for 3 to 4

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

months. She is not agoraphobic, but she hadn't gone out until she got the vaccine. It took her all day to get back home because she loves the outdoors. It is kind of sad, and she knows she is not the only one who experienced that. She was able to actually stay at home, and when she went out, she wanted to stay. She still has her second dose to take, not everyone in has this and she doesn't want to feel that sick again. Eventually she will perish away one day, from God knows what but a slow death of not being able to breathe she cannot picture for herself or anybody else. She tries not to watch the news, it was depressing, because it is all over the news, she tries to stay in the loop. She was tired and had a headache. She took Tylenol and slept for an hour or hour and half. When she woke up she felt heaviness on her back and chest on the left side, and as she moved around more it was on her back and less on her chest. It was the same as she felt when she had Covid. She didn't have any aches or pains. The other thing was she had no appetite for the next 3 days. Every time she woke up, she felt extremely nauseous but had nothing to vomit. For the next 3 days or 72 hours, she had diarrhea. If she ate anything, she was in the bathroom. On 24Apr2021 (Saturday) after 48 hours she started to feel the heat in her neck and face and ears like right on her ears. She was talking to her daughter and her daughter said these are normal. Where she got the injection was itchy and a little more red. She told herself not to scratch it in her sleep, she is one of those people if something itches, she scratches. What she would do is rub her arm up and down on the site. It was almost the size of an 8 ounce tomato sauce can or maybe the size of a baseball. Then the third day it got redder. In her sleep she was rubbing her arm because it got itchy. Today the swelling went down, the color is like a light pink, and the size is also minimized. The fever lasted that night. She took her temperature again the next day and it was 97.9. That is usually what it is when she wakes up. She is not just tired; she is exhausted and feels like she has to go to sleep. Her daughter came with her granddaughter who is a baby, and she didn't know how to tell them. She was happy to see them but so exhausted. She worries about the sharp pain in her thigh. The other thing is she started getting pain in the middle of her thigh, her inner thigh. A sharp pain with like a throbbing is almost like a band-aid

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

is too tight. If she rubbed her hand across her thigh, she could feel crushing and throbbing. She can feel it from touching the area. She had this before like when she is stretching. It started maybe 3 months ago and went away but then after she took the injection and heard about thing, she worried about a blood clot with Johnson & Johnson, not that she would know because she has never had a blood clot. It could be psychosomatic and all working in her head. It started the last 2 days when she woke up, she felt fine and as she was lying in bed, she started feeling a sharp throbbing pain that eventually goes away. She has no swelling of her legs or thighs, and her daughter said it looks fine. She is semi-terrified of hearing bad news. It takes her longer to go to the hospital. If she starts feeling worse, she will be there in no time. She does not want to wait until it is worse, but she does not want to spook herself into going. She suffers from anxiety. She definitely had the fever not like she was just tired it was like she was exhausted. She got up early and would take a little nap because she was doing a bunch of stuff. That hasn't happened, but that's her. It will be 2300 when she goes to sleep. She was doing a bunch of stuff and felt like she just needed to take a nap. Maybe it is part of that too, but usually she doesn't feel tired like this. After her daughter left, she read something on her phone and passed out. When she woke up, she saw she actually dropped her phone. Her thigh is now not a pinch but more a little bit of a muscle pain. Now it is not like the inner thigh, it is more behind the thigh now, but not below the knee, right behind the thigh, closest to the knee but not on the knee. It is the same thing as if the middle had gone behind her thigh a bit. The little pillow on her chair is not helping anything either. It feels like it maybe muscular, its deep feeling. It feels like it could be muscle, if she rubs it, she can feel it. When asked has it improved persisted or worsened, caller states it is there, but it is dull. She can say there is pain, but it is a little duller just because it is more in the muscle. It is hard to explain, it was not the same throbbing pain but there is a dull pain, it goes around the chunkier part of her thigh, like the inner thigh. When she rubs it there is pain but a dull pain. When she rubs it, it feels better but she can still feel the site where it hurts. When she rubs it, it is still located right in the lower middle going toward her knee but not at the knee, maybe

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

3 to 4 inches away from the fold of her knee, almost at the center of her thigh almost. Almost like a dull muscle ache, there is a bit of throbbing with it. She will go to the doctor if something weird happens and will call back when they have an idea of what happened to her. This will sound crazy. The next thing she felt was a light throbbing where her belly button is but more to the left side, but not at the belly button. It was like at her stomach, not right at the belly button but right on the same line as her belly button but more at her waist. It was a small throbbing started today about an hour ago. She is hoping it is gas. Her fever went away pretty fast. She was on the phone and took her temperature to tell what it was. The woman said to take some Tylenol. It went from 99.9 to 100 to 100.3. She thought oh no. That was the highest she saw. Then eventually it started going down to 99.4, and then by morning it was back to normal. She only took Tylenol the one time. She is thinking maybe it is from being nervous and causing her body to heat up. She doesn't know she is just thinking. She thinks the fever went away the same day within an hour to 2 hours. She also wasn't drinking enough water. When asked if her fever has recovered completely or with last effects, caller states that is fine now, her temperature today was 99.4 without the fan on, she says she thinks that was pretty normal. When she first wakes up it is 97.9 usually. There was also a 98.4. The redness and itching at the injection site started 3 hours after the injection. She took her 2 sons with her. She took it and then her son took it. They said to wait 15 minutes. As soon as she stepped out, she looked up and felt so dizzy. It looks like when in summer and it seems to be boiling hot, that is how it got for her. Things got blurry. It was not like she was going to black out, but she had to close her eyes because the room was going to spin. She knocked back on the door and took a seat, so she sat down because she was not feeling right. When she gets nervous, she chews gum as a coping mechanism. Her son got some gum for her. She felt better but kind of nervous waiting for 15 minutes to go by, what if she felt dizzy again. She let 20 minutes go by and she got up and was fine. She wanted to be out of there and in the cool air outside. That is the first reaction that she had. She is one of those people that feel so nervous she is sure that happens that they feel like, oh they are so nervous, and they read so

| | | | | | | | much, and it is in our faces everyday no matter what. Maybe it had nothing to do with the injection, maybe more that she was so nervous, but it was a weird sensation after. She knows when people first started getting the COVID vaccine, people were just like falling to the ground, she was like that would be terrible. She went with high expectations and was also nervous. Her heart was beating, and she could hear her own heartbeat. She still feels tired and like she can go take a nap now. She asks if that is normal. She would rather talk to Medical Information now. She is over this statistics part of it. She doesn't feel a release, she is just giving her information and she doesn't feel any better. Outcome of the event throbbing sensation to the left side of her belly button/It was like at her stomach was not recovered; of the event dizzy was recovered; of the events the injection was large, red, hot, and itchy/ the swelling went down, tiredness was recovering; of the other events was unknown. Information about lot/batch number has been requested. |

| 1302212 | 5/10/2021 | NY | 44 | F | 5/7/2021 | 5/7/2021 | Chills and fever began about 8 hrs after second shot on Friday afternoon. Normal baseline temp is 97 - temp was up to 101.5 overnight/early Saturday morning. Symptoms predominantly fever and fatigue all day Saturday, with temp hovering around 100.7-101.5 during the day. I expected symptoms like this based on others' experiences. The reason I am reporting is that I briefly passed out right around the 24 hour mark. I had eaten very little (a banana and two eggs that morning) but was drinking a fair amount of fluids, and had basically slept most of the day. Around 1:30PM, I woke up, took my temperature, and was surprised to see it read 101.5 - I felt cooler or at least I felt less uncomfortably warm than I had when it read higher. I got up, reheated some soup, and just as I was pouring it in the bowl, was hit with an overwhelming wave of nausea and dizziness such that I thought I wouldn't make it to the bathroom. En route, I bumped into a piece of furniture with my right arm. I remember grabbing my arm and the next thing I knew, I was lying on the hallway floor. I must have slid down somehow, because I didn't have any head pain or bump to the head - and managed to get to the bathroom. After a time, the nausea passed without vomiting, I made it back to bed, fell asleep, and felt better enough when I woke two hours later to eat some soup. I continued to drink a lot of fluids and had a smoothie before bed. My temperature peaked at 102.3 that night before bed. Overnight Saturday, I sweat through two shirts. My temperature Sunday morning was 99.1 and I noticed some low-level "COVID rash" at my injection site before bed Sunday night. I woke this morning (Monday) at 5AM to discover I had sweat through another shirt, but my temp was finally back to 97.1. Again, I wouldn't have reported this as out of the ordinary, if I hadn't briefly passed out. I should say that Saturday (day after my shot) was also the first full day of my period. I don't know if it was fever, blood sugar, cramps, vertigo, or the virus - but that particular wave of nausea and dizziness at 24 hours was really intense. I wouldn't have reported this if I hadn't briefly passed out |
| 1302173 | 5/10/2021 | GA | 18 | F | 5/8/2021 | 5/8/2021 | Pt passed out for few minutes, had seizures like symptoms |

| 1303535 | 5/10/2021 | CT | 29 | M | 5/10/2021 | 5/10/2021 | Patient received vaccine at around 11am. After waiting around for a few minutes he stated he was light headed. I went over to observe and gave patient some water. He was starting to sweat and turned very pale. 1 minute later he passed out. I brought him to the floor from his chair and he starting shaking and 'seizing" for about 10-15 seconds. We used pressure on his chest to try to "snap" him out of it. After about 15 seconds of "seizing,not breathing normally and his left arm completely locked up" he came to and did not know where he was for about 2-3 minutes. After about that time he started to realize where he was and recognized his wife who was assisting. EMS was called and arrived shortly, He was lucid and knew where he was and started to feel normal again. EMS checked his vitals and they were normal. Patient refused to go to hospital and EMS released him to his wife. I checked on patient 4 hours later and he had no ill effects and stated he felt just like he did before receiving the vaccination. |

Patient states that this is his second vaccination in the two-dose series. Patient denies previous reaction with the first vaccination. Patient states that he fears needles. Patient was witnessed with upper arm stiffening, convulsions and syncope lasting 2-3 seconds. RNs lowered patient to the ground with legs elevated. Patient regained consciousness within seconds. Patient was not post ictal. Patient denies headache, sore throat, difficulty breathing or itch. Patient vitals (151/79 BP, 98% O2, 74 HR, 14 Resp, Glucose 125, EKG NSR). Fire rescue was called. Patient was placed in wheelchair and taken to private area where he was further assessed by the Paramedics, NP and RN. Patient was noted to be diaphoretic. Water provided and patient placed in Trendelenburg position. Fire rescue arrived. Patient refused to be transported to the ER, although it was advised by the NP. Fire rescue did not have the patient sign out AMA. AMA form provided and signed, witnessed by the NP. Patient aware of risk involved with no seeking further medical evaluation, such as worsening adverse reaction, subsequent seizures, cardiac event, MVA and/or death. Patient verbalized understanding. Patient ambulated to his car without difficulty. |

| 1302276 | 5/10/2021 | PA | 17 | M | 5/7/2021 | 5/7/2021 | Approximately 10 minutes after vaccination, patient began jerking and passed out. Patient was placed on the floor and vitals were taken which were normal. After approximately 10 minutes, patient was brought to sitting position and after a few minutes began jerking movements and felt faint. After approximately 10 minutes, patient was walked to a chair but after a few minutes he again began jerking and felt faint. Patient was returned to the floor. Parents refused transport to the hospital. Father helped patient to the car and he was placed in the back seat lying down. Father stated he may take him to the ER if he seems like he needs it. |
| 1302665 | 5/10/2021 | IN | 72 | M | 4/30/2021 | 5/1/2021 | Got up in the middle of the night and passed out. EMS called and taken to hospital. Was there for 1 week and then transferred to another hospital facility nearby. |
| 1302792 | 5/10/2021 | CA | 71 | F | 4/28/2021 | 4/28/2021 | Syncope and whole body flushing one minute after vaccine was given, lasting a couple of minutes. Patient walked upstairs to primary care provider to be monitored for 30 minutes. |
| 1302859 | 5/10/2021 | FL | 62 | F | 5/10/2021 | 5/10/2021 | Patient felt dizzy and fainting 2-3 minutes after vaccine. Her breathing was normal. Pharmacist gave her 5 ml of benadryl (12.5mg/5ml). Patient start responding within 1 min, Mean while pharmacy call 911. Paramedics arrived and check all symptoms ,BP and ECG. BP was little elevated and ECG came normal. |
| 1302872 | 5/10/2021 | FL | 17 | F | 5/10/2021 | 5/10/2021 | Dizziness, followed by brief syncope, all resolved within 2 minutes. She fell out of chair on to ground and immediately woke. Sweaty and pale, placed cool compress on back of neck and gave her a cold water to drink. She remained upright on the floor for approximately 5 minutes until she felt like she was fully recovered. Her father was present the entire time. She stated that she had no injuries or pain from falling out of chair. No rashes, bruising or bleeding observed. Mgr came over and patient's father declined to file a report for injury. |
| 1302873 | 5/10/2021 | IL | 16 | F | 5/10/2021 | 5/10/2021 | Patient had anxiety about getting the second shot and had fainted on the first dose of pfizer. After the shot the patient thought she might faint, never did. Patient was hot, anxious and then vomited. 911 was called |

| 1301105 | 5/9/2021 | NY | 24 | F | 5/9/2021 | 5/9/2021 | Patient was a walk-in COVID-19 applicant. She filled out her form and told me she's very scared of needles and has fainted in the past from getting a vaccine. I asked whether she was comfortable receive vaccine at pharmacy setting and she said she really wanted the Janssen COVID-19 vaccine to avoid getting two shots. She appeared calm and the administration of the vaccine went smoothly without any issues. During the 15 minute observation period, patient's mother and technicians alerted me she has fallen over. I quickly instructed by technician to call 911, while the other paged CODE WHITE and I rushed to the patient. Her father helped me lie her down on their back (supine) and I elevated the patient s feet onto the chair. I took of her mask to listen to make sure she was breathing and she quickly regained consciousness and looked right at me. I had her take some deep breaths for me to make sure airways were clear and helped her sit down in a chair. I asked her to stay an additional 15 minutes to ensureshe is feeling fine. She decline emergency personnel from coming to the store. She was fine and left the store after 15 minutes. I will follow up with her to make sure she's doing well on 05/10/21. |
| 1301513 | 5/9/2021 | WA | 17 | F | 5/8/2021 | 5/8/2021 | This writer received the following report: Adverse Event: Guest reports that she passed out and this was her first time. (Vital Signs: SPO2-99%, P-60) Treatment: AID called - Juice and water provided - EMT's arrived and assessed. (Vital Signs: SPO2-100%, P-60, B/P-90/54). No further treatment indicated. Outcomes: EMT's assessed no further treatment indicated and they released guest to the care of her mother. Guest and her mother were informed if this event occurs to go to the nearest emergency room and report to her PCP. |

| 1301329 | 5/9/2021 | FL | 33 | F | 5/9/2021 | 5/9/2021 | Patient was given her shot, she got up and sat down in the nearest observation chair, then immediately said she was dizzy and thought she was going to pass out. I went to her and she repeated that she was about to pass out. When her head started to roll back I was able to hold her by her shoulders. Her eyes rolled back and her head dropped back and she started convulsing. She lost consciousness for about 10 seconds. When she came to she didn't know what was happening. She was very sweaty by this time. I asked if she had a history of seizures or had ever fainted before and she answered no. EMS was called. I checked her BP and it was 84/41. The patient tried to stand to assist with finding her husband in the store but I told her she had to sit until EMS arrive. We offered her water and orange juice and she asked for both. When the husband got there we asked him if she has a history of fainting or seizures and he said this has happened multiple times, mostly as a result of seeing blood. He said she hasn't had seizures but she has had tremors when this has happened. I checked her BP again and it was 116/88. She was feeling a lot better. EMS arrived and she was stable by that point. They recommended that she go to the hospital, but patient opted not to go. |

| 1301301 | 5/9/2021 | LA | 69 | F | 4/6/2021 | 4/7/2021 | The injection site felt "achey" immediately after the injection and this discomfort lasted several hours despite my gently massaging the band-aid site. My left arm felt "heavy" for the rest of the day. Within 18 hours of vaccination, I was awoken from sleep shaking violently. I thought that someone was shaking me violently. When I realized that my body was shaking so, I wrapped myself in a comforter; then I passed out or went back to sleep. When I was aware of myself again, I was too hot wrapped in the comforter and removed it. I was very concerned about what had happened to me so I moved slowly getting up and starting my day. I live alone so there was no one to help or advise me. For the next few days, I rested often, not sleeping, just feeling the need to lay about. By week 2 after the injection, I was "dragging" but not sleeping. When I laid down, my mind roamed about, when I tried to read or engage in meaningful activities were not successful. By week 3, I have full-blown insomnia. I go to bed at 4 am to be awake for hours while in bed, then being exhausted during the day. I am normally active, but I do not have the stamina to do what I love such as mowing my own lawn and working in garden. My heart rate jumps to 122 after 10-20 minutes of activities when in the past I could work steadily for 40 minutes and my heart rate never get above 90 beat per minute (I wear a charge 2 watch that monitors exercise parameters.) I had to stop to rest up to 4 times to complete the yard work that I could normally complete in less than 40 minutes. Currently, I have "hay fever" symptoms: itchy runny nose, tickle in the throat with dry cough, tired, runny eyes and frontal headache; I take benadryl and other allergy medicines. I have poor sleep habits. |
| 1301278 | 5/9/2021 | NC | 18 | M | 5/9/2021 | 5/9/2021 | Patient had a episode of syncope around 5 minutes of receiving the vaccine. Patient quickly recovered in less than a minute and then returned to normal around 10 minutes. |

| 1299223 | 5/8/2021 | MI | 45 | M | 4/14/2021 | 4/15/2021 | nearly fainted twice; I've been having weird pains in several spots inside my muscles all over the place in my legs, feet, arms, neck, chest, face and even my left hand ring finger tip. It's pain that is in spots, it feels; I've been having weird pains in several spots inside my muscles all over the place in my legs, feet, arms, neck, chest, face and even my left hand ring finger tip. It's pain that is in spots, it feels; pains in chest; catching my breath; very cold and clammy; This is a spontaneous report from a contactable consumer (the patient). A 45-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EW0169), via an unspecified route of administration, on 14Apr2021 at 11:30 (at the age of 45-years-old) as a single dose in the left arm for COVID-19 immunization. Medical history included cardiac disorder from an unknown date and unknown if ongoing, irregular heart beat and depression from an unknown date and unknown if ongoing. Concomitant medication included metoprolol (METOPROLOL) taken for an unspecified indication, start and stop date were not reported. The patient did not have any other vaccines within four weeks prior to the vaccination. The patient stated that when he first got the shot he actually nearly fainted twice and had to lay on the floor for a while. It was very scary, he thought he was going to die. He got very cold and clammy and had pains in chest and had a hard time catching his breath. They checked his vital signs a couple times and said they looked good. But he still felt sick and they said if he did not feel better soon they may have to call for an ambulance for him. Eventually he felt better enough to where he was able to get up off the floor and on handicap cart to drive out of there. Also, he's been having weird pains in several spots inside his muscles all over the place in his legs, feet, arms, neck, chest, face and even his left hand ring finger tip. It's pain that is in spots, it feels like mini-charley-horses that lasts anywhere from 20 something to 30 something seconds. Now it's mostly continuous pains in his thigh muscles between his legs. And a pain in one spot in his left arm bicep. This has been happening for days." The patient experienced "nearly fainted twice" on 15Apr2021 with outcome of not recovered, chest pain, got very cold and clammy and had a hard time catching his breath on 15Apr2021 with outcome of not recovered. He also |

| 1299280 | 5/8/2021 | WA | 59 | F | 4/22/2021 | 4/1/2021 | little heart palpitations; felt really warm; felt like she was on fire; Nauseous; she was white as a ghost; felt cold; Dizzy; bruised her tailbone; Passed out; from when she fell she has a knot on the back of her head, and her back has a kink; from when she fell she has a knot on the back of her head, and her back has a kink; This is a spontaneous report from a contactable consumer (patient). A 59-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) dose 1 via an unspecified route of administration, administered in left arm on 22Apr2021 17:36 (Lot Number: EW0161) (at age 59 years old) as single dose for covid-19 immunisation. Medical history included diabetic from an unknown date and unknown if ongoing diagnosed in 2001-2002. The patient's concomitant medications were not reported. She did not get any other vaccinations yesterday or in the last four weeks. She says she has started no other new meds recently. The patient stated she got her first dose on 22Apr2021 and was perfectly fine, she didn't feel anything. She says when she went to bed a few hours later, she felt really really warm like she was sunburnt or something. She says she slept, then woke up around midnight and got up and thought maybe she had to go to the bathroom. She says she felt nauseous and thought she was going to be sick so she went back to the bathroom and she was white as a ghost, and felt cold and dizzy. She says she was feeling like she was gonna pass out, so she thought her sugar levels had dropped really low, so she went downstairs to check them then woke up on the floor, she had passed out. She says she came to, and checked her sugar and it was normal, 110, so she is assuming she passed out due to the shot. She says her first dose was injected around 17:36, and it was a few hours later when she went to bed around 09:00-9:30PM and got into bed when she kind of felt like she was on fire. She says she did no treatment; she went to sleep. She says from when she fell she has a knot on the back of her head, and her back has a kink in it. She says she is sure she has also bruised her tailbone. As of 23Apr2021, she doesn't feel warm or anything now, she just has little heart palpitations that is all, and those have stayed about the same. Outcome of the events was unknown. |

A 59-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot number: ER8730, NDC number: Unknown, Expiration date: Unknown), via an unspecified route of administration in left arm on 12Apr2021 at 09:30 (at the age of 59-year-old) as a single dose for COVID-19 immunisation and asthmatic. The patient's medical history included rheumatoid arthritis (diagnosed three months ago), sleep disorder, blood pressure, blood pressure increased, PTSD (post-traumatic stress disorder). Patient's medical history (including any illness at time of vaccination) was none. Concomitant medications included trazodone (Strength: 25 mg) orally taking for years at 25 mg, once a day for sleep disorder, losartan (Strength: 25 mg) orally taking for 4 years at 25 mg, once a day for blood pressure, acetylsalicylic acid (ASPIRIN) orally taking for 4 years 81 mg, once a day for blood pressure increased, hydroxychloroquine (Strength: 200mg) orally taking for two months at 200 mg, once a day for rheumatoid arthritis, leflunomide (Strength: 10 mg) orally taking for two months at 10 mg, once a day, sertraline orally taking for 4 years at 50 mg, once a day for PTSD (post-traumatic stress disorder); All ongoing. The patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot number: EN6206, NDC number: Unknown, Expiration date: Unknown), on 22Mar2021 at 15:30 as a single dose in left arm for COVID-19 Immunization and asthmatic. Family history was none. Prior vaccinations (within 4 weeks) was none. No additional vaccines administered on same date of the Pfizer suspect. On 14Apr2021 she reports developing a headache that has been ongoing since then, 14-16 days total. She also reports fatigue. She has been seen by doctors and had CT scans and bloodwork, the doctors think it was a stress/fatigue headache. Caller indicated she didn't think the symptoms were vaccine related but wants to rule everything out. Enquired what information do we have for duration of headache after vaccination. Caller indicated she had already spoken to a nurse with safety. Caller</p> |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

was a 59-year-old female reporting a headache that started 2 days after her second dose of the Pfizer COVID-19 vaccine, with symptoms that have been ongoing for 14-16 days. Response: Provided information from fact sheet that 55.1% of patients reported headache in the clinical trials, and that data was coming from the 7 days after either dose. Enquired how long side effects last. Which states adverse events typically start 1-2 days after vaccination and resolve shortly thereafter; Also spoke from CDC data which indicates adverse events might be more intense after the second dose. Referred back to healthcare professional for additional assessment and treatment. Consumer calling regarding the Pfizer COVID-19 vaccine. Reports she got the second shot 12Apr2021 and a couple of days later she got pressure in her head that has turned into a major headache. States and it has been a major headache. Reports she has been to the emergency room and her primary care doctor. Adds she had a CT scan, and bloodwork till she looks like a pin cushion, and everything was coming back fine. Adds she was tired all the time and could not get rid of the headache. Her question; Mentions she was looking at the side effects and saw tiredness and headaches a couple of days after; but enquired have we had any complaints about them lasting so long. Clarified she received the second dose of the Pfizer COVID-19 vaccine on 12Apr2021 at 09:30 AM in the left arm. A couple of day later the headache started; and the tiredness started at the same time. Tiredness was reported as worsened. She got the shot at PRIVACY. Adds she has missed two weeks of work and she could sleep 24 hours a day if the headache would let her. Adds she was 60 years old and takes a lot of medication; she tries not. Primary/prescriber: States the rank was major; she thinks her doctor was on maternity leave; Product: Pfizer COVID-19 vaccine; treatment first dose of the vaccine 22Mar2021 at 15:30 PM in the left arm. Lot EN6206; provides lot number for both doses from vaccination card but does not see NDC, expiration date or dose. This past Sunday the headache got so bad that she passed out in her living room and her 72-year-old husband called 911. She was taken to the (PRIVACY) Hospital and they did the CT scan and the blood work that was normal. She went home and tried to go to work on Monday and that only lasted 3 hours. No investigation assessment. No

Still has difficulty focusing; This is a spontaneous report from a contactable consumer (patient's father). A 16-year-old male patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot: ER2613 and expiry: Jul2021), via an unspecified route of administration in right arm on 31Mar2021 14:30 (at the age of 16-year-old) as single dose for covid-19 immunisation. Vaccination was taken because he was going back to school. The vaccine was not administered at a military facility. No additional vaccines administered on same date of BNT162B2 and no prior vaccinations (within 4 weeks). The patient received first dose of bnt162b2 (Lot: EN6199, Expiry: Jun2021) on 10Mar2021 at 13:30 in right arm (at the age of 16-years-old) as single dose for covid-19 immunisation and experienced loss of taste and smell and joint pain, all events started in Mar2021. Medical history included mild allergy to Birch pollen (which everybody has, but nothing else/patient tested for allergies, and had no significant allergies, they thought he might be because he spilled a sugared soda behind his bookcase in his room and there was mold growing so they thought he might be allergic to mold, so they tested for allergies and he has no allergy to mold) and ongoing vitamin supplementation. Family Medical History included Sarcoidosis with mother. Concomitant medications included vitamin d3 for vitamin supplementation from 2020 (about a year ago) and ongoing; ascorbic acid, rosa canina fruit (VITAMIN C) for vitamin supplementation from an unspecified date (several years ago) and ongoing and an unspecified ongoing multivitamin from an unspecified date (several years ago) at 1 taken daily for vitamin supplementation. On 31Mar2021, the patient experienced pain in the arm at 17:30, tiredness at 20:30, shortness of breath, |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

headache at 22:30 and muscle pain at 22:30. On 01Apr2021, the patient experienced fever at 00:30, chills at 01:30, redness at 02:30, leg pain at 08:30, fatigue (ongoing) at 02:30, joint pain at 08:30, too sick to get out of bed and passed out and hit the floor, put a big bump on his head at 05:30 (about 15 hours after second dose, patient was at the kitchen table with his head between his knees trying to breathe, passed out, hit the floor and put a big bump on his head). On 02Apr2021, the patient experienced brain fog at 14:30, swelling at 14:30, swollen glands at 02:30, loss of taste and smell to some extent at 14:30 and too sick to get out of bed. On day 2 (02Apr2021) and was still about pushing 100 degrees Fahrenheit and on 21Apr2021 (after 21 days) sometimes over sometimes less. On the following Monday (05Apr2021), he struggled back to school after 5 days, but came home early. He has just been trashed, too trashed to train for his sport, further described as too weak to train, he hadn't trained for 3 weeks. He still has a fever. His local doctor did not have any suggestions other than he should take acetaminophen and ibuprofen alternately to get rid of the headache and fever. In 2021, the patient experienced 2-inch diameter raised circle at injection site and disappeared after 10 days and there was a time he could not barely remember his name, tried to study but just wasn't there, head on desk. Still has difficulty focusing and doing his calculus. It was reported that the time to recover from any exertion seems to be longer by a lot. On 01Apr2021, body temperature reached 103 degrees Fahrenheit. The patient tried to do a few things like a week ago just because he couldn't stand to be in the house anymore he took a bike out for about 15 minutes and was just trashed from that experience and took 3 days to recover. The events did not require emergency room visit nor physician's office neither hospitalized. The outcome was recovered from loss of consciousness, head injury on 01Apr2021; from illness on 02Apr2021; from headache on 04Apr2021; from chills on 06Apr2021; from pain in arm and fatigue on 07Apr2021; from erythema on 11Apr2021; from ageusia and anosmia on 14Apr2021; from lymphadenopathy on 16Apr2021; from arthralgia on 17Apr2021; from myalgia on 18Apr2021; from leg pain on 21Apr2021; from vaccination site swelling in 2021; then recovered with sequel from dyspnoea on 05Apr2021

| 1298904 | 5/8/2021 | MI | 73 | F | 2/1/2021 | | <p>Passed out 3 times after Moderna vaccine; hair thinning; dry skin and nose; dry skin and nose; muscle spasm in back; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of LOSS OF CONSCIOUSNESS (Passed out 3 times after Moderna vaccine) in a 73-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Co-suspect product included non-company product PALBOCICLIB (IBRANCE) for Breast cancer. Concurrent medical conditions included Breast cancer, Acute cystitis, Anxiety, Lipid metabolism disorder NOS, Unspecified disorder of thyroid, Dizziness, Giddiness, Hyperlipidemia, Hypokalemia, Pure hypercholesterolemia, Thyrotoxicosis, Acquired hypothyroidism, Urinary tract infection, Drug allergy (Allergy to Amoxicillin), Drug allergy (Allergy to Sulfa) and Drug allergy (Allergy to Penicillin.). Concomitant products included DOCOSANOL (ABREVA), ANASTROZOLE, ATORVASTATIN CALCIUM, CALCIUM CARBONATE, COLECALCIFEROL (CALTRATE +VIT.D), MECLIZINE HCL, PROCHLORPERAZINE MALEATE, ZOLEDRONIC ACID MONOHYDRATE (ZOMETA) and LEVOTHYROXINE SODIUM (SYNTHYROID) for an unknown indication. In February 2021, the patient started PALBOCICLIB (IBRANCE) (unknown route) 125 milligram. On an unknown date, the patient received dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On an unknown date, the patient experienced LOSS OF CONSCIOUSNESS (Passed out 3 times after Moderna vaccine) (seriousness criterion medically significant), ALOPECIA (hair thinning), DRY SKIN (dry skin and nose), NASAL DRYNESS (dry skin and nose) and MUSCLE SPASMS (muscle spasm in back). At the time of the report, LOSS OF CONSCIOUSNESS (Passed out 3 times after Moderna vaccine), ALOPECIA (hair thinning), DRY SKIN (dry skin and nose), NASAL DRYNESS (dry skin and nose) and MUSCLE SPASMS (muscle spasm in back) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. The patient reported that the co-suspect drug Ibrance (palbociclib) was taken once daily for 21 days. The patient reported</p> |

| 1299340 | 5/8/2021 | MD | | F | 4/8/2021 | 4/16/2021 | This is a spontaneous report from a contactable other hcp (registered nurse). A 30-years-old adult female patient of received second dose of bnt162b2 (BNT162B2, solution for injection, Lot Number and expiry date was not reported) via an unspecified route of administration on 08Apr2021 as single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. On 16Apr2021, the patient experinced fainting and she lost consciousness and abdominal pain. Event Verbatim included, She had a fainting and she lost consciousness as one of the staff reporter was asking her question that fainting event occurred on Friday April 16th and so reporter was asking her if she has Vaccinated and she has received her second Pfizer vaccination on prior Thursday which was on April 8th so it was of Pfizer. reporter wish if had more information to provide you. She was taken by ambulance and reporter found out about her six hours later occurred at 9hr in the morning and reporter found out about that by clinical manager that she is in surgery for two hours, So reprter found out that she has an emergency surgery. Reporter was told an identifiable drug identifiable patient and identifiable reaction, So unfortunately, They would not tell me what precipitated the emergency surgery. So reporter know that it's not a lot information but reporter wanted to report it with all the information. Reporter said that morning was that she fainted had a lost consciousness and she said that she has had prior episodes of something that as prior has affected, may be related to food although they tested her and could not figured out what food it was. She was complaining of severe abdominal pain and when EMT scan was done, she said she did want to go to the hospital and like, reporter said all reporter knew 6hrs later that the clinical manager said that she has been in surgery for two hours and that did occur. That reporter do not know. The outcome of the events was unknown. Follow up attempts needed. Further information is expected.; Sender's Comments: Based on the current limited available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events cannot be totally excluded/assessed. The case will be reassessed if additional information becomes available. The impact of |

this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

I got super nauseous.; I really wasn't feeling well; Then I got super hot and sweaty; Then I got super hot and sweaty; I passed out.; I had a fever of up to 103.5; This is a spontaneous report from a contactable consumer (patient). A 23-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), via an unspecified route of administration, administered in right arm on 21Apr2021 08:45 (Batch/Lot number was not reported) (at the age of 23 years old) as single dose for COVID-19 immunization. The patient medical history was not reported. The patient was not pregnant at the time of vaccination. Concomitant medication included ibuprofen. The patient previously took sepra and experienced allergies (known allergies); and first dose of BNT162B2 on 31Mar2021 08:45 at right arm for COVID-19 immunization. No other vaccine in four weeks. On 22Apr2021, the patient had a fever of up to 103.5 and was down to around 102 by the time of the incident (around 4:00). The patient woke up and was standing for about 3 minutes to refill water when she got super nauseous. She was making her way to the bathroom to throw up, and the next thing she knew she was on the floor. The patient was not sure how long she was passed out for though she had no reason to believe it was long. She tried to sit up, but she really wasn't feeling well, so she laid back down and closed her eyes for a bit. Then she got super hot and sweaty. Once that passed (maybe a few more minutes), she was able to check her temperature and she was down to around 101 and was able to get back to bed. No treatment for the events. No COVID prior vaccination. The patient had not been COVID tested post vaccination. The outcome of the events was recovered in Apr2021. Information about Batch/Lot number has been requested.

| 1299086 | 5/8/2021 | PA | 19 | F | 4/20/2021 | 4/20/2021 | nausea; passed out; seizure; enlarged heart; hurt knee; sore mouth; This is a spontaneous report from a contactable other HCP (patient). A 19-year-old female non-pregnant patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EP7534) via an unspecified route of administration, in the left arm on 20Apr2021 at 11:00 (at the age of 19-years-old) as a single dose for COVID-19 immunisation. Medical history was none. The patient's concomitant medications were not reported. The patient has no history of COVID-19 prior to vaccination. The patient had received other vaccines within 4 weeks prior to the COVID-19 vaccine: 2nd dose of Human papilloma virus (HPV) vaccine on 06Apr2021 in the right arm. On 20Apr2021 22:30, the patient experienced passed out, seizure, hurt knee, sore mouth, enlarged heart, and nausea. The patient reported, "I was fine all day until around 10:30 pm I went into my mothers room and she was asking me how my arm feels I told her it was fine and right after saying that she said I passed out in front of her and then I began to have a seizure for about 50 seconds and then I woke up. After waking up from the event I had a hurt knee and sore mouth as well as an enlarged heart. I have no history of seizures in the past so it was definitely scary." The patient underwent lab tests and procedures which included SARS-COV-2 test: negative on 20Apr2021. Therapeutic measures taken included anti seizure meds, fentanyl, and paracetamol (TYLENOL). The patient recovered with sequelae from the events, passed out, seizure, hurt knee, sore mouth, and enlarged heart. Outcome of nausea was unknown.; Sender's Comments: A contributory role of BNT162B2 to the reported events cannot be fully excluded based on close temporal relationship and lack of alternate explanation at this time. However, the information provided is very limited and does not allow for a complete medical assessment. Case will be reassessed if additional information is received. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and |

| 1300324 | 5/8/2021 | NY | 17 | F | 5/6/2021 | 5/6/2021 | PATIENT HAD A SYNCOPE EPISODE AROUND 5- 10 MINUTES AFTER GETTING THE INJECTION |
| 1299279 | 5/8/2021 | OR | 44 | F | 4/5/2021 | 4/5/2021 | almost passed out; Dizzy; heart started racing; Dry mouth; metal taste; hard to swallow; itchy on arm it is little bit blotchy; itchy on arm it is little bit blotchy; Migraine; This is a spontaneous report from a contactable consumer. A 44-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EW0180), dose 1 via an unspecified route of administration, administered in left arm on 05Apr2021 as single dose for covid-19 immunisation. The patient medical history was not reported. The patient had unspecified concomitant medications; unspecified allergy medicine and unspecified vitamins. On 05Apr2021, the patient experienced the following events: almost passed out, dizzy, heart started racing, dry mouth, metal taste, hard to swallow, itchy on arm it is little bit blotchy, migraine. Details were as follows: patient had a reaction after the vaccination. She got really dizzy, almost passed out. Then her heart started racing. It took about 10 minutes to go normal and then she got like a super dry mouth and a metal taste after that, elaborated as like she had penny or something in her mouth like metal. After that, it was little more hard to swallow and just started to get itchy on arm, it is little bit blotchy. Therapeutic measures were taken as a result of migraine, and included treatment with sumatriptan (MANUFACTURER UNKNOWN), at 100 mg (take half every time). The outcome of events, almost passed out, dizzy, heart started racing, dry mouth, metal taste, hard to swallow, itchy on arm it is little bit blotchy, migraine was unknown. |
| 1300395 | 5/8/2021 | MI | 16 | F | 5/7/2021 | 5/7/2021 | Patient received Pfizer vaccination at 04:55 pm. Her father accompanied her. A few minutes after receiving the vaccination, she passed out. Her father shook her arm and she became cognizant again. She did not remember passing out and has never passed out in the past. I monitored her for 30 minutes and gave her bottled water to stay hydrated. After 30 minutes she was feeling well and I observed her as she stood up. She had no further problems. |

| 1300281 | 5/8/2021 | AZ | 22 | M | 5/8/2021 | 5/8/2021 | Pt received Johnson and Johnson vaccine at about 145 pm. About 10 - 15 minutes later the pt was feeling light headed, nauseous, sweaty, and felt like he was going to faint. I attended to the patient, laid him on the ground bein case he fainted (which he did not), put his feet up, and asked him how he was feeling. The pt stated he felt better after laying down for a couple minutes and sat back up in his chair. I gave the pt the pt water and Gatorade and told the pt he would need to hang out for about 15 minutes longer. Pt stated he felt fine and 100% and requested to leave. |
| 1300235 | 5/8/2021 | NY | 16 | M | 5/4/2021 | 5/5/2021 | Child woke up at 3 am with severe nausea. Within minutes he complained about not being able to breathe. His lips turned blue and he was about to pass out. As I was able to keep him awake, I am not sure whether he would have had a febrile seizure (it very much looked like it) or just fainted. The fever spike was too fast, and his body couldn't handle it. His extreme nausea persisted for four hours (but he didn't vomit). He was completely debilitated. Fever spiked to 103 but stabilized at 102 for the following 24 hrs. |
| 1300200 | 5/8/2021 | CT | 21 | F | 5/7/2021 | 5/7/2021 | Patient fainted and hit her head on the floor. Once she came to she stated that she does faint sometimes after a vaccine. We called 911 and the ambulance responded and transported her to the hospital. I spoke with patient later in the day and she stated that she was feeling fine. |
| 1300143 | 5/8/2021 | | 43 | M | 5/8/2021 | 5/8/2021 | Syncope post vaccine with fall and head injury. Transported to trauma hosp by ambulance |
| 1300140 | 5/8/2021 | RI | 18 | M | 5/8/2021 | 5/8/2021 | Shortly after vaccine patient fainted. Came to within minutes, light headed. Rescue came, low BP. Took patient to hospital per patient request |

| 1300120 | 5/8/2021 | NY | 37 | M | 5/8/2021 | 5/8/2021 | Pt fainted right after sitting down after the vaccine was administered. I called his name and he responded and slowly sat up. He said he was feeling better, so I helped him into the chair. I sat with him for about 15 minutes and he was alert and seemed completely fine. I asked if he had ever had a problem after a vaccine, and he said that he fainted once after a vaccine more than 20 years ago. (He claimed on question 4 of the questionnaire that he had never fainted after a vaccine.) I had him call for a ride home and for someone to pick up his car. He waited another 45 minutes and left. I checked on him frequently throughout the hour he was here and he reported he was fine each time. |
| 1300084 | 5/8/2021 | IL | 28 | M | 5/8/2021 | 5/8/2021 | 28 y/o male experienced a syncopal episode approximately 10 min following janssen vaccine left deltoid. He suffered an abrasion to outer left patella. He struck to left side of his head on the floor. No signs of abrasion or swelling that area. approximately 3 minutes after syncope, he vomited. x3 h= His pupils |
| 1299976 | 5/8/2021 | FL | 27 | M | 5/8/2021 | 5/8/2021 | PATIENT FAINTED 10 MINUTES AFTER ADMINISTRATION OF COVID VACCINE. CALLED 911. EMS CAME TO PHARMACY AND EVALUATED PATIENT. PATIENT WAS NOT BROUGHT TO HOSPITAL AT THIS TIME. |

| 1300419 | 5/8/2021 | CA | 64 | F | 12/23/2020 | 12/23/2020 | This is my 7th report to VAERS and my number is 908013. I developed burning and numbness in my face and tongue as well as presyncope and high bp spike of 180/126, 30 minutes after receiving the Pfizer covid vaccine. I became severely ill after and have had persistent severe paresthesias in my face and scalp, tongue, limbs and tight constricting band around chest as well as fatigue, tremors, fasciculations, internal vibrations, dizziness, blurred vision and headaches for 19 weeks. I have seen many physicians and have been very ill. My case was presented to the CDC grand rounds and I have been evaluated by neurologists. I am on many meds and my severe agonizing paresthesia pain is better controlled now. I have been severely debilitated now for 19 weeks. |
| 1299844 | 5/8/2021 | MA | 17 | F | 4/25/2021 | 4/25/2021 | Patient had syncope event following first shot. Father was in room with pharmacist. She also stated she had no eaten anything prior. After event, she claimed this had happened prior BUT SHE DID NOT make aware that this previously occurred on form. |
| 1299511 | 5/8/2021 | OR | 16 | F | 5/7/2021 | 5/7/2021 | Systemic: Fainting / Unresponsive-Mild |
| 1299531 | 5/8/2021 | PA | 24 | M | 5/7/2021 | 5/7/2021 | Systemic: Fainting / Unresponsive-Severe, Additional Details: Patient stood from seat during his 15 minute waiting period. Syncope occurred within 5 minutes. Patient fell face first on to floor and hit shelves with left arm. Loss of consciousness for approximately 2 minutes. Lost both 2 front teeth. Bleeding from mouth and left arm laceration. Patient was escorted Hospital via ambulance upon their arrival. Patient did not recall passing out. |
| 1299538 | 5/8/2021 | IN | 35 | M | 5/7/2021 | 5/7/2021 | Systemic: Fainting / Unresponsive-Medium, Additional Details: pt has a history of fainting with needles. We do not think it was the vaccine but the needle. We did call an ambulance to check him out. |

| 1299763 | 5/8/2021 | PA | 18 | F | 5/8/2021 | 5/8/2021 | Patient was near syncope. After receiving the vaccine about 2 minutes she started getting light headed. Patient was given water and animal crackers to get. She was feeling a little better but when she turned her head she still felt lightheaded. I had her eat and drink some more water. I asked how she was feeling. She stated that she was feeling better so i had her sit the rest of the way up with her feet hanging over the bed. I asked how she was feeling. She stated that she was feeling good. I then had her stand up with me standing in front of her and asked how she was feeling. She stated that she was feeling light headed in the middle of her forehead. I had her sit back down and gave her an ice pack to put on her neck. I then asked how she was feeling and she stated that she was feeling better and while she had the ice pack on her forehead she kept eating and drinking. I then had her stand up and she stated that she was better. i took her vitals at 11:24 am heart rate 75, o2 99 and BP 115/81, again at 11:30 am heart rate 79, o2 97 and BP 117/82. I released her to go home with her mom and dad at 11:41. |

A 29-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) (lot number ER8735/expiration date: not provided), via an unspecified route of administration, on 20Apr2021 at 08:30 (at the age of 29 years old) as a single dose in the left arm for COVID-19 IMMUNIZATION. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) (lot number /expiration date: not provided), via an unspecified route of administration, on 04Jan2021 at 12:00 (at the age of 29 years old) as a single dose in the left arm for COVID-19 IMMUNIZATION. Relevant medical history included was not provided. The patient did not have any known allergies to medications, food, or other products. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medication included melatonin, fish oil, calcium. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 21Apr2021 at 02:00, the patient fainted, experienced aches, headache, fever, nauseous, excessively sweating, and heartrate was elevated to about 90 bpm vs resting heartrate of 60 and remained elevated for the next 12 hours. The patient went to the emergency room due to the events and received treatment for these events which included fluids. The clinical course was as follows: after experiencing expected side effects (aches, headache, fever), the patient got up to use the restroom in the middle of the night. About 1-2 minutes after getting up, he fainted. The patient awoke shortly after on the floor and felt nauseous and was excessively sweating. His heartrate was elevated to about 90 bpm vs resting heartrate of 60 and remained elevated for the next 12 hours. The outcome of the events was recovering. Since the vaccination, the patient had been tested for COVID-19 (saliva test) on 20Apr2021, and the result was negative. |

| 1294709 | 5/7/2021 | AR | 47 | M | 3/16/2021 | 3/16/2021 | Guillain Barre syndrome; Doesn't feel from his waist down on left side; Doesn't feel from his waist down on right side; Weakness on right side; Weakness on left side; Passed out; High blood pressure; Lost hearing on right side; Headache; Fever; Pain in back; Pain in neck that went up to his head; This is a spontaneous report from a contactable consumer. A 47-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) via an unspecified route of administration on 16Mar2021 at 15:00 or 15:10 (at the age of 47-years-old) as a single dose in the right arm for COVID-19 immunization. Medical history was reported as none. It was reported that the patient had no pre-existing conditions and was "100% healthy and normally ran every day for 2-3 miles." Concomitant medications were reported as none. The patient did not receive any other vaccines within 4 weeks prior to the COVID-19 vaccination. The patient did not have a history of adverse events that followed prior vaccinations. The patient previously received the flu shot in Sep2020 (at the age of 47-years-old) for immunization and experienced no side effects. It was reported that the patient received a flu shot every year and experienced no side effects. On 16Mar2021 the patient experienced fever, pain in back and pain in neck that went up to his head; on 17Mar2021 the patient experienced headache; on 18Mar2021 the patient experienced does not feel from his waist down on left side, does not feel from his waist down on right side, weakness on right side, weakness on left side, passed out and on unspecified dates the patient experienced Guillain Barre syndrome, lost hearing on right side and high blood pressure. The events does not feel from his waist down on left side, does not feel from his waist down on right side, weakness on right side, weakness of left side and passed out (911 was called) required an emergency room visit; does not feel from his waist down on left side, does not feel from his waist down on right side, weakness on right side, weakness on left side and Guillain Barre syndrome also required a physician office visit. The patient was hospitalized for the events passed out, does not feel from his waist down on left side, does not feel from his waist down on right side, Guillain Barre syndrome, weakness of right side and weakness of left side from 18Mar2021 to 08Apr2021 (also reported as "for 22 days"). The reporter (friend of |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

the patient) called to file a report for his friend, who did not speak any English. The reporter wanted to make Pfizer aware of the adverse event that the patient experienced. The reporter stated that the hospital staff stated that they reported the patient's adverse event to Pfizer, the local health department and the CDC, but the patient's family and friends were not sure if the report was filed, thus the reporter was calling. The clinical course was reported as follows: "6-7 hours after getting home from getting the vaccine on 16Mar2021, the patient started to feel fever, pain in his back, and pain in his neck that went up to his head. The hospital had given the patient Tylenol and the hospital staff informed the patient that if he felt a fever or pain after the COVID-19 vaccine, he should take the Tylenol. The hospital staff also informed the patient that if his symptoms got worse to call 911 and go to the emergency room. The patient took the Tylenol and his fever came down a bit and the patient went to sleep. On the next day, 17Mar2021, the patient's neck pain started going up more like a headache. On the morning of Thursday, 18Mar2021, the patient got weak. The patient could barely move his hand or neck or leg. After the weakness began, "it was like 1-2-3" and the patient was passed out. After the patient passed out, 911 was called and when emergency personnel arrived, the emergency personnel thought that the patient had had a stroke. When the patient woke up on 18Mar2021, the patient was unable to feel from the waist to all the way down. The medical staff at the hospital did a lot of testing on the patient, MRIs and all that stuff, and all of the test results were coming back negative. The medical staff took some fluid from the patient's back after the patient was in the hospital for 2-3 days. The results came back negative until 2 weeks later when the patient's friends and family were informed that the patient had Guillain-Barre Syndrome. The patient's left side got a little improvement with medicine, but the patient's right side did not get any improvement." The patient's fever was treated for the first few days while hospitalized, the patient no longer had a fever. The patient was also treated for high blood pressure for the first few days that he was hospitalized. The reporter was informed of the patient's hearing loss "after the patient started speaking good, about 3-4 days after the patient had the first dose of the COVID-19 vaccine on 16Mar2021. The patient was

|---------|----------|----|----|---|--|--|---|
| | | | | | <p>losing hearing before that, but the patient was not able to talk to the caller or family a lot." (as reported). The reporter did not provide details on medications administered during the patient's hospital stay. The reporter stated that the patient was just discharged from the hospital and sent home. The reported believed that the patient needed more care and more medicine and that he was not finished with treatment. The reporter stated that the patient should have been back to normal health before having been discharged from the hospital. He did not know why the patient was discharged. The reporter stated that the patient was sent home without any medicine and was still experiencing daily headaches. The patient took Advil Migraine for his headaches which did not work, or only worked for 10 minutes and then the pain would come back. The hospital referred the patient to a different facility. The reporter stated that the patient could not get an appointment with this facility for up to 2 months from now. The patient could not wait 2 months for relief. He could not be like that with a headache and no feeling on his right side for 2 months. According to a different doctor the patient needed "more IVIG, immunoglobulin and needed to get attention from a neurologist to watch him until he got better." The patient had an appointment scheduled with a neurologist for Monday 26Apr2021 at 08:00. The clinical outcome of the event fever was recovered/resolved on an unspecified date; does not feel from his waist down on left side and weakness on left side were recovering/resolving; does not feel from his waist down on right side, weakness on right side, lost hearing on right side, pain in back, pain in neck that went up to his head and headache were not recovered/not resolved and passed out, Guillain Barre syndrome and high blood pressure were unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up</p> | | |

| 1295509 | 5/7/2021 | TX | 16 | F | 4/10/2021 | 4/14/2021 | My 16-year-old daughter, very healthy without any health conditions, got her first dose of the Pfizer vaccine on Saturday evening, April 10th, at around 5pm. On Wednesday, she started complaining of shortness of breath, chest pains, which she described as a feeling of someone stubbing her heart. By Thursday, she began blacking out repeatedly throughout the day, each blackout lasting about a minute. These progressed and whenever she blacked out, she would not remember what happened. At first, she and I brushed it off as maybe lack of calcium since she rarely drinks milk. But as they intensified, I began to become more concerned. I told her I cannot leave her by herself in the house as I prepared to go pick up her young siblings from school then schedule an appointment with her doctor. On our way back home, she blacked out again, however, it was for more than a minute. Straight away, I drove to the ER close by. The doctor came back to inform me that her heartbeat was irregular and concerning based on her age. In that same moment, she began complaining of excessive pain like someone punching her heart out, and then she passed out again. Still with my two other children, the whole ordeal began to frighten them and illicit some heavy tears. Being that this ER was general admission, the doctors insisted they call in the paramedics to transport her to another ER for children. However, after being transported to the other ER, her condition began to intensify rather quickly and the pediatric doctor at the second ER informed us we would have to be transferred to Childrens intensive care unit where the cardiologists could check her heart, find the ultimate cause, and monitor her closely. In that moment, as a mother, I was speechless and extremely terrified. Seeing my daughter being transferred from ER to ER, made it even tougher on me so much that I could no longer hold myself together. Here she was in terrible pain and being moved around with no clear diagnosis and treatment. From there on, we spent a couple days in the Cardiac ICU waiting and praying with friends for answers and the best treatment she could get to ease the pain. By about the third day of being in the ICU, the cardiologists informed me, she had Acute Myocarditis. This was so shocking in a sense that both sides of the family have no history of heart issues. Secondly, she is a very healthy child. |

| 1298008 | 5/7/2021 | AZ | 24 | F | 5/7/2021 | 5/7/2021 | patient fainted as soon as I administered the vaccine to her. she did not fall because she was leaning against her friend. I offered to put her on the floor but she declined. she put her head between her knees and got her consciousness right back. EMT was called but pt told her she was fine and no assessment was done. |
| 1297599 | 5/7/2021 | OR | 16 | F | 5/7/2021 | 5/7/2021 | 16yoF was accompanied with an adult who was present for the vaccination. The COVID-19 Vaccine Pfizer-BioNTech 0.3mL administered IM in right deltoid while patient was sitting. Patient remained sitting for 10 minutes after administered dose. Patient reported feeling well after the injection. Patient stood up while we continued to talk, after 2 more minutes passed out while standing. Suddenly, patient began to go limp and her eyes crossed and rolled back. Patient fell backwards into the privacy curtain and into aisle 13 of the store. Patient's head bounced off the floor. Immunizer knelt next to patient. Patient was unresponsive until immunizer placed cold hand on back of neck and front of chest to check if she was breathing, immunizer calmly guided patient to breath, slow deep breaths into the belly and patient's eyes fluttered open. She said her head hurt really bad. Immunizer offered to the accompanying adult to call EMS because patient should be evaluated after hitting her head so hard. The accompanying adult denied EMS, then stating that patient had previously fainted while walking and said that she would be fine. Immunizer advised patient to remain laying down while immunizer got some ice. Ice was then placed on the back of the head. Patient slowly stood up after laying for 10 minutes and was walked over to a sitting area to put feet up and continue with ice for another 5 minutes before the accomanying adult wanted to leave. |

| 1297330 | 5/7/2021 | MO | 16 | M | 5/7/2021 | 5/7/2021 | Patient had no issues with 1st shot. After 5 minutes of injection pt fainted. He revived right away but pupils were dilated and he had trouble staying conscious. After a few more minutes pupils were normal but he was pale and sweaty. He drank some water and felt better. EMS were called and said he was ok. All happened within 30 minutes. |
| 1296970 | 5/7/2021 | GA | 42 | F | 4/15/2021 | 5/1/2021 | Passed out on May 1 2021 admitted into hospital with saddle bag pe and dvt |
| 1296554 | 5/7/2021 | IL | 30 | M | 5/7/2021 | 5/7/2021 | Pt had near syncopal episode following vaccine. Pt states "he has fainted around needles in the past" Vitals taken, hypotensive, reassessed pt after 5 minutes to find vitals WNL. Refused transport to hospital |
| 1296509 | 5/7/2021 | ME | 17 | M | 5/7/2021 | 5/7/2021 | Patient describes his experience as a "loss of vision" shortly followed by "blinking out" and dropping his phone. Patients in the observation area noticed him fainting and called pharmacy staff over to the location. Patient experienced no issues breathing nor experienced any swelling. Patient describes quickly feeling better, though pulse showed 60 BPM once EMS arrived. |
| 1296455 | 5/7/2021 | MI | 22 | F | 5/7/2021 | 5/7/2021 | Patient got warm was sweating fainted temporarily lost eyesight |
| 1296404 | 5/7/2021 | NY | 23 | M | 5/7/2021 | 5/7/2021 | The patient after receiving his vaccine, was recommended to take a seat for 15 minutes to observe for any adverse reactions. Very shortly after the shot, he walked up to the counsel window to ask for a bottled water because he was starting to feel faint. As I was trying to suggest he immediately take a seat, he fainted and fell forward into the immunization booth which absorbed most of his fall as he went to the ground and landed almost sitting cross legged. Immediately myself and pharmacy staff laid him flat onto his back and raised his legs above his head where he regained consciousness immediately and stayed laying down for a period of time to make sure he was feeling okay. After a few minutes we gave him a bottled water and had him sit down for 15 more minutes where he claimed he was feeling much better. |

| 1296340 | 5/7/2021 | UT | 16 | M | 5/7/2021 | 5/7/2021 | syncope - pallor, nausea, sweating, Had pt sit on floor and remove mask, gave water & stay for 30 min. Checked BP wnl before he left, with someone else driving. |
| 1296184 | 5/7/2021 | MI | 45 | M | 5/6/2021 | 5/6/2021 | Before receiving the vaccination the patient mentioned he had a fear of needles. Patient was asked if he ever fainted after getting a vaccination or injection and patient reported no. The vaccine was administered to the patient and patient appeared to be fine for the next few minutes after getting vaccinated. Patient was told he could take a seat in the waiting area and wait until his 15-minutes were up and he could go. Patient was seated in the waiting area for about a minute but then got up to walk down one of the isles. When walking down the isle patient fainted and collapsed. This occurred approximately 10 minutes or so after he received the vaccine. Patient was helped to a chair and once seated appeared to shake/convulse (almost like a seizure) for approximately 5-10 seconds before snapping out of it and regaining consciousness. Afterwards he was alert and talking but didn't remember fainting. 911 was called and he was checked out by paramedics. After observing him for 15 minutes or so and determining his heartrate and blood pressure were normal and he appeared to be ok, the paramedics told him they can take him to the hospital to be evaluated further, or he was free to leave on his own without going to the hospital. The patient said he felt fine and declined being taken to the hospital. After another 10-15 minutes the patient left under his own power. Patient mentioned he would possibly be calling his physician and alerting them to the episode. |

| 1291567 | 5/6/2021 | AR | 87 | F | 1/22/2021 | 1/22/2021 | patient was unconscious; patient was unconscious; UTI; Bedridden; Patient began to vomit; This case was received via FDA VAERS (Reference number: 0967119) on 27-Apr-2021 and was forwarded to Moderna on 27-Apr-2021. This regulatory authority case was reported by an other health care professional (subsequently medically confirmed) and describes the occurrence of LOSS OF CONSCIOUSNESS (patient was unconscious) and SYNCOPE (patient was unconscious) in an 87-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 029L20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Penicillin allergy, Syncope (granddaughter states patient has episodes of syncope) and Wheelchair user. On 22-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 22-Jan-2021, the patient experienced LOSS OF CONSCIOUSNESS (patient was unconscious) (seriousness criterion medically significant) and SYNCOPE (patient was unconscious) (seriousness criterion medically significant). 22-Jan-2021, the patient experienced URINARY TRACT INFECTION (UTI), BEDRIDDEN (Bedridden) and VOMITING (Patient began to vomit). At the time of the report, LOSS OF CONSCIOUSNESS (patient was unconscious) and SYNCOPE (patient was unconscious) had resolved and URINARY TRACT INFECTION (UTI), BEDRIDDEN (Bedridden) and VOMITING (Patient began to vomit) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. After administration, the patient remained in waiting area for the recommended 15 minutes observation time. Approximately 20 minutes after vaccination, patient was unconscious and appeared not to be breathing, but pulse was palpable. Pharmacist administered 1 dose of 0.3mg epinephrine via epi-pen into patient's left thigh. The patient quickly regained consciousness, spoke to family, said she did not feel well. Emergency medical services (ems) arrived. The patient began to vomit, was placed on stretcher and left with ems. A few hours later the granddaughter reported |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

that the patient had a urinary tract infection (UTI) and physical exam by emergency room (ER) attributed her experience to untreated infection.; Sender's Comments: Based on the information provided which includes a strong temporal association between the use of mRNA-1273 vaccine and onset of the reported events, a causal relationship cannot be excluded. Vomiting is consistent with event safety profile.

DIARRHOEA (severe non-stop diarrhea since the day she got her vaccine) had not resolved. Not Provided
The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. No concomitant medications were reported. Treatment medications include Pepto-Bismol (bismuth subsalicylate) for diarrhea for 1.5 days (unknown dose/frequency). Patient waited out 20 minutes post-vaccination and then went to the bathroom. When she came out of bathroom she fainted, paramedics were summoned. Mother took patient to Emergency Room(ER) 20 April 2021, after taking her first to urgent care (who directed mother to take patient to the ER), ER sent her home saying it was just a little stomach bug, but no one else in the family got this "bug". Patient's last test for Covid-19 was on Monday (26-Apr-2021) and results came back negative on 28-Apr-2021. Company comment: The event of faeces discolored is assessed as unlikely due to mRNA-1273 administration but due ingesting Pepto-Bismol. Based on the current available information and temporal association between the use of the product and the start date of the other events, a causal relationship cannot be excluded. Pyrexia and nausea are consistent with the product established safety profile.; Sender's Comments: The event of faeces discolored is assessed as unlikely due to mRNA-1273 administration but due ingesting Pepto-Bismol. Based on the current available information and temporal association between the use of the product and the start date of the other events, a causal relationship cannot be excluded. Pyrexia and nausea are consistent with the product established safety profile.

The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 26-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 26-Apr-2021, the patient experienced SEIZURE (thinks it was a potential seizure) (seriousness criterion medically significant), PRESYNCOPE (vasovagal effect from the needle) (seriousness criterion medically significant), MUSCULOSKELETAL STIFFNESS (Patient fell off the bench onto the floor and became rigid and stiff and exhibited some rigid movement) and FALL (Patient fell off the bench onto the floor and became rigid and stiff and exhibited some rigid movement). At the time of the report, SEIZURE (thinks it was a potential seizure), PRESYNCOPE (vasovagal effect from the needle), MUSCULOSKELETAL STIFFNESS (Patient fell off the bench onto the floor and became rigid and stiff and exhibited some rigid movement) and FALL (Patient fell off the bench onto the floor and became rigid and stiff and exhibited some rigid movement) was resolving. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. Concomitant medications taken by the patient were not provided. The reporter reported that patient never had any allergic reactions to vaccines or medications before and had no past medical histories for vasovagal reactions. After receiving the vaccine, the patient waited in the pharmacy for 15 minutes - 20 minutes. The patient fell off the bench onto the floor and became rigid and stiff and exhibited some rigid movement. The patient was out of it for 15-30 seconds. |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

The reporter stated that she called 911. The patient came to, his eyes were huge, but he was aware to self and surroundings. The emergency team came, took the patient's vitals which were stable and stated the patient likely experienced a vasovagal effect from the needle. However, the reporter thinks it was a potential seizure; more than a vasovagal response. Emergency team offered no treatment. The emergency team had encouraged the patient to follow up with a doctor but the patient did not want to make a big scene. Emergency team offered no treatment for the patient. Company comment: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

| 1291852 | 5/6/2021 | NJ | 35 | F | 2/4/2021 | 2/16/2021 | Effects of vaccine were all normal during the first few days and through the first week. Had a bit of heart palpitations and fever after dose #2 - but it subsided by day 2 and i was back to normal mostly, no real issues. A week later i experienced an episode of almost-syncope in which i start falling forward in my seat and almost hit the wall in front of me and couldn't hold my head up. This has NEVER happened to me before. I did have a panic attack AFTER this because of how scared i had become of that feeling, but i recognize that and know the difference. After that i continued to experience bouts of dizziness and disequilibrium. I have almost fallen reaching for things, opening my car door, walking, etc. Several weeks later i experienced another flare up of the syncope feeling while at work where i almost fainted again and was able to regain composure and the disequilibrium sensation lasted for several days to which i sought medical help. I have been visiting a chiropractor and a physical therapist for over a month now with minor improvement. I still experience unexplained episodes that prevent me from being able to work properly or leave my home as it would be unsafe to drive or be out in case i need medical assistance. I have never experienced ANYTHING like this until i was vaccinated and three months later it is still affecting my quality of life. |

| 1293902 | 5/6/2021 | CA | 63 | M | 3/16/2021 | 3/16/2021 | Within a minute I had a hot flash that started in my calf and went through my body. In less than a minute I was lightheaded and almost passed out (or fell asleep). I beeped my horn and the nurse came right over. They took my blood pressure and it was 150 over 120. (I've never had high blood pressure before. The second reading was 140 over 110. In about 5 minutes my BP was normal 120 over 80. |
| 1294106 | 5/6/2021 | OH | 24 | F | 5/6/2021 | 5/6/2021 | In reviewing patient information, she marked she has fainted in the past from vaccines. She clarified during the pre-examination that she fainted after getting a flu shot 2 years ago. She said she has not gotten a flu shot since and she had not had one prior to that since childhood. She said he thinks she fainted because she did not wait to be monitored after her shot and left immediately. She was informed that she should wait 30 minutes after her COVID vaccine to have proper monitoring. Patient received shot at 5pm, sat out in the waiting area outside pharmacy. Pharmacist checked on patient at 5:09pm and she was slumped over against the body of her friend. Pharmacist asked if she was okay and friend said she is beginning to faint. Friend was advised to lay friend on the ground, legs elevated, and a cold compress pack was giving to apply to patient's neck and face. At 5:14pm, patient was awake and alert. She remained seated on the ground for the remainder of her 30 minutes of monitoring. Patient left alert and well. |
| 1294148 | 5/6/2021 | IN | 44 | F | 4/1/2021 | 4/11/2021 | Pt received vaccine 4/1/2021, started to feel ill 4/11/2021 thought it was allergies. Continued to current date 5/6/2021. Had 3 different occurrences where she passed out. Dates were 4/30/2021, 5/5/2021, and today 5/6/2021 which lead to current admission. Came to ER found to have saddle PE from CTA scan. Went to Cath Lab and had INARI procedur to remove clot. Sent to ICU afterwards, was found to have DVT in left leg from ultrasound, started on argatroban. Currently is still in ICU, was admitted to ICU from cath lab today. |
| 1292166 | 5/6/2021 | OH | 24 | F | 5/5/2021 | 5/5/2021 | Syncope for less than one minute and quickly regained consciousness. |

| 1291946 | 5/6/2021 | PA | 61 | M | 5/6/2021 | 5/6/2021 | Patient received first Pfizer COVID-19 vaccine. About 10 minutes after vaccine was given, patient passed out. He was diaphoretic and unconscious. At one point, he respiration rate stopped, patient had very diminished, weak carotid pulse. Epi was about to be given and patient started spontaneously breathing. Patient did not fall. Patient became conscious a few minutes later. He said he felt lightheaded and dizzy then he was out. Patient's wife said he has no allergies and not diabetic. He ate breakfast this morning. Medical response was called to bedside. Vitals were taken. Medical response transported patient to ER. As patient was getting transported, he started to go in and out of consciousness again. Patient in ER at this time. |
| 1293627 | 5/6/2021 | TN | 16 | F | 5/3/2021 | 5/4/2021 | At approximately 9 AM on the morning after receiving the second dose, the patient became dizzy at school. As she was walking to the teacher's desk, she lost consciousness and fainted, hitting her head on a desk, scraping her neck on a desk, and suffering several other minor injuries from the fall. She was immediately seen by school nurse and released to my care for the rest of the day. She rested at home and then was seen in at Walk-In Clinic to be evaluated for a concussion. On Day 2 after receiving the vaccine, the patient reported a sore throat, but no other symptoms. She was seen on the third day post-vaccine by our pediatrician's office for possible strep. She tested negative for strep and a concussion from her fainting episode was confirmed due to the lingering headache. |
| 1292542 | 5/6/2021 | WI | 27 | M | 5/5/2021 | 5/5/2021 | Patient received vaccination. While he was sitting for 15 minute post-observation he notified us that he was feeling dizzy. He also became pale and started sweating. We had patient put his head between his knees, gave him some water, and a cool, moist towel. After a few minutes patient felt much better and got his color back. He never fainted or lost consciousness. |
| 1292993 | 5/6/2021 | WA | 31 | M | 5/6/2021 | 5/6/2021 | After about 10 minutes post-injection, patient started to get really dizzy. He was helped from chair to the floor. He never fully passed out but said he has gotten dizzy after traumatic events in the past. The paramedic was already onsite and monitored him for next 15 minutes until he felt better and was stable. He left feeling fine. |

| 1292972 | 5/6/2021 | CA | 17 | F | 5/6/2021 | 5/6/2021 | Client received her second dose of the Pfizer COVID-19 vaccine (Lot #EW0179 Exp. 8/2021) at 10:03 AM. EMT saw client stand in observation area. Client appeared "unsteady on her feet". EMT rushed to patient and guided her slowly to the ground while protecting her head. Patient then fainted. EMTs assisted patient to gravity bed where patient regained consciousness. Patient was alert and oriented to person, place, time, and event (AAO x 4) immediately following the incident. Client's vitals were assessed every 5 minutes. They were recorded as follows 10:19- Blood Pressure (BP) 100/74, Heart Rate (HR) 86, Oxygen Saturation (SPO2) 99%, and Respiratory Rate (RR) 18; 10:24- BP 100/72, HR 81, SPO2 99% RR 18; 10:29- BP 100/76, HR 82, SPO2 99% RR 16; 10:34- BP 102/74, HR 84, SPO2 99% RR 18; 10:39- BP 100/72, HR 82, SPO2 99% RR 18; 10:44- BP 110/76, HR 86, SPO2 99% RR 18. Client was given a bottle of water and instructed to remain in a semi-fowler's (45 degree) position until vitals stabilized. Patient remained on vaccination site for 30 minutes following the episode of fainting. EMT obtained orthostatic vital signs (vital trend from lying down, to sitting, to standing). Patient was negative for orthostatic hypotension. Symptoms resolved as indicated above in vital signs. Patient stated she was "feeling better" and declined EMS transport. Patient and father were educated by RN on home care (rest and fluids) and to seek emergency medical attention if symptoms persisted or worsened. Patient left the vaccination site at 10:45 with father and sister with steady gait and in no change in status. |

| 1288441 | 5/5/2021 | FL | 81 | F | 1/12/2021 | 1/15/2021 | shortness of breath; congestive heart failure; fainting; dizziness; This is a spontaneous report from a contactable consumer. An 81-year-old female patient (consumer's wife) received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number:EJ1289), dose 1 via an unspecified route of administration on 12Jan2021 as SINGLE DOSE (at the age of 81 years-old) for covid-19 immunisation. The patient's medical history was not reported. Concomitant medication included metoprolol taken for congestive heart failure from Jan2021 to 2021 and unspecified medication. The patient experienced shortness of breath, congestive heart failure, fainting and dizziness on 15Jan2021. The patient was hospitalized for shortness of breath from 15Jan2021 to Jan2021. On 15Jan2021, she had such trouble breathing that he had to take her to urgent Care. Urgent care diagnosed it as congestive heart failure with enlarged heart and fluid in her lungs because of her heart being enlarged. She had not had any previous heart problems. Then states there may have been some earlier but it did not rise to the level of being noticed. The urgent care said she should be admitted to the hospital and to go the emergency room. Urgent Care told the consumer that they thought it was important to admit her as soon as possible. The patient was hospitalized for congestive heart failure from Jan2021 to Jan2021 for 5 or 6 days. The patient underwent lab tests and procedures which included computerised tomogram: unknown result in 2021, computerised tomogram: images of the heart: unknown result in 2021, transesophageal echocardiogram: unknown result in 2021, echocardiogram: unknown result in 2021, magnetic resonance imaging brain scan: no activity in 2021, sars-cov-2 test: negative in Feb2021 and x-ray: unknown result in 2021. Therapeutic measures taken as a result of congestive heart failure included metoprolol from Jan2021 to 2021 and furosemide (LASIX) to get the fluid out and once the fluid was out they did a transesophageal echocardiography (TEE). The patient was told to follow up with the cardiologist and the regular general practitioner (GP) and things seemed to be going ok. They advised her to get the second COVID shot and she got it. The second dose of COVID Vaccine was on 02Feb2021, Lot: EM9810, NDC and Expiration unknown. The events shortness of |

| 1288280 | 5/5/2021 | | | F | | | he passed out/fell out during court; covid-19; diarrhea; This is a spontaneous report received from a contactable consumer. A 61-year-old female consumer (patient) reported for herself that she received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; Lot number: unknown) via an unspecified route at a single dose for COVID-19 immunization. The patient had a history of shortness of breath often, had fatigue, muscle and body ache and headache, loss of taste and smell not that one. People had told her that so many people have died from it from blot clots. She also had a history of irritated bowel syndrome and had these side effects because she went through it anyways. She had a history of anxiety but had not had an attack in a long time. The patients niece broke out in hives (she did not know which vaccine). She had been high step and said that she was a hand washer at a restaurant and once she was done and got home and it started piling up at the end of the day when she layed down. She had heard that people were having heart attacks so must take a baby aspirin. The patients concomitant medications were not reported. After receiving the vaccine she passed out/fell out during court. Some people told her that some costumers died of covid 19 infection. On an unknown date she had covid-19 (she and her husband had covid and both got vaccinated with both shots) and had diarrhea for a month and got over. Someone had told her that they would chip her. The outcome of events was unknown for passed out and Covid-19 and recovered on unspecified date for diarrhea. Information about the Lot/batch number has been requested. |
| 1288890 | 5/5/2021 | CA | 25 | M | 5/4/2021 | 5/4/2021 | Systemic: Fainting / Unresponsive-Medium, Systemic: Flushed / Sweating-Mild, Systemic: Hypotension-Mild, Additional Details: Pt fainted about 2 minutes after getting their COVID vaccine. We had him sit with his feet up. We checked blood pressure about 5 minutes after and found he was hypotensive (109/71). Called the ambulance was was released by them. |

| 1288173 | 5/5/2021 | NJ | 55 | F | 2/4/2021 | 2/4/2021 | chills; joint pain/Joint achiness/she fell off of her roof; hives/she broke out in hives; severely itchy; This is a spontaneous report from a contactable consumer reported that a 55-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number: EL3249) intramuscularly in left shoulder as single dose on 04Feb2021 at 12 for COVID-19 vaccination. Medical history reported was ongoing asthma diagnosed at about age 21. Stated that it is under control and she gets her allergy shots. She stated that it was environmental, ongoing bee allergy and severe allergy. She carries an epipen. Concomitant medications were not reported. Caller received the first shot of the Pfizer covid vaccine yesterday at 12 and after staying for 45 mins did not experience any issue. Later on, she started developing hives all over her body (itchy palms, neck, scalp, stomach) which she took 2 Benadryl for. Her hives have gotten 90% better, but she was experiencing some chills and joint pain. Caller was a consumer that was calling about the Covid-19 Vaccine and reported that she went yesterday, 04Feb2021, for her first shot at 12:00 and stayed there for 45 minutes because she was allergic to certain things. She said that she had no issues when she left at 12:45. Caller said that at about 16:45, she started to get severely itchy, and she broke out in hives. Caller said that it was on her scalp, her lips, her neck, her stomach, her arms, the palms of her hands, and the pads of her feet. The caller stated that there was nothing on her legs. She said that she woke up with more symptoms today 05Feb2021, and said that she woke up with chills and like every joint in her body feels like she fell off of her roof. Caller said that she took 2 Benadryl, and the hives are better. She stated that it totally knocked her out and she passed out on the sofa. Caller stated that the hives and the itching are about 90 percent better. Caller estimated her weight at about 160lbs. Caller stated that she took Tylenol for the chills and stated that it did not help the achiness in her joints at all. Caller stated that her chills and her joint achiness are the same. She said that she is allergic to Tetracycline, Penicillin, and sulfa drugs. Caller does not have the NDC, Lot, or expiration date for the medications. She stated that it was a long time ago. She has not followed up with her physician. They told her at the facility that for a reaction she needed to call Pfizer. |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

Caller stated that she has a EpiPen, nebulizer and a rescue inhaler at home with her if needed. There was no previous immunization with the Pfizer vaccine considered as suspect. Prior Vaccinations was reported as non (within 4 weeks). Just takes her allergy shots, but that was 3 weeks prior, and it was cleared with the physician. Outcome of the events hives/she broke out in hives and severely itchy was recovering, chills and joint pain/Joint achiness/she fell off of her roof was not recovered. Follow-up attempts are completed. No further information is expected.

| 1288056 | 5/5/2021 | OR | 61 | F | 4/28/2021 | 4/28/2021 | I had the second Moderna shot that afternoon, scheduled for 4:15pm but it was about 4:30pm when I got it. I moved around as instructed by my doc, and after 15 minutes went back to my car. I noticed after another several minutes that my pulse was still elevated so opted to go back in and talk to a health care professional. Pulse was 120. Paramedic wanted me to lie down in waiting area but I didn't want to be in such a potentially germ environment, and the guy next to me who had fainted earlier was just getting up himself. She walked me back to my car, where I agreed to wait, listen to a stress relief hypnosis audio and see if my pulse rate would calm down. She came back out w/ a BP cuff and said my blood pressure was 210 over 130 (or some number over 100; I don't recall which) and she said I needed to get in an ambulance right away and go to the hospital. I said I would make my own decisions about my body and I wanted to try a couple of other things first, promised not to leave, contacted my doctor, naturopath. (Note: I did not have any other worrisome symptoms -- blurred vision, dizziness, etc. My head was a little buzzy, but whether out of fear or in reaction to the shot I didn't know. I was a little flushed). He asked me a bunch of questions, said my body hadn't had time to mount an immune response to the vaccine and that I had likely had a histamine reaction to a preservative in the vaccine (or similar), which a couple of his other patients had experienced. He asked if I'd been drinking fluids (yes, plenty), had eaten recently (no, so he suggested I have some food; I had some nuts, a little cheese and some Cheez-Its so had that), asked if I had an antihistamine around -- I did, but I don't do well with Benadryl and didn't have Claritin, but after looking through my bag found some Allervive, an herbal product he compounds. He said, "That's perfect." I took two of the three capsules and hung up. Staff were checking up on me in my car every ten minutes or so, by the way, very kind and professional as I had been quite upset at the whole "get in an ambulance" scenario. He thought some of my reaction was probably also stress-related, and I noticed before the shot that I was teary, not from anxiety but the kind you get when you feel relief after a long ordeal. I didn't feel anxiety, really, until the first blood pressure measurement. He also let me know that if the bottom number didn't drop below 100 they couldn't let me go. |

| 1288974 | 5/5/2021 | FL | 81 | M | 4/9/2021 | 4/16/2021 | After eating, drinking some more water and taking the Allervive my BP was down to 138 over 75 in just a few minutes. I agreed to stick around and make sure it stuck. We re-tested again about 15 minutes later, perhaps longer, and it was the same. I had been a little flushed but that had gone away too. I left and went for a light walk and eventually drove home without incident. I had symptoms after the shot that could have been related to my body fighting off the allergic reaction or to the vaccine itself, but they were pretty mild (fatigue later that night; occasional heart rate elevation sometimes after eating or with very mild exertion -- not unusual for me if I'm "fighting off" something; sore, itchy, red blotch sized between a quarter and a half dollar at vaccination site -- it is still a little tender today and appears a bit bruised; a bit sinus headache-y for three days, especially when I bent down to tie my shoes or something like that - also not that unusual as I often seem to "cleanse" through my sinuses when I have a bug or am fighting something off). In hindsight, I think the symptoms I had after the first shot, which lasted about 9 hours, may have been fighting off the allergic reaction and not a reaction to the virus vaccine itself. |

| 1288101 | 5/5/2021 | FL | 86 | M | 1/20/2021 | 2/18/2021 | Sharp pain in heart/feels like scar tissue around heart; hurting in his chest, boom in chest; He felt severe pain from the pacemaker jolt on his heart/pacemakers is giving him violent reactions; Almost passed out; blood pressure has been erratic; severe swelling at injection site/swelling right arm; a lot of pain at the injection site/swelling and pain in his right arm; This spontaneous case was reported by a consumer and describes the occurrence of ANGINA PECTORIS (Sharp pain in heart/feels like scar tissue around heart) in an 86-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 039K20A and 031M20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Atrial fibrillation and Pacemaker insertion (cardiac) (He has a pacemaker for 10 years, implanted on 2007. He had the battery replaced in his pacemaker on 01/Dec/2018). Concurrent medical conditions included Post-traumatic stress disorder and Plantar fasciitis. Concomitant products included ASPIRIN [ACETYLSALICYLIC ACID] for an unknown indication. On 20-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 17-Feb-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 18-Feb-2021, the patient experienced PRESYNCOPE (Almost passed out), BLOOD PRESSURE FLUCTUATION (blood pressure has been erratic), VACCINATION SITE SWELLING (severe swelling at injection site/swelling right arm) and VACCINATION SITE PAIN (a lot of pain at the injection site/swelling and pain in his right arm). On 27-Apr-2021, the patient experienced ANGINA PECTORIS (Sharp pain in heart/feels like scar tissue around heart) (seriousness criteria hospitalization and medically significant) and CARDIAC COMPLICATION ASSOCIATED WITH DEVICE (He felt severe pain from the pacemaker jolt on his heart/pacemakers is giving him violent reactions). On an unknown date, the patient experienced CHEST PAIN (hurting in his chest, boom in chest). At the time of the report, ANGINA PECTORIS (Sharp pain in heart/feels like scar tissue around heart), CARDIAC COMPLICATION ASSOCIATED WITH DEVICE (He felt severe pain from the pacemaker jolt on his |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

heart/pacemakers is giving him violent reactions), CHEST PAIN (hurting in his chest, boom in chest), BLOOD PRESSURE FLUCTUATION (blood pressure has been erratic), VACCINATION SITE SWELLING (severe swelling at injection site/swelling right arm) and VACCINATION SITE PAIN (a lot of pain at the injection site/swelling and pain in his right arm) outcome was unknown and PRESYNCOPE (Almost passed out) had resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In February 2021, Oxygen saturation: 63 percent (Low) low. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Further information has been requested. Concomitant medication used by patient includes Aspirin 325 mg. No treatment medication information provided. This case was linked (Patient Link). Most recent FOLLOW-UP information incorporated above includes: On 27-Apr-2021: Angina pectoris was added as event. Start date of other events are updated.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Further information has been requested.

| 1288109 | 5/5/2021 | TX | 65 | F | 3/4/2021 | 4/19/2021 | <p>passed out; can't walk very well without assistance; Sleepy; Very weak; headache; In appropriate doses interval, more than 35 days; This spontaneous case was reported by a non-health professional (subsequently medically confirmed) and describes the occurrence of LOSS OF CONSCIOUSNESS (passed out) in a 65-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 013M20A and 013M20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Asthma (Taking asthma medication as concomitant). On 04-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 19-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 19-Apr-2021, after starting mRNA-1273 (Moderna COVID-19 Vaccine), the patient experienced INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (In appropriate doses interval, more than 35 days). On 20-Apr-2021, the patient experienced LOSS OF CONSCIOUSNESS (passed out) (seriousness criterion medically significant), GAIT DISTURBANCE (can't walk very well without assistance), SOMNOLENCE (Sleepy), ASTHENIA (Very weak) and HEADACHE (headache). At the time of the report, LOSS OF CONSCIOUSNESS (passed out), GAIT DISTURBANCE (can't walk very well without assistance), SOMNOLENCE (Sleepy), ASTHENIA (Very weak) and HEADACHE (headache) outcome was unknown and INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (In appropriate doses interval, more than 35 days) had resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 23-Apr-2021, Computerised tomogram: (Negative) negative. On 23-Apr-2021, X-ray: (Negative) negative. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not applicable. The patient's heart was checked but no abnormal results. Company comment: This report refers to a case of Inappropriate schedule of vaccine administered for mRNA-1273, lot # 013M20A with associated AEs(loss of consciousness, gait disturbance, somnolence, asthenia and headache). | 1288366 | 5/5/2021 | ME | 34 | F | 4/9/2021 | 4/9/2021 | <p>unusual and pronounced panic attacks and depression; unusual and pronounced panic attacks and depression; fatigue; fever; sweats; pain in my arm and neck; pain in my arm and neck; swollen lymph nodes; I nearly passed out from an anxiety attack; I nearly passed out from an anxiety attack; This is a spontaneous report from a contactable consumer reporting for herself. A 34-year-old female consumer reported that she received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration in arm left on 09Apr2021 01:15PM (at the age of 34-year-old) for COVID-19 immunisation. Relevant medical history included COVID prior vaccination. Past drug history included known allergy to cefaclor (CECLOR) and morphine. Concomitant medications were not reported. The patient nearly passed out from an anxiety attack 15 minutes after the vaccine was administered, on 09Apr2021 01:30PM: this had never happened before. For a week after, she experienced fatigue, fever, sweats, pain in arm and neck, and swollen lymph nodes. She had also experienced unusual and pronounced panic attacks and depression since receiving the vaccine and would be seeking medical attention for those issues. Events resulted in physician or other healthcare professional office/clinic visit. No treatment was received. The patient had not tested for COVID post vaccination. Outcome of the events was unknown. Information on the lot/batch number has been requested.</p> |

| 1288145 | 5/5/2021 | MO | 67 | M | 1/23/2021 | 1/23/2021 | soreness at injection site; Light headed/dizzy; Felt very anxious and tense; Tense; Heart racing; This is a spontaneous report received from a contactable consumer (reporting on himself). A 67-years-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Lot Number: EK9231; Expiration Date was not reported), via intramuscular route of administration in Arm Right on 23Jan2021 12:00 as single dose for COVID-19 immunization. Medical history included prostatomegaly, drug hypersensitivity both from an unknown date and unknown if ongoing. Concomitant medication(s) included finasteride (FINAS-TERIDE); ergocalciferol (VITAMIN D [ERGOCALCIFEROL]) both taken for an unspecified indication, start and stop date were not reported. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, patient was not diagnosed with COVID-19 Since the vaccination, the patient has not been tested for COVID-19. On 23Jan2021 12:30, he received his first dose of the Pfizer COVID vaccine. Patient states he felt fine at the clinic after 15 mins and then after he left he felt lightheaded and dizzy and this continued on. Patient says his reaction was about 20 plus minutes after his injection, which he was fine when he got the injection, he became lightheaded and that has kind of continued on. He says it was pretty bad on the first day, then the second day it went away. He says a couple days later it came back, with his heart kind of racing, and he was still experiencing that though it was getting better. This was not something he had be-fore and he feels anxious and body is tight with dizziness. He says he experiences it periodically, and today it was not bad, but yesterday it came back again. He says he was concerned about that, but he hasn't passed out or anything. He says he went to the doctor and had an EKG and blood work done, which were all ok. He says it has been off and on, and he was kind of very anxious and tense as well, his insides are tight and jittery, sort of. He says he didn't see that listed as a common side effect. He says he had soreness at injection site, that went away, and he had no fever or any-thing, just the lightheadedness. He says he wants to see about the lightheadedness, if it had been reported by others, since he didn't notice it as a common reaction, to see what is |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

going on there, since it has been over a week and it hasn't totally gone away, so he is concerned about having his second dose. Am doing better now. Went to the doctor for tests on 27Jan2021 (Wednesday). Test results were okay. Patient states these are not some of the common side effects he has seen or read about. He would like to know when will his symptoms go away. Patient would like to know if he should receive the second dose that was scheduled in less than two weeks. Patient states he called his doctor had an EKG and blood work done and his tests were negative. The outcome for soreness at injection site was recovered on an unspecified date and for rest events was recovering.

| 1288414 | 5/5/2021 | PA | | M | 4/9/2021 | 4/11/2021 | <p>bilateral pulmonary embolism; right DVT; sinus tachycardia; Afib with RVR.; This is a spontaneous report from a contactable physician. This report was received via a sales representative. A 68-year-old male patient received BNT162B2 (Pfizer COVID vaccine), dose 2 via an unspecified route of administration on 09Apr2021 (Batch/Lot Number: Unknown) as single dose for Covid-19 immunisation. Medical history included hypertension, gastroesophageal reflux disease (GERD), and deep vein thrombosis (DVT) original diagnosis from Jan2018. The patient previously received the first dose of BNT162B2 on 19Mar2021 for Covid-19 immunisation. The physician reported the patient had bilateral pulmonary embolism and a right DVT on 11Apr2021. The patient went to the ER on 11Apr2021. She confirms the pulmonary embolisms and the DVT were diagnosed 11Apr2021 when the patient went to the ER. She has more of the patient's story, caller does not think this would be linked to the vaccine but that is for someone else to decide she is reporting. The day of the event the patient's heart was racing, he passed out and went to the ER, he had sinus tachycardia and Afib with RVR (date/s unspecified). His heart rate was up to 140s and 150s. The patient has history of hypertension, GERD, and previous DVT, the original DVT that patient had was diagnosed in Jan2018 and he was placed on Xarelto at that time and he was on Xarelto until Jun2019. He has not been on anything for this since that time, until this episode. Caller says reporter did not provide any specific treatment information that the patient has received for the event she is reporting. Reporter provided the patient went to the emergency room, he did not say if the patient was admitted or had hospitalization. The outcome of events was unknown. Information about the Lot/batch number has been requested.; Sender's Comments: Drug causality would seem unlikely for BNT162B2. The reported events may be regarded as natural progression of patient's pre-existing conditions. The impact of this report on the benefit/risk profile of the Pfizer drug is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Committees and Investigators, as appropriate.</p> |

people over 50 years: Taken for years. Why was the patient taking Concomitant Products Centrum Silver for people over 50 years (Verbatim): Multivitamin Patient History: No Investigation Assessment: Yes Additional Context: This consumer is the patient who has been administered both first and second doses of Pfizer-BioNTech COVID-19 Vaccines. About 8-11 days after first dose of Pfizer-BioNTech COVID-19 Vaccine he had a very, very lightheaded episode where he almost passed out. About 8-11 days after second dose of Pfizer-BioNTech COVID-19 Vaccine he had a very lightheaded episode that was much more vertigo-like where things were spinning. He clarified he thinks one event was like 8 days and the other was like 10 days after the vaccine doses were administered, but is not sure, so left it as about 8-11 days. Consumer is not sure if the events are Pfizer-BioNTech COVID-19 Vaccine related, but they never happened to him before those doses were administered. He does not know if this is vaccine related or just coincidence that they popped up at the same time as the vaccine doses. He does not know if events could be age related, the medical community can't figure it out so he is trying to get information on if events could be related to the vaccines. Patient: Age at onset: Over the age of 65 years. Reporter: Address: Unknown. Primary: Further address details/Email: Unknown. Very, very lightheaded episode where he almost passed out: Onset about 8-11 days after first dose was administered, maybe 09Feb2021 or 10Feb2021. He went to the emergency room on the date of event onset and was admitted to hospital from about 13:00 that day, overnight and discharged about 17:00-18:00 the following day. While in hospital he had EKGs of his head-verified this information with caller repeatedly; MRIs of his head; CTs of his head; and echocardiograms of his heart. All of those tests came back ok, nothing abnormal on results. They recommended he have a stress test done which was not performed until after the second reported event following second dose of Pfizer-BioNTech COVID-19 Vaccine. Very lightheaded episode that was much more vertigo-like where things were spinning: Onset was about 8-11 days after second dose of Pfizer-BioNTech COVID-19 Vaccine was administered. He has never had vertigo in his life before event. He went back to the emergency room on date of onset of this event, but was not admitted

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

to the hospital at that time; was only in the emergency room about 5-6 hours. While in the emergency room he had CT scans of his head, MRIs of his head and EKGs and everything looks good, nothing abnormal on results. Outcome: He still has ongoing very lightheaded episodes for a good part of the day. Those episodes usually last about 30 minutes and occur multiple times daily but are not really severe like the 2 initial events were following the first dose and then the second dose. Pfizer-BioNTech COVID-19 Vaccine: First dose: 26Jan2021 Lot: EL9263 NDC/Expiry: Unknown, this is not on CDC vaccine record card. Dose: Unknown strength/volume/dose injection to left arm shoulder before 12:00 Second dose: 15Feb2021 Lot: EL9267 NDC/Expiry: Unknown, this is not on CDC vaccine record card. Dose: Unknown strength/volume/dose injection to left arm shoulder before 12:00 - verified with reporter that details were same for both first and second doses. This completed his prescribed therapy. Regarding concomitant products and other medical conditions caller reported he really had no issues going on prior to onset of these events. Regarding other testing/investigations done relative to these events: He had a nuclear stress test and exercise stress test, both performed on 10Mar2021 he believes and results of those tests were they both came back good, family doctor emailed him the results which were normal. He has gone to the ENT-ear, nose and throat doctor where he had a balance test done which he referred to also as a VNG test-Videonystagmography done on 17Mar2021. He will get results of balance test on Wednesday, 24Mar2021. He had blood work done the first time he was in the emergency room when he was admitted to the hospital in Feb2021; they took his blood 3-4 times while he was there overnight and blood work results all came back normal. He is not sure what they were testing for, but thinks they were looking for stroke type things because event almost made him pass out. They did not draw more blood the second emergency room visit. Follow-up (23Mar2021): This is a follow-up spontaneous report from a contactable consumer. COVID-19 VACCINE Question: AUTO-CALLBACK
REQUEST 23Mar2021 10:06AM Caller received both
doses of the Pfizer-BioNtech Covid-19 vaccine (1st dose
26Jan2021, 2nd dose 15Feb2021). About ten days after
the first dose he had a very lightheaded episode and he
almostfainted, he went to ER and had an MRI of his
head, a CT scan, a CT scan with contrast and also an
echocardiogram, they were relating this to a strokelike
symptom however the results were normal, also his blood
test results were fine. He went to his HCP and he was
schedules to get a nuclear stress test and an exercise
stress test, his results came back normal; before this
tests he received the second dose on 15Feb2021 and 10
days later he had again a very bad episode in his house
he had a lot of vertigo, he felt the walls were moving so
he went back to ER and had another EKG and CT scan,
his heart was ok, so they suspected it was vertigo. He
has daily episodes that las a few minutes were he feels
lightheaded. He went to an otolaryngologist ("ear and
nose doctor") to see if this was vertigo and had a balance
test done. Caller states he had never this symptoms
before, his vaccination card has the lot number for both
doses, he hasn't changed his medications or habits and
it's odd that this happened 9-10 days after both doses of
the vaccine. He would like to know if this has been
reported before as a side effect related to the vaccine.
Caller states that he already called Safety twice, report #.
Potential duplicate E-transmitting to DSU.
Response:Spoke from attached documents. Referred
caller to his HCP. Request Name: REQ-#
Product:PFIZER-BIONTECH COVID-19 VACCINE
Question: Caller received both doses of the Pfizer-
BioNtech Covid-19 vaccine (1st dose 26Jan2021, 2nd
dose 15Feb2021). About ten days after the first dose he
had a very lightheaded episode and he almost fainted, he
went to ER and had an MRI of his head, a CT scan, a CT
scan with contrast and also an echocardiogram, they

were relating this to a strokelike symptom however the results were normal, also his blood test results were fine. He went to his HCP and he was scheduled to get a nuclear stress test and an exercise stress test, his results came back normal; before this tests he received the second dose on 15Feb2021 and 10 days later he had again a very bad episode in his house he had a lot of vertigo, he felt the walls were moving so he went back to ER and had another EKG and CT scan, his heart was ok, so they suspected it was vertigo. He has daily episodes that last a few minutes where he feels lightheaded. He went to an otolaryngologist ("ear and nose doctor") to see if this was vertigo and had a balance test done. Caller states he had never this symptoms before, his vaccination card has the lot number for both doses, he hasn't changed his medications or habits and it's odd that this happened 9-10 days after both doses of the vaccine. He wanted to know if his information will help somebody else who may experience the same symptoms, and is his information could be useful for Pfizer. Follow-up (23Mar2021): This is a follow-up spontaneous report from a contactable consumer. This consumer reported that: Patient Details Sex - Male Height - 183 cm Or 6 feet Weight -95.25 kg Or 210 pounds Is the patient also the reporter? Yes Age - 67 Years Reporter Details Reporter type: Consumer or other non health professional Primary / Prescribing Healthcare Professional Info (the) Event Details I have been having some strange things; it's symptom like I never had before I had almost a very light headache where I almost fainted It might be stroke like symptom I continued to have some light headed symptoms but nothing real bad; continued to have symptoms which was not normal for me I had another episode; this was much more vertigo like or the room is spinning and the walk and things are moving Products Suspect products: Covid Vaccine Is this a Pfizer product? Yes NDC number: Unknown UPC number: Unknown Lot Number: EL9267 Expiry date: Unknown History Concomitant Products Other Products Yes Omeprazole Indication - Acid reflux Multivitamin Amlodipine Dosage 5 MG Indication Blood pressure Additional Context: Consumer stated, "I have been having some symptoms but I did call into one of your number yesterday and they told me call back and try to get into you but they did gave me some case number in case help you, they did an

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

open internet case# and I will give you that number if you like it. It's # (Hence follow-up was checked). Well I have been having some strange things that I don't know if its Covid shot related but it's symptom like I never had before. After I had received the first shot, I had almost a very light headache where I almost fainted. We went to ER, they were sort of testing, it might be stroke like symptom and they did a MRI of my brain and they did CT scan of my brain and CT scan contrast. They did micro cardiogram, some EKGs and work. All of those come back normal. So I spent the night in hospital, they sent me the next day. I continued to have some light headed symptoms but nothing real bad but continued to have symptoms which was not normal for me. After I had my shot about 10 days after the second shot, I had another episode. This was much more vertigo like or the room is spinning and the walk and things are moving. I did go back to ER again just in case there was something going on. They tested again another CT scan and EKG and everything looked normal and they said it sounded like a vertigo related. I told him I had shot about 10 days after each shot, the symptoms hit me. Because of the first episode my family doctor ordered some other testing done, and they did stress test of my heart, a nuclear stress test and an exercise stress test of my heart and both came back normal. But I am continuing to have the light headed, the episodes just about daily. Sometimes they last for 30 minutes or more, multiple times a day. Sometimes I have a good day but I have those light headed episodes and I never had it before I got the shot. I am also going ENT- ear, nose and throat doctor to check on vertigo stuff and they did some testing last week and I am supposed to get the result tomorrow on what they found about vertigo test but I never had vertigo or light headed or anything before the shot. So I don't know if anybody else is reporting this but I had 2 sorts of severe episodes both of them 10ish days after each shot and I am continuing to have light headed episodes but not severe as those 2 but I had light headed dizzy episodes daily, since the Covid vaccine. I want to report it, so you guys have a report file and other people reporting it. I guess I sort of want to know if you guys were having any other report or something like this. So that I know it might be related to the shot. I am still working with my ENT and I tried to figure out if it's vertigo.

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

If it's not vertigo then they have really run all sorts of test and if it's not vertigo we don't know if Covid shot triggered the vertigo or not. Let me know, we don't know. So they have ran 30,000 dollar test on me and so far all my tests are coming back normal." Consumer was informed about the role of Pfizer Drug Safety and Pfizer Medical Information. Consumer was provided with the contact# for Pfizer Medical Information as # and requested to dial the Option 3 and informed about timings as Monday to Sunday from 8 am to 8 pm EST. Consumer stated, "I already did, and that's what I just dialed. I just dialed that number and option no. 3, I just dialed. That's the no. I dialed that's #and pressed option number 3. Can you forward this call to that department?" Call could not be transferred because of some technical issue. When probed for exact date of AE, "Consumer stated, hang up one second. Let me pull my card out. I think it's all I that other file that I gave but I'll give it you again. I received my first shot on January 27 of this year and I had the first episode February 10th, then I received my second shot on February 25th of this year and I believe it was march 4th, I think when I had those episodes. Those are the 2 episodes. I had smaller episodes daily but they were two bad episodes." When probed for Physician's details, Consumer stated, "It was distributed from a count location." When probed for LOT#, Consumer stated, "Hang up one second. I haven't told you one thing, my second shot was February 15 not 25. I was looking at my visa card. My first shot was EL9263 and my second shot was EL9267." Expiration date of vaccine: Consumer stated, "I doesn't have that." Dose of vaccine: Consumer stated, "It did not write that on card." When probed for anatomical site of vaccine administration, Consumer stated, "Left arm shoulder." Lab Test: Consumer stated, "Every year I go and get my yearly test in which they had my blood work and my glucose levels are always good, cholesterol level as always good. All my other tests come back as normal." (Further not clarified hence not captured in tab) Treatment: Consumer stated, "The hospital was, the emergency room gave me something for dizziness that I am no longer taking. They gave me something for dizziness when I was there but I am no longer taking it. So I am really taking nothing. This time I am working with ENT i.e. ear, nose and throat doctor, they are doing vertigo type testing but they got nothing,

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

the results are supposed to be back tomorrow. I don't know what test they are going to show, if they do show vertigo there will be some treatments to help me. But we don't know what brought these episodes on, other than timing wise it was during the Covid shot. And I never had anything like that and I am not blaming it on the Covid shot. That was the only thing changed in my lifestyle. There might be a possibility, because that's the only thing changed, my medication has not changed, diet doesn't changed. Nothing is changed other than I got Covid." Consumer stated, "Can you give me report#." Reportum# was provided as # #Is there a product complaint to report?No Is there a medical information request?Yes Please describe the medical information request Consumer stated, "I have been having some symptoms but I did call into one of your number yesterday and they told me call back and try to get into you but they did gave me some case number in case help you, they did an open internet case# and I will give you that number if you like it. It's 4NW3L5MR (Hence follow-up was checked). Well I have been having some strange things that I don't know if its Covid shot related but it's symptom like I never had before. After I had received the first shot, I had almost a very light headed where I almost fainted. We went to ER, they were sort of testing, it might be stroke like symptom and they did a MRI of my brain and they did CT scan of my brain and CT scan contrast. They did micro cardiogram, some EKGs and work. All of those come back normal. So I spent the night in hospital, they sent me the next day. I continued to have some light headed symptoms but nothing real bad but continued to have symptoms which was not normal for me. After I had my shot about 10 days after the second shot, I had another episode. This was much more vertigo like or the room is spinning and the walk and things are moving. I did go back to ER again just in case there was something going on. They tested again another CT scan and EKG and everything looked normal and they said it sounded like a vertigo related." Consumer was informed about the role of Pfizer Drug Safety and Pfizer Medical Information. Consumer was provided with the contact# for Pfizer Medical Information as #and requested to dial the Option 3 and informed about timings as Monday to Sunday from 8 am to 8 pm EST. Consumer stated, "I already did, and that's what I just dialed. I just dialed that number and

Call could not be transferred because of some technical issue.</p> <p>Around 4 pm I had flu like symptoms. Headache, back pain, fatigue, chills, sweats. Around 5:30 I started feeling light-headed. I got out of bed and fainted on the floor. Laid there for a few moments. Got water. Laid back into bed and my body completely locked up. It felt like there were pins and needles coursing through my entire body. I couldn't bend or move my legs. My wrists were bent down and my fingers all locked together. I could not move them at all. I was screaming out in pain. It was the worst pain I've ever felt. My roommate called 911. Paramedics arrived and took my temperature and blood pressure. They tried calming me down. eventually I did. And my fingers and legs unlocked but I continued having a severe headache, back pain, muscle aches and nausea. I woke up every hour of the night and threw up several times. It's been 24 hours after the shot and I am still having headaches fatigue and muscle spasms.</p> |

A 33-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at left arm on 07Apr2021 10:00 AM at single dose for COVID-19 immunisation in Pharmacy or Drug Store. Medical history was none. If No other vaccine in four weeks. No Known allergies. No other medications in two weeks. Patient was not pregnant. Patient experienced Presyncope severe disequilibrium, vertigo, nausea, migraine (head and ear pressure), tinnitus, tremors. Vestibular disturbances lasting for Weeks. Adverse event start date was 14Apr2021 03:15 PM. event resulted in doctor or other healthcare professional office/clinic visit, disability or permanent damage. No covid prior vaccination. no covid tested post vaccination. Treatment received for the events with Steroids, Xanax, Benadryl, ibuprofen. Patient was recovering from the events. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of Presyncope severe disequilibrium, vertigo, nausea, migraine (head and ear pressure), tinnitus, tremors and Vestibular disturbances due to temporal relationship. However, the reported events may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including head CT/MRI, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p> |

| 1288386 | 5/5/2021 | MN | 52 | F | 4/8/2021 | 4/8/2021 | <p>allergic reaction; wasn't able to lift her hands; blood pressure was very low at about 80/59; tired; light headedness; Didn't feel very comfortable; weak in the legs; She was warm or cold, hot then suddenly cold; chills; fogginess; fainting reaction 15 minutes after getting the shot; palpitations for an hour; numbness in her lower jaw/bottom jaw was half numb; weakness on her bottom lip which was difficult to move, causing her to have difficulty in talking; weakness on her bottom lip which was difficult to move, causing her to have difficulty in talking; inner side of her leg, calf, and thigh was feeling hot; kind of a tightness in her chest/Every next breath was getting weaker and they disappeared after an hour. She felt like someone was holding her chest, do not let her to deep breath; This is a spontaneous report from a contactable consumer (patient) via a Pfizer-sponsored program. A 52-year-old female patient received BNT162B2, dose 1 via an unspecified route of administration, administered in left arm on 08Apr2021 08:30 (Batch/Lot Number: ER8729; Expiration Date: 31Jul2021) (at the age of 52-years-old) as single dose for COVID-19 immunisation. She reported says she was getting it because people who were vaccinated are being less cautious and putting her at risk for COVID. The vaccination facility was organized through a pharmacy was not administered in a military facility. Medical history included measles on an unknown date (she was sick only once with measles). The patient reported no family medical history but the only thing to put about her probably was that she has maybe rare in a good way immune system. She thought children infections that kids usually get, some of them are very contagious, she was sick only once with measles. She says she has never had chicken pox, she was not vaccinated for chicken pox, she was in contact with multiple people with chicken pox, has antibodies with chicken pox but she never had symptoms, she was never sick. She said she was never sick with any children's infection, she usually did not get sick at all, no flu, no cold things, never. She was not sure if it was measles or if it was rubella as she was translating from another language. There were no concomitant medications. The patient previously took lidocaine and experienced allergy with symptoms of cold sweat and palpitations. She says this allergy started a very long time ago. She said it was affecting only dental procedures and that they know</p> |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

about so they just don't use it on her. She says they consider it not be the lidocaine but due to the ephedrine inside of the lidocaine. She lists her symptoms as cold sweats and palpitation, no pain. She reported they thought the reaction was just too strong, she had 2 episode in 2 different offices, they don't use it on her. The patient had no prior vaccinations within four weeks. The patient declined being sick at the time of vaccination. On 08Apr2021, the patient experienced fainting reaction 15 minutes after getting the shot , palpitations for an hour, numbness in her lower jaw/bottom jaw was half numb, weakness on her bottom lip which was difficult to move, causing her to have difficulty in talking, inner side of her leg, calf, and thigh was feeling hot; kind of a tightness in her chest/every next breath was getting weaker and they disappeared after an hour. she felt like someone was holding her chest, do not let her to deep breath, not destructions with breathing, tired, lightheadedness, didn't feel very comfortable, weak in the legs, she was warm or cold, hot then suddenly cold, chills, and fogginess. On 14Apr2021, the patient experienced blood pressure was very low at about 80/59, wasn't able to lift her hands, weak again and dizziness. The patient's second dose was supposed to be next Friday but her healthcare provider thought it was an allergic reaction (unspecified date) and advised her to not get the second dose. The patient wanted to know what would Pfizer advise. The patient did not know if it was because of COVID but thought those were the effects of any kind of vaccines. The patient clarified her jaw was only half numb. She reported the events started after 15 minutes, the jaw was later, palpitations started after she broke the pattern of her thinking, that wasn't right. She said we had the list but it was missing that it started with one symptom and was replaced by another symptom. She said the only 2 that were together was the jaw part and the palpitations. She says the jaw part was a very short period of time, she felt it and thought what was this, she did not know how long it was, maybe one minute, less than one minute. She reported her palpitations were periodical palpitations, every next breath was getting weaker and they disappeared after an hour. The patient also reported her legs part was after the palpitations were gone. She had talked to multiple nurses and she realized from telling the story 5 times that the symptoms started from

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

up to the bottom; the reaction was from her head to her legs. She reported that she doesn't feel very comfortable, she doesn't know what will happen to her, no one knows. She says all symptoms were on the same day, she was able to move and felt comfortable to move after an hour and a half. She says she started to move after symptoms in the legs started to disappear, she was not able to take deep breath but she was able to breathe without destructions. She says she felt like someone was holding her chest, do not let her to deep breath, not destructions with breathing. She tries to explain the temperature situation, saying the feeling during this time was warm or cold, hot then suddenly cold, that there was no one explaining what happened with her. She says she she remembers noticing that suddenly she had chills. cold, she was talking to someone and she felt cold, she can't exactly say what. She says this probably lasted half a day, maybe 12 hours: She says she was very dizzy on that day, suddenly, and at night she measure her pressure to see what is going on. She says she she has been known for low blood pressure earlier in her life. She says 110/70 was her normal and she had around 80 something, 86/59, something like that, she hasn't had such a low blood pressure in 30 years, maybe since her pregnancy. She stated that she has recovered completely from everything. She says she is not sure if its coming back, she did not expect to have low blood pressure, but right now she is totally fine, a normal person. The patient confirmed her blood pressure was, she thought 86/59 on 14Apr2021. She said she took her blood pressure 2 times, a couple times, the first time was even lower on 14Apr2021. She says on the actual 08Apr2021 she took her blood pressure and it was 120 over something, a little bit higher than it usually would have been. She said she was usually running towards the lower acceptable range, 110 to 70, 110 to 75, something like at doesn't get more than 113. The events did not require a visit to emergency room nor a visit to physician's office. The patient wanted to know if these side effects were known to Pfizer and what happens to those side effects. She asked do they have information on if they increase with the second vaccine. The outcome of the events fainting reaction 15 minutes after getting the shot, palpitations for an hour, numbness in her lower jaw/bottom jaw was half numb, weakness on her bottom

| 1290723 | 5/5/2021 | ME | 27 | F | 5/5/2021 | 5/5/2021 | <p>Patient administered Janssen vaccine on 5/5/21 at 1011AM by pharmacist on duty. Patient did not admit any anxiety surrounding vaccine during counseling prior to receiving the vaccine. After administration patient mentioned she has can get anxious sometimes and has tendency to create symptoms in her head. She asked what to be on the look out for for signs of syncope and described starting to feel nauseous, clammy, and tunnel vision. Within seconds she briefly lost consciousness and started to slump in chair within immunization room. Pharmacist prevented her from falling out of chair while opening door to waiting room and asked for assistance from patients boyfriend. Together we held patient in place on chair and propped feet up on another chair. Immediately patient regained consciousness enough to explain what she was feeling but then quickly lost consciousness again and started snoring as if she immediately fell asleep. Boyfriend said no history of sleep issues/narcolepsy, together we laid patient on floor of immunization room with feet slightly elevated and boyfriend at her head and again she immediately regained consciousness. Patient explained that she was immediately starting to feel better and felt dizzy and described having very odd dream like scenarios. She laid on floor for 10 min, Alert and orientedx4, moved to seated position for another 10 min, accepted offer for apple juice, moved to waiting area to sit for another 10min before OK leaving. MOD/PDM aware....Called patient at 6pm that same evening and patient reported feeling great.</p> |

| 1291099 | 5/5/2021 | NY | 27 | M | 4/15/2021 | 4/15/2021 | syncope; fell from standing; hit head on table; This is a spontaneous report from a contactable health professional. A 27-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot: EW0164), intramuscular in the left arm on 15Apr2021 (at the age of 27-years-old) as a single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. It was unknown if the patient received any other vaccinations within 4 weeks of the vaccine. On 15Apr2021, immediately after the vaccine, the patient experienced syncope due to which he fell. He fell from standing and hit his head on a table. There were no signs of soft tissue injury. The patient was brought into the emergency department from the vaccination room. The patient was not treated for the events. The clinical outcome of syncope, fell from standing and hit head on table was resolved on Apr2021.; Sender's Comments: A contributory role of BNT162B2 to the reported events cannot be excluded based on temporal association. Case will be reassessed if additional information is received. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate. |
| 1291384 | 5/5/2021 | CO | 23 | F | 5/5/2021 | 5/5/2021 | After about 5 minutes after receiving the vaccine, the husband of the patient came to the pharmacy to notify the pharmacist that the patient had fainted. The pharmacist had technician call 911 and the pharmacist went to evaluate the patient. Upon arrival, the patient had gained consciousness. The pharmacist got a BP and HR. Talked to patient until EMS arrived. After talking with EMS, the patient left with the husband. |
| 1291245 | 5/5/2021 | NC | 17 | M | 5/5/2021 | 5/5/2021 | Passed out and had seizure lasting 45-60 seconds. |

A 46-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in arm left on 05Feb2021 at 10:30 (Lot Number: EL9261) (at the age of 46-year-old) as single dose for COVID-19 immunisation. The patient was not pregnant. Medical history included infectious mononucleosis (Recent mono) in 2020 (Spring), urinary tract infection (UTI) in 2020 (Summer), venous Insufficiency on Dec2020, shingles in past on an unspecified date, lactose & gluten intolerance from an unknown date and unknown if ongoing, COVID-19 from Jun2020 to an unknown date (I had recovered from mild COVID in Jun and Oct2020 that required no hospitalization and was managed with DAYQUIL, XYZAL, Prednisone, Vit D and melatonin). Concomitant medications included ibuprofen at 2400 mg and 800 mg; pregabalin (LYRICA); progesterone; bifidobacterium bifidum/bifidobacterium lactis/bifidobacterium longum/lactobacillus acidophilus/lactobacillus rhamnosus (PROBIOTIC), all concomitants were taken for an unspecified indication, start and stop date were not reported. The patient experienced mild injection site pain, COVID symptoms in same order as the Oct2020 |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

COVID (upper respiratory, less intense headache, shortness of breath, chest pain), dizzy, fatigue, vasovagal response, passed out, nausea, throwing up, tremor increased, chest pain & tightness to the point I could not move my arm to use my emergency inhaler prescribed after COVID/ I couldn't move, post COVID syndrome and orthostatic hypertension, tilt table testing confirmed COVID-induced POTS (postural orthostatic tachycardia syndrome) and lymph node pain, all on 05Feb2021 at 11:00. All events were serious disabling and required hospitalization. The patient underwent lab tests and procedures which included computerized tomogram (CT): unknown results on an unspecified date, D-dimer: 1300 is very elevated, it shows that I have a lot of inflammation in my body or I could have the clot, 1300, almost 3 times the normal value; magnetic resonance imaging head (MRI): unknown results on an unspecified date, SARS-COV-2 test (nasal swab): negative on 19Feb2021, tilt table test: COVID-induced pots on 05Feb2021 . Unspecified therapeutic measures were taken as a result of the events. The patient outcome of the event passed out was unknown and not recovered for all the other events.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of reported events cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

| 1290465 | 5/5/2021 | VA | 70 | F | 3/8/2021 | 4/3/2021 | STARTING AROUND 4/3 she started to experience dizziness, nausea and memory loss. On 04/06 She passed out while sitting in her chair, woke up and began throwing up. Had extreme short term memory loss and low blood pressure. On 04/08 while at her primary care Dr, he suggested a hospital visit with suspicion of possible stroke. Was admitted and released the following day. Dr advised possible mini strokes but could also be dehydration. CBC with differential showed other results than dehydration. Starting around 04/20 she started having chest pains and thought it was heart burn, after medication and another visit to her pcp she was admitted to the hospital again on 04/23. Her troponin levels indicated a possible heart attack. She had a heart catherization and was found to have a healthy heart. Again, her blood pressure has been decreased since, her hgb and hct has also been low with a history of it being high. A high WBC since all of this has started among other unexplained blood results. |

| 1289511 | 5/5/2021 | WY | 24 | F | 4/2/2021 | 4/2/2021 | That evening my arm swelled up and became very painful - not as much as the first vaccine. I had a hard time sleeping - nausea and headache throughout the night. 4/3 - extremely tired; felt like I couldn't get enough air (shortness of breath) body aches and muscles aches - over all lethargic. 4/4 - I was dizzy, short of breath . Those two symptoms lasted along with fatigue - which lasted for two days. I almost passed out that day - everything went black and I had to be assisted to the couch to recover from that. I used Tylenol for my symptoms when needed. I still have ongoing headaches - three weeks ago (about a week after I got the vaccine) - I noticed I was having ongoing headaches and I still have these. Pregnancy - 2nd pregnancy; 1st one was full term. Date of delivery expected - September 9, 2021. |

| 1289747 | 5/5/2021 | CA | 25 | M | 5/4/2021 | 5/4/2021 | Status post vaccination patient reported nausea, abdominal pain, and light headedness. Patient stated he went to car and was unsure whether he fainted or not as he felt weak. This occurred within a time frame of 20 minutes post vaccination. Vitals were checked and BP, temp, and pulse within normal range. Patient stated he was feeling much better and the event only lasted a short period of time. Patient was given a cold water bottle and observed at the pharmacy. Vitals were rechecked after another period of 15 minutes and were unremarkable. No medications were administered and no further medical attention required. Notably was a hot day (temperature in the 90s) and patient stated he had not eaten anything all day since cereal in the morning (vaccination administered at 5PM). Patient stated he was feeling much better. |
| 1289818 | 5/5/2021 | CA | 16 | M | 5/4/2021 | 5/4/2021 | Within 3 minutes of receiving the vaccine, Subject experienced syncope, had ringing in the ears, loss of vision, was pale, diaphoretic, and hyperventilation. BP 102/49 and 96/58. Staff responded, provided supportive care. Subject regained consciousness. Reported on 5/5/2021 made a full recovery. It is noted he reports he worked out that morning, had not eaten or had water that day. Did not seek medical attention. |
| 1290056 | 5/5/2021 | CO | 16 | M | 5/5/2021 | 5/5/2021 | Patient fainted minutes after receiving 2nd vaccine. |

| 1290064 | 5/5/2021 | WI | 24 | M | 4/13/2021 | 4/15/2021 | <p>He states he had the first Pfizer COVID-19 vaccine in the series on 4/13/2021. He states that two days later on 4/15/2021 he felt like his feet were heavy. He continues to experience that sensation in his feet, and even feeling like his feet are asleep at nighttime and when he first gets up in the morning. The asleep feeling in the feet gets better when he gets up and moves around but the heavy sensation in the legs does not get better. He states that his mobility is affected though that his legs feel heavy and he is not as easily mobile as he used to be. He feels his balance is off. Patient later reported that he did have an episode of syncope about 5 minutes after he got the vaccine but otherwise was doing okay until 4/15/2021. He presented to the ED with these symptoms on 5/3/2021 at approximately 7:14pm and was admitted to the hospital for evaluation. Patient states that he normally exercises regularly and has been having a great deal of difficulty especially with squatting and now has difficulty walking up stairs, feels very weak and his legs feel heavy. He reports that the numbness and tingling sensation of his feet when sleeping is new and he has never had it in the past. Symptoms get worse with exertion and prolonged activity. Neurologist was consulted and several tests were ordered. Neurology consult noted that patient had a prior COVID 19 infection in November 2020. Per neurologist notes: His symptoms first started about two days after he received Pfizer COVID vaccine on April 13, 2021. He recalled feeling his feet heaviness and it was hard to pick them up. He also had some calf pain. He also had difficulty with doing his stretches and yoga positioning. A week ago, he began to have difficulty with picking up a ball or anything from the ground. He also developed pins and needles at the fingertips at the same time he developed tingling sensation of his feet. He also has lower back pain. He tested positive for SARS-COV-2 antigen on November 12, 2020. He recalled having symptoms lasting for a few days consisting of diaphoresis, cough, and flu-like symptoms. Per neurologist, symptoms seem to resemble acute inflammatory demyelinating polyneuropathy (AIDP). Patient was treated with IVIG for 5 days.</p> |

| 1284724 | 5/4/2021 | OR | 56 | M | 4/21/2021 | 4/21/2021 | <p>passing out; blood pressure of 70/40; Feeling hot; Sweaty; Dizziness; Lethargy; Sore arm; Achy all over; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of LOSS OF CONSCIOUSNESS (passing out) in a 56-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 027B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 21-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 21-Apr-2021, the patient experienced LOSS OF CONSCIOUSNESS (passing out) (seriousness criterion medically significant), BLOOD PRESSURE DECREASED (blood pressure of 70/40), FEELING HOT (Feeling hot), HYPERHIDROSIS (Sweaty), DIZZINESS (Dizziness), LETHARGY (Lethargy), PAIN IN EXTREMITY (Sore arm) and MYALGIA (Achy all over). On 21-Apr-2021, LOSS OF CONSCIOUSNESS (passing out) had resolved. At the time of the report, BLOOD PRESSURE DECREASED (blood pressure of 70/40), FEELING HOT (Feeling hot), HYPERHIDROSIS (Sweaty), DIZZINESS (Dizziness), LETHARGY (Lethargy), PAIN IN EXTREMITY (Sore arm) and MYALGIA (Achy all over) outcome was unknown. Not Provided The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. No concomitant medications reported. Patient reports that paramedics had to come after he passed out. Treatment of the events included acetaminophen. Company comment: This case concerns a 56-year-old male with a serious unexpected event of loss of consciousness, and nonserious unexpected blood pressure decreased, feeling hot, hyperhidrosis, dizziness, lethargy and expected pain in extremity. Event onset the same day as first dose mRNA-1273. Events resolved. Based on current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.</p> |

Upon receipt of follow-up information on 19Apr2021, this case now contains serious adverse reaction. Information processed together. This is a spontaneous report from a contactable consumer (patient's father) via Medical Information team. A 31-year-old male patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration on 01Apr2021 (Batch/Lot number and Expiration date were not reported) at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was in excellent health and had no known allergies. The patient had took the Pfizer COVID-19 vaccine 18 days prior reporting (on 01Apr2021) and had blood pressure dropped to 70/50 and emergency medical services (EMS) was called an hour with him. The reporter was asking if the patient should take the second dose being that he had this reaction. The reporter further asked for the efficacy of one dose of the Pfizer COVID-19 vaccine and how long was the coverage of the vaccine as far as needing a booster shot. The reporter also asked about the 6 months topline analysis results of the Pfizer-BioNTech COVID-19 vaccine. It was further reported that fifteen minutes after the COVID-19 shot on 01Apr2021, the patient passed out; the patient had a big blood pressure drop from 110/90 to 70/50. The EMS was called in and attended to the patient. The patient was there for about an hour. The reporter was just calling to find out if the patient could get the second shot. The outcome of the events was unknown. Information on the batch/lot number has been requested.</p> |

| 1284762 | 5/4/2021 | FL | 80 | F | 3/11/2021 | 3/11/2021 | I had an allergic reaction to the Pfizer Covid vaccine; I fell; Passed Out Without Warning and Hit her Face on the Tile Floor; Busted Mouth; Stitches in Mouth; Right Knee Very Sore /Left Shoulder Very Sore and Can't Use It; Black Left Eye; states it was black, blue, purple, green and yellow; Tiredness; Left Hand Pinky Sore; This is a spontaneous report from a contactable consumer (patient). An 80-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), second dose via an unspecified route of administration, administered in Arm Right on 11Mar2021 14:00 at age of 80-year-old (Batch/lot Number: EN6205) at single dose for COVID-19 immunization. The vaccine was not administered at Military Facility. Medical history included she has hearing aides but it is hard to hear or understand sometimes. There were no concomitant medications. Prior Vaccinations (within 4 weeks) was the first dose of Pfizer COVID Vaccine (Batch/lot number: EL9267) on 18Feb2021 at age of 80-year-old administered in right arm and no adverse events following prior vaccinations. The patient reported she had an allergic reaction to the Pfizer COVID vaccine, she fell on 11Mar2021, not fainted. On 11Mar2021, the patient passed out without warning and hit her face on the tile floor, experienced busted mouth/stitches in mouth, right knee and left shoulder were very sore, black left eye/it was black, blue, purple, green and yellow, tiredness, left hand pinky sore. The patient was calling about the Pfizer COVID Second Shot; verified Pfizer COVID Vaccine. Her second shot was on 11Mar2021 and on the same day she passed out without any warning whatsoever, and she hit the tile floor and ended up in the hospital for five days. She passed out and didn't remember falling or feeling anything before falling. The patient also has a primary physician, but she had been seeing the plastic surgeon for this. The patient asked what does she do if she needs to get a booster. It scared her to death if she would have to take another shot. The patient asked (name) to hand her a pair of glasses to read the plastic surgeons name. She stated the printing is so small on there. She was supposed to see the doctor on 19Apr2021, but she didn't feel good enough to go see the doctor. For busted Mouth, they put in 3 layers of stitches. The stiches have been giving her a fit because sometimes they come undone and hang down. She had to go back into him and |

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

get them cut out twice, and she had another one from last night (18Apr2021). It is very sore. States the stiches inside the lip have not resolved and it was still hard. One part of her lip is soft and one part is hard. It was all hard in the beginning. The stitches on the inside are supposed to dissolve. For right Knee it was very sore and she can't hardly use it. For left shoulder it is very sore and she can't hardly use it. It made it awkward to get in and out of bed when she can't use her left arm or her right knee. Her left shoulder was really bothering her and she may have to go have some more work done. It has been popping and went in and out of the joint. That would be back with her primary doctor. Sore pinky on left hand had recovered it didn't stay that long. Black left eye, it was black and blue purple green and yellow. It cleared up in the last couple of days. She was lucky she didn't break the bone around her eye. Treatment included stitches, hospitalization, given antibiotics and blood clotting shots so she didn't get blood clots, she had 3 of those in her belly. She wasn't allowed to get out of the bed when she was in the hospital. She had a terrible experience in the hospital. For the event onset time, it was at 20:00, they drove home from (place name), which is an hour and something, and they stopped at (place name), came home and set outside and she said she had to go lay down because she was tired. She woke up an hour and half to 2 hours later, got out of bed, sat on side, stood up and got herself together and walked to bottom of bed and went out flat. The events required a visit to emergency room and physician office. For emergency room visit, it was reported on 11Mar2021 at (hospital name); the patient should've called redacted number but didn't, they drove in. The patient was hospitalized from 11Mar2021 to 16Mar2021 at (hospital name). The outcome of passed out, tiredness were resolved on 11Mar2021, outcome of 'black left eye/it was black, blue, purple, green and yellow' was resolved on 17Apr2021, outcome of left hand pinky sore was resolved in 2021, the outcome of fell, allergic reaction to the Pfizer COVID vaccine were unknow, outcome of busted mouth, right knee/left shoulder very sore were not resolved.

| 1284737 | 5/4/2021 | KY | 37 | M | 2/19/2021 | 2/19/2021 | dizziness/dizzy/almost felt like fainting; felt like fainting; racing heart; sweating; This is a spontaneous report from contactable consumers (one is the patient). A 37-year-old male patient received bnt162b2 (BNT162B2), dose 1 via an unspecified route of administration in the left arm on 19Feb2021 13:00 [also reported as 26Feb2021 12:45 PM] (Lot Number: EL9267; Expiration Date: May2021) as a single dose for covid-19 immunisation. Medical history included drug penicillin allergies and low testosterone ongoing since 2018. Concomitant medication included testosterone cipionate (TESTOSTERONE CYPIONATE) for low testosterone, start and stop date were not reported. The patient previously took amoxicillin but had allergies. The patient reported that a few minutes after his first vaccination (19Feb2021), he experienced a racing heart, dizziness, sweating, and almost felt like fainting. A couple waves of this hit him and subsided after 10-15 minutes. The events required emergency room visit. The patient has not been covid tested post vaccination. The patient was not diagnosed with covid prior vaccination. The patient has his blood checked twice/year all normal levels (unspecified date). The patient mentioned that he became slightly dizzy after receiving his first COVID-19 vaccine and he was not nervous or scared prior to or following receiving the vaccine. He also does not have history or problems receiving other vaccines or blood draws when he received the second vaccine, he felt normal for a couple minutes although he would feel "something" thought his body immediately after the injection. A few minutes went suddenly, he became very dizzy or short of breath, EMS was on standby at this site, so they advised him to sit on the floor. They connected heart /O2 monitor to him (2021), and his heart rate was very highly (around 130 BPM) or then it would swing widely to less than 50 BPM. During these swings, he would get very dizzy or faint. This happened multiple times starting from less severe to severe with fainting, to finally going away, unfortunately after 30 minutes or so when the heart rate swings were observed, EMS administered Epinephrine and Benadryl in IV form. He was taken to a hospital via ambulance where he was later discharged after no issue in observation. The events tachycardia, dizziness and fainting were considered serious with seriousness criterion of hospitalization/prolongation of hospitalization |

| 1284723 | 5/4/2021 | IN | 67 | M | 3/19/2021 | 4/23/2021 | <p>he couldn't pee; low appetite; he thought he may pass out; Chills; severe headache every time he got up; feel sick to his stomach but never vomited; low grade fever; tired; This spontaneous case was reported by a consumer and describes the occurrence of URINARY RETENTION (he couldn't pee) in a 67-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 037A21B and 030A2L1A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included COVID-19 in December 2020. Concomitant products included FLUOXETINE HYDROCHLORIDE (PROZAC) for an unknown indication. On 19-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 23-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 23-Apr-2021, the patient experienced URINARY RETENTION (he couldn't pee) (seriousness criterion medically significant), DECREASED APPETITE (low appetite), PRESYNCOPE (he thought he may pass out), CHILLS (Chills), HEADACHE (severe headache every time he got up), NAUSEA (feel sick to his stomach but never vomited), PYREXIA (low grade fever) and FATIGUE (tired). On 23-Apr-2021, DECREASED APPETITE (low appetite) had resolved. On 25-Apr-2021, URINARY RETENTION (he couldn't pee), PRESYNCOPE (he thought he may pass out), CHILLS (Chills), HEADACHE (severe headache every time he got up), NAUSEA (feel sick to his stomach but never vomited), PYREXIA (low grade fever) and FATIGUE (tired) had resolved. The reporter stated, the patient had similar side effect from what he had from the 1st dose. Additional concomitant medications included Blood pressure pills, Cholesterol pills and maybe back pain pill. Treatment medication included Tylenol. Based on the information provided which includes a strong temporal association between the use of mRNA-1273 vaccine and onset of the reported events, a causal relationship cannot be excluded. Chills, headache, pyrexia, fatigue and nausea are consistent with the product safety profile. Most recent FOLLOW-UP information incorporated above includes: On 26-Apr-2021: An additional document received on 26 Apr 2021</p> |

The patient's height, and weight were not reported. The patient's past medical history included bladder infection, and concurrent conditions included high blood pressure, high cholesterol, and asthma/ bronchitis/ get asthma attacks often. The patient's other pre-existing medical conditions included that she had no history of heart attack or pain. The patient's family history included that her mother had bladder infection and lady part infections. The patient was not pregnant at the time of reporting. The patient received Covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 202A21A and expiry: 23-JUN-2021) dose was not reported, 1 total administered on 10-APR-2021 around 10:00 AM for prophylactic vaccination on right arm. No concomitant medications were reported. On 10-APR-2021, the patient almost passed out after she got the shot (vaccination), they (vaccine facility) had to take her out to the car, and she could hardly walk. The patient reported that injector pulled the needle back and put it in again (Wrong injection technique). It was reported that right after injection when she turns around her arm was big as baseball, mushy, swollen and it was painful (injection site). The mushiness was going down, but it was still mushy. The patient's arm was hard as a marble, redness was still as big as a baseball and she could not touch her arm. On 20-APR-2021, the patient had bladder infection/abdominal pain to groin and had infection from lady's problem and further stated it as bladder infection. The patient think that the bladder infection was not because of the Janssen vaccine. On 21-APR-2021, the patient experienced hives on the neck and she applied Benadryl cream on it. The patient went to her physician on 22-APR-2021 (Thursday) and Nurse looked at her arm and said that it was perfusion and there was blood clot inside the bump. The patient's physician told her to</p> |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

take Benadryl and put ice and heating pad on it. The patient reported that she was already putting ice packs 3-4 times a day and heating pads 3 times a day. The patient also showed her hives to her physician and she was told to keep putting Benadryl on it. The patient had a follow up with her physician on 03-MAY-2021 for her arm checkup. On an unknown date in APR-2021 (reported as first night), she could see penguins walking around, marching up the stairs on first night (Hallucinations) and then no more penguins after the first night. On the same first night, the patient experienced nausea, diarrhea, and vomiting. On an unknown date, the patient experienced wheezing and she thinks that her wheezing was not related to the Janssen Covid-19 vaccine. According to patient her wheezing is related to her asthma. The patient did not have any trouble sleeping since she was taking the Benadryl. The patient stated that she could move her arm up and down, but she was scared to do so. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from hallucinations, bladder infection/abdominal pain to groin, diarrhea, vomiting, and nausea, and the outcome of almost passed out, hives on neck, couldn't touch the arm, blood clot inside the bump (injection site), wheezing, could hardly walk, injector pulled the needle back and put it in again and redness is still as big as a baseball was not reported. The reporter considered the causality between Covid-19 vaccine ad26.cov2.s and wheezing, and bladder infection as not related. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: 20210452551-covid-19 vaccine ad26.cov2.s- blood clot inside the bump (injection site), hallucinations. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s).

| 1284602 | 5/4/2021 | WV | 51 | F | 1/14/2021 | 1/15/2021 | Loss of consciousness; single syncopal episode; tried to get ready for work; did not sleep much that night; pain/body aches; Tired; Awoke nauseated; This case was received via VAERS on 27-Apr-2021 and was forwarded to Moderna on 27-Apr-2021. This regulatory authority case was reported by an other health care professional (subsequently medically confirmed) and describes the occurrence of LOSS OF CONSCIOUSNESS (Loss of consciousness) and SYNCOPE (single syncopal episode) in a 51-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 013L20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Multiple organ dysfunction syndrome. Concurrent medical conditions included COPD and Asthma. Concomitant products included FLUTICASONE FUROATE, VILANTEROL TRIFENATATE (BREQ ELLIPTA) and FLUTICASONE for an unknown indication. On 14-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 15-Jan-2021, the patient experienced LOSS OF CONSCIOUSNESS (Loss of consciousness) (seriousness criterion medically significant), SYNCOPE (single syncopal episode) (seriousness criterion medically significant), IMPAIRED WORK ABILITY (tried to get ready for work), INSOMNIA (did not sleep much that night), MYALGIA (pain/body aches), FATIGUE (Tired) and NAUSEA (Awoke nauseated). At the time of the report, LOSS OF CONSCIOUSNESS (Loss of consciousness), SYNCOPE (single syncopal episode), IMPAIRED WORK ABILITY (tried to get ready for work), INSOMNIA (did not sleep much that night), MYALGIA (pain/body aches), FATIGUE (Tired) and NAUSEA (Awoke nauseated) had resolved. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. The patient has done a telehealth visit with physician couple hours after the events. No further treatment was rendered. Treatment information was not provided. Based on the current available information and temporal association between the use of the product and the start date of the event, a |

| 1284511 | 5/4/2021 | TX | 44 | M | 5/3/2021 | 5/3/2021 | I'm three weeks post vaccine #2. During weeks 2 and 3 I have had vertigo off and on and almost fainted once. It wasn't clear that it was related to the vaccine until my husband started having the same symptom. I also had some leg tingling which may or may not be related. My blood pressure is normal. 70s / 120s. I am still currently having these symptoms and have not contacted my doctor. |
| 1284758 | 5/4/2021 | OR | 47 | M | 4/18/2021 | 4/19/2021 | Got up in night to use bathroom and fainted. |
| | | | | | | | passed out; extreme nausea; hit the bathroom floor; have a cut lip; extreme chills; This is a spontaneous report from a contactable consumer (patient). A 47-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) dose 2 via an unspecified route of administration, administered in left arm on 18Apr2021 10:45 (Lot Number: EW0164) as single dose for COVID-19 immunisation. Medical history included irritable bowel syndrome and allergy. Concomitant medications included chlorthalidone, clidinium bromide (LIBRAX), Multi-Vitamin, colecalciferol (D3), ascorbic acid (VIT C), fish oil. No other vaccine was received in four weeks. No COVID prior vaccination. No COVID tested post vaccination. The patient received first dose of BNT162B2 (lot# ER2613) in left arm on 27Mar2021 12:00 PM for COVID-19 immunization. The patient experienced extreme nausea 19Apr2021 00:30, then he passed out and hit the bathroom floor. The patient woke up a few moments later, when her wife found him. The patient had a cut lip. The patient then had extreme chills for 30-60 minutes. The events resulted in doctor or other healthcare professional office/clinic visit. It's unknown if treatment was received. The outcome of events was recovering. |

| 1286545 | 5/4/2021 | OR | 81 | F | 4/7/2021 | 4/28/2021 | <p>Pt received vaccine in her home state, unable to get details of vaccine administration such as date, site, lot #, etc. Per ED MD note : 81-year-old female with reported history of atrial fibrillation found down at hotel room. Patient states she has been on the ground in the room for 3 days, she was found covered in feces. Alert and oriented x4 however intermittently appears confused and has varying history. She does not know how she got on the ground, however denies fall or syncope. No significant current complaints. Slightly tachycardic and febrile, slightly hypertensive, exam without any significant acute findings, no obvious skin source of ulcer or infection, no focal neurological deficits, no pain. Initiated aggressive fluid hydration and sepsis work-up. EKG appears normal with no signs of ischemia or arrhythmia. Labs show slightly elevated troponin, low magnesium, metabolic/lactic acidosis. VBG relatively normal. Urine negative for infection chest x-ray without evidence of pneumonia, no clinical signs or symptoms to identify source of infection. Nothing to suggest meningitis at this time. CT head is negative. Unclear source of fever however empirically treated with antibiotics and fluids. Patient remains hemodynamically stable with no hypotension. She did arrive slightly hypoxic and with increased respiratory rate however clear lung sounds and no indications of heart failure, COPD/asthma. CT chest without evidence of pulmonary embolism, focal pneumonia, or fluid overload. Respiratory status possibly related to compensation for metabolic acidosis that is likely due to lack of fluid intake due to being on the ground. CK is normal and kidney function is normal. Consulted medicine for admission for further evaluation and treatment. Cardiology was also consulted for NSTEMI, agrees with current plan. per H&P 4/28/21: Altered mental status (R41.82): Etiology is not clear. Patient states she had J&J Covid vaccine about 3 weeks ago. Need to rule out cerebral venous sinus thrombosis. Get a CT scan of the brain with contrast. If negative will get CT venogram or MRV and MRI of the head. Neuro checks. Request PT OT and speech therapy evaluation. Check urine drug screen. Check blood alcohol level. Non-STEMI (non-ST elevated myocardial infarction) (I21.4): Start argatroban drip until cerebral vein sinus thrombosis is excluded then we can switch to heparin drip. Start aspirin and statin. Check fasting lipid panel.</p> |

Monitor on telemetry. Trend troponin. Request echocardiogram. Cardiology to consult. Dr. was consulted from the ER. » Beta-Blocker Ordered: Beta-Blocker Ordered » Aspirin Ordered: Aspirin Ordered » Statin Ordered: Statin Ordered Fall (W19.XXXA): Plan as documented above. Rhabdomyolysis (M62.82): Hydrate and recheck CPK. Elevated liver enzymes (R74.8): Check hepatitis panel. Monitor levels. Fever (R50.9): No clear source of infection. Follow up on blood cultures. CT chest negative for infectious process. Check CT of the abdomen and pelvis. Start empiric antibiotics: Vancomycin and Zosyn. Hypomagnesemia (E83.42): Administer magnesium sulfate. Repeat level in the morning. Diabetes (E11.9): Start sliding scale insulin. Monitor fingersticks. Hypoglycemic protocol. Check hemoglobin A1c. Hypertension (I10): Fortunately patient is hemodynamically stable. We will cautiously start metoprolol. Adjust antihypertensives to optimal blood pressure control. Acidosis, lactic (E87.2): Likely due to profound volume depletion. Rule out sepsis. Hydrate and trend level. VTE: Argatroban. » VTE Prophylaxis Assessment: Risk Level documented as Low Risk Discharge Planning: » Discharge Planning: » Discharge To, Anticipated: Home independently Per Intensivist note 4/30/21: . Another consideration was TTP, however, patient has normal renal function with no significant evidence of microangiopathic hemolytic anemia (no schistocytes on smear). Also does not seem consistent with ITP. Suspect more a result from sepsis given bacteremia Per attending note 4/30/21: Altered mental status (R41.82): Likely septic encephalopathy due to sepsis. No cerebral venous sinus thrombosis. MRI negative for stroke. AMS has resolved. Continue antibiotics. Per attending note 5/2/21: Addendum by MD, on May 02, 2021 09:58:55 (Verified) Discussed with cardiologist, Dr. . Possible need for TEE with regards to persistent bacteremia. We will keep n.p.o. overnight for TEE tomorrow. Repeat blood culture from 4/30/2021 just came back positive for Enterococcus. Suspect endocarditis due to TAVR. ? need for TEE to evaluate the valves (TAVR) more closely. Duration of antibiotics depends on bacterial clearance: To be determined. Get another set of cultures. On Zosyn. per attending note 5/4/21: Enterococcal bacteremia (R78.81): Etiology not entirely

| 1286515 | 5/4/2021 | CA | 70 | F | 5/4/2021 | 5/4/2021 | First, the injection was far more painful than anticipated (and it bled down my arm). My arm immediately ached intensely. Approximately 10 minutes after injection, I began to sweat profusely, followed by intensifying extreme lightheadedness. I could not stand, or lift my head, as I would have definitely passed out. My shoulders and neck became extremely painful, as if ?frozen?, also preventing me from lifting my head. After about 35 minutes I very gradually began to recover. It was about an hour before I began to move around normally. Pharmacy and store staff debated calling the paramedics, but I refused. FYI, I had not been especially anxious about the vaccine, and I have never experienced such a reaction to anything in my life. It was a traumatic experience I would not wish to repeat. |
| 1286314 | 5/4/2021 | NC | 47 | F | 3/13/2021 | 3/13/2021 | Immediately felt overwhelmed with heat and fainted (within 5 minutes) of receiving the shot. I was scheduled to have my normal period within a week and have never had another period. I am experiencing full on menopause and I have never had a single symptom. I have full sweats and freezing temperatures all throughout the day. |

| 1282053 | 5/3/2021 | KY | 64 | F | 4/30/2021 | 4/30/2021 | Patient reported that she had a history of fainting after receiving other vaccines, so she had her friend drive her and got the vaccine administered in her car. A few minutes after getting the vaccine, the patient appeared to have a vasovagal episode where she stared off into the distance and stopped responding to questions for about 30 seconds to 1 minute before coming to. She reported having some tingling in her fingers and feeling a little weak afterwards. Provided the patient with a wet cloth for her forehead and some candy. Patient was a little shaken up but seemed to be back to normal in a few minutes. Contacted EMS just to be sure, and they checked her pulse and blood pressure, which were a little elevated but within normal limits. Patient said she was feeling better and did not need to go with them to the hospital. After waiting a few more minutes, she reported that she was feeling mostly back to normal and her friend drove them back home. |
| 1282185 | 5/3/2021 | | 52 | M | 5/3/2021 | 5/3/2021 | After injection patient felt dizzy and fainted. Vasovagal episode. Patient has a history of vasovagal. Patient awoken after ammonia. Vital signs taken by EMS. Patient is hypotensive. Patient was placed on stretcher in trendelenburg . Patient recovered |

| 1284271 | 5/3/2021 | AZ | 57 | F | 4/30/2021 | 4/30/2021 | Patient experienced light fainting, lower blood pressure after getting her vaccine. Patient's vitals were normal, patient was observed for 30 min by EMS. Patient felt fine after 30 min. Patient didn't need any treatment. |
| 1284011 | 5/3/2021 | CO | 29 | M | 5/3/2021 | 5/3/2021 | At 1809, patient returned to vaccination site as passenger of personal vehicle with complaint of tingling sensation throughout his body that lasted for about 5 minutes. Patient denied loss of consciousness. Patient had received Janssen vaccination to his left deltoid at 17:56. Patient had reported history of feeling near syncope to vaccinations. Patient's level of consciousness, stroke scale, and vital signs were assessed. Patient was offered a call for emergency services on his behalf but patient denied emergency services. Patient stated that a mild tingling sensation continued on his left arm but that he did not feel any more tingling throughout his body at 18:10. At 18:14 patient stated that he wanted to continue to monitor himself at home and he was encouraged to call for emergency services if symptoms continued or worsened. Patient left as passenger of personal vehicle at 18:18 while his friend was driver of their vehicle. |
| 1284439 | 5/3/2021 | AK | 28 | M | 5/3/2021 | 5/3/2021 | Patient fainted 4 minutes after vaccine given. Patient was able to talk but described "eyes in back of head". Blood pressure reading taken 132/76 pulse 72 then 128/82 pulse 85. Patient was responsive to our questions sitting on floor for 5 minutes. We then we observed him for and additional 15 minutes in our waiting area before he left. |
| 1283967 | 5/3/2021 | RI | 41 | F | 4/11/2021 | 5/1/2021 | Syncope |
| 1283764 | 5/3/2021 | SC | 38 | F | 5/3/2021 | 5/3/2021 | Patient received dose in right arm with no complications. However, about 1-2 minutes after vaccination patient reported feeling lightheaded. As I was instructing her to remain seated, she passed out and was unresponsive. She appeared to be having a seizure immediately after that lasted about 1 minute. Once this episode passed, she became responsive and could talk. EMS arrived and took over. |

| 1279428 | 5/2/2021 | | | F | | 4/1/2021 | fainted; rash; died 2 weeks ago after receiving the covid vaccine/ passed away;This is a spontaneous report received from a non-contactable consumer reporting on behalf of the patient via a Pfizer-sponsored program. A female patient of unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), first and second dose, both via unspecified route of administration on unspecified dates (Batch/Lot number was not reported) as a single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The reporter mentioned that she had a friend that died 2 weeks ago after receiving the COVID vaccine. They are going to search for the cause of death (autopsy) because after the vaccine she had a rash, fainted, and went to the hospital, and she recovered (unspecified dates). But after a month or so, she passed away. The reporter mentioned that the patient was born very unhealthy person. Outcome of rash and fainted was recovered on unspecified dates. The patient died in Apr2021. It was unknown if an autopsy was performed. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: died 2 weeks ago after receiving the covid vaccine/ passed away |

| 1280839 | 5/2/2021 | TX | 39 | F | 3/27/2021 | 4/7/2021 | I had the first vaccine on March 27, that night just felt flu-like symptoms, and my left arm was sore. My left arm was still sore from the 27 through April 11. April 7, I was having a hard time breathing, and my left arm swelled up where the injection was given. My husband took me to Hospital, and they said I was having a reaction to the COVID vaccine and gave me prednisone to help with the reaction. I went back to the same ER on April 9 and April 11 with the same problem, but worse. April 14, I went to work and passed out in the bathroom and called my husband to come to pick me up from work. He said our primary doctor, and then I went to . There they discovered a blood clot in my lungs. The doctor said it was a combination of my birth control pill and the COVID vaccine. |
| 1280533 | 5/2/2021 | FL | 18 | F | 5/1/2021 | 5/1/2021 | Pt explained on Covid-19 consent form that she has syncope when seeing a needle. She explained she has an intense fear of needles and has fainted in the past when getting vaccinations. She also explained that she has anxiety. She explained that when she faints it looks like a seizure but it is not. When pt was given shot she was responsive during the needle going in. She was in a seated position. We talked the entire time of administration. After putting the the bandage on her right arm she explained she felt sick (about 40 seconds after injection). She was still responsive for about two minutes then she fainted and her body shook about two times. My coworker and I got her on the ground, she was still responsive enough to ask for a cup of water. Which we gave her, she then went unresponsive for 20 seconds and spilled the water. After this we sat with her on the ground for another 5 minutes and she said she was fine. We helped her to a seated position. We then made her wait another 30 minutes in our waiting area. She assured us she was fine and reiterated that this has happened before in the past anytime a needle was involved. On 5/2/2021 she was contacted and she explained she looked a little pale throughout the day of vaccination, but feels fine now and just has a sore arm. |

| 1280492 | 5/2/2021 | NY | 16 | F | 5/2/2021 | 5/2/2021 | 16 y/o female with NO PMH and no h/o similar prior experiences/syncope c/o "feeling tired" ~3 min after receiving the 1st dose of pfizer vaccine. Pt LOC, "gently" falling onto the floor, landing on her face ~5 min after receiving the vaccine. Pt reported feeling tired before LOC, not associated with any other symptoms (dizziness, changes in vision/hearing). LOC lasted ~10 seconds, pt immediately returned to baseline. She was sat up with the help of her mother and nurse and the clinical lead was notified. Pt was laid down on a cot, VS were taken, ice was applied to her pressure points. Pt reported complete resolution of symptoms within ~5 min. Pt was progressively moved from lying down to sitting to standing. Pt denies eating or drinking anything today and was given fluids and snacks. Pt was monitored for a total duration of 45 min. Pt was driven home by parents. Pt was advised to eat and hydrate today and for the next dose. Pt and parents were advised to call PCP / 911 if symptoms return/persist/worsen or if pt develops concussive symptoms. Pt was instructed to inform the nurse that she fainted ater 1st dose and to prophylactically lay down prior to receiving prior to second dose vaccination. |

| 1280487 | 5/2/2021 | OR | 23 | F | 5/1/2021 | 5/1/2021 | Immediately after receiving the shot I began to have fairly intense pain at injection site. It continued in waves. I began to walk around the store for the allotted 15 minutes. I began to feel very dizzy and faint. My ears began ringing and I didn't feel well. I stumbled back to the pharmacy to ask for help. At this point I was also feeling like it was very hard to breathe. I explained all these symptoms to the pharmacists on duty and they told me to just sit down. After sitting down I still felt faint but suddenly felt the need to vomit. I stumbled to the bathroom where I collapsed in front of the toilet and passed out twice, striking my head and throat on the bowl. After awaking I was very disoriented and felt very hot and clammy. The pharmacist then came and found me and told me to once again sit down and continue waiting. After sitting down for about 5 more minutes I began to feel less dizzy and was having an easier time breathing. I left the store as the pharmacist was ignoring me and didn't seem concerned about my symptoms. After arriving home I was tired and weak and very very cold. I noted my body temp was lower than usual. I took a nap and then these symptoms continued for about 24 hours. I am now feeling much better. |
| 1280332 | 5/2/2021 | CT | 19 | M | 5/1/2021 | 5/1/2021 | Patient felt dizzy and fainted after 5 minutes of vaccination. |
| 1280277 | 5/2/2021 | CA | 16 | F | 5/2/2021 | 5/2/2021 | Patient passed out with associated convulsions within 2 minutes of vaccine being administered. No previous Hx of this post vaccination but did occur once after donating blood. Patient was lowered to flat position on floor. |

| 1280215 | 5/2/2021 | TX | 66 | M | 5/2/2021 | 5/2/2021 | Patient was administered the Johnson and Johnson Janssen COVID-19 vaccine. Shortly after, a few seconds, the patient stated he felt flushed and head started to fall back. Staff member cradled his head and called another staff member over. Staff member called 9-1-1. Patient went unconscious and his eyes rolled back for approximately 30 seconds. When aware, we (staff members) transferred patient from the chair to the floor where staff member supported his back and fanned him due to his profuse sweating. Staff member continued talking to him when he became unconscious again, this time gasping for air and turning pale. We kept saying his name until he came to again and was somewhat aware of his surroundings. He fainted one last time. After this time, he sat up on his own and seemed to be very coherent. The EMS arrived shortly after and took over. They said they would take him out to check him out but he seemed to be doing better. An EMS personnel let us know the patient did tell him that he has fainted from vaccines before. However, he did not disclose this to us on the PQCF form or when asked verbally. |
| 1280207 | 5/2/2021 | NV | 71 | M | 2/1/2021 | 4/7/2021 | Awoke unable to breathe, severe weight in right lung. Called Clinic, advised to go to ER at Hospital. Chest CT showed multiple pulmonary embolli in both lungs-placed on Eliquis. 19 days later had severe nausea, vomiting, fainting. Clinic nurse again advised going to ER where cerebral hemorrhage was diagnosed. Patient life flighted to Hospital. Eliquis discontinued, Keppra started to prevent seizures. In ICU 4/26-28, released to home. |
| 1280061 | 5/2/2021 | NY | 68 | M | 3/11/2021 | 3/11/2021 | Pain in left side of chest, light headed, cold sweats and fainted. Taken to Hospital and released in about 3 hours. Two days later started getting back pains on my left side. Pain got worse and after another couple of days I started coughing up some blood. On March 17th 2021 I was admitted to the hospital with a pulmonary embolism. |

| 1276934 | 5/1/2021 | OH | 37 | F | 4/1/2021 | 4/2/2021 | The next morning I woke up and felt very groggy and slightly chilled. I decided to take a shower to warm up. While in the shower I became dizzy and light headed to the point I fainted. I contacted my family physician. I was told as long as I was feeling okay to be on bed rest for the day with my feet elevated and to continue to drink lots of fluids. I was fine the following day. |
| 1276852 | 5/1/2021 | CA | | U | 2/16/2021 | 2/1/2021 | unconscious about 2 minutes; moderate headache; I had a general unwell feeling; nauseated; incontinent; I became faint; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received bnt162b2 (BNT162B2, solution for injection), dose 2 via an unspecified route of administration on 16Feb2021 (Batch/Lot number was not reported) as SINGLE DOSE for covid-19 immunization. The patient medical history and concomitant medications were not reported. The patient had received first dose of COVID-19 vaccine previously. The patient stated that they had their second Covid-19 vaccine on 16Feb2021. Approximately 10 hours (on 16Feb2021) afterward the patient developed a moderate headache, which 400 mg of ibuprofen eased. The patient had a general unwell feeling much of the following day (16Feb2021), so the patient rested and napped. About 36 hours after the injection the patient became faint, nauseated, and incontinent. The patient was unconscious about 2 minutes. The patient was taken by ambulance to the hospital and remained through the night for observation for the event loss of consciousness. To date, all the tests were negative. The patient received treatment for the event headache. The outcome of the event headache was recovering. The outcome of the events loss of consciousness, syncope, malaise and nausea was unknown. Information about Lot/Batch number has been requested. |

| 1276790 | 5/1/2021 | NJ | 56 | F | 2/12/2021 | 3/29/2021 | having a blood clot down whole right leg / up right side into right chest / under right breast / several clots in her lower abdomen; she almost died; urinary tract infection; right leg is very swollen; Kept losing consciousness/Passed out; hard time walking; had to use a walker; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of THROMBOSIS (having a blood clot down whole right leg / up right side into right chest / under right breast / several clots in her lower abdomen), LOSS OF CONSCIOUSNESS (Kept losing consciousness/Passed out) and FEELING ABNORMAL (she almost died) in a 56-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 002b21a and 004m20a) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concomitant products included LEVOFLOXACIN, RIVAROXABAN (XARELTO), LISINOPRIL, HYDROCHLOROTHIAZIDE, OXYCODONE and LEVOTHYROXINE SODIUM (SYNTHROID) for an unknown indication. On 12-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 12-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 29-Mar-2021, the patient experienced GAIT DISTURBANCE (hard time walking) and WALKING AID USER (had to use a walker). On 12-Apr-2021, the patient experienced THROMBOSIS (having a blood clot down whole right leg / up right side into right chest / under right breast / several clots in her lower abdomen) (seriousness criteria hospitalization prolonged, medically significant, life threatening and intervention required) and LOSS OF CONSCIOUSNESS (Kept losing consciousness/Passed out) (seriousness criterion medically significant). 12-Apr-2021, the patient experienced FEELING ABNORMAL (she almost died) (seriousness criteria hospitalization and medically significant). On 26-Apr-2021, the patient experienced PERIPHERAL SWELLING (right leg is very swollen). On an unknown date, the patient experienced URINARY TRACT INFECTION (urinary tract infection). The patient was hospitalized from 12-Apr-2021 to 19-Apr-2021 due to FEELING ABNORMAL and THROMBOSIS. On 12-Apr-2021, LOSS OF CONSCIOUSNESS (Kept losing |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

consciousness/Passed out) had resolved. At the time of the report, THROMBOSIS (having a blood clot down whole right leg / up right side into right chest / under right breast / several clots in her lower abdomen) was resolving and FEELING ABNORMAL (she almost died), URINARY TRACT INFECTION (urinary tract infection), GAIT DISTURBANCE (hard time walking), PERIPHERAL SWELLING (right leg is very swollen) and WALKING AID USER (had to use a walker) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 12-Apr-2021, Computerised tomogram: blood clots (abnormal) blood clot. On 12-Apr-2021, Ultrasound scan: blood clots (abnormal) blood clots. Action taken with mRNA-1273 in response to the events was not applicable. Patient stated she was in the ICU24-48 hours then transferred to another area of the hospital where she spent another 5-6days. She is still having to use a walker. Her right leg is very swollen. She has to walk and keep her right leg elevated. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. However, Further information has been requested. This case was linked to MOD-2021-090647 (Patient Link).; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. | 1277206 | 5/1/2021 | WA | 33 | M | 3/25/2021 | 3/25/2021 | <p>Passed out; Felt strange/weird; Nauseous; Dizzy; ears rang; Blood pressure drop; This is a spontaneous report from a contactable consumer, reporting for himself. A 33-year-old male patient received the first dose of the bnt162b2 (BNT162B2; Lot Number: EN6208), via an unspecified route of administration in the left arm on 25Mar2021 at 11:00 at a single dose for covid-19 immunisation. The patient received the vaccination in the pharmacy. There was no medical history or concomitant medications. There were no other vaccines administered in the last four weeks. On 25Mar2021 at 23:30, the patient experienced passed out, felt strange/weird, nauseous, dizzy, ears rang, and blood pressure drop. The clinical course was as follows: the patient was advised to wait 15 minutes before leaving. He set an alarm. He bought some food to eat (potatoes and jerky) and waited to leave the site until 11:22. He felt strange/weird, but this was not an unusual feeling after receiving any kind of shot/vaccine for the patient. He was driving to work and started to get a little nauseous but nothing too bad. Thirty seconds later, he started to get dizzy, ears rang, felt blood pressure drop, and passed out going freeway speeds. He was treated in the emergency department and released the same day. There was no treatment given in response to the events. There was no covid prior to or post vaccination. The clinical outcome of the events was recovering. No follow-up attempts are needed. No further information is expected.</p> |

| 1277219 | 5/1/2021 | CA | 44 | F | 4/4/2021 | 4/5/2021 | <p>passed out at work; abnormal (more than usual) vaginal bleeding; she felt uncomfortable on the morning of 05Apr2021; her hands and feet were cold; she was kind of sweating; she felt sick on 05Apr2021; her body temperature went up; her body felt warm; This is a spontaneous report from a contactable consumer (patient). A 44-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), second dose via an unspecified route of administration, administered in Arm Left on 04Apr2021 15:45 (3:45 PM) (Batch/Lot Number: ER8734) as SINGLE DOSE for covid-19 immunisation. The patient medical history includes Shellfish Allergy (Reported she has had a shellfish allergy for a long time, approximately 7-8 years). She said as long as she had no shellfish, she was completely fine. There were no concomitant medications. There were no prior vaccinations (within 4 weeks). There was no additional vaccine administered on the same date as the COVID-19 Vaccine. The patient previously took bnt162b2 for COVID-19 immunization on 14Mar2021 first dose intramuscular at the left arm (Lot Number: EN6208). It was reported that the patient has received both doses of the Pfizer Covid 19 Vaccine. Her second Pfizer Covid vaccine was received on 04Apr2021. Caller started her menstrual cycle on 07Apr2021. She experienced abnormal vaginal bleeding that night. The following day on 08Apr2021 she passed out at work and was transported to the ER via ambulance. She was advised by the ER provider that her symptom was not related to the Covid 19 vaccine. However, she spoke with her OBGYN and was advised they have heard that abnormal bleeding maybe caused by the Covid 19 vaccine. The patient asked if symptom has been reported? It was further reported that she had her first COVID-19 Vaccine shot on 14Mar2021, and her second COVID-19 Vaccine dose on 04Apr2021 at 3:45 PM (PST). She clarified later in the day on 04Apr2021, the COVID-19 Vaccine kicked in. She said she felt sick on 05Apr2021. She said she felt uncomfortable on the morning of 05Apr2021, but still went to work. She said she felt OK once she got to work, but then took time off from work (on 05Apr2021) because she felt uncomfortable. She said when she got home from work (on 05Apr2021), she took 2 Tylenol. She said she was cold, and her body temperature went up, and she was kind of sweating. She clarified her hands and</p> |

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

feet were cold, and later in the day (05Apr2021) her body temperature went up. She said she was aware of the COVID-19 side effects because some of her friends had similar symptoms, so she was kind of expecting the symptoms. She said later in the evening on 05Apr2021, she took 2 Advil and went to bed. She said her body felt warm, but she thought her symptoms were to be expected. She said on 07Apr2021, her (menstrual) period started at 10:00 PM. She said she had abnormal (more than usual) vaginal bleeding for the whole night. She said on 08Apr2021, she felt uncomfortable in the morning when she was getting ready for work. She said she went to work (on 08Apr2021), and at 1:30 PM passed out while at work. She said from her work, she was sent by ambulance to the Emergency Room. She said she was not sure if her passing out had anything to do with the COVID-19 Vaccine, but she had never passed out at work before. She said she asked the Emergency Room doctor about the COVID-19 Vaccine and her passing out. She said the Emergency Room doctor said her passing out had nothing to do with her second COVID-19 Vaccine dose. She said she read more online about the COVID-19 Vaccine. She said she then asked the nurse at her OBGYN's office about abnormal bleeding after getting the COVID-19 Vaccine. She said the nurse had heard of some cases of abnormal bleeding after getting the COVID-19 Vaccine. She said her OBGYN's nurse told her to call to find out if her abnormal bleeding had anything to do with her second COVID-19 Vaccine. She said her OBGYN's nurse provided her with the number to get more information about the COVID-19 Vaccine. It was added that while she was at the Emergency Room, she had 7 vials of blood taken, 2 ultrasounds; an external one of her tummy (abdominal ultrasound), and an internal one where something was stuck in her (transvaginal ultrasound). She said she did not know the results of her testing, and was waiting for a copy of her medical records. The patient also weighed 165 lbs on an unspecified date. It was reported that for the treatment she had taken 2 Tylenol and 2 Advil at different times while at home, but was at work, and didn't have the Tylenol or Advil to provide the dosing, NDC, Lot, and Expiration Dates. For the Emergency Room treatment she reported an EKG was done, and she was given an IV drip. She said she

| 1277403 | 5/1/2021 | IL | 61 | M | 4/30/2021 | 4/30/2021 | was not sure what IV fluids were given to her. The patient required visit to Emergency Room and stated she was taken by ambulance on 08Apr2021 and discharged from the Emergency Room at 6:00 PM the same day. The patient also visited Physician Office and stated she went for a follow-up with her OBGYN doctor at between 9:00 AM-10:00 AM on 09Apr2021. She said the Emergency Room doctor had called her OBGYN doctor on 08Apr2021, while she was in the Emergency Room. The patient underwent laboratory tests which includes: EKG, Blood Test, Abdominal Ultrasound, Transvaginal Ultrasound (All tests were performed while at the Emergency Room on 08Apr2021. Patient stated she was waiting for a copy of her medical records with the test results). The outcome of the events was recovered on Apr2021. |

| 1276393 | 5/1/2021 | | 50 | F | 4/1/2021 | | TACHYCARDIA; DRY MOUTH; DIZZINESS WITH STANDING AND INTERMITTENTLY WITH SITTING; PULMONARY EMBOLISM; FEELING OF DOOM/ FEELING OF PASSED OUT; FATIGUE; This spontaneous report received from a patient via a company representative via the VAERS (Vaccine Adverse Event Reporting System) concerned a 50 year old female unknown ethnicity . The patient's height, and weight were not reported. The patient's concurrent conditions included osteoarthritis, gluten intolerance, and diflucan allergy. The patient was previously treated with fluconazole. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, intramuscular, batch number: 1805029, expiry: UNKNOWN) with unspecified dose on left arm, on 27-MAR-2021 11:00 for prophylactic vaccination. Concomitant medications included amino acids NOS, biotin, cannabidiol, collagen, ethinylestradiol/norethisterone acetate, and hyaluronic acid. On 07-APR-2021, the patient experienced dizziness with standing and intermittently with sitting, tachycardia, dry mouth, chest pressure, shortness of breath, and feeling of extreme doom. On an unspecified date, the patient was transported to the clinic. In the clinic the patient had heart rate of about 140 with irregular beats. The patient had undergone Electrocardiography test which showed ST Depression. The patient's symptoms were improved by taking nitroglycerin. As the clinic did not have the technology to provide care so the patient was emergently transported to the hospital. In the hospital the patient's D-dimer level was positive. Later the patient undergone Computerized Angiogram for lungs which showed pulmonary embolism. The patient undergone Dopplers studies of both legs which showed as negative. The patient had received Heparin treatment for several hours and then later switched to Eliquis. After 6 hours being on Eliquis treatment the patient had same original symptoms and for that again nitroglycerin was administered. The patient was placed back on heparin for a longer period of time. Later on the patient got switched to Eliquis 10 mg twice daily for 7 days and further to 5 mg twice daily for 6 to 9 months. The patient had undergone Angiogram of head and neck which was normal. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from tachycardia, feeling of doom/ feeling of passed out and dry mouth on |
